Copyright © 2005, 2025, Oracle and/or its affiliates.

This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish, or display any part, in any form, or by any means. Reverse engineering, disassembly, or decompilation of this software, unless required by law for interoperability, is prohibited.

The information contained herein is subject to change without notice and is not warranted to be error-free. If you find any errors, please report them to us in writing.

If this is software, software documentation, data (as defined in the Federal Acquisition Regulation), or related documentation that is delivered to the U.S. Government or anyone licensing it on behalf of the U.S. Government, then the following notice is applicable:

U.S. GOVERNMENT END USERS: Oracle programs (including any operating system, integrated software, any programs embedded, installed, or activated on delivered hardware, and modifications of such programs) and Oracle computer documentation or other Oracle data delivered to or accessed by U.S. Government end users are "commercial computer software," "commercial computer software documentation," or "limited rights data" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, the use, reproduction, duplication, release, display, disclosure, modification, preparation of derivative works, and/or adaptation of i) Oracle programs (including any operating system, integrated software, any programs embedded, installed, or activated on delivered hardware, and modifications of such programs), ii) Oracle computer documentation and/or iii) other Oracle data, is subject to the rights and limitations specified in the license contained in the applicable contract. The terms governing the U.S. Government's use of Oracle cloud services are defined by the applicable contract for such services. No other rights are granted to the U.S. Government.

This software or hardware is developed for general use in a variety of information management applications. It is not developed or intended for use in any inherently dangerous applications, including applications that may create a risk of personal injury. If you use this software or hardware in dangerous applications, then you shall be responsible to take all appropriate fail-safe, backup, redundancy, and other measures to ensure its safe use. Oracle Corporation and its affiliates disclaim any liability for any damages caused by use of this software or hardware in dangerous applications.

Oracle®, Java, and MySQL are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Intel and Intel Inside are trademarks or registered trademarks of Intel Corporation. All SPARC trademarks are used under license and are trademarks or registered trademarks of SPARC International, Inc. AMD, Epyc, and the AMD logo are trademarks or registered trademarks of Advanced Micro Devices. UNIX is a registered trademark of The Open Group.

This software or hardware and documentation may provide access to or information about content, products, and services from third parties. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to third-party content, products, and services unless otherwise set forth in an applicable agreement between you and Oracle. Oracle Corporation and its affiliates will not be responsible for any loss, costs, or damages incurred due to your access to or use of third-party content, products, or services, except as set forth in an applicable agreement between you and Oracle.

If this document is in public or private pre-General Availability status:

This documentation is in pre-General Availability status and is intended for demonstration and preliminary use only. It may not be specific to the hardware on which you are using the software. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to this documentation and will not be responsible for any loss, costs, or damages incurred due to the use of this documentation.

If this document is in private pre-General Availability status:

The information contained in this document is for informational sharing purposes only and should be considered in your capacity as a customer advisory board member or pursuant to your pre-General Availability trial agreement only. It is not a commitment to deliver any material, code, or functionality, and should not be relied upon in making purchasing decisions. The development, release, timing, and pricing of any features or functionality described in this document may change and remains at the sole discretion of Oracle.

This document in any form, software or printed matter, contains proprietary information that is the exclusive property of Oracle. Your access to and use of this confidential material is subject to the terms and conditions of your Oracle Master Agreement, Oracle License and Services Agreement, Oracle PartnerNetwork Agreement, Oracle distribution agreement, or other license agreement which has been executed by you and Oracle and with which you agree to comply. Documentation Accessibility

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at <https://www.oracle.com/corporate/accessibility>.

Access to Oracle Support

Oracle customers that have purchased support have access to electronic support through My Oracle Support. For information, visit <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info> or visit <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs> if you are hearing impaired.

Sample Code

Oracle may provide sample code in SuiteAnswers, the Help Center, User Guides, or elsewhere through help links. All such sample code is provided "as is" and "as available", for use only with an authorized NetSuite Service account, and is made available as a SuiteCloud Technology subject to the SuiteCloud Terms of Service at www.netsuite.com/tos.

Oracle may modify or remove sample code at any time without notice.

No Excessive Use of the Service

As the Service is a multi-tenant service offering on shared databases, Customer may not use the Service in excess of limits or thresholds that Oracle considers commercially reasonable for the Service. If Oracle reasonably concludes that a Customer's use is excessive and/or will cause immediate or ongoing performance issues for one or more of Oracle's other customers, Oracle may slow down or throttle Customer's excess use until such time that Customer's use stays within reasonable limits. If Customer's particular usage pattern requires a higher limit or threshold, then the Customer should procure a subscription to the Service that accommodates a higher limit and/or threshold that more effectively aligns with the Customer's actual usage pattern.

Beta Features

This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish, or display any part, in any form, or by any means. Banking

NetSuite banking gives you several ways to track your income accurately. Record deposits to your bank accounts to capture customer payments and other money you receive in your business. For a deposit, select payments for existing transactions, add funds not related to transaction payments, and record any cash you get back from the bank. Remove undeposited funds from deposits, record cash back, manage returned or Non-Sufficient Funds (NSF) checks, and more. For more information, see [Deposits](#).

NetSuite lets you use the Write Checks transaction to issue a check for an expense or record a non-check transaction. For more information, see [Checking](#).

To create a transaction that changes a general ledger account balance, create a journal entry. For more information, see the help topic [Journal Entries](#).

Move funds from one bank account to another, or into non-bank accounts. For more information, see [Transferring Funds](#).

Add company credit card accounts, enter charges, pay the bill, and reconcile the statement. For more information, see [Company Credit Cards](#).

Create and save a record for a financial institution, then add multiple format profiles. Format profiles let you set up how bank data is imported and parsed. You can configure imports for bank data matching, reconciliation, or expense reporting. For more information, see [Financial Institution Records](#).

If you use online banking, you can import transaction data automatically or manually. With automatic imports, you get new data from your financial institution daily. For more information, see [Automatic Bank Data Import](#). Alternatively, download transaction data and manually import it into NetSuite. For more information, see [Manual Bank Data Import](#).

You may import bank lines that don't have matching customer payments in NetSuite. The Automated Cash Application feature lets you generate a batch of customer payments and apply them to open invoices. NetSuite then matches and clears these payments automatically, ready for reconciliation. For more information, see [Automated Cash Application](#).

Use Intelligent Transaction Matching to automatically match imported bank lines with existing 9r system-generated account transactions. On the Match Bank Data, view matched and unmatched transactions, and manually match exceptions. Reconcile account statements on the Reconcile Account Statement page, which displays matched and cleared transactions. For details, see [Bank Data Matching and Reconciliation](#).

Important: If you have the right permissions (see [Permissions for Banking Features](#)), NetSuite automatically enables all new accounts to use the Match Bank Data and Reconcile Account Statement pages. These replace the old Reconcile Bank Statement and Reconcile Credit Card Statement pages, which are still functional but no longer supported. If you still use the old pages, edit your accounts to use the new ones. For more information, see [Editing Accounts to Use the Match Bank Data and Reconcile Account Statement Pages](#).

If you have accounts that still use the old reconciliation pages and aren't ready to migrate, see [Reconciling Bank Statements](#) and [Reconciling Credit Card Statements](#).

For information about adding and deleting bank accounts, see the help topics [Creating Accounts](#) and [Deleting Accounts and Making Accounts Inactive](#).

Permissions for Banking Features

You need certain permissions to use banking features in NetSuite. The following table lists the permissions you need for Financial Institution Records, Statement File Import, Automated Cash Application, Intelligent Transaction Matching, and Account Reconciliation:

Note: If you have the Administrator role, you can assign permissions to roles. For more information, see the help topic [Setting Permissions](#).

Feature	Permission	Description
Financial Institution Records	Financial Institution Records	Create and save financial institution records and format profiles where you configure account linkings and bank transaction codes. This permission requires full-level access. For more information, see Financial Institution Records .
Statement File Import	Import Online Banking File	Access the Upload File page and Banking Import History pages. Access levels include: ■ Full – Access the Upload File and Banking Import History pages, import files, view import errors, and delete files you imported manually. ■ Create or Edit – Access the Upload File and Banking Import History pages, import files, and view import errors. ■ View – View the Banking Import History page. For more information, see the help topic Bank Data Import .
Automated Cash Application	Automated Cash Application	Access the Automated Cash Application page. This permission may be enabled by default, depending on your role. Full is the only access level.
	Accounts	View and select accounts on the Automated Cash Application page. Your role needs at least view-level access.
	Customer Payment	View, edit, or create customer payment records. Your role needs at least edit-level access.
	Invoice	View, edit, or create invoice records. Your role needs at least edit-level access.
Intelligent Transaction Matching and Account Reconciliation	Accounts	View and select accounts on the Match Bank Data and Reconcile Account Statement pages. All new accounts use these pages automatically. If you have existing accounts that don't, check the Use Match Bank Data and Reconcile Account Statement Pages box on each account record. If you use NetSuite's default BAI2 or CAMT.053 parsers, set up account linkings on the Account page. For more information, see the help topic Editing an Account . Your role needs at least view-level access.
	Matching Rules for Online Banking	Access the Reconciliation Rules page. Access levels include: ■ Full, Edit, or Create – Access the Reconciliation Rules page, which has two rule types: □ Matching rules – Create, edit, and delete on the Reconciliation Rules page.

Feature	Permission	Description
		□ Auto-create rules – Generate during the matching process on the Match Bank Data page. Edit and delete on the Reconciliation Rules page. ■ View – No access.
	Reconcile Reporting	Access the Reconciliation History, Detail, and Summary Reports.
	Reconcile	Access the Match Bank Data and Reconcile Account Statement pages and match transactions. Some roles may have Edit or only View access. ■ Edit – Access the Match Bank Data and Reconcile Account Statement pages, match transactions, and close a reconciliation. ■ View – Access the Reconcile Account Statement page and transaction details. The Account Reconciliation Summary portlet also appears on your dashboard by default.

Other possible restrictions may affect the list of accounts and details you see:

- **Subsidiary Restrictions** – For example, an employee of Subsidiary A can only access Subsidiary A's account list by default. If the user role has **Allow Cross-Subsidiary Record Viewing** enabled, the account list displays all available accounts for the user to reconcile.
- **Department, Class, or Location Restrictions** – For example, with access to department A and Department Restriction set to **own**, **subordinate**, and **unassigned**, you see only accounts in A, its children, or unassigned accounts. You can't access accounts from department B.

For more information, see [Bank Data Matching and Reconciliation](#).

For permission details about Bank Feeds and Auto Bank Statement Import SuiteApps, see the following help topics:

- [Roles and Permissions for Bank Feeds](#)
- [Roles and Permissions for Auto Bank Statement Import](#)

Deposits

In NetSuite, record deposits to your bank accounts to capture customer payments and other money received. This helps you track income accurately.

Typically organizations post customer payments received in the form of cash, checks, and credit card payments to the Undeposited Funds ledger account rather than to a specific bank account. This avoids a time lag between your book balance and your bank balance. When you record a deposit, NetSuite moves funds from Undeposited Funds to the bank account ledger to keep your bank balances accurate.

If you record customer payments directly to a bank account instead of Undeposited Funds, you don't need to create deposits for those amounts.

To record deposits to your bank accounts, go to Transactions > Bank > Make Deposits.

You can edit a saved deposit in the Deposits list. You can also delete a recorded deposit from the Deposits list. For more information, see [Making Deposits](#).

Information about using deposits in this topic includes:

- [Making Deposits](#)
- [Viewing the Deposits List](#)
- [Printing Deposit Slips](#)
- [Recording Cash Back from a Deposit](#)

Making Deposits

Make a deposit in NetSuite to record funds you add to your bank account. For a deposit, select payments for existing transactions, add funds not related to transaction payments, and record any cash you get back from the bank.

Note: Many organizations post customer payments to the Undeposited Funds account instead of a specific bank account. This prevents a time lag between your book balance and your bank balance. When you record a deposit, NetSuite moves funds from Undeposited Funds to the bank account ledger to keep your bank balances accurate. If you record customer payments directly to a bank account instead of Undeposited Funds, you don't need to create deposits for those amounts.

Warning: If another user deletes a payment or cash sale marked for deposit while you're creating a deposit, NetSuite displays a message that the record has changed. You can't save the deposit because the data is missing.

When making a deposit, besides the standard save options, you can also do the following from the header:

- **Reset** – clears all input on all subtabs and in the header
- On the **Payments** subtab, check or clear the box below **Customize**. Checking the box selects all payment items for the deposit. Clearing the box removes them from the deposit.

Add items to a deposit with payment methods other than Check or Cash. For example, add a custom payment method or a credit card. If you select **Print** on the deposit form, NetSuite warns you that the deposit has items other than Check or Cash. Continue with the deposit if this is correct, or make changes as needed.

The system doesn't track tax periods on deposits.

If you use a custom role without the permission to make deposits, add the Deposit permission to the role.

To add the Deposit permission:

1. Log in as an administrator.
2. Go to Setup > Users/Roles > Manage Roles.
3. On the Manage Roles page, click **Edit** next to the custom role you want to modify.
4. On the **Permissions** subtab of the Role page, find the Transactions sublist.
5. From the dropdown list in the Permission column, select **Deposit**.
6. From the dropdown list in the Level column, select the access level for the permission.
7. Click **OK**.
8. Click **Save**.

To record a customer deposit, follow the same steps but select the Customer Deposit permission. To record a customer deposit, see the help topic [Recording a Customer Deposit](#).

To make a deposit:

1. Go to Transactions > Bank > Make Deposits.
 2. In the Primary Information section:
 - a. Select the custom form for the deposit.
The system-generated deposit number appears.
 - b. Select the bank account for the deposit.
The currency and exchange rate display for the account. For information about exchange rates, see the help topic [Currency Exchange Rates](#).
If the bank account's currency matches the subsidiary's base currency, the **Exchange Rate** field is read-only.
-  **Note:** If you use NetSuite OneWorld, the bank account determines the subsidiary and the selectable payments at the line level in step 4a. For other deposits, the bank account determines the subsidiary and the currency. If you change the bank account, class, department, location, and all line items are cleared.
- c. The **Amount** field displays the total amount of payments, other deposits, and cash back selected or entered on the **Deposits** subtab.
 - d. Accept today's date or enter the date of the deposit.
 - e. Select a posting period if you use the **Accounting Periods** feature.
 - f. Enter a memo if needed.
 - g. To enter multiple deposits before printing deposit slips, check the **To Be Printed** box. For more information, see [Printing Multiple Deposit Slips](#).
 3. In the Classification section, select a department, class, and location for the deposit if needed.
If you use NetSuite OneWorld, the subsidiary defaults to the one linked to the selected bank account.
 4. On the **Deposits** subtab, enter the items for the deposit.
 - a. The **Payments** subtab lists all payments posted to the **Undeposited Funds** account. Check the box next to each item to include it in this deposit.

Filter the items by date, date range, or payment processing profile.

The **Amount** column displays the payment amount in the bank account currency, entered when received for a cash sale, invoice, or other transaction. To change the amount, click the link in the **Date** column to open the source transaction.

If the field is empty, enter the amount manually. NetSuite leaves the field blank if the payment currency and bank account currency differ, and the bank and subsidiary currencies are also different.

If the payment currency is different from the bank's, but the bank and subsidiary currencies match, NetSuite uses the stored exchange rate to calculate the amount.

 **Note:** You can't modify a zero payment amount.

 **Warning:** If you move a cleared cash sale transaction to **Undeposited Funds**, NetSuite returns it to an uncleared status.

- b. On the **Other Deposits** subtab, enter items not received as payments to **Undeposited Funds**.

Enter the name, amount (positive), account, payment method, and payment number for each item. Optionally enter a classification and memo. Click **Add**.

 **Note:** You can select an entity in the **Name** field. The available entities are filtered by the selected bank account.

If you use NetSuite OneWorld with shared records, this field displays all vendors and customers assigned to the subsidiary for the selected bank account. For more information about shared records, see the help topics [Assigning Subsidiaries to a Vendor](#) and [Assigning Subsidiaries to a Customer](#).

- c. On the **Cash Back** subtab, enter the cash back amount, account, classification, and memo. Click **Add**.
5. On the **Communication** subtab, attach files and notes to this transaction if needed.
 - a. On the **User Notes** subtab, enter a title and note for any comments. Click **Add** after each note
 - b. On the **Files** subtab, attach files from the File Cabinet. To upload a new file, select **New** from the dropdown list in the **Attach Files** column.
 - c. Use the **Events**, **Tasks**, and **Phone Calls** subtabs to attach activities like events, phone calls, and tasks to the transaction. For more information, see the help topic [Attaching Events, Tasks, and Calls to Records and Transactions](#).
6. If you use NetSuite OneWorld and have Multi-Book Accounting, the **Accounting Books** subtab appears. This subtab displays secondary books for the deposit and their base currencies and exchange rates. For information about Multi-Book Accounting, see the help topic [Using Multi-Book Accounting](#).
7. After you enter all the items for the deposit, verify the total is correct and click **Save**.

To edit a saved deposit in the Deposits list:

1. Go to Transactions > Bank > Make Deposits > List.
2. From the Deposits list, click **Edit** next to the deposit you want to modify.

3. On the Deposit page, make the needed changes.
4. Click **Save**.

If you change the deposit amount, a prompt to unreconcile the transaction appears. Click **OK**, and then open the correct statement period and reconcile the transaction again.

 **Note:** If you change the account, no prompt appears and the transaction stays reconciled.

To delete an existing deposit from the Deposits list:

1. Go to Transactions > Bank > Make Deposits > List.
2. From the Deposits list, click **Edit** next to the deposit you want to delete.
3. On the Deposit page, under **Actions**, click **Delete**.
4. At the prompt, click **OK** to confirm.

Viewing the Deposits List

The Deposits page provides a list of deposits recorded in NetSuite and an overview of deposit details. From the list, access individual deposit records or print the deposit slip.

To view the deposits list, go to Transactions > Bank > Make Deposits > List.

By default, the Deposits page displays the following information for each deposit:

- Date of the deposit
- Document number for the deposit
- Bank account for the deposit
- Memo
- Currency of the bank account
- Amount (Foreign Currency)
- Amount of deposit
- Whether the deposit was posted

Depending on your enabled features, this page may also display feature-specific columns.

Filtering the Deposits List

To limit the deposits in the list, select one or more filters on the Deposits page. In addition to standard filters, add custom ones like Account by customizing. Delete existing deposits from the list as well.

To add custom filters to the Deposits list:

1. From the Deposits list, click **Customize View**.
2. On the Saved Transaction Search page, open the **Available Filters** subtab.
3. Select a filter in the dropdown list.
4. The **Show in Footer** box is checked by default. Clear this box if you don't want to display a dropdown list of filter values on the Deposits list.
5. Click **Add**.

6. Click **Save**.

Removing Undeposited Funds Lines from Deposits

If you post a customer payment to Undeposited Funds, it appears on the Payments subtab of the Deposit page. Include it in a deposit by selecting the payment when making a deposit. In some cases, you may need to remove undeposited payments if you've already accounted for them.

To remove unnecessary Undeposited Funds lines from the Deposit page:

1. Go to Transactions > Bank > Make Deposits.
2. On the **Payments** subtab of the **Deposits** subtab, check the box in the **Deposit** column next to the journal lines you want to remove.
3. Note the total amount of the lines you check on the **Payments** subtab.
4. Open the **Cash Back** subtab.
5. In the **Amount** field, enter the total amount of all lines you checked on the **Payments** subtab.
For example, if the total is 500.00, enter 500.00 in the **Amount** field.
6. In the **Account** field for this line, select **Undeposited Funds**.
7. Click **Save**.

Printing Deposit Slips

Print slips for cash and check deposits. Print a deposit slip for an individual deposit, or queue multiple slips and print them together.

Deposit slips print on printer paper and don't require special forms. They're printed as PDFs from your local or network printer. Download the latest Adobe Reader for free from the [Adobe website](#).

To customize the fields on your deposit slips, go to Customization > Forms > Transaction Forms. Click the deposit slip name you want to customize and complete the fields as needed. For more information, see the help topic [Creating Custom Entry and Transaction Forms](#).

You can also order deposit slips from <http://www.netsuiteforms.com>. There are two layouts, both 378L in correct alignment.

 **Note:** You can't customize the printed deposit slip layout.

Printing a Single Deposit Slip

Print a single deposit slip when you enter a deposit at Transactions > Bank > Make Deposits. After entering all deposit information, click **Save & Print**, and then click **Print** in the Adobe application.

Print deposit slips you entered previously by going to Transactions > Bank > Make Deposits > List. Click **Print** next to the deposit slip you want to print.

Printing Multiple Deposit Slips

If you enter multiple deposits before printing, you can print all slips at one time by checking the **To Be Printed** box for each deposit.

To print multiple deposit slips:

1. Go to Transactions > Management > Print Checks and Forms.
2. Click **Deposits**.
3. On the Deposits page, select the **Account** to print deposit slips for.
4. Check the box next to each deposit you want to print, or click **Mark All** to print all listed deposits.
5. Click **Print**.
 - If you don't enable the Download PDF Files preference, a preview of your deposits opens in Adobe Reader.
 - If you enabled the Download PDF Files preference, save your deposits first, and then open them with Adobe Reader.
6. Click **Print** in Adobe Reader.
7. To print multiple copies, enter the number in the print message.
8. Click **OK**.

Recording Cash Back from a Deposit

Record cash received back from a deposit when you create the deposit slip in NetSuite. Enter the amount received on the **Cash Back** subtab of the Deposit page.

To balance your bank account, create new deposits or charges during the reconciliation process. For more information, see [Reconciling Bank Statements](#).

To record cash back from a deposit:

1. Go to Transactions > Bank > Make Deposits.
2. Create a deposit. For more information, see [Making Deposits](#).
3. Open the **Cash Back** subtab.
 - a. In the **Amount** field, enter the amount of cash you received back.
 - b. Select the account the deposit comes from.
 - c. Select a department, class or location.
 - d. Enter a memo if needed.
4. Click **Add**.

Repeat these steps for any other cash items you received from deposits.
5. Click **Save**.

Checking

In NetSuite, use the Write Checks transaction to issue a check to pay an expense or record a non-check transaction. For example, you can:

- reimburse employees for expenses if you don't use Direct Deposit or Accounts Payable
- pay vendors if you don't use Accounts Payable
- record cash transactions
- enter other non-check debits, such as debit card transactions

If you use Accounts Payable, pay vendors at Transactions > Payables > Pay Bills.

Information about writing checks in this topic includes:

- [Writing Checks](#)
- [Resetting Check Numbers](#)
- [Printing Checks](#)
- [Entering Non-Check Debits](#)
- [Recording Cash Transactions Using Checks](#)
- [Tracking Petty Cash](#)

Writing Checks

 **Note:** The Write Checks option is not available for Japan Edition.

In NetSuite, use the Write Checks transaction to issue a check to pay an expense or record a non-check transaction. For example, you can:

- reimburse employees for expenses if you do not use Direct Deposit or Accounts Payable
- pay vendors if you do not use Accounts Payable
- record cash transactions
- enter other non-check debits, such as debit card transactions

If you use Accounts Payable, pay vendors at Transactions > Payables > Pay Bills. For more information, see the help topic [Vendor Bill](#).

 **Note:** If you need to stop payment on a check, the preferred method is to void the check in the system. When you void a check with a reversing journal entry, NetSuite records a reversing journal entry to cancel the general ledger impact of the check. If you void a check without a reversing journal entry, NetSuite sets the check amount to zero. Voiding a check doesn't remove it from the system, ensuring that you maintain the proper audit trail. For information about voiding a check, see [Voiding a Check](#) and [Voiding Transactions](#).

Saving a check transaction records the expense by debiting the specified expense account and crediting the selected bank account.

When you save a check transaction, you have three options:

- To process the information and return to the Transactions page, click **Save**.
If you select **To be Printed** for the transaction, you can print it on the Print Checks page. For more information, see [Printing Checks](#).
- To process the information and return to another blank Check page, click **Save & New**.
- To save the information and immediately print the check you created, click **Save & Print**. For more information, see [Printing a Single Check](#).

To write a check:

1. Go to Transactions > Bank > Write Checks.

 **Note:** The Write Checks option is not available for Japan Edition.

2. In the Primary Information section:

- a. From the **Account** list, select the bank account from which to withdraw the funds for this check.

The **Balance** field is read-only.

- b. Select the **Payee** for this check.

- c. In the **Amount** field, enter the amount you want to write the check for.

You can also leave this field blank and enter amounts from the expenses and items added for the check. **Auto Fill** displays the amount from the previous transaction for this payee.

The currency and exchange rate appear in the **Currency** and **Exchange Rate** fields, if they're visible.

 **Note:** These fields only appear if the Multiple Currencies feature is enabled. If disabled, the currency and exchange rate match the base currency and exchange rate of the associated subsidiary or company.

If the payee is an employee, these fields are populated based on the base currency of the associated subsidiary or company. You need to use this currency for transactions with this employee.

If the payee is a vendor or customer, these fields are populated based on the primary currency on the payee's record. To add multiple currencies for the vendor or customer, see the help topic [Assigning Currencies to Entities](#).

 **Note:** The Multiple Currencies feature includes what used to be separate Multi-Currency Customers and Multi-Currency Vendors features. If those features are still in your account, you need to enable them along with Multiple Currencies. Otherwise, customer and vendor records can only contain one currency. For more information, see the help topic [Multiple Currencies](#).

- d. Use today's date or enter a new one for this transaction.
- e. If you use accounting periods, pick a posting period for this check.
- f. Select **To Be Printed** to save this check in your print queue to print later.

If you don't check this box, you can click **Save & Print** to print this check immediately.

- g. The **Check #** field is populated with one of the following:
 - If you checked **To Be Printed**, this box is populated with **To Print**.

You choose starting numbers when you print those checks.

- If you print this check right away when you save, NetSuite increases the largest check number by one. You can enter another number, but the next number reverts to the standard pattern.

 **Note:** You can also use this field to record ACH, ATM, or other reference numbers or text.

- h. Enter a memo for the check (optional).
3. In the Classification section:
 - a. If you use NetSuite OneWorld, the **Subsidiary** field displays the primary subsidiary for the **Payee** by default.

 **Note:** If you share vendor and customer records with multiple subsidiaries, you can change the subsidiary from the primary to a secondary one. When you change the subsidiary, NetSuite updates the bank account to that of the selected subsidiary and updates the currency to that of the new bank. NetSuite also clears the lines on the **Expenses** and **Items** subtabs. For more information about shared vendor and customer records, see the help topics [Assigning Subsidiaries to a Vendor](#) and [Assigning Subsidiaries to a Customer](#).

- b. If you use departments or classes, select one to associate with this check.
4. On the **Expenses & Items** subtab, click the **Expenses** subtab and select any expenses for this transaction. For more information, see [Adding Expenses to a Check](#).
5. On the **Expenses & Items** subtab, click the **Items** subtab and select any items for this transaction. For more information, see [Adding Items to a Check](#).
6. If you use the Landed Cost feature, on the **Landed Cost** subtab, select the allocation method, enter shipping and duty costs, and select their sources. For more information, see the help topic [Landed Cost](#).
7. On the **Payee Address** subtab, the address from the payee record displays. If **Auto Fill** is enabled, the address from the latest transaction displays. If you haven't sent invoices or **Auto Fill** is disabled, the **Default Billing** address appears.

 **Note:** The **Auto Fill** preference takes precedence over the **Default Billing** address.

To enable or disable the **Auto Fill** preference, go to Home > Set Preferences. On the Transactions subtab, in the Basics section, check or clear the **Auto Fill Transactions** box.

To enable or disable the **Default Billing** box, go to Lists > Relationships > Customers and click **Edit** next to a customer. On the customer record, in the **Address** subtab, check or clear the **Default Billing** box next to an address.

8. On the **Relationships** subtab, the primary contact for the customer automatically appears. You can edit, add, or delete contact information for this transaction.
9. On the **Communication** subtab, attach files and notes to this transaction.
 - a. On the **User Notes** subtab, enter a title and note for any comments you want to add, and then **Add** after each note
 - b. On the **Files** subtab, select and attach files from the File Cabinet. To upload a new file, select **New** from the dropdown list in the **Attach Files** column.
 - c. Use the **Events**, **Tasks**, and **Phone Calls** subtabs to add to attach activities like events, phone calls, and tasks to this transaction. For more information, see the help topic [Attaching Events, Tasks, and Calls to Records and Transactions](#).

10. If you use NetSuite OneWorld and have Multi-Book Accounting, the **Accounting Books** subtab appears. This subtab lists any secondary books for the selected check, if any, and their base currencies and exchange rates. For information about Multi-Book Accounting, see the help topic [Using Multi-Book Accounting](#).
11. If you use the International Tax Reports SuiteApp, on the **Tax Reporting** subtab, select the delivery terms, region of origin, nature of transaction code, and mode of transport. Check the **Non-deductible Tax Adjusted** box if this check includes a nondeductible tax. For more information, see the help topic [EU Intrastat Report](#).
12. Click **Save**.

To edit a saved check in the Checks list:

1. Go to Transactions > Bank > Write Checks > List.
2. From the Checks list, click **Edit** next to the check you want to modify.
3. On the Check page, modify the saved check as required.
4. Click **Save**.

If you change the check amount, a prompt appears to unreconcile the transaction. Click **OK**, open the correct statement period, and reconcile the transaction again.

 **Note:** If you change the account for the transaction, no unreconcile prompt appears and the transaction remains reconciled.

To delete an existing check from the Checks list:

1. Go to Transactions > Bank > Write Checks > List.
2. From the Checks list, click **Edit** next to the check you want to delete.
3. To remove the check, under **Actions**, click **Delete**.
4. In the confirmation prompt, click **OK**.

Adding Expenses to a Check

Add expenses to a check to directly account for expenses related to your organization.

A common use is to pay for internal company expenses, like petty cash, or to pay bills when you don't get a vendor invoice.

To add expenses to a check:

1. Go to Transactions > Bank > Write Checks.
2. At the top of the Check page, enter the payee, dates, and payment details. You can enter the amount here or in the detail lines. For more information, see [Writing Checks](#).

If the **Auto Fill** preference is turned off, click **Auto Fill** to enter information from the last transaction for this payee.

To enable or disable the **Auto Fill** preference, go to Home > Set Preferences. On the **Transactions** subtab, in the Basics section, check or clear the **Auto Fill Transactions** box.

3. On the **Expenses & Items** subtab, open the **Expenses** subtab to enter the expenses.
 - a. In the **Account** field, select the appropriate ledger account.

Note: You must have the **Expand Account Lists** preference enabled to select a credit card account in this field. For more information, see the help topic [Accounting Preferences](#).

- b. Enter an amount for the expense item. This updates the **Amount** field in the header.
 - c. Optionally enter a memo.
 - d. Select an expense category if you use internal categories and have added this field to the Check page.
 - e. Select a department, class, or location to associate with this transaction, if needed.
 - f. Enter the **Customer** or **Project** for this expense.
 - g. If this expense is billable, check the **Billable** box.
 - h. Click **Add**.
4. Repeat for any additional expenses.
 5. Click **Save**.

Note: If you use voucher checks, you can print up to 19 line items per check. If you have more than 19, the extra items don't appear on the voucher.

Adding Items to a Check

Items are goods and services you acquire. When you write a check, you can add items from your item list.

To add items to a check:

1. Go to Transactions > Bank > Write Checks.
2. At the top of the Check page, enter the payee, dates, amount, and payment details. For more information, see [Writing Checks](#).
If the **Auto Fill** preference is turned off, click **Auto Fill** to enter information from the last transaction for this payee.
3. On the **Expenses & Items** subtab, click the **Items** subtab.
 - a. Select an item from the list and enter the quantity.
The description, rate, and amount fields are populated.
 - b. Enter the serial or lot numbers, if needed.
 - c. Enter an expiration date for the item, if needed.
 - d. In the **Bin Numbers** field, the preferred bin is selected. To stock items in other bins, click the bin number, click the **Bins** icon, edit the quantities, and click **Done**.
 - e. Select a tax code so the **Tax Rate** field is populated
 - f. Set options, if needed.
 - g. Enter the customer or project for this item.
 - h. Select a department, class, and location to associate with this transaction, if needed.
 - i. If this is billable, check the **Billable** box.
 - j. Check the **Update Item Price** box to change the purchase price for this item.
4. Click **Add**.

5. To add more items, repeat step 3.
6. Click **Save**.

 **Note:** If you use voucher checks, you can print up to 19 line items per check. If you have more than 19, the extra items don't appear on the voucher.

Adding Bank Account Register Shortcuts

You can add shortcuts on your dashboard to access the register for each bank account.

To use shortcuts, first enable the Shortcuts portlet on your dashboard at Home > Dashboard. Click **Personalize** to open the Personalize Dashboard panel. Under Standard Content, click or drag **Shortcuts**.

To create a shortcut to a bank account register:

1. Go to Transactions > Bank > Write Checks.
2. In the **Account** field, select a bank account.
3. Under **Actions**, select **Go to Register**.
4. When the register opens, click **Add To Shortcuts**, available in the Shortcuts menu.
5. On the Add Shortcut page, accept the account name from your chart of accounts or change it to the name you want to appear on your NetSuite Home page. Check **Open in New Window** to open the register in a new window.
6. Click **Save**.

Repeat these steps for each bank account. You can also add a shortcut to any ledger account.

To access a bank account register, click its link in your Shortcuts portlet.

Voiding a Check

The Write Checks transaction lets you issue a check to pay an expense or record a non-check transaction if you don't use Accounts Payable. For information about writing checks in NetSuite, see [Writing Checks](#).

When you write a check, the amount posts to the journal account affected by the payment. When you void the check, the selected journal account is impacted by the voiding journal entry. For information about the GL impact from writing a check, see the [Writing Checks](#) subtopic in the [Bank Transaction GL Impact](#) help topic.

To void a check from a closed period, you need to reopen the period first.

 **Note:** You cannot void a range of checks at one time.

You can void a check with or without a reversing journal entry. To do this, you set the **Void Transactions Using Reversing Journals** preference (see the help topic [Void Transactions Using Reversing Journals Preference](#)):

- **Voiding with a reversing journal entry** – NetSuite voids the check and records a journal entry with the opposite amount to cancel the general ledger impact. The **Void Transactions Using Reversing Journals** box is checked.

To void a check that has been deposited, you should manually create a reversing journal entry.

- **Voiding without a reversing journal entry** – NetSuite voids the check and sets the transaction amount to zero. For example, use this for a bounced check. The **Void Transactions Using Reversing Journals** box is cleared.

 **Warning:** If you void a check without a reversing journal entry and it's already cleared, NetSuite unmatched it or removes its cleared status. If it was reconciled, it becomes unreconciled. This may cause inconsistencies in your account reconciliation, like an incorrect balance.

If you void a cleared check with a reversing journal entry, the check remains matched or user-cleared. If the check was previously reconciled, it remains reconciled.

 **Note:** If a transaction is still valid but needs changes, don't void it. Instead, unmatched or remove its cleared status, make your changes, then match or clear it again and reconcile.

To unmatched a transaction or remove its cleared status, see [Undoing Submitted Transaction Matches](#) and [Undoing the Cleared Status of Submitted Transactions](#). To reconcile transactions, see [Reconciling Transactions](#).

To void a check:

1. Go to Transactions > Bank > Write Checks > List.
2. Click the **Edit** link for the check you want to void.
3. Click **Void**.

If you're voiding this check with a reversing journal entry, the Voiding Journal page appears. Click **Save**.

 **Note:** If the Voiding Journal page doesn't appear but you want to void the check with a reversing journal entry, set the **Void Transactions Using Reversing Journals** preference. See the help topic [Void Transactions Using Reversing Journals Preference](#).

The system sets the check's status to **Voided** and records a journal entry with the opposite amount to cancel the general ledger impact. For more information about creating a journal entry, see the help topic [Making Journal Entries](#).

If you void this check without a reversing journal entry, the system sets the status to **Voided** and the amount to zero. If the check was cleared, a confirmation window warns you that this may cause an account reconciliation issue, like an incorrect balance. The check becomes unreconciled if it was reconciled, and it's unmatched or has its cleared status removed. Click **Cancel** to stop or **OK** to void the check.

For information about voiding transactions, see the help topic [Voiding Transactions](#).

 **Note:** If you need to cancel a vendor bill, see the help topic [Canceling a Vendor Bill](#). Unlike checks, bills are cancelled rather than voided.

If you void a check without a reversing journal entry and the check was previously cleared, you need to reconcile the voided check. See [Troubleshooting Reconciliation Issues](#).

To remove a voided check from the print queue,, edit the check and then clear the **To Be Printed** box.

Voided Check Scenarios

The following table outlines some scenarios where a check is voided in NetSuite and what action to take:

Scenario	Action to Take
You created and voided a check, but no check was delivered to or deposited by the vendor. The check and its reversing journal entry (if recorded) don't have a matching imported bank line.	Go to Transactions > Bank > Match Bank Data. Mark the voided check and its reversing journal entry (if recorded) as cleared. See Marking Transactions as Cleared . Then, reconcile your transaction or transactions. See Reconciling Transactions .
You created and voided a check, but it was an ACH payment. The payment was sent, your account was debited, but it failed due to incorrect vendor bank info and was credited back to your account.	Go to Transactions > Bank > Match Bank Data. Match the voided check to the debit transaction, and the reversing journal entry to the credit transaction. See Matching Bank Data . Then, reconcile your transactions. See Reconciling Transactions .

Resetting Check Numbers

By default, NetSuite sets the Check # field to the largest existing check number increased by one. If you have the appropriate permission, you can reset numbering to a lower or higher number than the current one.

To reset check numbering:

1. Go to Lists > Accounting > Accounts, or Setup > Accounting > Chart of Accounts.
2. In the list of accounts, click **Edit** next to the bank account where you want to reset check numbering.
3. In the **Next Check Number** field, enter the check number for the next check from this account
4. Click **Save**.

If your NetSuite account uses auto-generated check numbering, you can reset the initial numbering for the check transaction type. For information about auto-generated numbers, see the help topic [Set Auto-Generated Numbers](#).

Printing Checks

To save a check in your print queue for later, check the **To Be Printed** box. For details, see [Writing Checks](#). To remove the check from the print queue, edit the check and clear the **To Be Printed** box.

Print checks on the Print Checks page at Transactions > Management > Print Checks and Forms > Checks. You can also print a single check immediately after writing a check transaction.

Your administrator can customize printed form layouts with Advanced PDF/HTML templates. For information, see the help topic [Advanced PDF/HTML Templates](#).

Checks print as PDFs with Adobe Reader. Visit the [Adobe website](#) to download the latest version for free.

Select the account for the checks, select the check type, and enter the check number. Decide if the checks should print from back to front.

Note: For information about reprinting a check, see [Reprinting a Check](#).

To print checks:

- Set your check printing preferences. For more information, see [Setting Check Printing Preferences](#).
- Ensure that Adobe Reader is available.
- Order check printing forms from the Forms Fulfillment Center, a NetSuite partner at www.netsuiteforms.com. For more information, see [Forms Available for Check Printing](#).
- Print single or multiple checks. For more information, see [Printing a Single Check](#) and [Printing Checks for Multiple Transactions](#).
- For reprinting checks and troubleshooting, see [Handling Check Printing Problems](#).
- To view the template the system uses to print your checks, see [Viewing Check Printing Templates](#).

To clear the printer queue, go to **Devices and Printers** on your Start menu.

Setting Check Printing Preferences

You set check printing preferences on the Printing & Fax Preferences page.

Note: Check printing preferences, including the Default Check Type, only apply to basic printing layouts. If you have the Administrator role, you can use advanced printing layouts to customize your printed forms. You can customize forms with Advanced PDF/HTML templates. For more information, see the help topic [Advanced PDF/HTML Templates](#).

To set check printing preferences:

1. Go to Setup > Company > Preferences > Printing & Fax.
2. Click the **Printing** subtab.
3. Under Check Printing, in the **Default Check Type** field, choose one of two check types:
 - **Standard** – printed without a voucher, three checks per 8.5 x 11 inch sheet.
 - **Voucher** – printed at the top of an 8.5 x 11 inch sheet with voucher information at the bottom, one check per sheet.

If you use voucher checks, you can print up to 19 line items on each check. If you have more than 19 line items for a single check, the extra items won't appear on the voucher.

Always print the check at the top. NetSuite doesn't support printing checks in the middle of the page.

Note: When you customize a check form PDF layout, you see only the check, not vouchers, no matter your check type preference. Even if you change the page size, you can only add or edit standard check elements. For information about customizing check layouts, see the help topic [Customizing Transaction Form PDF Layouts](#).

4. Select a font style in the **Check Font** field.

Note: The preferences in steps 3 and 4 don't affect the layout of the check form.

5. Select a font size in the **Check Font Size** field.
6. Click **Save**.

If your organization uses basic printing, you can set a different check template for each subsidiary. For information, see the help topic [Specifying Check Layout by Subsidiary](#).

Adjusting Check Printing Position

If you need to adjust the printing position for the text on the check form, go to Home > Set Preferences. On the **Transactions** subtab in the Printing section, changes the values in the **Horizontal** and **Vertical Print Offset** fields. Changes the values on the Set Preferences page affects all checks you print.

Automatic scaling in the Page Handling section of the Print window can cause problems when printing checks. Ensure that **Page Scaling** is set to **None**, and the boxes below it are cleared in the Print window.

Forms Available for Check Printing

You can use NetSuite to print two types of checks:

- **Standard** – printed without a voucher, three checks per 8.5 x 11 inch sheet.
- **Voucher** – printed at the top of an 8.5 x 11 inch sheet with voucher information printed at the bottom, one check per sheet.

Always print the check at the top. NetSuite doesn't support printing checks in the middle of the page.

Note: You can customize check forms, but you must print forms as Standard (three to a sheet) or Voucher (check at the top only.) When you customize a check layout, you see only the check, not vouchers, no matter your check type preference. Even if you change the page size, you can only add or edit standard check elements.

For information about customizing forms, see the help topic [Customizing Transaction Form PDF Layouts](#). For information about the Advanced PDF/HTML Templates feature, see the help topic [Advanced PDF/HTML Templates](#).

If your organization uses basic printing, you can set a different check template for each subsidiary. For information, see the help topic [Specifying Check Layout by Subsidiary](#).

For more information about setting up check printing and aligning check forms, see [Setting Check Printing Preferences](#).

NetSuite checks are available from the Forms Fulfillment Center, a NetSuite partner at www.netsuiteforms.com. The following checks are compatible with NetSuite:

- Laser Top Multipurpose Check (DNL208)
- Laser Top Multipurpose Check - Unlined (DNL200)
- Laser 3-Up Multipurpose Check - Unlined (DNL201)
- Laser 3-Up Multipurpose Checks w/Lines Product (DNL202)

Printing a Check at the Form Bottom

Some locales require printing a check at the bottom of the form instead of the top. For example, some U.K. accounts require stock that prints at the bottom of the form. If you have this requirement, order check stock from www.access-plus.co.uk and use reference number INF01SL.

Viewing Check Printing Templates

Before printing a check, you can view the template the system uses to print the check. Where you view the template depends on whether your check uses a basic layout or a customized layout with Advanced PDF/HTML Templates. This procedure is about viewing templates for checks that use basic layouts. For information about advanced templates and how to view them, see the help topics [Advanced PDF/HTML Templates](#) and [Viewing an Advanced Template in the Template Editor](#).

To view templates for checks that use a basic layout:

1. Go to Customization > Forms > Transaction Form PDF Layouts.
2. Click **Customize** next to the layout you want to view.

Note: To find out which transaction form layout a check uses, see the **Custom Form** field on the check record.

NetSuite displays the template it uses to print the check.

3. To see a preview of your print output, click **Preview**.

For more information about basic printing templates, see the help topic [Basic Printing Layouts](#).

Printing a Single Check

Print a single check immediately after you write a check transaction by clicking **Save & Print** when you save the transaction.

Alternately, print one or more checks from the queue of saved check transactions. For more information, see [Printing Checks for Multiple Transactions](#).

Note: For information about reprinting a check, see [Reprinting a Check](#).

To print a single check:

1. Go to Transactions > Bank > Write Checks.
2. On the Check page, enter the necessary information. For more information, see [Writing Checks](#).
3. When you're done, click **Save & Print**.

NetSuite displays the printout for your check as a PDF.

4. Place a blank check in your printer tray, ensuring that the check number matches the number on the Check page.

When you print checks, NetSuite prints the check number in the upper right corner in a small font. It shouldn't overlap the number on your preprinted check stock.

When you view your checks in the Adobe application before printing them, verify that the number NetSuite assigned to the check matches the number on your preprinted checks. To reset the check number, see [Resetting Check Numbers](#).

5. Click **Print** in the Adobe application.
6. To print multiple copies, enter the number you need in the print message, then load the right number of blank pages after the check in your printer.
7. In the Page Handling section of the Print window, verify that **Page Scaling** is set to **None** and the boxes below it are clear. Automatic scaling can cause problems printing checks.

8. Click **OK**.

If you have the Administrator role, you can customize printed form layouts with Advanced PDF/HTML templates. For information, see the help topic [Advanced PDF/HTML Templates](#).

Printing Checks for Multiple Transactions

Follow these steps to print checks for more than one transaction.

To save a check in your print queue for later, check the **To Be Printed** box. For details, see [Writing Checks](#). To remove the check from the print queue, edit the check and clear the **To Be Printed** box.

 **Note:** For information about reprinting a check, see [Reprinting a Check](#).

To print checks for multiple transactions:

1. Go to Transactions > Management > Print Checks and Forms and then click **Checks**.
NetSuite displays the Print Checks page.
2. To determine the order in which NetSuite prints the checks, click a column header to sort by that column.
3. Select the bank account you want to print checks from.

 **Note:** Only bank accounts with transactions where the **To Be Printed** box is checked appear in the **Account** dropdown list.

4. NetSuite displays the next available check number to print.
Enter the starting check number for your preprinted checks if it's different.
To reset the check number sequence, see [Resetting Check Numbers](#).
5. If higher-number checks go into your printer before lower-number checks, click **Print Back to Front**.
6. Choose the preprinted check type.
 - Choose **Standard** to print a check without a payment voucher.
 - Choose **Voucher** to print a check with a payment voucher.
7. If you enabled auto-generated numbers for vendors, sort the list of checks by the vendor name instead of ID. Click the **Payee** column header to sort checks by the payee name.
Set your preferences for autogenerated numbers at Setup > Company > Auto-Generated Numbers.
8. Check the box in the **Print** column next to each check you want to print.

 **Note:** If you check one or more boxes and then click a column header to sort, a confirmation message appears. If you click **OK**, NetSuite changes the print order and clears any checked boxes in the Print column. If you click **Cancel**, the print order doesn't change and checked boxes remain checked.

9. Click **Print**.

To preview your checks:

1. Preview your checks using the following methods:

- If you enabled the Download PDF Files preference, select **Print** to save your checks, then open them with Adobe.
 - If you didn't enable Download PDF Files, a preview of your checks opens automatically in Adobe.
2. To specify the Download PDF Files preference, go to the Defaults section of the **General** subtab at Home > Set Preferences.
 3. Place your checks in your printer tray, ensuring that the check number matches the value in the **First Check Number** field.
 4. Click **Print** in the Adobe application window.
 5. To print multiple copies, enter the number you need in the Print window, then load the right number of blank pages after each check in your printer.
 6. In the Page Handling section of the Print window, verify that **Page Scaling** is set to **None** and the boxes below it are clear. Automatic scaling can cause problems printing checks.
 7. Click **OK**.

If you have the Administrator role, you can customize printed form layouts with Advanced PDF/HTML templates. For information, see the help topic [Advanced PDF/HTML Templates](#).

Handling Check Printing Problems

For more information about setting up check printing and aligning check forms, see [Setting Check Printing Preferences](#).

Reprinting a Check

Follow these steps if a check doesn't print correctly because of a printing error or another problem.

To reprint a check:

1. Go to Transactions > Bank > Write Checks and then click List or Search to find the check you want to reprint.
2. Click **Edit** next to the check you want to reprint.
The check opens in Edit mode.
3. If you printed the check with an error and already issued it, void the check before reprinting. See [Voiding a Check](#). Otherwise, skip to step 4.
4. Check the **To Be Printed** box.
5. Change the check number to match your next blank check.
6. Repeat the printing process. See [Printing Checks for Multiple Transactions](#).

Note: To reprint the check with the same number, on the Print Checks page for the associated account, change the **First Check Number** value as needed. After you save, a confirmation dialog appears saying the check will have a duplicate number. Click **OK**.

Print Scaling

Print scaling on your printer can cause problems when printing checks. When the PDF opens and you click the Print button, the Print window opens. In the Page Handling section of the Print window, verify that **Page Scaling** is set to **None**, and the boxes below it are clear.

Forgetting to Print a Check

If you click **Save** instead of **Save & Print** when saving a check you want to print immediately, follow these steps to print the check from the Print Check page.

To print a check later:

1. Go to Transactions > Bank > Write Checks > List.
 2. Find the check transaction you want to print and click **Edit**.
 3. Check the **To Be Printed** box and click **Save**.
Alternately, click **Save & Print** to print the check immediately.
 4. Go to Transactions > Management > Print Checks and Forms.
 5. Click **Checks**.
 6. On the Checks page, select the bank account you want to print checks from.
 7. Check the box in the **Print** column next to each check you want to print.
 8. Enter the rest of the required information and click **Save** to print the check.
- For detailed printing instructions, see [Printing Checks for Multiple Transactions](#).

If you have the Administrator role, you can customize printed form layouts with Advanced PDF/HTML templates. For information, see the help topic [Advanced PDF/HTML Templates](#).

Entering Non-Check Debits

Enter non-check debit transactions on an account using the Write Checks transaction. Non-check debit transactions include debit card, ATM (automated teller machine), and EFT (electronic funds transfer) payments.

To enter non-check debit transactions:

1. Go to Transactions > Bank > Write Checks.
2. On the Check page, verify that the correct bank account appears in the **Account** field.
3. Enter the payment information in the appropriate fields.
4. In the **Check Number** field, enter **Debit** or another label to show the payment isn't made by a check.
5. Click **Save**.

This debit appears on the account register.

You should use the Write Checks transaction to enter non-check debits. You can also record debits while reconciling your bank statement.

To enter non-cash debit transactions while reconciling a bank statement:

1. Go to Transactions > Bank > Reconcile Bank Statement.
2. Click the **New Charges** subtab.
 - a. Enter the required information for the charge.
 - b. Click **Add**.

3. Finish the rest of the reconciliation.

For complete reconciliation instructions, see [Reconciling Bank Statements](#).

When you've cleared all transactions on the statement and entered any extras, the statement balance and cleared balance should match. Use the **Difference** field to track your progress.

4. When you're done, you can:

- Click **Save** to reconcile your bank statement.
- Click **Save & Print** to save and print your reconciliation.
- Click **Hold** to keep your reconciliation until you return to save or print it.

Recording Cash Transactions Using Checks

In NetSuite, record detailed cash transactions that you don't enter as bills on the Write Checks page.

For example, while serving at a party Christy's Catering runs out of soda. The owner must immediately purchase more soda with cash and bring it back to the party. Because this cost is for a project, Christy's Catering can record the cash transaction using Write Checks and capture the expense without creating a vendor bill first.

To record a cash transaction:

1. Go to Transactions > Bank > Write Checks.
2. On the Check page, select the ledger account to record the cash expense.
3. Enter the name of the payee who received cash.
4. In the **Check #** field, type **CASH**.
You can also include a tracking number.
5. Enter the amount spent.
6. On the **Expenses & Items** subtab, enter line items for the expenses or items for this cash transaction.
For example, on the **Expenses** subtab, you can select a Beverage expense account, enter the customer, and select **Billable** to charge the expense to your customer.
7. Click **Save**.

To view the transaction, go to Transactions > Bank > Write Checks > List. Click **View** next to the item you created.

Tracking Petty Cash

Important: Before making any changes, ask your accountant if writing journal entries or changing the account type is the best way for your business to track petty cash.

Tracking Petty Cash Using Journal Entries

Most companies follow the standard accounting practice of using journal entries to track petty cash transactions. When you establish a Petty Cash account, write a check for the cash you want to keep on

hand, and cash it. Make a journal entry that debits the Petty Cash asset account and credits the journal account for the bank.

Every time you spend cash from the Petty Cash account, use your receipts to make journal entries that debit the expense accounts for each receipt and credit the Petty Cash asset account for the cash spent. Write and cash a check to replenish the petty cash funds as needed.

For information about journal entries, see the help topic [Making Journal Entries](#).

Tracking Petty Cash Using the Write Checks Function

To use the Write Checks function for petty cash expenses, set up your Petty Cash account as a Bank account. As a Bank account, your Petty Cash account appears as a choice on the Check page at Transactions > Bank > Write Checks. Use the Write Checks transaction to record expenses.

Write and cash a check to fund your petty cash. Then write a check against the Petty Cash Bank account to record expenses paid with petty cash.

You can also enter a Bill for the purchases you paid through Petty Cash, then pay the bill from the Petty Cash account.

Transferring Funds

A transfer is a movement of funds between bank accounts. In NetSuite, bank accounts also include accounts for petty cash.

NetSuite lets you make two types of bank transfers. You can transfer funds between two bank accounts with the same currency, or from a base currency account to a foreign currency account.

Information about transferring funds in this topic includes:

- [Transferring Funds Between Bank Accounts](#)
- [Transferring Funds to Non-Bank Accounts](#)
- [Deleting Funds Transfers](#)

Transferring Funds Between Bank Accounts

NetSuite lets you make two types of bank transfers. You can transfer funds between two bank accounts with the same currency, or from a base currency account to a foreign currency account.

 **Note:** You can only transfer funds between bank accounts in the same subsidiary.

- **Two bank accounts with shared currency** – Transfer funds between two bank accounts that share a currency. The exchange rate is always one. The G/L impact is in the subsidiary's base currency. NetSuite translates the transfer amount to the base currency using the default system rate. For example, if you transfer 100 euros between Australian euro accounts with AUD as the base currency, NetSuite still converts the amount using the system rate.

 **Note:** The default system rate is not visible on the user interface.

- **Base currency bank account to foreign currency bank account** – Transfer funds from a base currency bank account to any foreign currency bank account. The exchange rate is between the subsidiary's base currency and the selected foreign currency. When you select the From and To accounts, NetSuite displays the default system exchange rate between the two currencies.

When you enter a value in the From Amount field, NetSuite translates it and displays it in the To Amount field without rounding.

NetSuite updates the exchange rate if:

- The translated From Amount field value multiplied by the exchange rate does not equal the To Amount field value after rounding.
- You change the translated value in the From Amount field.

For example, if you transfer 100 USD from a U.S. bank account to a U.K. bank account in GBP, NetSuite displays the default exchange rate (1.6). Entering 100 in the From Amount field displays 62.50 in the To Amount field. If you enter 130 in the To Amount field, NetSuite updates the exchange rate to 0.7692307692307693 (100/130). The G/L impact is in base currency, USD 100.

 **Important:** If the bank account currencies differ, one account must be in the base currency.

To enter a funds transfer:

1. Go to Transactions > Bank > Transfer Funds.
2. In the **From Account** field, select the source account containing the funds you want to transfer.

The account balance and currency appear next to the **From Account** field.

3. In the **To Account** field, select the target account to receive the funds.
The account balance and currency appear next to the **To Account** field. The exchange rate between the two account currencies displays below.
4. Select the posting period for the transfer.
The period must be open.
5. Accept or select the date in the **Date** field.
6. In the top **Amount** field, enter the amount to transfer from the **From Account**, in that account's currency.
The second **Amount** field displays the amount to be transferred into the **To Account**, after currency translation.
7. Enter a memo if needed.
8. Enter a department, class, or location if needed.
9. Click **Save**.

The transfer is complete, and the bank account balances update automatically.

Transferring Funds to Non-Bank Accounts

In NetSuite, funds transfers refer specifically to transfers between bank accounts.

Transfers between bank accounts and non-bank accounts are usually done with checks or deposits. For example, if you pay off a loan with a check, write a check from your checking account and select the loan payable account for the expense.

 **Note:** When your bank account and loan are with the same bank, you can also use the bank's online system to transfer between operating accounts and loan accounts.

To transfer funds to non-bank accounts, make a general journal entry. For information about journal entries, see the help topics [Journal Entries](#), [Journal Entries Overview](#), and [Journal Entry Preferences](#).

To make a general journal entry:

1. Go to Transactions > Financial > Make Journal Entries.
2. On the Journal page, enter the appropriate information as directed by instructions in [Making Journal Entries](#).

Deleting Funds Transfers

Delete a funds transfer if it was made in error.

 **Note:** You need the Deleted Records permission with full-level access to do this procedure.

To delete a funds transfer:

1. Go to Transactions > Bank > Transfer Funds > List.

2. From the Transfers list, click **Edit** next to the funds transfer you want to delete.
3. On the Transfer page, under **Actions**, click **Delete**.
4. At the prompt, click **OK** to confirm.

Company Credit Cards

After you set up company credit card accounts, you can enter company credit card charges, pay the credit card bill, and reconcile the credit card statement.

Information about using company credit cards in this topic includes:

- [Creating Company Credit Card Accounts](#)
- [Entering Company Credit Card Charges](#)
- [Paying the Company Credit Card Bill](#)
- [Reconciling Credit Card Statements](#)

Creating Company Credit Card Accounts

You can add a company credit card to your accounts at any time. After you set up the account, enter company credit card charges, pay the bill, and reconcile the statement.

To add a new company credit card account:

1. Go to Setup > Accounting > Manage G/L > Chart of Accounts > New.
2. In the **Type** list, select **Credit Card**.
3. Enter the number to identify this account.
4. Enter a name for the account.
5. Complete other fields if needed.
6. If you use NetSuite OneWorld, choose the subsidiary for this account.
Credit card accounts can be assigned to only one subsidiary.
7. Click **Save**.

To modify an existing company credit card account:

1. Go to Setup > Accounting > Manage G/L > Chart of Accounts.
2. From the Chart of Accounts, click **Edit** next to the credit card account you want to modify.
3. Modify fields as needed.
You can't change the account currency if transactions already exist in that currency.
From the **Actions** menu, delete or merge the company credit card account as needed.
4. Click **Save**.

Entering Company Credit Card Charges

To manage charges and payments for your company credit card, enter each transaction individually. Transactions post immediately.

To import credit card charges, see the help topic [Credit Card Charge Import](#).

To import bank or credit card statements, see [Bank Data Import](#).

To enter credit card transactions:

1. Go to Transactions > Bank > Use Credit Card.
2. Select the transaction type you want to enter:
 - **Charge** to record a purchase
 - **Credit** to record a credit on your account

Note: For credit type transactions like returned items, tax posts to GST or VAT on Purchases.

3. Under Primary Information, enter a reference number from the credit card transaction if needed.
4. In the **Vendor** field, select the entity you are paying or the entity crediting you for a previous purchase.
The currency field defaults to the currency on the entity record.
In NetSuite OneWorld, the subsidiary appears under Classification.
5. In the **Account** field, select the credit card account for this transaction.
The current balance of the credit card account appears in the **Balance** field.
In NetSuite OneWorld, the list displays only credit card accounts with the same currency as the vendor.

Note: The currency for a credit card account is always the currency of the subsidiary when the account was created. If you change the subsidiary to one with a different currency, the account keeps its original currency and is available only for transactions in that currency.

6. In the **Amount** field, enter the amount of the transaction.
7. Enter a different exchange rate if needed.
8. The **Date** field displays the current date.
Enter a different date if needed.
9. If you use the **Accounting Period** feature, select a posting period.
You can enter transactions only to open periods.
10. Enter a memo if needed.

Expenses

1. Under **Expenses & Items**, on the **Expenses** subtab, select the expense account.
Available expenses are filtered by the selected vendor and subsidiary.

Important: The Unbilled Receivable account appears in the account list when the **Expand Account Lists** accounting preference is enabled. **Don't select this account.** All debits and credits must be system-generated.

2. Enter the amount for the expense.
3. Enter memo if needed.
4. Enter a class, department, or location if needed.
5. If the expense is billable to a customer, select the customer and check the **Billable** box.
6. Click **Add**.
7. Repeat these steps for each expense you want to add to this credit card charge.

Items

1. To add items, on the **Items** subtab, select an item name or click **Add Multiple** to quickly add several items.

Available items are filtered by the selected vendor and subsidiary.

2. Enter the item information.

For details about entering item information, see the help topic [Creating Item Records](#).

Note: If you use NetSuite OneWorld and share the selected vendor with multiple subsidiaries, the item price is based on the item definition for the vendor and subsidiary. Changing the subsidiary could change the item price.

3. Click **Add**.
4. Repeat these steps for each item you want to add to this credit card.

Tax Details

If VAT/GST nexuses and tax preferences are set in your NetSuite account, click the **Tax Details** subtab to select the vendor's nexus and tax registration number. Check the **Override** box to override vendor defaults, and then complete the tax lines.

Relationships

Click the **Relationships** subtab to add contact information. The primary contact is selected automatically. To edit this contact, click the contact's name. Add more contacts by entering their information and clicking **Add**.

Communication

- Use the **Phone Calls**, **Events**, and **Tasks** subtabs to attach activities to the transaction. For more information, see the help topic [Attaching Events, Tasks, and Calls to Records and Transactions](#).
- On the **Files** subtab, select and attach files related to the transaction. For more information, see the help topic [Attaching Files to Records](#).
- On the **User Notes** subtab, enter a title, memo date, time, type, and direction for any comments you want to add. Click **Add** after each note. For more information, see the help topic [Attaching Events, Tasks, and Calls to Records and Transactions](#).

The **Balance** field displays the current balance for the credit card account. After you enter each transaction, the account balance should match your credit card statement, unless you've made additional charges since the statement was printed.

Accounting Books

If you use NetSuite OneWorld and have **Multi-Book Accounting**, the Accounting Books subtab appears. This subtab shows secondary books for the selected vendor, if any, and their base currencies and exchange rates. For information about Multi-Book Accounting, see the help topic [Using Multi-Book Accounting](#).

Tax Reporting

If you use the International Tax Reports SuiteApp, on the **Tax Reporting** subtab, select the delivery terms, region of origin, nature of transaction code, and mode of transport. Check the **Non-deductible Tax Adjusted** box if this check includes a nondeductible tax. For more information, see the help topic [EU Intrastat Report](#).

Save the credit card transaction.

Paying the Company Credit Card Bill

To make a payment for the company credit card:

1. Go to Transactions > Bank > Write Checks.
For general information about checks, see [Writing Checks](#).
2. In the **Account** field, select the account with the funds to cover the check.
3. Select the credit card company in the **Payee** field.
To set up a new payee, click the plus icon and choose **Vendor** or **Other Name** for the payee type.
4. In the **Amount** field, enter the payment amount for the credit card balance.
5. Click the **Expenses** subtab.
6. Select the credit card account in the **Account** field.
7. In the **Amount** field, enter the amount you're paying.
8. Click **Add**.
9. Click **Save**.

When you save the check transaction, NetSuite posts the payment. If you paid the balance in full, the credit card account balance is zero.

To process a credit refunded by the credit card company, see [Reconciling Credit Card Statements](#).

Reconciling Credit Card Statements

Note: This is the original reconciliation feature, which is no longer supported as of NetSuite 2021.1. A redesigned version of transaction matching and statement reconciliation is available, which enables you to match and reconcile account transactions without requiring Microsoft Excel or third-party tools. For details, see [Bank Data Matching and Reconciliation](#).

As with your bank statements, you should reconcile your credit card statement against your credit card register to keep your NetSuite accounts accurate.

If you use online banking, you can import credit card statement data. For more information, see [Bank Data Import](#).

The reconciliation process includes verifying transactions on your credit card account and your ledger account:

- Payments and credits (such as for returned merchandise)
- Charge and cash advances
- Fees and chargebacks

You can mark a credit card transaction as cleared from the chart of accounts if it has gone through, but does not yet appear on the statement. Go to Reports > Financial > Chart of Accounts. Click the name of the account linked to the credit card. Check the box in the **Clr** column if a transaction is cleared, but not yet reconciled.

When you reconcile a transaction, it is automatically marked cleared. Transactions must be both cleared and reconciled before closing a period.

 **Tip:** You can unclear a cleared transaction through the register for the credit card account. Click Actions, then click Go To Register. On the account register, locate the transaction and clear the Clr box. This makes the transaction unreconciled again.

If you change the amount of a previously reconciled transaction, the transaction becomes unreconciled again. Open the correct statement period for the transaction and reconcile the transaction again.

 **Note:** If you change the account of the transaction, the transaction does not become unreconciled.

You can begin a credit card account reconciliation and then resume at a later time. NetSuite preserves the reconciliation until you return to save it or save and print it. For more information, see [Completing a Reconciliation at a Later Time](#).

To reconcile a credit card statement:

1. Go to Transactions > Bank > Reconcile Credit Card Statement. You can also access this page by clicking the **Reconcile** link for a transaction on the credit card's ledger account register.
2. In the **Account** field, select the credit card you are balancing.

If your account does not appear, on your account record, you need to clear the **Use Match Bank Data and Reconcile Account Statement Pages** box (see the help topic [Editing an Account](#)). As of NetSuite 2021.1, this box is automatically checked for newly-created accounts.

 **Warning:** The Reconcile Bank Statement and Reconcile Credit Card Statement pages are no longer supported and will be removed in the future. For information about the redesigned reconciliation feature, see [Bank Data Matching and Reconciliation](#).

If you use NetSuite OneWorld, the subsidiary associated with this account displays in the **Subsidiary** field.

The **Last Reconciled Balance** field displays the balance of this account from the last time you reconciled your credit card statement. If it is incorrect, ensure that all previous reconciliations are complete and accurate.

3. In the **Statement Date** field, enter or pick the date of the statement.
4. In the **Start Date** field, enter the beginning of the reconciliation period.
5. In the **Ending Statement Balance** field, enter the closing balance on the statement.

The **Reconciled This Statement** field updates as you check off transactions.

The **Difference** field keeps track of the difference between the **Ending Statement Balance** and the combined total of the **Last Reconciled Balance** and **Reconciled This Statement** fields.

 **Tip:** You can specify the number of items that display on the page at Home > Set Preferences > General > Number of Rows in List Segments.

Payments and Credits

1. Click the **Payments and Credits** subtab.

This subtab displays payments and credits to be reconciled.

If you make a general journal entry against a credit card account, the entry on the **Payments and Credits** subtab displays in the **Credit** column in the register for the account.

A **Yes** displays in the **Cleared** column for all transactions that have been marked as cleared on the account register. Transactions must be both cleared and reconciled before closing a period.

The **Date** column displays the date of the transaction.

Click the link to view the original transaction.

The **Type** column displays the transaction type.

The **Tran No.** column displays the check number reference.

Click the link to view the original transaction.

The **Payor** column displays to whom payments were made.

Click the link to view the entity record.

The **Memo** column displays a brief description or information about the nature of the transaction.

The **Amount** column displays the total amount of the transaction.

If you use NetSuite OneWorld, note that only transactions for the subsidiary associated with the credit card account are listed.

Note: When you mark a transaction as reconciled, a transaction not marked cleared automatically clears.

2. Check the boxes next to the transactions you want to reconcile.

As you check transactions, the **Last Reconciled Balance** field is updated, and the total of those transactions displays on the subtab.

- To reconcile all payments and credits, click **Mark All**.
- If you mark credit card transactions as **Cleared** on an ongoing basis, when you open a reconciliation you can click **Mark All Cleared to Reconcile**. This button updates all transactions that are already cleared to be marked for reconciliation. Then, each transaction does not need to be marked individually.

3. If you want to select and reconcile all transactions, click **Mark All**.

Charges and Cash Advances

1. Click the **Charges and Cash Advances** subtab.

This subtab displays charges and cash advances made to this credit card account that need to be reconciled.

If you make a general journal entry against a credit card account, the entry on the **Charges and Cash Advances** subtab displays in the **Charge** column in the register for the account.

A **Yes** displays in the **Cleared** column for all transactions that have been marked as cleared on the account register. Transactions must be both cleared and reconciled to close out a period.

The **Date** column displays the date of the transaction.

Click the link to view the original transaction.

The **Type** column displays the transaction type.

The **Check No.** column displays the check number of the transaction, reference number of credit card transactions, and so on.

Click the link to view the original transaction.

The **Payee** column displays to whom payments were made.

Click the link to view the entity record.

The **Memo** column displays a brief description or information about the nature of the transaction.

The **Amount** column displays the total amount of the transaction.

If you use NetSuite OneWorld, note that only transactions for the subsidiary associated with the credit card account are listed.

 **Note:** When you mark a transaction as reconciled, a transaction not marked cleared automatically clears.

2. Check the boxes next to the transactions you want to reconcile.

As you check transactions, the **Last Reconciled Balance** field is updated, and the total of those transactions displays on the subtab.

- To reconcile all deposits and credits, click **Mark All**.
- If you mark credit card transactions as **Cleared** on an ongoing basis, when you open a reconciliation you can click **Mark All Cleared to Reconcile**. This button updates all transactions that are already cleared to be marked for reconciliation. Then, each transaction does not need to be marked individually.

3. If you want to select and reconcile all transactions, click **Mark All**.

New Charges

1. Click the **New Charges** subtab.
2. Fill in the appropriate information for each charge, and then click **Add**.

If you use NetSuite OneWorld, note the following:

- **Payor** (vendor or other entity) must be associated with the same subsidiary as the credit card account.

 **Note:** If you have shared vendors and customers with multiple subsidiaries and this subsidiary is a secondary subsidiary to one or more shared entities, the **Payor** field lists all of the entities to which this subsidiary is assigned. Selecting a shared entity payor enables you to enter charges for the entity as well as this subsidiary. For more information about shared records, see the help topics [Assigning Subsidiaries to a Vendor](#) and [Assigning Subsidiaries to a Customer](#).

- **Accounts** are restricted to non-bank accounts to which the subsidiary associated with the credit card account has access.
- Only classes, departments, and locations associated with the same subsidiary as the credit card account are available.

As you add transactions, the **Reconciled This Statement** field is updated, and the total of all the other charges is shown on the subtab.

 **Note:** Charges you enter here are submitted if you click **Complete Later**, **Save**, or **Save & Print**.

New Credits

1. Click the **New Credits** subtab.
2. Fill in the appropriate information for the credit, and then click **Add**.

If you use NetSuite OneWorld, note the following:

- **Payee** (vendor, customer, or other entity) must be associated with the same subsidiary as the credit card account.

 **Note:** If you have shared vendors and customers with multiple subsidiaries and this subsidiary is a secondary subsidiary to one or more shared entities, the **Payee** field lists all of the entities to which this subsidiary is assigned. Selecting a shared entity payee enables you to enter credits for the entity as well as this subsidiary.

- **Accounts** are restricted to non-bank accounts to which the subsidiary associated with the credit card account has access.
- Only classes, departments, and locations associated with the same subsidiary as the credit card account are available.

As you add transactions, the **Reconciled This Statement** field is updated, and the total of all the other charges is shown on the subtab.

 **Note:** Credits you enter here are submitted if you click **Complete Later**, **Save**, or **Save & Print**.

3. Repeat for each credit.

When you have reconciled all the transactions listed on the statement and entered any additional credits or charges, the statement balance should equal the sum of the last reconciled balance and the transactions reconciled this statement.

Use a balance adjustment journal entry to manage any difference.

Use the **Difference** field to track your progress in matching these balances.

When you have finished, choose one of three options:

- Click **Save** to reconcile your credit card statement.
- Click **Save & Print** to save and print your reconciliation.
- Click **Complete Later** to save your reconciliation until you return to submit or print it.

 **Note:** When you click **Complete Later**, only the reconciliation is reserved. Credits and charges entered on the **New Credits** and **New Charges** tabs are submitted as new transactions.

Your credit card account is reconciled. To view your three previous reconciliations, go to Transactions > Bank > Reconcile Credit Card Statement. Click **History**. For more information, see [Reconciliation History Report](#).

To view the Reconciliation Summary report for your account, go to Reports > Banking/Budgeting > Reconciliation. You can click **View Detail** to see reconciliation details. For more information, see [Reconciliation Summary Report](#) and [Reconciliation Detail Report](#).

 **Warning:** Although you can edit a previously saved reconciliation statement, you should delete the statement and create a new one. Editing a previously saved reconciliation statement can cause future reconciliation imbalances. See [Deleting a Reconciliation](#).

Financial Institution Records

NetSuite contains financial institution records, which represent banks and credit card companies, or corporate card companies, from which you want to retrieve financial institution data.

Financial institution records contain format profiles that let you configure settings needed for manual or automatic data import. You can set up a format profile to import data for use in the bank reconciliation process or for use in employee expense reports. For more details, see [Format Profile Creation](#).

If your role has the Financial Institution Records permission with a full access level, you can create your own financial institution record and an associated format profile. For details on the Financial Institution Records permission, see [Permissions for Banking Features](#).

When you add a format profile to a user-made financial institution record, you'll need to select a profile type, connectivity method, and transaction parser. For more information, see [Format Profile Creation](#).

Alternatively, use a SuiteApp to provision financial institution and format profile records that let you directly connect to a financial institution to retrieve data. These format profiles contain a preselected and read-only profile type, connectivity method, and transaction parser.

This section includes the following topics:

- [Creating Financial Institution Records](#)
- [Format Profile Creation](#)
- [Creating Format Profiles for Bank Reconciliation](#)
- [Creating Format Profiles for Expense Reporting](#)

Creating Financial Institution Records

You can create a record for a financial institution. Financial institution records are for storing format profiles, which enable you to configure settings necessary for importing financial institution data. You can use format profiles to configure imports of the following:

- Bank or credit card data for bank reconciliation
- Corporate card charges for expense reporting

For details, see [Format Profile Creation](#).

If you use the Bank Feeds SuiteApp or AMEX Corporate Card Integration SuiteApp, NetSuite automatically creates a financial institution record and associated format profile or profiles. Therefore, if you're using either of these SuiteApps, you don't need to do the procedure that follows. For details, see [Bank Feeds SuiteApp](#) and [American Express Integration for Expense Reporting](#).

To create a financial institution record:

1. Go to Setup > Accounting > Financial Institution.
The Financial Institution page appears.
2. In the **Financial Institution** field, enter a financial institution name.
3. In the **Description** field, enter a description to help you identify this financial institution.

Important: To configure format profiles for this financial institution, you must save the financial institution record first.

4. Check the **Inactive box** to inactivate the financial institution record. The box is clear by default.
5. Click **Save**.

Format Profile Creation

After you've saved a financial institution record, you can add one or more format profiles to it.

Format profiles enable you to configure settings necessary for manual or automatic import of financial institution data. There are two format profile types, and each uses a different workflow:

- **Bank Reconciliation** – Configure a format profile to import bank and credit card data for reconciliation. Link your financial institution accounts to corresponding accounts in NetSuite, and map custom bank codes to bank data types. Bank Reconciliation is the default format profile type. For more information, see [Creating Format Profiles for Bank Reconciliation](#).

Note: As of NetSuite 2021.2, you can automatically generate customer payments from your imported data and apply them to invoices. These payments are automatically matched and cleared in the system. See [Automated Cash Application](#).

- **Corporate Card Expenses** – Configure a format profile to import credit card charges for expense reporting. Link credit card charges to employee accounts and map expense codes to user-defined expense categories. For more information, see [Creating Format Profiles for Expense Reporting](#).

You can only associate a format profile with one financial institution record. If you delete a financial institution record, NetSuite also deletes the associated format profile. You can't delete a format profile that has associated imports.

This section contains the follow topics:

- [Creating Format Profiles for Bank Reconciliation](#)
- [Creating Format Profiles for Expense Reporting](#)

Creating Format Profiles for Bank Reconciliation

Configure a format profile to automatically or manually import bank or credit card data for bank or credit card reconciliation.

- **Format Profile for Automatic Import** - Uses a connectivity plug-in and transaction parser to configure a direct connection to a financial institution to retrieve bank data automatically. You can use standard plug-ins available through the Bank Feeds SuiteApp (see [Bank Feeds SuiteApp](#)). Alternatively, you can use custom plug-ins built using the Financial Institution Connectivity Plug-in and Financial Institution Parser Plug-in interfaces. For details, see the help topics [Financial Institution Connectivity Plug-in](#) and [Financial Institution Parser Plug-in](#).

For reasons why you would configure a format profile for automatic import, see [Automatic Bank Data Import](#).

- **Format Profile for Manual Import** - Uses a transaction parser to manually import a bank file you have downloaded from a financial institution.

For reasons why you would configure a format profile for manual import, see [Manual Bank Data Import](#).

Both manual and automatic import format profiles enable you to do the following:

- Link financial institution accounts to corresponding accounts in NetSuite
- Map custom bank codes to corresponding bank data types
- Configure a parser plug-in, if parser configuration fields are available

Important: Unless you're using the Bank Feeds SuiteApp, to avoid performance degradation, don't exceed these limits:

- 10,000 transactions for all bank data imports
- 500 linked accounts for automatic imports
- 2,500 linked accounts for manual imports

If an import will exceed the suggested limit for linked accounts, configure multiple format profiles for parallel imports.

For information on how many banking transactions you can import and how many accounts you can link using the Bank Feeds SuiteApp, see [Limitations of Using the Bank Feeds SuiteApp](#).

To do the following procedure, you need the Financial Institution Records permission.

To create a format profile for bank reconciliation:

1. Go to Setup > Accounting > Financial Institution > List.
The Financial Institutions page appears.
2. Next to the financial institution record for which you want to add a format profile, click **View**.
The Financial Institution page appears.
3. In the **Format Profile: Configuration** subtab, click **Add**.

Important: You must be in View mode to enable the Add button. The button is not available in Edit mode.

The Format Profile page appears.

4. In the **Profile Name** field, enter a name for your format profile. For example, Wells Fargo - BAI2.
5. In the **Description** field, enter a description to help you identify this format profile.
6. From the **Profile Type** dropdown list, select **Bank Reconciliation**, which is the default profile type.
You can't modify the profile type after you save.
7. From the **Connectivity Method** dropdown list, select a Financial Institution Connectivity Plug-in or select **Manual Import**.

For a plug-in to be available, you must create and upload one to NetSuite. For details, see the help topic [Financial Institution Connectivity Plug-in Interface Overview](#).

Alternatively, if you have installed the Auto Bank Statement Import (ABSI) SuiteApp, you can use the SFTP Connectivity Plug-in available in the list. For details about the SuiteApp, see [Auto Bank Statement Import SuiteApp](#).

 **Important:** If the list contains a plug-in provisioned by the Bank Feeds SuiteApp, do not select it. If you try to select such a plug-in on a custom format profile, an error occurs when you try to save it.

8. From the **Transaction Parser** list, select a parser.

The Transaction Parser field is required. For a plug-in to be available, you must either create and upload one to NetSuite or use a plug-in provided by the Bank Statement Parsers SuiteApp.

 **Important:** If the list contains a plug-in provisioned by the Bank Feeds SuiteApp, do not select it. If you try to select such a plug-in on a custom format profile, an error occurs when you try to save it.

For details on parser configuration, see [Transaction Parser Configuration](#).

9. If you selected a connectivity plug-in from the **Connectivity Method** list, do one of the following in the **Connectivity Configuration** subtab:

- If you selected a Financial Institution Connectivity Plug-in, configure a direct connection to a financial institution. See [Configuring a Connection to a Financial Institution \(Without a SuiteApp\)](#).
- If you selected an SFTP Connectivity Plug-in, configure a connection using an SFTP protocol. See the help topic [Configuring SFTP Connection for Auto Bank Statement Import](#).

If you selected **Manual Import** from the **Connectivity Method** list, this step is not applicable.

10. Link financial institution accounts to corresponding accounts in NetSuite. For details, see [Bank Account Linking](#).

For a successful import, you'll need at least one active linked account.

11. (Optional) Map custom bank codes to corresponding bank data types in NetSuite. For details, see [Mapping Custom Bank Codes](#).
12. (Optional) If parser configuration fields are available, configure your transaction parser. See [Transaction Parser Configuration](#).
13. Click **Save**.

If the format profile is configured to connect to a financial institution and the save is successful:

- NetSuite displays a progress message that an import process has begun. To view the processing status of your import, click **Track your status** See [Banking Import History](#).
- For any newly-linked accounts, NetSuite imports the last 60 calendar days of data. For any existing accounts, NetSuite imports any new data since the last successful import. If you are saving this format profile for the first time, NetSuite creates a daily import schedule. For more information, see [Automatic Bank Data Import](#).

 **Note:** If your format profile contains plug-in implementations that aren't enabled in your account, the import process and initiation of the daily import schedule won't run. Select another plug-in, or enable the selected one. See the help topic [Creating a New Plug-in Implementation](#).

- If you're using the Intelligent Transaction Matching feature, NetSuite uses reconciliation rules to automatically match your imported data to account transactions. To view automatically-matched transactions, see [Viewing Transactions To Be Submitted](#). To match imported bank lines that require manual matching, see [Matching Bank Data](#).
- If you are using the Automated Cash Application feature, you can automatically generate customer payments from your imported data and apply them to invoices. These generated payments are automatically matched and cleared in the system. See [Generating Customer Payments](#).

If you have configured the format profile for manual import, you must go to the Upload File page to import data. For details, see [Manual Bank Data Import](#).

14. Repeat these steps to create another Bank Reconciliation format profile.

Tip: You can click on the hyperlinked financial institution name to go back to the financial institution record.

For details on the bank reconciliation process, see [Bank Data Matching and Reconciliation](#). For information on the automated cash application process, see [Automated Cash Application](#).

For details on banking-related permissions, see [Permissions for Banking Features](#).

Configuring a Connection to a Financial Institution (Without a SuiteApp)

In a Bank Reconciliation format profile, you can configure a connection to a financial institution to automatically retrieve bank or credit card data, without using a SuiteApp. To accomplish this, create and configure your own financial institution record and a corresponding format profile that uses custom transaction parser and connectivity plug-in implementations.

The following procedure shows how to configure a connection using custom plug-in implementations. To configure a connection using the Bank Feeds or Auto Bank Statement Import SuiteApps, see [Setting Up Bank Feeds Integration](#) and [Setting Up Auto Bank Statement Import](#). For details on these SuiteApps, see [Bank Feeds SuiteApp](#) and [Auto Bank Statement Import SuiteApp](#).

To configure direct connectivity to a financial institution, without using a SuiteApp:

1. Go to Setup > Accounting > Financial Institution > List.
The Financial Institutions page appears.
2. Next to the financial institution record for which you want to add a format profile, click **View**.
If you do not have a financial institution record, you need to create one. See [Creating Financial Institution Records](#).
The Financial Institution page appears.
3. In the **Format Profile: Configuration** subtab, click **Add**.

Important: You must be in View mode to enable the Add button. The button is not available in Edit mode.

The Format Profile page appears.

4. Enter the primary information for the format profile.

Note: In an automatically provisioned record, the primary information is populated and cannot be changed.

- a. In the **Profile Name** field, enter a name for your format profile.
- b. In the **Description** field, enter a description to help you identify this format profile.
- c. In the **Profile Type** field, select **Bank Reconciliation**. This profile type is the default.
- d. From the **Connectivity Method** dropdown list, select a custom Financial Institution Connectivity Plug-in.

For a plug-in to be available, you must create and upload one to NetSuite. For details, see the help topic [Financial Institution Connectivity Plug-in Interface Overview](#).

Alternatively, if you have installed the Auto Bank Statement Import (ABSI) SuiteApp, you can use the SFTP Connectivity Plug-in available in the list. For details about the SuiteApp, see [Auto Bank Statement Import SuiteApp](#).

Important: If the list contains a plug-in provisioned by the Bank Feeds SuiteApp, do not select it. If you try to select such a plug-in on a custom format profile, an error occurs when you try to save it.

- e. From the **Transaction Parser** list, select a custom parser plug-in.

The **Transaction Parser** field is required. For a plug-in to be available, you must either create and upload one to NetSuite or have the Bank Feeds or Auto Bank Statement Import SuiteApps installed.

Important: If the list contains a plug-in provisioned by the Bank Feeds SuiteApp, do not select it. If you try to select such a plug-in on a custom format profile, an error occurs when you try to save it.

For details on parser configuration, see [Transaction Parser Configuration](#).

5. On the **Connectivity Configuration** subtab, configure a connection to a financial institution.

The configuration steps required depend on the configuration of the connectivity plug-in selected.

If you're using a custom plug-in, the required configuration steps depend on its initial implementation.

Important: Configuration for a financial institution depends entirely on what the plug-in requires for the connection. However, the general steps typically involve authenticating your bank connection (providing login credentials) and giving NetSuite access to your accounts. The end result is always the same for all plug-ins. After configuration is complete, NetSuite has access to the user's bank accounts, and later, the user's transactions.

If you are using the SFTP Connectivity plug-in, see the help topic [Configuring SFTP Connection for Auto Bank Statement Import](#).

After you configure a connection to a financial institution or institutions, the Account Linking subtab is populated with information.

6. On the **Account Linking** subtab, link the financial institution accounts to corresponding accounts in NetSuite. For details, see [Linking Accounts for Financial Institution Connectivity](#).
7. (Optional) Map custom bank codes to corresponding bank data types in NetSuite. For details, see [Mapping Custom Bank Codes](#).
8. Click **Save**.

If you configured the format profile correctly and the save is successful:

- NetSuite displays a progress message that an import process has begun. To view the processing status of your import, click **Track your status** See [Banking Import History](#).
- For any newly-linked accounts, NetSuite imports the last 60 calendar days of data. For any existing accounts, NetSuite imports any new data since the last successful import. If you are saving this format profile for the first time, NetSuite creates a daily import schedule. For more information, see [Automatic Bank Data Import](#).

Note: If your format profile contains plug-in implementations that aren't enabled in your account, the import process and initiation of the daily import schedule won't run. Select another plug-in or enable the selected plug-in. See the help topic [Creating a New Plug-in Implementation](#).

- If you're using the Intelligent Transaction Matching feature, NetSuite uses reconciliation rules to automatically match your imported data to account transactions. To view automatically-matched transactions, see [Viewing Transactions To Be Submitted](#). To match imported bank lines that require manual matching, see [Matching Bank Data](#).
- If you're using the Automated Cash Application feature, you can automatically generate customer payments from your imported data and apply them to invoices. These payments are automatically matched and cleared in the system. See [Generating Customer Payments](#).

Bank Account Linking

In a Bank Reconciliation format profile, link bank data from financial institutions to corresponding accounts in NetSuite.

Important: For a successful import, you need at least one active linked account. To manually import a bank statement file successfully, you must link all the bank accounts in the file to corresponding NetSuite accounts. Also, make sure the currency of the bank accounts matches the corresponding accounts in NetSuite.

Unless you're using the Bank Feeds SuiteApp, don't exceed these limits to avoid performance degradation:

- 10,000 transactions for all bank data imports
- 500 linked accounts for automatic imports
- 2,500 linked accounts for manual imports

If an import is going to exceed the suggest limit of linked accounts, you should configure multiple format profiles to facilitate parallel imports.

For information on how many banking transactions you can import and how many accounts you can link using the Bank Feeds SuiteApp, see [Limitations of Using the Bank Feeds SuiteApp](#).

To avoid inaccurate or inconsistent balances on the Match Bank Data page, only perform one-to-one account linking. Don't link more than one bank account to the same NetSuite account.

The procedure to link bank data depends on your configuration. Choose one of the following procedures:

- If the format profile directly connects to a financial institution, see [Linking Accounts for Financial Institution Connectivity](#). The Account Linking subtab is populated with information from the financial institution accounts.
- If the format profile uses the manual import method, see [Linking Accounts for Manual Import](#). You must manually enter each account linking.

Linking Accounts for Financial Institution Connectivity

Link data from financial institutions to corresponding accounts in NetSuite.

Important: To avoid performance degradation:

- If you're using a format profile provisioned by the Bank Feeds SuiteApp, you can link up to 20 accounts. See [Limitations of Using the Bank Feeds SuiteApp](#).
- If you're not using a format profile provisioned by the Bank Feeds SuiteApp, link no more than 500 accounts.

The Account Linking subtab is populated with information from the financial institution accounts for which you have a configured connection. If you are configuring a manual import, see [Linking Accounts for Manual Import](#).

To do this procedure, you need to create a format profile and complete some initial setup, including configuring a direct connection to a financial institution. For details, see steps 1 – 5 of [Configuring a Connection to a Financial Institution \(Without a SuiteApp\)](#).

To link bank accounts for financial institution connectivity:

1. To open the appropriate Format Profile page for the appropriate financial institution record:
 - a. Go to Setup > Accounting > Financial Institution > List.
The Financial Institutions page appears.
 - b. Next to the appropriate financial institution record, click **View**.
The Financial Institution page appears.
 - c. In the **Format Profile: Configuration** subtab, click **Edit** next to the format profile in which you want to link accounts.
The Format Profile page appears.
2. Click the **Account Linking** subtab.
NetSuite displays the following:
 - A list of the financial institution accounts you've configured a connection for.
 - The name of the financial institution each account belongs to.
 If no financial institution is identified for an account, **No Financial Institution Found** appears.
3. Click the **Account Linking** subtab.
4. From each **Linked GL Account** list, select a bank or credit card account in NetSuite to link to the adjacent accounts.

Note: The accounts available in the list aren't restricted by classifications like subsidiaries, departments, locations, or classes. Restriction preferences don't apply to the dropdown list.

Important: To avoid inaccurate or inconsistent balances on the Match Bank Data page, only perform one-to-one account linking. Don't link more than one bank account to the same NetSuite account.

5. Click **Save** to save the format profile, or **Save & New** to save the current format profile and create a new one.

If you've configured the format profile correctly and save is successful:

- A progress message appears when the import begins. To check the processing status of your import, click **Track your status**. See [Banking Import History](#).
- For any newly-linked accounts, NetSuite imports the last 60 calendar days of data. For any existing accounts, NetSuite imports any new data since the last successful import. If you are saving this format profile for the first time, NetSuite creates a daily import schedule. For more information, see [Automatic Bank Data Import](#).

Note: If your format profile contains plug-in implementations that aren't enabled in your account, the import process and initiation of the daily import schedule won't run. Select another plug-in, or enable the selected one. See the help topic [Creating a New Plug-in Implementation](#).

- If you're using the Intelligent Transaction Matching feature, NetSuite uses reconciliation rules to automatically match your imported data to account transactions. To view automatically-matched transactions, see [Viewing Transactions To Be Submitted](#). To match imported bank lines that require manual matching, see [Matching Bank Data](#).
- If you are using the Automated Cash Application feature, you can automatically generate customer payments from your imported data and apply them to invoices. These generated payments are automatically matched and cleared in the system. See [Generating Customer Payments](#).

To troubleshoot account linking issues, see [Troubleshooting Account Linking Issues for Automatic Import](#).

Linking Accounts for Manual Import

Link accounts from the imported bank statement to corresponding accounts in NetSuite.

Important: To avoid performance degradation, don't link more than 2,500 accounts.

To do this procedure, you need to create a format profile and complete some initial setup. For details, see steps 1– 8 of [Creating Format Profiles for Bank Reconciliation](#).

To link bank accounts for manual import:

1. To open the appropriate Format Profile page for the appropriate financial institution record:
 - a. Go to Setup > Accounting > Financial Institution > List.
The Financial Institutions page appears.
 - b. Next to the appropriate financial institution record, click **View**.
The Financial Institution page appears.
 - c. In the **Format Profile: Configuration** subtab, click **Edit** next to the format profile in which you want to link accounts.
The Format Profile page appears.
2. In the **Account Linking** subtab, In each row, link an account from the imported bank statement to the corresponding account in NetSuite:
 - a. In the **Unique Account ID** column (previously called Account Mapping Key), enter a unique account ID from the statement file for this format profile.
If you selected a standard parser plug-in available through the Bank Statement Parsers SuiteApp, the unique account ID you need to enter depends on the file format to be parsed. See [Identifying Unique Account IDs for Standard Bank Statement Parsers](#).
If you selected a custom parser plug-in, the plug-in will have its own logic about how to determine the unique account ID you need to enter.

There is a limit of 80 characters.

Important: For compliance reasons, you cannot enter a credit card number. To ensure that the unique account ID does not contain a credit card number, NetSuite removes all non-numeric characters.

- If the remaining string is less than 13 characters or greater than 20 characters, NetSuite accepts the unique account ID.
- If the remaining string is greater than 12 characters and less than 21 characters, NetSuite performs a Luhn check. If the check passes, NetSuite blocks you from using the unique account ID. If the check fails, NetSuite accepts the unique account ID.

- b. In the **Description** column, enter a description to help you identify this unique account ID.
- c. From the **Linked GL Account** dropdown list, select the bank or credit card account in NetSuite to which you want to link the unique account ID from the statement.

Note: The accounts available in the list aren't restricted by classifications like subsidiaries, departments, locations, or classes. Restriction preferences don't apply to the dropdown list.

Important: To avoid inaccurate or inconsistent balances on the Match Bank Data page, only perform one-to-one account linking. Don't link more than one bank account to the same NetSuite account.

- d. Check the **Inactive** box to inactivate the unique account ID. By default, the system clears this box.
3. Click **Save** to save the format profile, or **Save & New** to save the current format profile and create a new one.

To import bank data using this format profile record, go to Transactions > Bank > Banking Import History > Upload File. For details, see [Manual Bank Data Import](#).

If you're using the Intelligent Transaction Matching feature, NetSuite uses reconciliation rules to automatically match your imported data to account transactions. To view automatically-matched transactions, see [Viewing Transactions To Be Submitted](#). To match imported bank lines that require manual matching, see [Matching Bank Data](#).

If you're using the Automated Cash Application feature, you can automatically generate customer payments from your imported data and apply them to invoices. These payments are automatically matched and cleared in the system. See [Generating Customer Payments](#).

For details on the bank reconciliation process, see [Bank Data Matching and Reconciliation](#). For information on the automated cash application process, see [Automated Cash Application](#).

For details on banking-related permissions, see [Permissions for Banking Features](#).

Troubleshooting Account Linking Issues for Automatic Import

The system may fail to link one or more accounts in a Bank Reconciliation format profile configured for automatic import. You can troubleshoot account linking issues from the **Account Linking** subtab.

Note: Bank data imports can now be partially completed, even if the import fails for some accounts. See [Banking Import History](#).

To troubleshoot account linking issues:

1. To open the appropriate Format Profile page for the appropriate financial institution record:
 - a. Go to Setup > Accounting > Financial Institution > List.
The Financial Institutions page appears.
 - b. Next to the appropriate financial institution record, click **View**.
The Financial Institution page appears.
 - c. In the **Format Profile: Configuration** subtab, click **Edit** next to the format profile in which you want to link accounts.
The Format Profile page appears.
2. Click the **Account Linking** subtab.
If the system fails to link one or more accounts, the subtab displays a message to notify you. In addition, the subtab displays warning icons next to the accounts the system could not link. To see account-specific errors, hover over a warning icon.
Account linking might fail for an account if the plug-in file has errors you need to fix, including:
 - A blank Account ID field.
 - An invalid Account type.
 - An invalid Currency code.
 - A blank Group Name field. The Group Name field refers to the financial institution name by which accounts are grouped on the **Account Linking** subtab. When this field is blank, NetSuite can't identify a financial institution for the account to link.
3. If needed, click the **Connectivity Configuration** subtab and reauthenticate the accounts that NetSuite couldn't link. For details, see [Configuring a Connection to a Financial Institution \(Without a SuiteApp\)](#).

For a list of all your imports and error information, including specific failure reasons and accounts affected, go to Transactions > Bank > Banking Import History. See [Banking Import History](#).

Mapping Custom Bank Codes

(Optional) In a Bank Reconciliation format profile, map custom bank codes to corresponding bank data types in NetSuite.

To map custom bank transaction codes:

1. To open the appropriate Format Profile page for the appropriate financial institution record:
 - a. Go to Setup > Accounting > Financial Institution > List.
The Financial Institutions page appears.
 - b. Next to the appropriate financial institution record, click **View**.
The Financial Institution page appears.
 - c. In the **Format Profile: Configuration** subtab, click **Edit** next to the appropriate format profile.
The Format Profile page appears.

2. Click the **Code Type Mapping** subtab.
3. In the **Bank Transaction Code** column, enter a custom bank transaction code from your financial institution.
For a list of custom bank transaction codes, contact your financial institution.
There is a limit of 80 characters for the code.
4. In the **Description** column, enter a description to help you identify this bank transaction code.
5. From the **Bank Data Type** dropdown list, select the bank data type to which you want to map the bank transaction code.
6. If you are using a parser that has unsigned amount values (for example, BAI2 or MT940 file format), from the **Debit/Credit** dropdown list, select **Debit** or **Credit** for the bank transaction code. Otherwise, select **N/A**.

 **Note:** The Debit or Credit value you set in a format profile overrides the value in the bank data NetSuite imports. For example, if the bank code type is a credit value but you select a debit value in your format profile, NetSuite imports the data as a debit.

7. If you'd like to exclude the bank transaction code from transaction processing so that NetSuite ignores all transactions containing the code, check the **Exclude** box. By default, the system clears this box.

Some formats contain codes you want to exclude. For example, in the BAI2 format, the bank transaction code "890" doesn't contain useful monetary information for imported transactions. However, the "890" code is already excluded from the core parsers and parser plug-ins for BAI2.

Excluded transactions don't count toward the number of imported transactions and don't appear on the Import Details page.
8. Check the **Inactive** box to inactivate the bank transaction code. By default, the system clears this box.
9. Click **Save** to save the format profile, or **Save & New** to save the current format profile and create a new one.

If you configured the format profile to connect to a financial institution and the save is successful:

- NetSuite displays a progress message that an import process has begun. To view the processing status of your import, click **Track your status**. See [Banking Import History](#).
- For any newly-linked accounts, NetSuite imports the last 60 calendar days of data. For any existing accounts, NetSuite imports any new data since the last successful import. If you are saving this format profile for the first time, NetSuite creates a daily import schedule. For more information, see [Automatic Bank Data Import](#).

 **Note:** If your format profile contains plug-in implementations that aren't enabled in your account, the import process and initiation of the daily import schedule won't run. Select another plug-in or enable the selected plug-in. See the help topic [Creating a New Plug-in Implementation](#).

If you have configured the format profile for manual import, you must go to Transactions > Bank > Banking Import History > Upload File to import data. For details, see [Manual Bank Data Import](#).

If you're using the Intelligent Transaction Matching feature, NetSuite uses reconciliation rules to automatically match your imported data to account transactions. To view automatically-matched transactions, see [Viewing Transactions To Be Submitted](#). To match imported bank lines that require manual matching, see [Matching Bank Data](#).

For details on the bank reconciliation process, see [Bank Data Matching and Reconciliation](#).

For details on banking-related permissions, see [Permissions for Banking Features](#).

Transaction Parser Configuration

This section explains the options for the Transaction Parser dropdown list. From the list, you can select either a standard or custom parser:

- **Standard parser** – Available through either the Bank Statement Parsers SuiteApp or AMEX Corporate Card Integration SuiteApp:
 - **Bank Statement Parsers SuiteApp** – Includes OFX/QFX, BAI2, MT940, CAMT.053, and CSV file formats. After you select the BAI2, MT940, or CAMT.053 parser and save the format profile record, the Parser Configuration subtab values appear and is populated with configuration settings. For details on modifying the parser-specific default settings, see [Configuring Standard Bank Transaction Parsers](#). For details on the SuiteApp, see [Bank Statement Parsers SuiteApp](#).
 - **AMEX Corporate Card Integration SuiteApp** – Includes the AMEX Parser Plug-in, which you use to parse corporate card charges for expense reports. For details, see the help topic [American Express Integration for Expense Reporting](#).
The AMEX Parser Plug-in does not support parser configuration. When you select this parser plug-in, the Parser Configuration subtab is not visible.
- **Custom parser** – Created using the Financial Institution Parser Plug-in interface. For a custom (non-standard) parser to be available in the Transaction Parser list, you must develop and upload one to NetSuite. For details, see the help topic [Financial Institution Parser Plug-in](#).

 **Note:** The Bank Statement Parser Plug-in interface is not supported as of NetSuite 2020.2.

If you're creating a new format profile, save it first before configuring the parser.

Creating Format Profiles for Expense Reporting

If you're using the Expense Reports feature, you can now create a format profile to configure imports of corporate card charges from any provider for expense reporting. Such format profiles use a custom transaction parser built using the Financial Institution Parser Plug-in interface to import transactions from a file you have downloaded from a financial institution.

 **Note:** You can automate imports of corporate card charges from American Express by using the AMEX Corporate Card Integration SuiteApp. This SuiteApp automatically provisions a financial institution record and format profile to configure your import. For more details, see the help topic [American Express Integration for Expense Reporting](#).

Format profiles that use custom connectivity and parser plug-ins for automatic retrieval are now supported. For more information, see the help topic [Importing Corporate Card Data](#).

- **Format Profile for Automatic Import** – Uses a connectivity plug-in and transaction parser to configure a direct connection to American Express to retrieve corporate card charges automatically. You configure automatic imports using the AMEX Corporate Card Integration SuiteApp. See the help topic [American Express Integration for Expense Reporting](#).
- **Format Profile for Manual Import** – Uses a custom transaction parser built using the Financial Institution Parser Plug-in interface to manually import corporate card charges from a file you have downloaded from a financial institution.

Format profiles configured for manual import enable you to do the following:

- Link corporate credit card charges to corresponding employee records in NetSuite
- Map expense codes to corresponding user-defined expense categories
- Configure a parser plug-in, if parser configuration is supported

To do this procedure, you need the following:

- Financial Institution Records permission.
- Custom parser built with the Financial Institution Parser Plug-in interface. See the help topic [Financial Institution Parser Plug-in Interface Overview](#).

Important: To avoid performance degradation, you should not configure a bank data import that exceeds 10,000 corporate card transactions.

To create a format profile for expense reporting:

1. Go to Setup > Accounting > Financial Institution > List.
The Financial Institutions page appears.
2. Next to the financial institution record for which you want to add a format profile, click **View**.
The Financial Institution page appears.
3. In the **Format Profile: Configuration** subtab, click **Add**.

Important: You must be in View mode to enable the Add button. The button is not available in Edit mode.

The Format Profile page appears.

4. In the **Profile Name** field, enter a name for your format profile. For example, Wells Fargo Charges.
5. In the **Description** field, enter a description to help you identify this format profile.
6. From the **Profile Type** field dropdown, select **Corporate Card Expenses**.
The profile type can't be modified after you save.
7. From the **Connectivity Method** dropdown list, select **Manual Import**.

Note: In a format profile provisioned by the AMEX Corporate Card Integration SuiteApp, a connectivity plug-in is automatically selected.

8. From the **Transaction Parser** list, select a custom parser built with the Financial Institution Parser Plug-in interface.
For a custom plug-in to be available, you must create and upload one to NetSuite. For details, see the help topic [Financial Institution Parser Plug-in Interface Overview](#).

Note: The **Transaction Parser** field is required.

9. Link corporate credit card charges to corresponding employee records in NetSuite. For details, see [Linking Employee Accounts](#).
10. (Optional) Map custom expense codes to corresponding user-defined expense categories.

Note: The plug-in file can't contain any duplicate expense codes.

For details, see [Mapping Custom Expense Codes](#).

11. (Optional) If parser configuration is required, configure your transaction parser. See [Transaction Parser Configuration](#).
If your parser plug-in supports parser configuration, the **Parser Configuration** subtab appears and is populated with configuration fields.
12. Click **Save**.
13. Repeat these steps for each format profile that you want to create for expense reporting.

Tip: You can click on the hyperlinked financial institution name to go back to the financial institution record.

After import configuration is complete, you can manually import your data at Transactions > Bank > Banking Import History > Upload File. See [Importing Data Using a Financial Institution Record](#).

Note: If your format profile contains an inactive parser plug-in, an import process isn't initiated.

To view imported charges, see the Imported Employee Expenses page (Transactions > Employees > Imported Employee Expenses). For more information, see [Viewing Imported Corporate Card Expenses](#).

To add imported charges to expense reports, see the help topic [Creating Expense Reports With Imported Transactions](#).

For details on the corporate card expense reporting process, see the help topic [Corporate Card Expenses](#).

Configuring a Connection to American Express

Currently, the AMEX Corporate Card Integration SuiteApp to automate AMEX corporate card charge imports and a custom connectivity plug-in to configure a direct connection to another provider are supported. See the help topics [American Express Integration for Expense Reporting](#) and [Importing Corporate Card Data](#). If you want to import corporate card charges from another provider, you can use the Financial Institution Parser Plug-in. For more information, see [Importing Data Using a Financial Institution Record](#).

Linking Employee Accounts

In a Corporate Card Expenses format profile configured for manual or automatic import, choose the criteria that NetSuite uses to link corporate card charges to corresponding employee records in NetSuite. You can match an employee by their cardholder name or their NetSuite employee ID.

Before you link employee accounts, you should do the following:

- Let the corporate card issuer know whether you are configuring NetSuite to link to employee records by their cardholder name or employee ID.
- If you are configuring NetSuite to match by employee ID, provide all the required NetSuite employee IDs to the corporate card issuer. To identify employee IDs, go to Lists > Employees > Employees, and click View next to an employee. The Employee ID is displayed on the employee record.
- If you are configuring NetSuite to match by cardholder name, define the corporate card information for all employee records NetSuite is linking to. For more information, see the help topic [Configuring AMEX Integration](#).

Important: If these prerequisites aren't completed before an import, NetSuite retrieves corporate card charges but can't link them to employee records. Make sure to inactivate a Corporate Card Expenses format profile if these prerequisites haven't been met. This prevents any imports associated with that format profile from occurring.

After a file is imported from a corporate card issuer, it's moved to a different folder on their gateway and can't be accessed or re-imported. If you want to reimport the file, you'll need to contact the corporate card issuer to regenerate it and add it to the correct folder before importing.

To do this procedure, you need to have a Corporate Card Expenses format profile configured for manual or automatic import. To configure a manual import, see [Creating Format Profiles for Expense Reporting](#). To configure automatic imports, see the help topic [American Express Integration for Expense Reporting](#).

To link charges to corresponding employee records:

1. To open the appropriate Format Profile page for the appropriate financial institution record:
 - a. Go to Setup > Accounting > Financial Institution > List.
The Financial Institutions page appears.
 - b. Next to the appropriate financial institution record, click **View**.
The Financial Institution page appears.
 - c. In the **Format Profile: Configuration** subtab, click **Edit** next to the appropriate format profile with the profile type Corporate Card Expenses.
The Format Profile page appears.
2. Click the **Import Configuration** subtab.

Note: The Import Configuration subtab is only visible if the profile type of your format profile is Corporate Card Expenses. If the profile type is Bank Reconciliation, the Account Linking subtab appears, instead.

3. From the **Match Employee By** dropdown list:
 - To link charges to employee records by employee cardholder name, select **Cardholder Name**.
 - To link charges to employee records by NetSuite employee ID, select **Employee ID**.
4. From the **Expense Type** dropdown list:
 - To credit charges to employees' default corporate card general ledger accounts, select **Corporate Card**. The employee's company is responsible for paying the charges to the corporate card company.
 - To credit charges to liability accounts, select **Reimbursable**. The employee is responsible for paying the charges to the corporate card company, which the employee's company in turn reimburses.
5. From the **Employee Expense Source Type** list, select the financial institution from which you are importing your data. If the financial institution is not listed, select **Other**.
If you are configuring a manual import, select **Imported data**.
6. Click **Save** to save the format profile, or **Save & New** to save the current format profile and create a new one.

Warning: If you have not completed the prerequisites to successfully link charges to employee records and have automatic import configured, you must inactivate the format profile to postpone the first scheduled import. Otherwise, NetSuite retrieves charges but cannot link them to employee records.

For information about the corporate card expense reporting workflow, see the help topic [Corporate Card Expenses](#).

Mapping Custom Expense Codes

(Optional) In a Corporate Card Expenses format profile configured for either manual or automatic import, map custom expense codes from the Financial Institution Parser Plug-in file to your own expense categories in NetSuite. For example, for the custom expense code TRA, you could map it to an expense category called Travel.

If you map expense codes, employees don't need to select an expense category during expense reporting.

To do this procedure, you need to have a Corporate Card Expenses format profile configured for manual or automatic import. To configure a manual import, see [Creating Format Profiles for Expense Reporting](#). To configure automatic imports, see the help topic [American Express Integration for Expense Reporting](#). You also need to ensure that the Financial Institution Parser Plug-in file does not contain any duplicate expense codes. For a list of custom expense codes, contact the corporate card company from which you want to retrieve data

To map custom expense codes:

1. To open the appropriate Format Profile page for the appropriate financial institution record:
 - a. Go to Setup > Accounting > Financial Institution > List.
NetSuite displays the Financial Institutions page.
 - b. Next to the appropriate financial institution record, click **View**.
NetSuite displays the Financial Institution page.
 - c. In the **Format Profile: Configuration** subtab, click **Edit** next to the appropriate format profile with the profile type Corporate Card Expenses.
NetSuite displays the Format Profile page.
2. Click the **Expense Code Mapping** subtab.

 **Note:** The Expense Code Mapping subtab only appears if the following conditions are met:

- The profile type of your format profile is Corporate Card Expenses. If the profile type is Bank Reconciliation, the Account Linking subtab appears instead.
- You select an implementation of the Financial Institution Parser Plug-in. This can be the AMEX Parser Plug-in or a custom plug-in that contains expense codes.

The subtab shows a list of custom expense codes and descriptions generated by the Financial Institution Parser Plug-in.

If you change your transaction parser selection, you need to refresh the Format Profile page to see up-to-date information in the Expense Code Mapping subtab.

3. In the **Expense Category** column, select a NetSuite expense category or begin entering the name of the category.

 **Tip:** To add a new expense category, go to Setup > Accounting > Setup Tasks > Expense Categories. See the help topic [Creating an Expense Category](#).
If you've created any new expense categories, refresh the Format Profile page to see them.

4. After you've set your expense categories, click **Save** to save the format profile, or **Save & New** to save the current format profile and create a new one

When the expense lines are imported (either manually or at the next scheduled import), they are automatically added to a record called Imported Employee Expenses. After an employee adds their expense lines to an expense report, the mapped expense categories automatically appear. For details, see the help topic [American Express Integration for Expense Reporting](#).

Modifying Financial Institution Records

You can modify fields and add additional format profiles to existing financial institution records.

Note: If you are using the provisioned financial institution record from the Bank Feeds SuiteApp, you cannot modify any fields. However, although the record is bundled with two format profiles, you can add additional format profiles.

To modify financial institution records:

1. Go to Setup > Accounting > Financial Institution > List.
The Financial Institutions page appears.
2. Next to the financial institution record you want to modify, click **Edit**.
The Financial Institution page opens for editing.
3. For a financial institution record you've created, you can modify the following:
 - Financial Institution field
 - Description field
 - Inactive box for the financial institution record

Note: To modify or add format profiles, the financial institution record must be in View mode.

4. Click **Save**.

Modifying Format Profiles

To modify or add format profiles, the Financial Institution page must be in View mode.

To modify format profiles:

1. Go to Setup > Accounting > Financial Institution > List.
The Financial Institutions page appears.
2. Next to the financial institution record that contains the format profile you want to modify, click **View**.
The Financial Institution page appears.
3. In the **Format Profile: Configuration** subtab, click the appropriate format profile.
The Format Profile page appears.
4. Click **Edit**.
5. You can modify the following primary information on a format profile record:
 - **Profile Name**
 - **Description**
 - **Inactive** box

Note: If this format profile is provisioned by a SuiteApp that has since been uninstalled, NetSuite checks this box. To clear this box, you need to select a parser plugin.

- **Connectivity Method**

If this format profile is provisioned by a SuiteApp that has been uninstalled, this field says Manual Import. If this format profile has a Bank Reconciliation profile type, you can set up automatic imports. For details, see [Configuring a Connection to a Financial Institution \(Without a SuiteApp\)](#).

■ **Transaction Parser**

Note: If this format profile is provisioned by a SuiteApp that has been uninstalled, NetSuite clears this field. To reactivate this format profile, you need to select a parser plug-in. If you are modifying a format profile with a Bank Reconciliation profile type, see step 8 in [Creating Format Profiles for Bank Reconciliation](#). If you are modifying a format profile with a Corporate Card Expenses profile type, see step 8 in [Creating Format Profiles for Expense Reporting](#).

6. On the **Connectivity Configuration** subtab:
 - (Optional) If the profile type is Bank Reconciliation, configure a connection to a financial institution. See [Configuring a Connection to a Financial Institution \(Without a SuiteApp\)](#).
 - (Optional) If the profile type is Corporate Card Expenses, configure a connection to American Express. See the help topic [American Express Integration for Expense Reporting](#).
7. (Optional) Link your imported data to general ledger accounts or employee records, depending on your format profile type:
 - In a format profile with the Bank Reconciliation profile type, the **Account Linking** subtab appears. See [Bank Account Linking](#).
 - In a format profile with the Corporate Card Expenses profile type, the **Import Configuration** subtab appears. See [Linking Employee Accounts](#).
8. (Optional) Map custom transaction codes to corresponding bank data types or map custom expense codes to expense categories in NetSuite, depending on your profile type.
 - In a format profile with the Bank Reconciliation profile type, the **Code Type Mapping** subtab appears. To map transaction codes to bank data types in NetSuite, see [Mapping Custom Bank Codes](#).
 - In a format profile with the Corporate Card Expenses profile type, the **Expense Code Mapping** subtab appears. To map expense codes to expense categories in NetSuite, see [Mapping Custom Expense Codes](#).
9. (Optional) If the **Parser Configuration** subtab is visible, configure your selected parser plug-in. See [Transaction Parser Configuration](#).
10. Click **Save**.
If successful and the format profile is configured to connect to a financial institution to retrieve data for reconciliation:
 - A progress message appears when the import starts. To check processing status, click **Track your status**.
 - NetSuite imports any new data from your existing accounts since the last successful import. For any new accounts mapped, NetSuite imports the last 60 calendar days of data. For more information, see [Automatic Bank Data Import](#).

Note: There are cases where an import isn't initiated. For example, NetSuite can't import data from the same format profile twice within a 60-minute period.

To match and reconcile your imported data, see [Bank Data Matching and Reconciliation](#).

To automatically generate customer payments from imported bank lines, apply the payments to invoices, and match and submit the payments for reconciliation, see [Generating Customer Payments](#).

If successful and the format profile is configured to connect to American Express, NetSuite applies the revised format profile configurations to the next import.

If you've configured the format profile for manual import, go to the Upload File page to import data. For details, see [Manual Bank Data Import](#).

Note: If your format profile contains any plug-in implementations not enabled in your account, manual and automatic import do not run. Select another plug-in or enable the selected plug-in. See the help topic [Creating a New Plug-in Implementation](#).

Deleting Financial Institution Records

You can delete a financial institution record if it does not have any format profiles that have been used to import data. If the financial institution record has associated imports, you can only inactivate it and the associated format profiles. For more information, see [Modifying Financial Institution Records](#).

When you delete a financial institution record, NetSuite also deletes the associated format profiles.

To delete a financial institution record:

1. Go to Setup > Accounting > Financial Institution > List.
2. Next to the profile you want to delete, click **Edit**.
3. Click **Delete**.
A confirmation message appears.
4. Click **OK**.

Deleting a Format Profile

You can delete a format profile from a financial institution record if it doesn't have any associated imports.

 **Tip:** You can inactivate a format profile, instead of deleting it. See [Modifying Format Profiles](#).

To delete a format profile record:

1. Go to Setup > Accounting > Financial Institution > List.
2. Next to the financial institution record that contains the format profile you want to delete, click **View**.
3. Click on the format profile you want to delete.
4. Click **Edit**.
5. Click **Delete**.
A confirmation message appears.
6. Click **OK**.

Viewing the List of Financial Institution Records

You can view the list of financial institution records. If a record is not complete or requires updates, you can click **Edit** or **View** next to the record in the list.

For more information on modifications you can make, see [Modifying Financial Institution Records](#).

To view financial institution records:

1. Go to Setup > Accounting > Financial Institutions > List.
The Financial Institutions page appears.
2. To filter the list of financial institutions:
 - To view a list that includes inactive records, click **Show Inactives**.
 - To sort by the Name column, click the column header.
3. You can do the following:
 - Check the **Inactive** box to inactivate the financial institution record. You don't need to open the record to inactivate it.
 - Click **Edit** next to an existing financial institution record to modify the fields on the record.
For details, see [Modifying Financial Institution Records](#).
To modify or add format profiles, go to the financial institution record in View mode.
 - Click **View** next to an existing financial institution record to view the individual record and modify or add format profiles.
 - Click **New Financial Institution** to add a new financial institution record.
The Financial Institution page appears. For more details, see [Creating Financial Institution Records](#).

Bank Data Import

- Bank or credit card data for reconciliation and matching
- Corporate card expense data for expense reporting

You can set up automatic or manual imports in either case.

- **Automatic import** – If you have the Administrator role, you can use the Format Profile page to set up daily automatic imports. For more information, see [Automatic Bank Data Import](#).
- **Manual import** – Download the financial statement file from your financial institution, and then import it into NetSuite from the Upload File page. You can import a file using the parser and configuration settings from an existing format profile. If you're importing data for reconciliation, you can also use NetSuite's default parser functionality. See [Manual Bank Data Import](#).

If your role has the Import Online Banking File permission, you can use the Statement File Import feature. For details, see [Permissions for Banking Features](#).

The data source determines the number of transactions you can import. However, unless you're using the Bank Feeds SuiteApp or AMEX Corporate Card Integration SuiteApp, you should not exceed 10,000 transactions per import.

When importing data for bank or credit card reconciliation, the data source also determines the number of financial institution accounts you can link in a format profile. When configuring an automatic import without using the Bank Feeds SuiteApp, you should try to link no more than 500 accounts. For a manual import, you should not link more than 2,500 accounts.

 **Note:** There is no suggested limit on the number of employee accounts you can link when importing corporate card expense data for expense reporting.

If an import is going to exceed these suggested limits, you need to create multiple format profiles to make parallel imports easier. Otherwise, you may start to notice performance issues.

The number of the following can affect import performance for bank or credit card reconciliation:

- General ledger accounts
- General ledger transactions
- Active reconciliation rules

To learn how many banking transactions you can import and how many accounts you can link with the Bank Feeds SuiteApp, see [Limitations of Using the Bank Feeds SuiteApp](#).

To see how many American Express corporate card transactions you can import with the AMEX Credit Card Integration SuiteApp, see the help topic [American Express Integration for Expense Reporting](#).

When you import data for bank or credit card reconciliation, NetSuite uses reconciliation rules to automatically match your imported bank lines to account transactions. All imported bank lines that can't be matched by the system are available for manual matching on the Match Bank Data page. You can reconcile matched transactions on the Reconcile Account Statement page. For more information, see [Bank Data Matching and Reconciliation](#).

 **Note:** All imported bank lines with a positive amount also appear and can be processed on the Automated Cash Application page. With the Automated Cash Application feature, you can automatically generate a batch of customer payments in NetSuite and apply them to open invoices. The system then automatically matches and clears the generated customer payments. For details, see [Automated Cash Application](#).

When you import corporate card charges for expense reporting, NetSuite stores them in the Imported Employee Expenses list. Add your imported charges to expense reports. For more information, see the help topic [Creating Expense Reports With Imported Transactions](#).

This section includes the following topics:

- [Automatic Bank Data Import](#)
- [Manual Bank Data Import](#)
- [Viewing Imported Banking Data](#)
- [Deleting Imported Statements](#)

Automatic Bank Data Import

Automate bank data imports by configuring format profiles, which let you connect to financial institutions and retrieve financial data. If you have the Administrator role, you can automate bank or credit card data imports for matching and reconciliation. See [Automating Imports for Bank Reconciliation](#).

If you're using the Expense Reports feature, you can automate imports of corporate card charges from American Express for expense reporting. See [Automating Imports for Expense Reporting](#).

When you save a format profile configured for automatic import for the first time, NetSuite creates a daily import schedule.

If you have automatic import for bank reconciliation configured, you can initiate a manual update of your account data on the Match Bank Data page. You should only do this if your account does not contain the latest data, or if there was an import error. For details, see [Updating Imported Bank Data](#).

If you have automatic import for expense reporting configured, NetSuite stores imported corporate card charges in the Imported Employee Expenses list. When new expenses are available, employees get an email notification and a reminder in the Reminder portlet on the NetSuite Home page. For information about viewing expenses and creating expense reports, see the help topic [Creating Expense Reports With Imported Transactions](#).

To see a list of all your imports of bank, credit card, and corporate card data, go to the Banking Import History page (Transactions > Bank > Banking Import History). See [Viewing Imported Banking Data](#).

Automatic import is useful if:

- You have large data volumes.
- You have frequent imports.
- You want to save time by removing the need for manually importing data.
- (If you're performing bank reconciliation) You want to automate the process of importing and matching data.
- (If you're performing bank reconciliation) You want to receive daily up-to-date banking transactions and account balances.

Automating Imports for Bank Reconciliation

If you have the Administrator role, you can use a Financial Institution Connectivity Plug-in to automate bank data imports for bank or credit card reconciliation.

NetSuite uses reconciliation rules to automatically match imported bank lines to account transactions during bank or credit card reconciliation. All imported bank lines that can't be matched by the system are available for manual matching on the Match Bank Data page. You can reconcile matched transactions on the Reconcile Account Statement page. For more information, see [Bank Data Matching and Reconciliation](#).

Note: All imported bank lines with a positive amount also appear and can be processed on the Automated Cash Application page. The Automated Cash Application feature lets you automatically generate a batch of customer payments in NetSuite and apply them to open invoices. NetSuite then automatically matches and clears the generated customer payments. For details, see [Automated Cash Application](#).

This section involves using a custom or standard connectivity plug-in in a format profile that you create. You can use either the standard SFTP Connectivity plug-in available through the Auto Bank Statement Import (ABSI) SuiteApp, or develop a custom plug-in. For more information about the ABSI SuiteApp, see [Auto Bank Statement Import SuiteApp](#).

Important: To avoid performance issues, you should not configure a bank data import that exceeds 10,000 transactions and 500 linked accounts. If an import exceeds these thresholds, you need to create multiple format profiles to facilitate parallel imports.

If you want to use connectivity and parser plug-ins in format profiles provisioned by the Bank Feeds SuiteApp, see [Bank Feeds SuiteApp](#). For information about how many banking transactions you can import and how many accounts you can link see [Limitations of Using the Bank Feeds SuiteApp](#).

To automate imports for bank reconciliation:

1. Develop and upload a custom Financial Institution Connectivity Plug-in. For details, see the help topic [Financial Institution Connectivity Plug-in](#). Or, install the ABSI SuiteApp. See [Installing Auto Bank Statement Import SuiteApp](#).
2. Develop and upload a custom Financial Institution Parser Plug-in. For details, see the help topic [Financial Institution Parser Plug-in](#). Or, install the Bank Statement Parsers SuiteApp. See [Installing the Bank Statement Parsers SuiteApp](#).
3. Create a financial institution record. See [Creating Financial Institution Records](#).
4. Add a format profile to the financial institution record. See steps 1-3 in [Creating Format Profiles for Bank Reconciliation](#).
5. Configure the format profile to automate imports of bank or credit card data for matching and reconciliation:
 - a. In the **Profile Name** field, enter a name for your format profile—for example, Wells Fargo – BAI2.
 - b. In the **Description** field, enter a description to help you identify the format profile.
 - c. From the **Profile Type** field dropdown, select **Bank Reconciliation**.
 - d. From the **Connectivity Method** dropdown list, select the appropriate Financial Institution Connectivity Plug-in implementation.
If you installed the ABSI SuiteApp, select **SFTP Connectivity**.
 - e. From the **Transaction Parser** list, select the appropriate custom or standard Financial Institution Parser Plug-in implementation.
For information about the available standard parser plug-ins, see [Bank Statement Parsers SuiteApp](#).
 - f. Use the subtabs to configure a connection to a financial institution, link accounts, map custom bank codes (optional), and set up your transaction parser (optional). See the following help topics:
 - [Configuring a Connection to a Financial Institution \(Without a SuiteApp\)](#)
 - [Linking Accounts for Financial Institution Connectivity](#)
 - [Mapping Custom Bank Codes](#)

■ Transaction Parser Configuration

g. Click **Save**.

If the save is successful, NetSuite displays a progress message to let you know that a bank data import has started.

If you are saving this format profile for the first time, NetSuite creates a daily import schedule and requests to download the last 60 calendar days of available bank data from your financial institution. At each scheduled import, NetSuite imports new data from your financial institution into your accounts. If the data import fails, NetSuite requests data for up to seven previous calendar days.

If you're not saving this format profile for the first time, NetSuite imports new bank or credit card data from your existing accounts that are linked to corresponding general ledger accounts in NetSuite. For any newly-linked accounts, NetSuite imports the last 60 calendar days of data.

 **Note:** There are cases where an import is not started. For example, NetSuite doesn't import data from the same format profile twice within a 60-minute period.

To view the processing status of your import, click **Track your status**.

NetSuite displays the Banking Import History page. This page provides import statuses and troubleshooting information, including account-specific failure reasons and which accounts are affected. For more information, see [Banking Import History](#).

To match and reconcile data, see [Bank Data Matching and Reconciliation](#).

To automatically generate customer payments from imported bank lines, apply the payments to invoices, and match and submit the payments for reconciliation, see [Generating Customer Payments](#).

For more information about the overall process for creating format profiles that use the Bank Reconciliation profile type, see [Creating Format Profiles for Bank Reconciliation](#).

Automating Imports for Expense Reporting

Currently, only the AMEX Corporate Card Integration SuiteApp is supported to automate AMEX corporate card charge imports. See the help topic [American Express Integration for Expense Reporting](#).

A custom connectivity plug-in to set up a direct connection to another provider isn't supported yet. If you need to import corporate card charges from another provider, you should use manual import. See [Importing Data Using a Financial Institution Record](#).

Manual Bank Data Import

Download a financial statement file from your financial institution, and then manually import it into NetSuite for reconciliation or expense reporting. NetSuite encrypts financial data files during processing. Files are removed and aren't stored after processing.

 **Note:** For compliance reasons, NetSuite does not store statement files. After parsing, the file is removed from the database and can't be accessed or downloaded.

NetSuite uses reconciliation rules to automatically match imported bank lines to account transactions during bank or credit card reconciliation. All imported bank lines that can't be matched by the system are

available for manual matching on the Match Bank Data page. You can reconcile matched transactions on the Reconcile Account Statement page. For more information, see [Bank Data Matching and Reconciliation](#).

Note: All imported bank lines with a positive amount also appear and can be processed on the Automated Cash Application page. The Automated Cash Application feature lets you automatically generate a batch of customer payments in NetSuite and apply them to open invoices. NetSuite then automatically matches and clears the generated customer payments. For details, see [Automated Cash Application](#).

The file format you can use for manual data import depends on your setup. For information about file formats supported by the Bank Statement Parsers SuiteApp, see [Bank Statement Parsers SuiteApp](#). For information about file formats supported by NetSuite's default parser functionality, see [Supported File Formats for Default Parsers](#).

Note: If your file format is not supported by the Bank Statement Parsers SuiteApp or NetSuite's default parser functionality, use a Financial Institution Parser Plug-in. See the help topic [Financial Institution Parser Plug-in Interface Overview](#).

When you import corporate card charges for expense reporting, NetSuite stores them in the Imported Employee Expenses list, where you can add them to expense reports. For more information, see the help topic [Creating Expense Reports With Imported Transactions](#).

Reasons for manual import include the following:

- You have a small volume of data that you have already downloaded from a financial institution and have on your local machine.
- You want to upload a single file.

You can manually import a file using the parser and configuration settings from an existing financial institution record. If you're importing data for reconciliation, you can also use NetSuite's default parser functionality. For details, see the following procedural topics:

- [Importing Data Using a Financial Institution Record](#)
- [Importing Data Using Default Parsers](#)
- [Importing Data Using a Bank Connectivity Plug-in](#)

Important: To avoid performance issues, you should not configure an import that exceeds 10,000 transactions.

 [Importing Files Using Financial Institution Records](#)

Note: This video displays the NetSuite 2021.1 user interface.

Importing Data Using a Financial Institution Record

Use this procedure to download a financial statement file from your financial institution and import it using settings in a financial institution record. Financial institution records let you configure imports for each financial institution you want to retrieve data from. You can configure imports for bank reconciliation or corporate card expenses.

Important: You must have financial institution records set up in NetSuite to do this procedure. If you have the Administrator role, you can create a financial institution record to configure an import. For details about creating and managing financial institution records, see [Financial Institution Records](#). If you want to import data but do not have an Administrator role or configured financial institution records, contact your administrator.

You can also import data using NetSuite's default parser functionality. See [Importing Data Using Default Parsers](#).

Note: If you're importing corporate card charges for expense reporting, follow this procedure. Use the other manual import methods only for importing bank or credit card data for reconciliation.

To import data using a financial institution record:

1. Ensure you complete the following prerequisites:
 - a. Create and upload a custom parser built with the Financial Institution Parser Plug-in interface into NetSuite. For details about this plug-in, see the help topic [Financial Institution Parser Plug-in Interface Overview](#).
To create a script file for the plug-in, see the help topic [Creating a Financial Institution Parser Plug-in Script File](#).
For upload instructions, see the help topic [Adding the Plug-in Implementation](#).
 - b. Create a financial institution record to store your manual import configuration, including your parser plug-in implementation. See [Creating Financial Institution Records](#).

Note: If you do not have access to financial institution records, contact your administrator.

- c. Within the financial institution record, create a format profile with the settings needed to manually import your data. You can configure an import for bank or credit card statement files for matching and reconciliation, or import corporate card charges for expense reporting. See [Creating Format Profiles for Bank Reconciliation](#) and [Creating Format Profiles for Expense Reporting](#).
2. Go to your financial institution website and download your financial statement in the appropriate file format.
Choose the file format based on the transaction parser you selected for your import. For example, if you're using a BAI2 parser, choose BAI2. If you have the Administrator role, you can check the parser type by opening the financial institution record and viewing its settings. See [Financial Institution Records](#).

If you do not have access to financial institution records, contact your administrator.

Important: To ensure successful file import, do not modify the downloaded statement file.

3. Give the statement file a name. The file name can be up to 50 characters, including the extension.
4. Go to Transactions > Bank > Banking Import History > Upload File.
NetSuite displays the Upload File page. The Manual Import subtab is open by default.
5. Click **Choose File**, or use the drag-and-drop functionality.

Important: The file name can be up to 50 characters, including the extension.

6. Select the name of the file you want to import.

7. Under Import Options, choose **Select a Financial Institution**.
8. From the **Financial Institution** list, select a financial institution record.
9. From the **Format Profile** list, select a format profile record.

A format profile is a record within a financial institution record with import configuration settings. Only format profiles set up for manual import appear in this list. If the financial institution record has only one format profile, NetSuite selects it by default.

 **Note:** Depending on your NetSuite role, you can create a new financial institution or format profile by clicking the plus icon.

10. Click **Import**.

 **Note:** You don't have to wait on the page while the import runs. You can work on other actions, such as starting a new import. The number of concurrent bulk imports depends on your NetSuite Service Tier. For details, see the help topic [NetSuite Service Tiers](#).

NetSuite displays a progress message. To view the processing status of your import, click **Track your status**.

NetSuite displays the Banking Import History page. For more information, see [Banking Import History](#).

When the import process completes, do one of the following:

- If you're importing bank or credit card statement files for reconciliation, perform matching and reconciliation. See [Bank Data Matching and Reconciliation](#).
To automatically generate customer payments from imported bank lines, apply the payments to invoices, and match and submit the payments for reconciliation, see [Generating Customer Payments](#).
- If you're importing corporate card expense files for expense reporting, add the imported charges to expense reports. See the help topic [Creating Expense Reports With Imported Transactions](#).

Importing Data Using Default Parsers

If you don't have financial institution records set up, use NetSuite's default parser functionality to import data for matching and reconciliation.

 **Note:** NetSuite's default parsers can't be customized. Unless you have no financial institution records set up, use the standard parsers in the Bank Statement Parsers SuiteApp. For details, see [Bank Statement Parsers SuiteApp](#).

 **Important:** Use this procedure only to configure a manual import for bank or credit card reconciliation. To configure a manual import for expense reporting, see [Importing Data Using a Financial Institution Record](#).

To import a statement using default parsers:

1. Download your bank or credit card statement from your financial institution's website in one of the accepted file formats. See [Supported File Formats for Default Parsers](#).

If you're importing a CSV file, make sure it matches the provided CSV template and constraints. See [Preparing CSV Files for Import](#).

Important: To ensure a successful file import, do not modify the downloaded statement file.

2. Give the statement file a name. The file name can be up to 50 characters, including the extension.
3. Go to Transactions > Bank > Upload File.

NetSuite displays the Upload File page. The Manual Import subtab is open by default.

4. Click **Choose File**, or use the drag-and-drop functionality.

Important: The file name can be up to 50 characters, including the extension.

5. Select the name of the file you want to import.
6. Under Import Options, choose **Import with default parser (CSV, OFX, QFX, BAI2, or CAMT.053)**.

Note: NetSuite displays a link to download the CSV template when you choose this option. For details, see [Preparing CSV Files for Import](#).

7. In the **Account** field, select the bank or credit card account for this import.
8. If required, in the **Character Encoding** field, select the character encoding for the file.

If character encoding isn't required for the file format (CAMT.053.001.06-formatted XML, BAI2-formatted TXT, or CSV), the field doesn't appear.

- **(Unicode) UTF-8 encoding** – UTF-8 character encoding is a variable-width encoding that can represent every character in the Unicode character set and has become the dominant character encoding.

If you intend to use this format, make sure your file contains valid UTF-8 characters. You may need to use a third party editor to convert your file to UTF-8 before importing into NetSuite. Some editors append a BOM (Byte Order Marker) to indicating that the file is UTF-8 encoded.

Note: If you're using the BAI2 format with UTF-8 encoding, this option works with these banks: TD, Wells Fargo, US Bank, JP Morgan Chase, and Bank of America Merrill Lynch.

- **Western (Windows 1252) encoding** – Windows 1252 encoding is a character encoding of the Latin alphabet, used by default in the legacy components of Windows in English and some other Western languages.
 - **Western (ISO-8859-1) encoding** – ISO-8859-1 encodes what's commonly referred to as "Latin alphabet no. 1," consisting of 191 characters from the Latin script. This character encoding is used throughout the Americas, Western Europe, Oceania, and much of Africa. It is also commonly used in most standard romanizations of East Asian languages.
 - **Chinese Simplified (GB18030)** – GB18030 is the registered Internet name for the official character set of the People's Republic of China (PRC), superseding GB2312. This character set is formally called "Chinese National Standard GB 18030-2005: Information technology -- Chinese coded character set." GB abbreviates Guójiā Biāozhūn, which means national standard in Chinese. (This description is cited from Wikipedia.) This option is the default when the Chinese language preference has been selected.
 - **Japanese (Shift-JIS) encoding** – Shift-JIS character encoding is the most widely used format for supporting the Japanese language. This option is the default for the Japanese edition and when the Japanese language preference has been selected.
 - **(Western) MacRoman** – MacRoman encoding is the basis for most popular 8-bit character sets including Windows-1252 and the first block of characters in Unicode.
9. If you're uploading a QIF file, select a date format from the **Date Format** field.

 **Note:** The QIF file format isn't supported. Use one of the new supported formats instead.

10. Click **Import**.

 **Note:** You don't have to wait on the page for the import to finish. You can perform other actions, such as starting a new import. The number of concurrent bulk imports depends on your NetSuite Service Tier. For details, see the help topic [NetSuite Service Tiers](#).

NetSuite displays a progress message. To check your import status, click **Track your status**.

NetSuite displays the Banking Import History page. For more information, see [Banking Import History](#).

When the import process is complete, perform matching and reconciliation. See [Bank Data Matching and Reconciliation](#).

To generate customer payments from imported bank lines, apply payments to invoices, and match and submit them for reconciliation, see [Generating Customer Payments](#).

Supported File Formats for Default Parsers

Download the account statement from your bank or credit card company in one of the supported file formats. To ensure successful file import, do not modify the downloaded statement file. The file name can be up to 50 characters, including the extension.

You can import account statements that are in the following formats:

 **Important:** If you try to import a CAMT.053.001.06-formatted XML or BAI2-formatted TXT file, and the bank mapping fields in the relevant account aren't set, the import will fail. For instructions, see the help topic [Editing an Account](#). BAI2, CAMT, and CSV files must have UTF-8 encoding.

- BAI2 (Bank Administrative Institute Version 2) TXT with UTF-8 encoding – common format developed by Bank Administrative Institute for exchanging data. This data describes account activities, including securities transactions and lock box deposits. NetSuite supports BAI2 Prior-day Reporting for Bank. The statement can contain multiple bank or credit card accounts.

 **Note:** If you're using default parsers, NetSuite supports the BAI2 format with UTF-8 encoding for the following financial institutions: TD, Wells Fargo, US Bank, JP Morgan Chase, and Bank of America Merrill Lynch. If you're using Financial Institution Parser Plug-ins or Bank Statement Parser Plug-ins, NetSuite supports any format.

- CAMT.053.001.06 XML with UTF-8 encoding – File format in compliance with ISO 20022 and used by SWIFT. This statement file can contain end-of-day transactions for multiple bank or credit card accounts.
- CSV with UTF-8 encoding – Files with the .csv extension. Make sure the statement file also adheres to the provided CSV template and constraints. See [Preparing CSV Files for Import](#).
- OFX (Open Financial Exchange) – File format sponsored by Intuit, Microsoft, and Fiserv (CheckFree). It is commonly used with Microsoft Money. When importing, select the method of character encoding associated with the file. If you're not sure which encoding the file has, check with your financial institution.
- QFX (Quicken Financial Exchange) – File format developed by Intuit and is used with their Quicken software. It is a variant of the OFX file format. When importing, select the method of character encoding associated with the file. If you're not sure which encoding the file has, check with your financial institution.

 **Note:** The QIF file format isn't supported. Use one of the new supported formats instead.

If your financial institution provides banking data in another format, use a third-party conversion tool to change the file to a supported format, and then import it.

Preparing CSV Files for Import

Statement files in CSV format must adhere to the provided CSV template and constraints. The file needs to be UTF-8 encoded.

You can download the CSV template by going to Transactions > Bank > Banking Import History > Upload File, selecting **Import with a default parser (CSV, OFX, QFX, BAI2, or CAMT.053)**, and clicking **Download the CSV template**.

Or, you can create the file with the required columns and specifications.

If you're using Excel, ensure the file is UTF-8 encoded. Go to **File > Save As**, and then select **CSV UTF-8 (Comma delimited) (*.csv)** from the file format list.

 **Important:** The CSV file can only contain transactions that belong to a single account.

To ensure successful import, the column headings must be in the first row in the specified order as follows: Date (MM/DD/YYYY), Payor/Payee Name, Transaction ID, Transaction Type, Amount, Memo, NS Internal Customer ID, NS Customer Name, Invoice Number(s).

The following column data is required:

 **Note:** The Memo field is optional. The memo can't exceed 4000 characters or include any commas, semicolons or underscores.

- Date (MM/DD/YYYY) – The transaction date. Content must be in the format of MM/DD/YYYY. A one-digit month must be preceded by a zero. If you're using Excel, ensure that the date does not get reformatted.
- Payer/Payee Name – Payer or Payee name. There is a limit of 70 characters.
- Transaction ID – Unique Bank Transaction or Reference ID. This can also be populated with the check number. There is a limit of 90 characters.
- Transaction Type – Values in this column must be one of the following transaction types, all uppercase: CREDIT, DEBIT, CHECK, PAYMENT, ACH, INTEREST, DEPOSIT, TRANSFER, FEE, OTHER.
- Amount – The amount column must be a single column. If your file contains CREDIT and DEBIT columns, combine them into a single amount column. Positive amounts are CREDITS. Negative amounts are DEBITS, and must begin with a minus sign or be in parentheses.
The amount column can't contain currency symbols or commas instead of decimal places. The amount currency should be in the same currency as the selected account.
- Memo (Optional) – There's a limit of 4000 characters for the memo. The Memo field can't include any commas, semicolons or underscores.
- NS Internal Customer ID – (Optional) The NetSuite internal customer ID. Content must be numeric. There's a limit of 12 characters.

When you import the statement, NetSuite uses the customer ID first to try to match the statement to a NetSuite customer. If the customer ID is missing, NetSuite checks for a customer name next.

- NS Customer Name – (Optional) If the specified customer ID doesn't match any data, NetSuite uses the value to look up the customer ID. Content is free-form text. The character limit is 512.

When you import the statement, if the customer ID is missing, NetSuite uses the customer name to try to match the statement to a NetSuite customer. If the customer name is missing, NetSuite checks for invoice numbers.

- **Invoice Number(s) – (Optional)** A comma-separated list of invoice numbers in a single field, with no spaces between numbers (for example, 132,133,134). If you use a script or comma-separated file instead of the CSV template in a spreadsheet, place quotation marks around multiple invoice numbers (for example, "132,133,134"). For each invoice number in the list, there's a limit of 128 characters. If the imported file specifies multiple invoices for a transaction, they must all belong to same customer and AR account.

When you import the statement, if the customer name and customer ID are both missing, NetSuite uses the invoice numbers to try to match the statement to a NetSuite customer. If the customer name, ID, and invoice numbers are all missing, the system can't perform an exact match. However, NetSuite can match the statement to a customer in other ways. See [Customer Match Criteria](#).

Important: If you exceed the character limit for any field, the import fails. If you use multibyte characters, the character limit may decrease.

If present, remove the following:

- Empty columns (containing no data) between other filled columns.
- Empty rows (containing no data) between other filled rows.
- Columns containing opening and closing balances.
- Any columns not specified by the template.
- Multiple accounts.
- Bank account number.

Importing Data Using a Bank Connectivity Plug-in

Warning: The Bank Connectivity Plug-in interface is still functional but no longer supported. To directly connect to a financial institution and automate bank data imports for matching and reconciliation, use the Financial Institution Connectivity Plug-in. For details, see [Automating Imports for Bank Reconciliation](#).

Follow this procedure to download files locally from a secure server, which the Bank Connectivity Plug-in can then get and upload automatically to NetSuite. If your financial institution can generate the files to a specific location, like a Secure File Transfer Protocol (SFTP) server, then the plug-in can get the file and upload it.

To do this procedure, you need the following:

- **Configured financial institution records** – Enables you to configure imports for specific financial institutions from which you want to retrieve data. See [Financial Institution Records](#). If you don't have the Administrator role and don't have financial institution records configured, contact your administrator.
- **Bank Connectivity Plug-in** – See the help topic [Bank Connectivity Plug-in](#).

Important: The following procedure is only applicable if you're configuring a manual import for bank or credit card reconciliation. To configure a manual import for expense reporting, see [Importing Data Using a Financial Institution Record](#).

To import bank data using the Bank Connectivity Plug-in:

1. Go to Transactions > Bank > Banking Import History > Upload File.
NetSuite displays the Upload File page. The Manual Import subtab is open by default.
2. Click the **Connectivity Plug-in** subtab.
3. From the **Connectivity Plug-in** list, select a Bank Connectivity Plug-in. Only Bank Connectivity Plug-ins appear in this list.
4. From the **Financial Institution** list, select a financial institution record.
5. From the **Format Profile** list, select a format profile record.

A format profile is a record within a financial institution record that contains configuration settings for imports. Only format profiles configured for manual import appear in this list. If the selected financial institution record only has one format profile, NetSuite selects it by default.

Note: If you have the applicable permissions, you can create a new financial institution, format profile record, or connectivity plug-in from this page. Click the plus icon next to the field.

6. Click **Import** to initiate the import process.

The Bank Connectivity Plug-in retrieves the file and uploads it to NetSuite, using the settings configured in the selected financial institution and associated format profile record.

NetSuite displays a progress message. To check the processing status of your import, click **Track your status**.

NetSuite displays the Banking Import History page. For more information, see [Banking Import History](#).

When the import process completes, you can perform matching and reconciliation. See [Bank Data Matching and Reconciliation](#).

To automatically generate customer payments from imported bank lines, apply the payments to invoices, and match and submit the payments for reconciliation, see [Generating Customer Payments](#).

Viewing Imported Banking Data

This section provides information about viewing imported banking data in NetSuite. You can view a list of imported account statements and their statuses. You can also view more information, including individual bank lines imported.

To view your imported data, you can do any of the following:

- Go to Transactions > Bank > Banking Import History. This page lets you track your import statuses and troubleshoot errors. For details, see [Banking Import History](#).
- If you import bank or credit card lines for reconciliation, you can view your data at Transactions > Bank > Match Bank Data. You can also view your bank or credit card lines on the Automated Cash Application page (Transactions > Bank > Automated Cash Application), if they contain a positive amount. For details, see [Viewing Data Imported for Reconciliation](#).
- If corporate card charges were imported for expense reporting, NetSuite stores them in the Imported Employee Expenses list. When new expenses are available, employees receive an email notification and a reminder in the Reminder portlet on the NetSuite Home page. You can click the link in the notification or reminder to see a list of your imported expenses. For details, see [Viewing Imported Corporate Card Expenses](#)

To import a bank, credit card, or corporate card statement, see the help topic [Bank Data Import](#).

Banking Import History

The Banking Import History page (previously called Imported Statement List) is a place to audit imports and to troubleshoot issues. The page displays a list of imported account statements, along with import statuses and error details. To see the Banking Import History page, go to Transactions > Bank > Banking Import History.

Note: To access the Banking Import History page, your role requires the Import Online Banking File permission. For details, see [Permissions for Banking Features](#).

There are no subsidiary restrictions for the Banking Import History page.

There's a filter region at the top where you can filter imports by import status, profile type, date range, or you can use the Search field.

Viewing Import Error Details

You can view import errors on the Banking Import History page.

To view import error details:

1. Go to Transactions > Bank > Banking Import History.
NetSuite displays the list of imported account statements, along with import statuses and error details.
2. To view the expanded details of an imported statement, click the plus icon next to an import status.
For bank and credit card data imports with a Failed or Partially Completed status, NetSuite displays account-specific errors.
An import for an account fails, for example, if the date of a transaction is improperly formatted (for example, a one-digit month is not preceded by a zero).
For corporate card charge imports with a Failed status, NetSuite displays generic import errors. For specific error information, consult the Execution Log for the plug-in implementation used for the import. Go to Customization > Plug-ins > Plug-in Implementations, select your implementation, and then click the **Execution Log** subtab.

To refresh the information for the imported statements, click the refresh icon above the table. Next to the icon, you can see the Last Refreshed date and time.

Import Details

Specific information provided on the Banking Import History page includes the following:

- **Import Status** – The status of the data import. To filter the list by status, you can select one or more options from the Bank Import Status list in the filter region. The default value is All. NetSuite has six import statuses:
 - **Completed** – The import process completed successfully. If the statement has a problem and was manually imported, you can delete it. See [Deleting Imported Statements](#).
 - **Partially Completed** – NetSuite successfully completed an import for some but not all bank or credit card accounts. The system indicates a Partially Completed import by using an orange exclamation mark icon. If you have the Import Online Banking File permission with create-level access, NetSuite displays a list of failure reasons and affected accounts in the expanded details. You cannot delete partially completed imports.

Note: The Partially Completed status only applies to imports with a Bank Reconciliation profile type. This status does not apply to corporate card charge imports.

- ❑ **Failed** – The import process failed, which is indicated by a red exclamation mark icon.

If this import uses a Bank Reconciliation profile type and you have the Import Online Banking File permission with create-level access, NetSuite displays account-specific errors. In the expanded details, you can view all failure reasons for the import, along with the accounts affected for each error.

If this import uses a Corporate Card Expenses profile type, NetSuite displays a generic error. For specific error information, consult the Execution Log for the plug-in implementation used for the import. See [Viewing Import Error Details](#).
- ❑ **Deleted** – The imported statement was deleted.
- ❑ **Importing** – NetSuite is currently importing the statement. In the expanded details, a status bar is displayed.
- ❑ **Matching** – NetSuite is currently automatically matching the transactions in your imported statement. In the expanded details, a status bar appears.
- **Internal ID** – The internal ID of the import record. You can enable internal IDs on the Set Preferences page (Home > Set Preferences). By default, NetSuite disables this field.
- **Data Source** – The name of the imported statement file or the name of the Financial Institution Connectivity plug-in used to import data directly from a financial institution. This name is provided regardless of whether the import completed, partially completed, failed, or succeeded but was deleted.
- **Format Profile** – If you have a financial institution record configured, this value displays the format profile selected for the import, which stores the file format information. The format profile sets which parser reads the data, the method of retrieval, and the purpose of use. For details, see [Format Profile Creation](#).
- **Profile Type** – The configuration type of the format profile selected for the import. This value is either Bank Reconciliation or Corporate Card Expenses. A Bank Reconciliation profile is for importing bank or credit card data for reconciliation and matching. A Corporate Card Expenses profile is for importing corporate card charges for expense reporting. For details, see [Format Profile Creation](#).
- **Date Submitted** – The system date and time at which the statement was submitted for import.
- **Imported By** – This value represents who imported the file. This can be a user's email address or the system, if the import was system-generated.

To view a list of individual bank or credit card lines for your imported statements that require matching, see [Viewing Data Imported for Reconciliation](#).

Note: As of NetSuite 2020.2, the Import Details page is no longer supported. However, you can still access import details by adding the Bank Statement Import List portlet to the Home dashboard. To add a List portlet, see the help topic [List Portlets](#).

To view a list of individual corporate card expense transactions for your imported statements, see [Viewing Imported Corporate Card Expenses](#).

To import a bank, credit card, or corporate card statement, see the help topic [Bank Data Import](#).

Viewing Data Imported for Reconciliation

On the Match Bank Data page, you can view a list of bank or credit card lines for your imported statement that require manual matching. See [Viewing Imported Data on the Match Bank Data Page](#).

You can also view your bank or credit card lines on the Automated Cash Application page, if the following criteria are met:

- The bank lines contain a positive amount.
- The bank lines haven't been matched to an existing account transaction in NetSuite, which was then submitted on the Match Bank Data page. If a transaction gets matched and submitted, NetSuite permanently removes the corresponding imported bank line from the Automated Cash Application page.

For more information, see [Viewing Imported Data on the Automated Cash Application Page](#).

Viewing Imported Data on the Match Bank Data Page

On the Match Bank Data page, you can view a list of bank or credit card lines for your imported statement that require manual matching.

Note: As of NetSuite 2020.2, the Import Details page is no longer supported. However, you can still access import details by adding the Bank Statement Import List portlet to the Home dashboard. To add a List portlet, see the help topic [List Portlets](#).

When you import data for bank or credit card reconciliation, NetSuite automatically matches your data to account transactions in NetSuite on the Match Bank Data page. To view automatically-matched transactions, see [Viewing Transactions To Be Submitted](#). To match transactions that require manual matching, see [Matching Bank Data](#).

Note: If NetSuite is processing a bank line, the line item is dimmed. Refresh the Imported Bank Data grid by clicking the Refresh icon above it.

To view imported data on the Match Bank Data page:

1. Go to Transactions > Bank > Match Bank Data.
To access the Match Bank Data and Reconcile Account Statement pages, your role requires the Reconcile permission. For details, see [Permissions for Banking Features](#).
2. From the **Account** list, select the bank or credit card account for which you want to view your imported data.

Note: If you want to use the Match Bank Data and Reconcile Account Statement pages for an existing account, check the **Use Match Bank Data and Reconcile Account Statement Pages** box on the account record. NetSuite automatically checks this box for newly-created accounts. For details, see the help topic [Editing an Account](#). NetSuite displays the Imported Bank Data and Account Transactions grids for the selected account

t.

3. To view the list of imported bank lines for the account that requires matching, look at the Imported Bank Data grid in the **To Be Matched** subtab.
4. To view account transactions that NetSuite has automatically matched against your imported data, click the **Review** subtab.
5. To confirm your imported account statement is accurate, review the following information in the **To Be Matched** and **Review** subtabs:
 - **Date** – The date on which the transaction occurred. If the transaction date isn't in the imported file, this column displays the posting date. The posting date of a transaction refers to the date when the transaction is posted to a general ledger account.

- **Type** – The type of transaction, such as Check, Payment, Deposit, and Interest.
 - **Tran No.** – The transaction ID, if available.
 - **Name** – The name of the merchant or payee.
 - **Memo** – The memo for the transaction, if available.
 - **Amount** – The transaction amount.
6. To view excluded imported data, including duplicate bank lines, click the **Excluded** subtab.
- NetSuite detects a duplicate transaction and moves it to the **Excluded** subtab when all of the following criteria are met:
- All transaction fields from the preceding step are identical to the fields of an existing transaction from a previous import.
 - Both transactions belong to the same financial institution account and have the same currency.

 **Note:** A transaction with a duplicate unique identifier is automatically prevented from being imported.

If the transaction isn't a duplicate, click **Restore**. For more information, see [Restoring Excluded Imported Bank Lines](#).

To match and reconcile your data, see [Bank Data Matching and Reconciliation](#).

Viewing Imported Data on the Automated Cash Application Page

You can view imported bank or credit card lines on the Automated Cash Application page, if all of the following criteria are met:

- The bank lines contain a positive amount.
- The bank lines haven't been matched to an existing account transaction in NetSuite, which was then submitted on the Match Bank Data page. If an existing transaction has been matched and submitted, NetSuite permanently removes the corresponding imported bank line from the Automated Cash Application page.

The Automated Cash Application feature lets you automatically generate a batch of customer payments in NetSuite and apply them to open invoices. NetSuite then automatically matches and clears the generated customer payments.

To view imported data on the Automated Cash Application page:

1. Go to Transactions > Bank > Automated Cash Application.
To use the Automated Cash Application feature, you need certain permissions. For details, see [Permissions for Banking Features](#).
2. From the **Account** list, select the bank or credit card account you want to use to view your imported data.
NetSuite displays a list of imported bank lines for the account that didn't have matching payments.

 **Important:** Not all bank lines on the Automated Cash Application page are payments.

3. (Optional) Filter the list of incoming bank lines. See [Filtering Imported Bank Lines](#).
4. To confirm your imported account statement is accurate, review the following information in the data grid on the Automated Cash Application page.

- **Type** – The type of transaction, such as Payment, Deposit, and Interest.
- **Date** – The date on which the transaction occurred.
- **Ref No.** – The transaction ID, if available.
- **Payor** – The name of the merchant or payor
- **Memo** – The memo for the transaction, if available.
- **Customer** – The customer associated with the transaction.
- **Amount** – The transaction amount.

For more information about using the Automated Cash Application feature, see [Generating Customer Payments](#).

To match and reconcile your data, see [Bank Data Matching and Reconciliation](#).

Viewing Imported Corporate Card Expenses

When you import corporate card charges using a format profile, NetSuite puts them in the Imported Employee Expenses list. When new expenses are available, employees receive an email notification and a reminder in the Reminder portlet on the NetSuite Home page. You'll see a list of your imported expenses when you click the link in the notification or reminder.

If you have the Administrator role, you can view and validate expense lines for every employee, daily.

To view imported corporate card expenses:

1. Go to Transactions > Employees > Imported Employee Expenses. Alternatively, do the following:
 - a. On the Home dashboard, go to the Reminders portlet.
NetSuite displays the number of imported expense report charges waiting to be expensed.
 - b. Click **Expense Report Charges Waiting**.

The Imported Employee Expenses list appears. If you have the Administrator role, expenses for all employees appear. Otherwise, only your expenses appear.

2. Before you add expenses to an expense report, make sure the details are correct by reviewing the following transaction information:

 **Note:** If you have the Administrator role, you can validate expense lines for all employees daily.

- **Employee** – The employee to which the expense applies.
- **Status** – The status of the expense, which can be the following:
 - **Failed** – The expense could not be imported. Contact your administrator for assistance.
 - **Ignored** – An expense excluded from the expense report. You can ignore expenses by selecting them and clicking **Ignore Selected**.
 - **Pending** – There was a problem linking the charge to this employee. The employee record may contain an error, like a typo in the cardholder name, that needs fixing. Contact your administrator for assistance.
 - **Processed** – This expense has already been added to an expense report.
 - **Ready** – You can add this expense to an expense report. To add expenses to expense reports, select expenses and click **Add to New Expense Report**.
- **Date** – The date on which the expense occurred.

- **Amount** – The amount charged to the corporate card.
- **Expense Category** – The category of the expense.
- **Memo** – The memo for the expense, if available.
- **Corporate Card** – The corporate card to which this expense was charged.

For more information about this page, including how to add expense transactions to expense reports, see the help topic [Creating Expense Reports With Imported Transactions](#).

Deleting Imported Statements

If there's a problem, you can delete an unreconciled bank, credit card, or corporate card statement if it was imported manually.

Important: After you reconcile a statement, you can't delete or change the imported file. You also can't delete a file that was automatically imported.

The Delete Import option lets you delete an account statement when all of the following criteria are met:

- The import was successful.
- The import was manual.
- The account statement is unreconciled.

If you delete a statement that contains matched transactions, NetSuite undoes the matches.

Note: When you delete a bank statement, NetSuite deletes all of the transactions for that statement. If you delete an imported transaction and import it again, NetSuite won't mark the transaction as a duplicate.

To delete an imported statement:

1. Go to Transactions > Bank > Banking Import History.
2. For the imported statement you want to delete, click the plus icon to expand the details of the import.

Note: You can't delete failed or automated imports.

3. Click **Delete Import**.
 4. In the confirmation popup message, click **OK**.
- NetSuite deletes the statement, including all of its transactions.

Automated Cash Application

You can import bank lines that don't have matching customer payments in NetSuite. The Automated Cash Application feature lets you automatically generate a batch of customer payments in NetSuite and apply them to open invoices. The generated customer payments are then automatically matched and cleared in the system. To generate customer payments, see [Generating Customer Payments](#).

 **Tip:** Before you manually match transactions, use the Automated Cash Application feature to generate all customer payments from imported bank lines and match them. After all customer payments are handled, manually match any remaining transactions. See [Matching Bank Data](#).

The Automated Cash Application feature displays all imported bank lines with a positive amount for an account and assigns a customer to each transaction if a match is found. For details about how NetSuite matches a customer to a bank line, see [Customer Match Criteria](#).

If a customer match isn't found for a bank line and you want to generate a customer payment for it, select a customer. See [Adding or Changing a Customer](#).

When you select a customer, you can create a customer mapping rule that the system remembers and uses for future incoming bank lines. For details on customer mapping rules, see [Customer Mapping Rules for Automated Cash Application](#).

If a bank line specifies invoice numbers, the system displays the invoices the payment will be applied to. Otherwise, the system provides a list of suggested invoices. The system automatically allocates payment amounts to invoices, but you can adjust them as needed. To review invoices for a bank line, see [Reviewing Invoices for an Imported Bank Line](#).

To use the Automated Cash Application feature, your user role needs certain permissions. For details, see [Permissions for Banking Features](#).

This section includes the following topics:

- [Setting Accounting Preferences](#)
- [Generating Customer Payments](#)
- [Filtering Imported Bank Lines](#)
- [Adding or Changing a Customer](#)
- [Customer Match Criteria](#)
- [Customer Mapping Rules for Automated Cash Application](#)
- [Reviewing Invoices for an Imported Bank Line](#)
- [Viewing Open Invoices for a Customer](#)
- [Including or Excluding Invoices from Payment Application](#)
- [Troubleshooting Missing Records from the Customer](#)
- [Checking the Process Status for Generated Payments](#)

Setting Accounting Preferences

To set accounting preferences, go to Setup > Accounting > Accounting Preferences.

To determine how NetSuite applies payments missing invoice numbers, set the **Apply Payments Without Invoice Numbers** preference on the General subtab in the Accounts Receivable section.

From the list, select your preferred method for handling generated customer payments missing invoice numbers. The method you choose determines how NetSuite suggests invoices for payment application when the imported bank line doesn't specify invoice numbers.

- **Apply by payment amount first, then to oldest invoice** – NetSuite makes the following suggestions:
 - If an invoice has an amount due equal to the payment, NetSuite suggests that invoice for payment application. The system doesn't consider discounts or preallocated amounts due.
 - If no invoice contains an amount due equal to the payment, NetSuite suggests the customer's oldest invoice or invoices for payment application. The system determines the oldest invoices based on the **Aging Reports Use** preference, which uses the due date or transaction date. If your aging preference is set to **Due Date** but your invoices don't specify one, the system suggests the oldest invoice using the transaction date.

 **Note:** If multiple invoices have the same amount due as the payment, NetSuite suggests the oldest invoice from the group for payment application.

By default, NetSuite uses the **Apply by payment amount first, then to oldest invoice** method.

- **Apply to oldest invoice by date of aging preference** – NetSuite suggests the customer's oldest invoice or invoices for payment application. The system determines the oldest invoices based on the **Aging Reports Use** preference, which uses the due date or transaction date. If your aging preference is set to **Due Date** but your invoices don't specify one, the system suggests the oldest invoice using the transaction date.
- **Keep payment unapplied** – NetSuite doesn't display invoice suggestions for payment application or automatically apply the payment to invoices. You must manually apply the payment to the appropriate invoice or invoices. See the help topic [Recording a Customer Payment](#).

 **Important:** If you select the first or second option, set the default accounts receivable account to ensure NetSuite uses the correct account. Use the **Default Receivables Account** preference at Setup > Accounting > Accounting Preferences > Item/Transactions. You can override this preference for a specific customer by defining the **Default Receivables Account** field on the customer record. For more information, see the help topic [Entering Financial Information for the Customer](#).

If you don't set a default accounts receivable account, NetSuite applies payments without invoice numbers to the oldest invoices associated with the last used accounts receivable account.

Generating Customer Payments

The Automated Cash Application feature automatically generates customer payments from imported bank lines and applies them to invoices in NetSuite.

 **Note:** The Automated Cash Application feature lets you generate an unapplied payment for a single customer. If you have the Consolidated Payments feature enabled, you can apply a payment to multiple customers at Customers > Accounts Receivable > Accept Customer Payments. For details on the Consolidated Payments feature, see the help topic [Consolidated Payments](#). For information about applying payments, see the help topic [Applying a Payment on the Customer Payment Page](#).

Your role needs certain permissions to do this procedure. For details, see [Permissions for Banking Features](#).

To generate customer payments:

1. If you haven't already done so, import your bank data (see [Bank Data Import](#)).

All imported bank lines with a positive amount appear and can be processed on both the Match Bank Data and Automated Cash Application pages. However, you should generate all customer payments first, and then match any remaining imported bank lines.

2. To open the Automated Cash Application page, do one of the following:
 - Go to Transactions > Bank > Automated Cash Application.
 - If you are on the Match Bank Data page, click **Automated Cash Application** in the upper right-hand corner.
3. From the **Account** list, select the bank or credit card account you want to generate customer payments for.

NetSuite displays a list of imported bank lines that don't have matching payments. An imported line appears if the following criteria are met:

 **Important:** Not all bank lines on the Automated Cash Application page are payments.

- The bank line contains a positive amount.
- The bank line hasn't been matched to an existing account transaction in NetSuite that's been submitted on the Match Bank Data page. If a transaction was matched and submitted, NetSuite permanently removes the imported bank line from the Automated Cash Application page.

 **Note:** If you import bank lines that specify invoices and later change the customer ID or currency on the invoices, NetSuite can't generate the payments.

4. (Optional) Filter the list of incoming bank lines. See [Filtering Imported Bank Lines](#).
 5. If needed, add or change the customer for an imported bank line. For details, see [Adding or Changing a Customer](#).
- To generate a payment from an imported bank line, you must select a customer. If a customer isn't selected and no customers are available in the list, see [Troubleshooting Missing Records from the Customer](#).

 **Tip:** You can create a customer mapping rule from your selection that the system remembers and uses for similar imported bank lines. For details, see [Creating Customer Mapping Rules](#).

The field in the Customer column for an imported bank line is populated if NetSuite finds an exact, preferred, or partial customer match. For details, see [Customer Match Criteria](#).

6. To review the invoice or invoices a payment is applied to, click the plus icon in a row. For details, see [Reviewing Invoices for an Imported Bank Line](#).

 **Note:** If a payment from a customer has open invoices under the customer's top-level customer or subcustomer, those invoices aren't listed. To view invoices for another customer, change the customer you want to generate the payment for. For details, see [Adding or Changing a Customer](#). Note that you can generate a payment only for a single customer.

To generate a payment for multiple customers, go to Customers > Accounts Receivable > Accept Customer Payments. Make sure you have the Consolidated Payments feature enabled. For details, see the help topic [Consolidated Payments](#).

7. (Optional) To view all open invoices for a customer, click **View Invoices** in the expanded details of a row. For details, see [Viewing Open Invoices for a Customer](#). In addition to invoices, NetSuite displays journal entries with the same general ledger impact.

8. To include or exclude open invoices from payment application for a customer, see [Including or Excluding Invoices from Payment Application](#).
9. If you want to generate a payment for a bank line, check the left box. This box is active only if a customer is selected.
10. If you don't want to generate a payment for a bank line, clear the box.

 **Note:** You can generate customer payments that don't apply to any invoices if none are applicable.

11. After reviewing your imported bank lines, making any adjustments, and selecting boxes as needed, click **Submit**.

NetSuite displays the confirmation message detailing the number of payments being generated or excluded.

12. Click **OK**.

NetSuite starts generating the payments, applying them to applicable invoices, and matching them to imported bank lines.

NetSuite redirects you to the Processed Records page, which displays your batch's processing status. For details, see [Checking the Process Status for Generated Payments](#).

 **Important:** If you set accounting preferences that make fields like **Class**, **Department**, and **Location** required, those fields in customer payments aren't populated. To set values for required fields, edit the payment after it's created. For details, see the help topic [Correcting Payments to Invoices](#).

When an invoice number isn't specified, the system applies the payment according to your preference settings. For details, see [Setting Accounting Preferences](#).

13. When processing completes, view your matched and cleared transactions at Transactions > Bank > Reconcile Account Statement.

Continue with the reconciliation process:

- If required, from the Match Bank Data page, match any unmatched transactions and submit them. See [Matching Bank Data](#).
- Reconcile the transactions. See [Reconciling Transactions](#).

 **Note:** When a transaction becomes unreconciled, NetSuite doesn't delete the payment generated by the Automated Cash Application feature. The corresponding imported bank line doesn't reappear on the Automated Cash Application page, but you can find and process it on the Match Bank Data page.

Filtering Imported Bank Lines

On the Automated Cash Application page, filter imported bank lines as needed.

To filter imported bank lines:

1. Go to Transactions > Bank > Automated Cash Application.
2. From the **Account** list, select the bank or credit card account you want to view.

NetSuite displays a list of all bank lines without matching payments.

If the number of bank lines in the list exceeds the page limit, click the arrows to view the next or previous page.

3. Filter your data:

- To switch from a list of all bank lines to only those excluded from payment generation, click **Show Excluded Only**.

Note: **Show Excluded Only** is only applicable if the box is checked for one or more bank lines.

- To search for specific text or numbers, in the **Search** field, start typing the text or number value. As you type, NetSuite narrows the results.

When entering a date, use the same format displayed on the page (set in User Preferences). For a long date format (May 1, 2018), enter **May** to search for May dates. Enter four digits for the year (2018). For a short date format, use two digits for the month or day (05/01/2018).

- To modify the date range for bank lines, enter or select dates in the **From** and **To** fields.

Adding or Changing a Customer

On the Automated Cash Application page, add or change customers for imported bank lines as needed.

Note: If a payment from a customer has open invoices under the customer's top-level customer or subcustomer, those invoices aren't listed. To view invoices for another customer, change the customer you want to generate the payment for. See [Adding or Changing a Customer](#). Note that you can generate a payment only for a single customer.

To generate a payment for multiple customers, go to Customers > Accounts Receivable > Accept Customer Payments. Ensure you have the Consolidated Payments feature enabled. For details, see the help topic [Consolidated Payments](#).

To add or change a customer:

1. Go to Transactions > Bank > Automated Cash Application.
2. From the **Account** list, select the bank or credit card account you want to generate customer payments for.

NetSuite displays a list of imported bank lines that don't have matching payments. A bank line can have one of the following statuses:

- **Ready To Submit** – A customer is selected, and the box for the imported bank line is checked and ready for submission. If a customer name is populated and an invoice number is specified, this status appears automatically.
- **To Review** – A customer is selected, and the box for the imported bank line is active and cleared. Check the box if needed. Expand the row to review the invoice or invoices to be applied.
- **No Customer** – No customer is selected, so the box for the imported bank line is inactive. To activate the box, select a customer.

3. From the list in the Customer column, select the customer for the imported bank line. By default, the list displays the first 1,000 results. If you don't see the customer, start typing the name to narrow your search.

If no customers are available from the list, see [Troubleshooting Missing Records from the Customer](#).

A customer name is populated for an imported bank line if NetSuite finds an exact, preferred, or partial customer match. For details, see [Customer Match Criteria](#). If the customer name is missing or incorrect, select the correct customer to generate a payment.

 **Important:** Only customers with the same currency and subsidiary (if applicable) as the selected account are available for selection.

4. In the confirmation window, choose one of the following:

- To create a new customer mapping rule, click **Make Rule**.

Choose this option if both of the following are true:

- Your imported bank line contains a Payor or Memo value uniquely tied to the selected customer.
- You want NetSuite to apply this customer to future similar bank lines.

NetSuite selects the customer and creates a customer mapping rule. Customer mapping rules let the system remember your selection for similar imported bank lines, based on the **Payor** and **Memo** field. For more information, see [Customer Mapping Rules for Automated Cash Application](#).

 **Note:** If you have an existing customer mapping rule that contradicts your new rule, the new rule overwrites the existing one.

- If you don't want to create a customer mapping rule for the customer selection, click **Don't Make Rule**.

Choose this option if either of the following is true:

- You want NetSuite to apply this customer only to the current bank line, not to others.
- The Payor and Memo values are generic and don't uniquely tie to the customer.

NetSuite selects the customer but doesn't create a customer mapping rule.

After you click **Make Rule** or **Don't Make Rule**, the box for the bank line becomes active. The system suggests open invoices for the newly selected customer based on your accounting preferences. For details, see [Reviewing Invoices for an Imported Bank Line](#).

Customer Match Criteria

The Automated Cash Application feature matches customers to imported bank lines based on the following criteria:

Match Type	Conditions	Details
Exact Match	The imported bank line must specify either of the following in the appropriate fields: ■ Customer name ■ Customer ID ■ Invoice number or numbers	If the conditions for an exact match are met and the customer or invoice information in the bank line is correct, NetSuite displays the associated customer's name.

Match Type	Conditions	Details
	 Note: In a CSV file, invoice numbers must be specified in the Invoice Number column. If there are multiple invoice numbers for a single bank line in a CSV file, certain formatting requirements apply. For details, see Preparing CSV Files for Import.	If the bank line contains incorrect customer or invoice information, an exclamation mark icon displays next to the field in the Customer column. To see what's incorrect, hover over the icon. If the bank line specifies invoice numbers for different customers, the system identifies the customer of the first invoice and displays an exclamation mark icon. To view other invoices, select the appropriate customer.  Note: The Automated Cash Application feature doesn't support multiple customers per bank line.
Preferred Match	You must have a customer mapping rule the system can use to identify a customer. The rule must contain values similar enough to the Payor and Memo fields in future imported bank lines for NetSuite to identify the right customer. The system compares rule values to future imported bank lines by removing white space, numbers, special characters, and capitalization. To create a customer mapping rule, see Adding or Changing a Customer. To view customer mapping rules, see Viewing Customer Mapping Rules.	When NetSuite can't achieve an exact match, it uses any existing customer mapping rules to try to identify a customer. Customer mapping rules let the system remember a customer selection for similar imported bank lines, based on the Payor and Memo field. In the bank line, NetSuite looks for payor and memo values similar to those in the rule to map to the right customer. NetSuite checks the payor value first and then the memo value.
Partial Match	You have a bank line with a payor or memo value similar enough to a customer name for the system to identify that customer as a potential match.	If NetSuite can't perform an exact or preferred match, it performs a partial match. A partial match uses a similarity algorithm to compare the Payor and Memo fields in incoming bank lines to customer names. The algorithm uses both characters and word length to try to identify a customer for the imported bank line. If the wrong customer is selected, which can happen if customer names are too similar, select the right customer and create a mapping rule.

If NetSuite can't identify a customer, the Customer column field isn't populated. In this case, an exclamation mark icon always displays next to the field. Blank Customer column fields usually occur for non-payment bank lines that don't specify customer info, like deposits. To view error details, hover over the icon.

If the Customer column field is blank, select a customer. For details, see [Adding or Changing a Customer](#).

If no customers are available from the list, see [Troubleshooting Missing Records from the Customer](#).

Customer Mapping Rules for Automated Cash Application

When you select a customer for an imported bank line on the Automated Cash Application page, you can create a customer mapping rule. When a customer mapping rule is created, NetSuite saves an association between the Payor and Memo fields of the imported bank line and the selected customer. The next time you receive a bank line without customer information, NetSuite uses the rule to find an associated customer. The system compares payor and memo values in the bank line with those in the rule.

To create a customer mapping rule, see [Creating Customer Mapping Rules](#).

To view customer mapping rules, see [Viewing Customer Mapping Rules](#).

To remove a customer mapping rule, see [Removing Customer Mapping Rules](#).

Creating Customer Mapping Rules

On the Automated Cash Application page, create a customer mapping rule for an imported bank line when you add or change a customer. Create a customer mapping rule if both of the following are true:

- Your imported bank line has a Payor or Memo value uniquely tied to the selected customer.
- You want NetSuite to apply this customer to future similar bank lines.

Warning: You can only have one customer mapping rule that maps to the same reduced value. For example, if you have a mapping for the payor "Mary's Fit4Less" and create a new mapping for the payor "Go2Gym!", the new mapping overwrites the existing one since both reduce to "". Imported bank lines with the payor "Mary's Fit4Less" would then map to "Go2Gym!".

To create a customer mapping rule:

1. Go to Transactions > Bank > Automated Cash Application.
2. From the **Account** list, select the bank or credit card account you want to create a customer mapping rule for.
NetSuite displays a list of imported bank lines that don't have matching payments.
3. From the list in the **Customer** column:
 - If no customer name is selected for an imported bank line, select or enter the appropriate customer. By default, the list displays the first 1,000 results. If no customers are available from the list, see [Troubleshooting Missing Records from the Customer](#).
 - If a customer name is selected but is incorrect, select or enter the correct customer.
 - If a customer name is selected, correct, and not read-only, do the following:
 1. Click the customer name field.
 2. To clear the field, click the **X** icon.
 3. Select or enter the customer name again.

Note: If NetSuite finds an exact match for an imported bank line and the customer or invoice information is correct, the box for the bank line is automatically checked. The customer name is read-only and you can't create a customer mapping rule.

4. In the confirmation window, click **Make Rule**.

NetSuite selects the customer and creates a customer mapping rule. If an existing rule contradicts your new rule, the new rule overwrites the old one. To view your newly-created rule, see [Viewing Customer Mapping Rules](#).

Viewing Customer Mapping Rules

When you create a customer mapping rule on the Automated Cash Application page (see [Creating Customer Mapping Rules](#)), NetSuite displays the rule in the Customer Mapping Rules window.

To view customer mapping rules:

1. Go to Transactions > Bank > Automated Cash Application.
2. From the **Account** list, select the bank or credit card account you want to view.
NetSuite displays a list of bank lines that don't have matching payments.
3. To view your customer mapping rules, click **View Customer Mapping Rules**. This button is active only if you selected an account.

The Customer Mapping Rules window displays a grid of customer mapping rules for your account, if any exist. Each rule contains a saved association between the Payor and Memo fields of an imported bank line and a customer in NetSuite. The **Payor Similar To** and **Memo Similar To** columns display the information NetSuite uses to match incoming bank lines to the **Customer** column value.

 **Note:** The values for **Payor Similar To** and **Memo Similar To** don't need to match the **Payor** and **Memo** fields of future imported bank lines exactly. They only need to be similar enough for NetSuite to identify the right customer.

When comparing rule values to future imported bank lines, the system transforms the values by removing white space and capitalization. For example, NetSuite may assign an imported bank line with the payor "Will Burr" to a customer mapping rule with the payor "Wilbur".

If words in the **Payor** or **Memo** field of imported banked lines contain numbers or special characters, the system ignores those words when performing mapping. For example, NetSuite maps the payor "L'Oreal Shampoo" to simply "Shampoo". If all words in the **Payor** or **Memo** field contain numbers or special characters, NetSuite maps to the reduced value, "".

4. To filter the list of customer mapping rules:
 - In the **Search** field, start typing a value from a rule you want to find. You can search for values in any column where you can type, including:
 - Payor Similar To
 - Memo Similar To
 - Customer
 As you type, NetSuite narrows the results in the list.
 - To view only active rules, click **Show Active Only**.
 - To filter by customer name, select a customer from the **Customer** list.

 **Note:** On the Automated Cash Application page, the Customer list displays only customer names included in the Customer Mapping Rules window.

5. To make a rule inactive, clear the **Active** box.
Any changes to your rules are saved immediately. The **Payor Similar To**, **Memo Similar To**, and **Customer** values are read-only.
By default, customer mapping rules are active.

 **Important:** NetSuite doesn't run the Automated Cash Application when you manually run reconciliation rules from the Match Bank Data page.

6. To remove a customer mapping rule, see [Removing Customer Mapping Rules](#).
7. When you're done reviewing your rules, click **Close**.

Removing Customer Mapping Rules

If you no longer need a customer mapping rule, remove it.

To remove a customer mapping rule:

1. Go to Transactions > Bank > Automated Cash Application.
2. From the **Account** list, select the bank or credit card account you want to view.
NetSuite displays a list of bank lines that don't have matching payments.
3. To view your customer mapping rules, click **View Customer Mapping Rules**.

 **Tip:** If you don't want the system to use the rule now but may need it later, clear the **Active** box instead.

4. For the rule you want to remove, click the delete icon.
5. In the confirmation window, click **OK** to remove the rule or **Cancel** to keep it.
When you delete a rule, the system removes it from the list and doesn't use it when identifying customers.
Any changes to your rules are saved immediately .

Reviewing Invoices for an Imported Bank Line

On the Automated Cash Application page, review the invoices payments will be applied to, along with payment amounts the system automatically allocates.

To review invoices for an imported bank line:

1. To open the Automated Cash Application page, do one of the following:
 - Go to Transactions > Bank > Automated Cash Application.
 - If you're on the Match Bank Data page, click **Automated Cash Application** in the upper right-hand corner.
2. From the **Account** list, select the bank or credit card account you want to review.
NetSuite displays a list of imported bank lines that don't have matching payments. If NetSuite found invoice matches, the invoice numbers appear in the Invoice Matches column.

3. For the bank line you want to review, click the plus icon.

The expanded details for the bank line appear.

If the bank line specifies invoices, the system displays the invoices it applies the payment to, or provides a list of suggested invoices.

The **Applied Amount** fields display the payment amounts NetSuite can apply to each invoice. The system considers whether the invoice is preallocated in other payments. When you click **Submit**, the system applies these amounts to the invoices.

The system displays invoice suggestions based on the **Apply Payments Without Invoice Numbers** preference. For details, see [Setting Accounting Preferences](#).

When suggesting invoices by amount, the system doesn't consider discounts or preallocated amounts. A preallocated amount is already assigned to another payment and can't be assigned elsewhere. For example, if an invoice is assigned to Payment A, it can't be assigned to Payment B.

Important: You can only apply payments to invoices with the same currency as the account. To create a payment with a different currency, see the help topic [Adding Additional Information to a Customer Payment](#).

4. (Optional) If needed, select a different customer.

The system updates invoice suggestions based on the **Apply Payments Without Invoice Numbers** preference. See [Setting Accounting Preferences](#).

If you have a multicurrency customer, the system suggests invoices that match the currency of the imported bank line.

Note: If a payment from a customer has open invoices under the customer's top-level customer or subcustomer, those invoices aren't listed. To view invoices for another customer, change the customer you want to generate the payment for. See [Adding or Changing a Customer](#). Note that you can generate a payment only for a single customer. To generate a payment for multiple customers, go to Customers > Accounts Receivable > Accept Customer Payments. Ensure you have the Consolidated Payments feature enabled. For details, see the help topic [Consolidated Payments](#).

5. (Optional) In the **Applied Amount** field for an invoice or invoices, adjust the value by entering a positive number.

The system recalculates the applied amounts for the other invoices. In the **Summary** box, the system also recalculates the payment's applied and unapplied amount.

If you enter a nonnumerical character or a negative number, the system displays an error message. In some cases, the system autocorrects the value you enter. For error and warning scenarios, see [Applied Amount Error and Warning Scenarios](#).

6. If NetSuite displays an invoice you don't want to apply the payment to, remove the invoice by clicking the trash icon next to it.
7. To view all open invoices for the customer, along with journal entries with the same general ledger impact, click **View Invoices**. For more information, see [Viewing Open Invoices for a Customer](#).

Applied Amount Error and Warning Scenarios

When you adjust an applied amount for an invoice on the Automated Cash Application page, you may get an error or warning message, depending on the situation. The following table outlines the error and warning scenarios that you may see when updating an applied amount.

Scenario	Message Type	Message Example	Action Item
Pasting a nonnumerical character or negative number.	Error	Applied Amount Not Accepted For Invoice A, enter a positive number in the Applied Amount field.	In the Applied Amount field for your invoice, enter a positive number that doesn't exceed the amount due or payment amount.  Note: Pasting a value cause an error.
Entering an amount greater than the amount due after other preallocations are subtracted from a preallocated invoice.	Warning	Applied Amount Autocorrected Invoice A has been matched with other imported payments. We adjusted the invoice's applied amount accordingly.	(Optional) Adjust the applied amount for your invoice if needed needed.
Entering an amount that exceeds the payment's remaining balance after other allocations.	Warning	Applied Amount Autocorrected The applied amount for Invoice A exceeded the payment amount for Payment A. We adjusted the invoice's applied amount accordingly.	
Entering an amount greater than the payment amount.	Warning	Applied Amount Autocorrected The applied amount for Invoice A exceeded the payment amount for Payment A. We adjusted the invoice's applied amount accordingly.	
Entering an amount greater than the amount due for the invoice.	Warning	Applied Amount Autocorrected For Invoice A, the applied amount exceeded the amount due. We adjusted the invoice's applied amount accordingly.	

To view invoices and update applied amounts, see [Reviewing Invoices for an Imported Bank Line](#).

Viewing Open Invoices for a Customer

On the Automated Cash Application page, view all open invoices for a customer.

To view open invoices for a customer:

- To open the Automated Cash Application page, do one of the following:
 - Go to Transactions > Bank > Automated Cash Application.
 - If you're on the Match Bank Data page, click **Automated Cash Application** in the upper right-hand corner.
- From the **Account** list, select the bank or credit card account you want to review.

NetSuite displays a list of imported bank lines that don't have matching payments. If NetSuite found invoice matches, the invoice numbers appear in the Invoice Matches column.

3. For the bank line you want to review, click the plus icon.

The expanded details for the bank line appear.

If the bank line specifies invoices, the system displays the invoices it applies the payment to, or provides a list of suggested invoices.

Note: If a payment from a customer has open invoices under the customer's top-level customer or subcustomer, those invoices aren't listed. To view invoices for another customer, change the customer you want to generate the payment for. See [Adding or Changing a Customer](#). Note that you can generate a payment only for a single customer. To generate a payment for multiple customers, go to Customers > Accounts Receivable > Accept Customer Payments. Ensure you have the Consolidated Payments feature enabled. For details, see the help topic [Consolidated Payments](#).

4. To view all open invoices for the customer, along with journal entries with the same general ledger impact, click **View Invoices**.

The View Invoices window displays the following:

- The imported bank line associated with the customer
- A grid of all the open invoices for the customer. These invoices may be linked to another imported bank line and may not have any unapplied amount left.

Note: The **Amount Due** value is the amount due on the invoice, without subtracting allocated amounts.

If the customer doesn't have any open invoices, the grid isn't populated.

Each invoice has a box next to it. A checked box means the invoice is included in the payment application for the customer.

By default, the grid of invoices loads and sorts according to the **Aging Reports Use** preference. You can sort the grid as needed.

To include or exclude open invoices from payment application for the customer, see [Including or Excluding Invoices from Payment Application](#).

Including or Excluding Invoices from Payment Application

On the Automated Cash Application page, include or exclude open invoices from payment application for a customer.

To view open invoices for a customer, see [Viewing Open Invoices for a Customer](#).

To include or exclude invoices from payment application:

1. Go to Transactions > Bank > Automated Cash Application.
2. From the **Account** list, select the bank or credit card account you want to review.

NetSuite displays a list of imported bank lines that don't have matching payments. If NetSuite found invoice matches, the invoice numbers appear in the Invoice Matches column.

3. For the bank line you want to review, click the plus icon.

The expanded details for the bank line appear.

If the bank line specifies invoices, the system displays the invoices it applies the payment to, or provides a list of suggested invoices.

4. To view all open invoices for the customer, along with journal entries that have the same general ledger impact, click **View Invoices**.

The View Invoices window displays the following:

- The imported bank line associated with the customer
- A grid of all the open invoices for the customer. These invoices may be linked to another imported bank line and may not have any unapplied amount left.

Note: The **Amount Due** value is the original amount due on the invoice, without subtracting allocated amounts.

If the customer doesn't have any open invoices, the grid isn't populated.

Each invoice has a box next to it. A checked box means the invoice is included in the payment application for the customer.

By default, the grid of invoices loads and sorts according to the **Aging Reports Use** preference. You can sort the grid as needed.

5. To include or exclude invoices from payment application, check or clear the boxes next to each invoice.
6. Click **Save**.

The system automatically reloads the invoice cards for all bank lines assigned to the customer and allocates amounts to each invoice. Invoices included in the payment application appear. Any invoices excluded from payment application no longer appear.

Troubleshooting Missing Records from the Customer

There may be cases where NetSuite can't suggest any customer matches for imported bank lines, or can't display any customers in the Customer list. The following table lists the possible causes for this scenario and solutions for each one.

Cause	Solution
No customer records share the same currency and (if applicable) subsidiary as the selected account.	Modify an existing customer record accordingly. Alternatively, create a new customer record that shares the same currency and (if applicable) subsidiary as the selected account. For details on managing customer records, see the help topic Customers .
Customer records share the same currency and (if applicable) subsidiary as the selected account. However, these records are all inactive.	Activate the customer record or records. For instructions, see Activating Customer Records .

When you have a customer record that shares the same currency and (if applicable) subsidiary as your account, you can generate payments. For more information, see [Generating Customer Payments](#).

Activating Customer Records

If customer names don't appear on the Automated Cash Application page, it may be because the customer records NetSuite can apply payments to are inactive. To generate payments, you need to activate one or more of these customer records first.

 **Note:** The system applies generated payments to customer records that share the same currency and (if applicable) subsidiary as the account you select on the Automated Cash Application page.

To activate a customer record:

1. Go to Lists > Relationships > Customers (Administrator), and then check the **Show Inactives** box. NetSuite displays all inactive customer records.
2. Click **Edit** next to the customer record you want to activate.
The customer record opens.

 **Tip:** Look for records that share the same currency and (if applicable) subsidiary as your account. You can check the **Primary Currency** field in the **Financial** subtab. The subsidiary of the customer, if applicable, is populated in the following places:

- **Primary Subsidiary** field, in the Classification section.
- **Primary Subsidiary** column, on the Customers page.

3. Click the **System Information** subtab and clear the **Inactive** box.
4. Click **Save** to save your changes.

You can now generate payments for this customer. See [Generating Customer Payments](#).

Checking the Process Status for Generated Payments

After you generate a batch of payments, view the processing status on the Process Status page. Transactions are processed asynchronously, so you can keep working in NetSuite and check the processing status at intervals.

Go to Transactions > Bank > Automated Cash Application > Status.

To update the page, click **Refresh**.

The Process Status page displays the following information:

- Submission ID – The unique identifier for the batch processing job.
- Process Type – For payments, the process type is Auto Cash.
- Submission Status:
 - Not Started – The batch job has been submitted but hasn't started.
 - In Progress – Transactions in the batch are being processed. The Percent Complete column indicates progress.
 - Complete – All transactions in the batch are processed. If errors occurred, the Message column displays the number of errors.

- Percent Complete – The percentage of records processed.
- Message – Indicates the number of errors that occurred during the processing.
- Date Created – The date and time the bulk processing started.
- Created By – The user who submitted the bulk process job.

These columns are also filters, so you can narrow the list to display the batches you want to view.

You can also filter the list by creation date.

After the batch is complete, view the results on the Processed Records page. The Processed Records page includes the submission ID, line number, transaction, line status, result, and an error message if an error occurred. The generated transactions are now available on the Confirm Transaction Matches page.

Bank Data Matching and Reconciliation

Note: To use the Match Bank Data and Reconcile Account Statement pages, you must have the proper permissions assigned to your role. For details, see [Permissions for Banking Features](#). If you want to use the pages for an existing account, check the **Use Match Bank Data and Reconcile Account Statement Pages** box on the Edit Account page. NetSuite automatically checks this box for any new accounts. For details, see [Editing Accounts to Use the Match Bank Data and Reconcile Account Statement Pages](#).

When bank data is imported into NetSuite (see [Bank Data Import](#)), the Intelligent Transaction Matching feature runs reconciliation rules to automatically match imported lines to corresponding transactions. You can manually match exceptions and reconcile transactions, without requiring spreadsheets or third-party tools.

When bank data is imported into NetSuite or you manually run reconciliation rules, the Intelligent Transaction Matching feature matches imported bank data with account transactions.

If you have account statements but importing them is difficult or not possible, mark the corresponding account transactions as cleared in NetSuite without importing the matching bank lines.

On the Match Bank Data page, you can view side-by-side grids of imported bank lines and account transactions in NetSuite. You can do the following:

- Match account transactions.
- For transactions with no matching bank line, mark them as cleared pending submission.
- Exclude imported bank lines.
- Review matched and user-cleared account transactions.
- Submit transactions to clear them in the system.

Important: Before you manually match imported bank lines to corresponding account transactions, use the Automated Cash Application feature. This feature enables you to generate matching customer payments in NetSuite from imported bank lines, if applicable. These transactions are then automatically matched and cleared. For more information, see [Automated Cash Application](#).

After you finish manually matching transactions or marking transactions as cleared, submit them. Go to the Reconcile Account Statement page to review the submitted transactions, include or exclude transactions from the reconciliation, and then reconcile the statement.

Note: Customer payments that were generated, matched, and cleared using the Automated Cash Application feature appear on the Reconcile Account Statement page.

To reconcile custom transactions, go to Accounting Preferences and then check the **Show All Transaction Types In Reconciliation** box. See the help topic [General Accounting Preferences](#).

Information about bank data matching and reconciliation in this topic includes:

- [Intelligent Transaction Matching for Bank Data](#)
- [Reconciling Bank and Credit Card Statements](#)
- [Account Reconciliation Reports](#)
- [Bank Data Matching Improvements \(20.1\)](#)

 **Note:** This video displays the NetSuite 2020.1 user interface.

Intelligent Transaction Matching for Bank Data

When bank data is imported into NetSuite or you manually run reconciliation rules, the Intelligent Transaction Matching feature automatically matches imported bank data with account transactions. For details on importing bank data, see [Bank Data Import](#). For information about running rules against imported data, see [Manually Running Reconciliation Rules](#).

Intelligent Transaction Matching **uses two types of rules on new bank lines** (except for in-transit payments):

 **Note:** Intelligent Transaction Matching does not run rules against account transactions. Any account transactions that are currently matched can't be matched again, regardless of their reconciliation state.

- **System Rules** – Default matching rules you can't change or remove. They automatically match imported bank lines to your account transactions. Default rules are listed in the System Rules list on the Reconciliation Rules page. For more information, see [System Reconciliation Rules](#).
- **User Rules** – Custom rules you can create and edit, and choose their order. They're listed in the User Rules list on the Reconciliation Rules page, and include:
 - **Matching rules** – Rules that automatically match imported bank lines with account transactions if they meet the criteria you set. Matching rules are created and edited on the Reconciliation Rules page, and you can apply them to more than one account. For more information, see [Creating User Transaction Matching Rules](#).
 - **Auto-create rules** – Rules that automatically create and match these types of transactions automatically:
 - Deposits and charges for general ledger bank accounts
 - Charges and refunds for general ledger credit card accounts

If a bank line matches the criteria in the rule, NetSuite creates an account transaction and matches it automatically. You can edit auto-create rules on the Reconciliation Rules page, but you make them from the Match Bank Data page, during a one-to-one match. You can only use each auto-create rule for one account. For details, see [Generating Auto-Create Rules](#).

To see how NetSuite groups transactions with these rules, see [Grouping Multiple Transactions](#).

To view automatically matched transactions, go to Transactions > Bank > Match Bank Data and then click **Review**.

 **Note:** If a rule finds two or more possible matches, NetSuite can't choose one, so you need to pick and match the correct transaction yourself.

For example, say you import a \$70 bank deposit dated 03/22/2023. NetSuite finds two possibilities: a \$70 deposit from 02/14/2023 and another from 01/16/2023. Because both are the right amount and at or before the imported deposit's date, the system can't decide. You need to choose and match the right transaction yourself.

On the **Review** subtab, each line item is a group of matched transactions. By default, all line items are collapsed. To view the individual transactions in the group, expand the line item.

In-Transit Payment Matching

In-transit payments are non-posting and aren't eligible for matching using system or user rules. Instead, Intelligent Transaction Matching matches in-transit payments using a built-in rule that isn't visible to you. This rule requires the transaction number and amount of the in-transit payment to match those of the imported bank line. In addition, the imported bank line must be a Payment type.

For more information about in-transit payments, see the help topic [In-Transit Payments](#).

To enable the In-Transit Payments feature, see the help topic [Enabling the In-Transit Payments Feature](#).

System Reconciliation Rules

Intelligent Transaction Matching runs built-in matching rules to match imported data with existing account transactions in NetSuite. You can find these rules on the Reconciliation Rules page, although you can't edit or remove them. NetSuite prioritizes system rules in the following order:

- [Match on Transaction Number and Amount](#)
- [Match on Amount and Transaction Number without Prefixes and Leading Zeros](#)
- [Match on Amount when Date is within 90 Previous Days](#)

Note: If a rule finds two or more possible matches, NetSuite can't choose one, so you need to pick and match the correct transaction yourself.

For example, say you import a \$70 bank deposit dated 03/22/2023. NetSuite finds two possibilities: a \$70 deposit from 02/14/2023 and another from 01/16/2023. Because both are the right amount and at or before the imported deposit's date, the system can't decide. You need to choose and match the right transaction yourself.

For system rules to automatically match transactions based on the transaction number, they must match the Transaction ID from the imported bank line with the NetSuite Check Number. The NetSuite Check Number corresponds to the:

- Check # on Bill Payments, Checks, Customer Payments, and Cash Sales.
- Deposit # on Deposits.
- Transfer # on Transfers.
- Entry No. on Journal Entries.
- Reference # on Credit Card Charges and Credit Card Refunds.

For details, see [Transaction Types in Matching Rules](#).

Match on Transaction Number and Amount

Using this rule, Intelligent Transaction Matching attempts to find transaction matches on the imported transaction ID and (general ledger) account transaction check number. Intelligent Transaction Matching also attempts to find matches for groups of transactions with the same transaction number.

The date of the account transaction must also be the same as or before the date of the imported bank line.

Intelligent Transaction Matching matches transactions when the transaction number and amount are exact, and the account transaction date is on or before the imported transaction date.

For many-to-one or many-to-many matches, Intelligent Transaction Matching matches transactions when the sum of imported bank line amounts equals the sum of account transaction amounts. For details on these match types, see [Many-to-One Transaction Matches](#) and [Many-to-Many Transaction Matches](#).

If these criteria aren't met, Intelligent Transaction Matching runs the next active system (default) rule.

Match on Amount and Transaction Number without Prefixes and Leading Zeros

Using this rule, Intelligent Transaction Matching attempts to find transaction matches on the numeric value of the transaction number. Intelligent Transaction Matching also attempts to find matches for groups of transactions with the same numeric value.

The date of the account transaction in NetSuite must also be the same as or before the imported transaction date.

Intelligent Transaction Matching successfully matches the transactions if:

- Transaction numbers differ only by an alphabetical prefix (for example, N123 and 123), with an exact amount match and the account transaction date on or before the imported date.
- Transaction numbers differ only by leading spaces (for example, '123' and ' 123'), with an exact amount match and the account transaction date on or before the imported date.
- The transaction number differs only by leading zeros (for example, 000123 and 123), with an exact amount match and the account transaction date on or before the imported date.

If these criteria aren't met, Intelligent Transaction Matching runs the next active system (default) rule.

Match on Amount when Date is within 90 Previous Days

Using this rule, Intelligent Transaction Matching attempts to find transaction matches if:

- The account transaction date is the same as or up to 90 days before the imported transaction date.
- The imported amount is equal to the amount of the account transaction in NetSuite.

Intelligent Transaction Matching successfully matches the transactions if:

- The amount and transaction date are both exact matches.
- The amount is an exact match, and the date of the account transaction in NetSuite is up to 90 days before the imported transaction date.

Because this rule doesn't check the transaction number, NetSuite doesn't group transactions by it. For details, see [Grouping Multiple Transactions](#).

If these criteria aren't met, Intelligent Transaction Matching tries the first active custom rule, if there is one. For details, see [Creating User Transaction Matching Rules](#).

Creating User Transaction Matching Rules

You can add custom matching rules to match imported bank lines with account transactions in NetSuite. You can also choose the order NetSuite uses to run the rules.

The next time NetSuite imports bank data, or you run reconciliation rules manually, Intelligent Transaction Matching uses your new rules. Be sure to select one or more accounts for the custom rule to run on. NetSuite only uses the rule for imported bank lines from those selected accounts.

 **Note:** If a rule finds two or more possible matches, NetSuite can't choose one, so you need to pick and match the correct transaction yourself.

For example, say you import a \$70 bank deposit dated 03/22/2023. NetSuite finds two possibilities: a \$70 deposit from 02/14/2023 and another from 01/16/2023. Because both are the right amount and at or before the imported deposit's date, the system can't decide. You need to choose and match the right transaction yourself.

ERP: Creating Custom Transaction Matching Rules

For an example of a custom matching rule, see [User Matching Rule Example](#).

For information about transaction types and matching types, see [Transaction Types in Matching Rules](#) and [Bank Transaction Matching Types](#).

 **Note:** To make rules that run on the transaction number, match the Transaction ID from the imported bank line with the NetSuite Check Number. The NetSuite Check Number in the User Matching Rule window corresponds to the:

- Check # on Bill Payments, Checks, Customer Payments, and Cash Sales.
- Deposit # on Deposits.
- Transfer # on Transfers.
- Entry No. on Journal Entries.
- Reference # on Credit Card Charges and Credit Card Refunds.

For details, see [Transaction Types in Matching Rules](#).

To create a new matching rule:

1. Go to Transactions > Bank > Reconciliation Rules.
2. On the Reconciliation Rules page, under the User Rules heading, click **New Rule**.
The Matching Rule window appears. The Accounts subtab is open by default.
3. In the **Rule Name** field, type a name for your new matching rule. This is a required field.
4. Filter the accounts in the list:
 - To switch from a list of all accounts to only the included accounts, click **Show Included Only**.
 - To filter by type, from the **Account Type** list, select an account type.
 - To search for an account, in the **Search** field, enter an account type, account name, description, or currency to search for.

 **Note:** The permissions on your user role determine which accounts you can view or edit. If you don't have permission for an account, it doesn't appear in the list. For details, see [Permissions for Banking Features](#).

5. To include an account for your custom rule, check the box for the account.

 **Tip:** To include all accounts, check the box in the column header.

You must include at least one account.

NetSuite only runs the custom rule against transactions for the selected accounts.

6. To specify the rule conditions, open the **Conditions** subtab.
7. From the **Transaction Type** list, select the first transaction type for this rule condition.

The list contains imported bank lines and account transactions in NetSuite. Your selection determines which options are available in the Primary Field and the other Transaction Type list. For example, if you choose an imported type, the other Transaction Type list displays only NetSuite types. The first selected Transaction Type for the first condition line restricts the available options for the subsequent condition rows. For information about choosing the appropriate transactions types, see [Transaction Types in Matching Rules](#).

8. From the **Primary Field** list, select the first field on which the system runs this matching rule condition.

The options available in the list depend on the selected Transaction Type.

 **Note:** If you select the Memo option, the system matches on the Memo field in the Journal Entry or Check header. The rule doesn't use memo values from transaction lines, and you can't group transactions by memo.

9. From the **Operator** list, select an operator for the matching rule.

The selected Transaction Type and Primary Field determine which options are available in the list. Operators include:

- **Equals** – Specifies that the selected fields must be equal. For example, the NetSuite date must equal the imported date.
- **Equals (Ignore Prefix)** – Specifies that the selected fields must be equal, but ignores any alphabetic prefix or leading zeros on each transaction. For example, the Transaction ID 2134 still matches N2134.
- **Before** – Specifies that the selected transaction type date can be before the other selected transaction type date. For example, the NetSuite date can be before the imported date.
- **After** – Specifies that the selected transaction type date can be after the other selected transaction type date. For example, the NetSuite date can be after the imported date.
- **Within x Previous Days of** – Specifies the number of days by which a date match can vary. A matching date can be the same as or up to the specified number of days before the other date.

10. If you need to enter a value input (and the selected operator is Equals, Equals (Ignore Prefix), or Within x Previous Days of), in the **Value** field, enter the appropriate alphanumeric value.
11. From the second **Transaction Type** list, select the second transaction type for this rule condition, if it is not already selected by default.

The previously selected Transaction Type determines which options are available in the list. For example, if you chose an imported type first, this Transaction Type list displays only NetSuite types. For information about choosing the appropriate transactions types, see [Transaction Types in Matching Rules](#).

12. From the **Compare Field** list, select the other field the system runs this matching rule condition on, if it's not already selected by default.

Make sure the compare field is the same data type as the primary field.

Note: If you select the Memo option, the system matches on the Memo field in the Journal Entry or Check header. The rule doesn't use memo values from transaction lines, and you can't group transactions by memo.

13. To add an extra condition, click the add icon.

Note: To remove a condition, click the delete icon.

14. To save and create your new custom rule, click **Save**.
The new rule appears under the User Rules heading.
15. To assign the order in which NetSuite runs the rules, use the icon to drag the rules into the desired order.

The next time bank data is imported, Intelligent Transaction Matching will use your new custom rules.

Transaction Types in Matching Rules

When creating custom matching rules or matching transactions manually, remember if the transaction types are from imported bank data or a general ledger account in NetSuite.

Imported bank data uses the bank's perspective, but account transactions use yours. Debits on the bank statement appear as credits in your general ledger, and inversely.

For example, a customer payment deposit appears as a credit on the bank statement, but as a debit in your general ledger account.

Some transaction types can't be used as matching rule sub-types. To run a rule for these types, pick **All Imported** and **All NetSuite** in the Transaction Type lists:

- Cash Sale
- Customer Refund (not supported for the Check Number field)
- Customer Credit (not supported for the Check Number field)
- Cash Refund (not supported for the Check Number field)

Note: To make rules that run on the transaction number, match the Transaction ID from the imported bank line with the NetSuite Check Number. The NetSuite Check Number in the Custom Matching Rule window corresponds to the:

- Check # on Bill Payments, Checks, Customer Payments, and Cash Sales.
- Deposit # on Deposits.
- Transfer # on Transfers.
- Entry No. on Journal Entries.
- Reference # on Credit Card Charges and Credit Card Refunds.

The following table demonstrates how you can map transaction types.

Imported Bank Data Types	General Ledger Account Transaction Types
ACH	Bill Payments
	Checks
	Customer Payments
	Deposits
	Journal Entries
	Transfers
Checks	Bill Payments
	Checks
	Customer Payments
	Deposits

	Credit Card Charges
	Deposits
	Journal Entries
Others	Bill Payments
	Customer Payments
	Journal Entries
	Transfers
	Checks
	Deposits
	Credit Card Charges
	Credit Card Refunds
Payments	Bill Payments
	Checks
	Credit Card Refunds
	Deposits
	Journal Entries
	Transfers
Transfers	Bill Payments
	Checks
	Credit Card Refunds
	Journal Entries
	Transfers

User Matching Rule Example

After watching the system automatically match transactions and matching the rest yourself, you may spot some patterns and want to create custom matching rules.

This section provides an example of a custom matching rule.

In this scenario, you want a rule that matches a transaction ID with an ID in the Journal Entry memo and a date within two previous days. You want this rule to run on all accounts.

Match on Memo when Date is within Two Days

1. In the **Custom Rule Name** field, type **Match on Memo and Date within Two Previous Days**.

2. To include all accounts, check the box in the column header.
3. To specify the rule conditions, click **Rule Conditions**.
4. From the **Transaction Type** list, select **All Imported**.
The system will select **All NetSuite** in the second **Transaction Type** list by default.
5. From the **Primary Field** list, select **Transaction ID**.
6. From the **Operator** list, select **Equals (Ignore Prefix)**.
7. From the **Compare Field** list, select **Memo**.
8. To add the next condition, click the add icon.
9. From the **Transaction Type** list, select **All Imported**.
The system will select **All NetSuite** in the second **Transaction Type** list by default.
10. From the **Primary Field** list, select **Date**.
11. From the **Operator** list, select **Within x Previous Days of**.
12. In the **Value** field, enter **2**.
NetSuite automatically selects the correct **Transaction Type** and **Compare Field**.
13. Click **Save**.

The following screenshot displays a user matching rule that uses the **Memo** and **Date** fields to produce a transaction match.

Matching Rule

Save **Cancel**

RULE NAME *

Match on Memo and Date within Two Previous Days

Accounts **Conditions**

All rules include the condition to match on equal amount or amount sum by default.

All Imported	Transaction ID	Equals (Ignore Pre...		All NetSuite	Memo	=
All Imported	Date	Within x Previous ...	2	All NetSuite	Date	= +

Rules for Automatically Creating Transactions

You can use auto-create rules to automatically create and match account transactions with imported bank lines.

Tip: If you have imported bank lines for payments that aren't in NetSuite, use the Automated Cash Application feature to generate and apply those payments to open invoices. They'll also be matched, cleared, and ready for reconciliation. See [Automated Cash Application](#).

Note: Transactions that are automatically created and matched by auto-create rules do not impact your general ledger account until you submit them on the Match Bank Data page.

If you import bank lines with a recurring Payor/Payee or Memo, auto-create rules look for bank lines with the right transaction type and Payor/Payee. If the bank line doesn't have a Payor/Payee, the rule checks for the specified Memo.

NetSuite generates auto-create rules from one-to-one matches on the Match Bank Data page, but you can edit them on the Reconciliation Rules page. For more information, see [Generating Auto-Create Rules](#).

Information about auto-create rules in this section includes:

- [Editing Auto-Create Rules](#)

- [Autocreating Transactions for Reconciliation \(20.2\)](#)

Editing Auto-Create Rules

Auto-create rules contain conditions and actions that you can edit.

Conditions are the criteria the rule looks for in future imports. Auto-create rules check the Payor/Payee first, and then the Memo. You can add more conditions if needed. For details, see [Editing Rule Conditions of Auto-Create Rules](#).

Actions are the actions the rule takes if the conditions are met. The rule uses a memorized transaction record as a template to create future account transactions. You can override these values by changing the rule's actions.

For details, see [Editing Action Data of Auto-Create Rules](#).

For information about memorized transactions, see the help topic [Memorized Transactions](#).

Editing Rule Conditions of Auto-Create Rules

Auto-create rules use the bank line that triggered the rule as a template for conditions. If imported data meets those conditions, NetSuite can automatically create and match account transactions. Auto-create rules are different from matching rules, which only match existing transactions.

You can modify or add rule conditions as needed. If you add more than one, the Transaction Type has to be the same.

To edit conditions of auto-create rules:

1. Generate an auto-create rule. See [Generating Auto-Create Rules](#).
2. Go to Transactions > Bank > Reconciliation Matching Rules.
3. On the Reconciliation Rules page, click the auto-create rule you want to edit.
The Auto-Create GL Transaction Rule window appears. The **Accounts** subtab is open by default, which cannot be changed.
4. Open the **Conditions** subtab.
The subtab is populated with conditions from the account transaction that was used to generate the auto-create rule.
5. From the **Transaction Type** field, select a transaction type.
Supported transaction types include:
 - All Imported
 - Imported ACH
 - Imported Checks
 - Imported Credits
 - Imported Debits
 - Imported Deposits
 - Imported Fees
 - Imported Interest

- Imported Others
- Imported Payments
- Imported Transfers

6. From the **Primary Field** list, select the first field on which the system runs this auto-create rule condition.

The options available in the list include the following:

- Amount
- Date
- Memo
- Payor/Payee Name
- Transaction ID

7. From the **Operator** list, select an operator for the rule.

The selected Transaction Type and Primary Field determine which options are available in the list. Operators include:

- **Equals** – Specifies that the selected field must be equal to a certain value. For example, the Payor/Payee field must equal the value ESSO.
- **Equals (Ignore Prefix)** – Specifies that the selected field must be equal to a certain value, but ignores any alphabetic prefix or leading zeros. For example, the Transaction ID 2134 still matches N2134.
- **Before** – Specifies that the selected transaction type date can be before a certain date.
- **After** – Specifies that the selected transaction type can be after a certain date.
- **Less Than** – Specifies that the selected transaction type amount must be less than a certain value.
- **Greater Than** – Specifies that the selected transaction type amount must be greater than a certain value.
- **Contains** – Specifies a value contained in the imported transaction type, payor or payee name, or memo included in the rule. If future imports contain this value, the rule creates account transactions from them.

8. If you need to enter a value input, in the **Value** field, enter the appropriate value.

You can enter a value input for the following operators:

- Equals
- Equals (Ignore Prefix)
- Less Than
- Greater Than
- Contains

9. To add another condition, click the add icon.

The add icon is only active if all fields for the condition are populated.

Note: To remove a condition, click the delete icon.

10. To save the auto-create rule, click **Save**.

The new rule appears under the User Rules heading.

11. To assign the order in which NetSuite runs the rules, use the icon to drag the rules into the desired order.

The next time bank data is imported, Intelligent Transaction Matching includes your new rule. To run a rule, see [Running an Auto-Create Rule](#).

Editing Action Data of Auto-Create Rules

An auto-create rule includes actions that tell NetSuite how to generate transactions when its conditions are met.

By default, action data comes from a memorized transaction record—a template NetSuite creates from a matched account transaction. The auto-create rule uses it to generate future transactions.

You can override the values in the memorized transaction record by modifying the rule's actions.

 **Note:** The memorized transaction record doesn't impact the general ledger account.

To edit actions of auto-create rules:

1. Generate an auto-create rule. See [Generating Auto-Create Rules](#).
 2. Go to Transactions > Bank > Reconciliation Rules.
 3. On the Reconciliation Rules page, click the auto-create rule you want to edit.
The Auto-Create GL Transaction Rule window appears. The **Accounts** subtab is open by default, which cannot be changed.
 4. Open the **Actions** subtab.
The subtab is populated with action data and contains two parts:
 - A row of fields that mirror the line-level information in the associated memorized transaction record. This includes the general ledger account that automatically generated transactions go into, and the payor/payee, class, department, and location the rule looks for in future imports.
 - A grid that specifies how NetSuite obtains the date and memo values for automatically generated account transactions.

Other fields, like the amount and currency, are copied from the memorized record. The Transaction ID's generated automatically.
 5. (Optional) To change the general ledger account, from the **GL Account** field, select a different account.
 6. (Optional) To change the payor or payee, from the **Payor/Payee** field, select a different name.
-  **Note:** To limit scrolling, start typing in the **Payor/Payee** field to narrow the results.
7. Set the **Class**, **Department**, and **Location** fields.
These fields may be required, depending on your company settings. See the help topic [Using Per-Line Classifications](#).
 8. To edit the action for the **Date** transaction field, from the **Action** field in the first row, select an action. There are two actions:
 - **Copy from imported bank line** – The Date field in the created transactions is copied from the imported bank line. This action is the default.
 - **Autogenerate** – NetSuite sets the date in the automatically-created transaction to the creation date.

 **Note:** The Date action cannot be removed, and there is no option to add another Date action.
 9. To edit the action for the **Memo** transaction field, from the **Action** field in the second row, select an action. There are two actions:

 **Note:** The Memo field in Actions is the top-level memo. To change line-level memos, use the memorized transaction record. For details on memorized transactions, see the help topic [Memorized Transactions](#).

- **Copy from imported bank line** – The Memo field in the created transactions is copied from the imported bank line. When selected, you can copy imported fields into the memo, which appear in the **Value** list:
 - Bank: Amount
 - Bank: Date
 - Bank: Memo
 - Bank: Tran No.
 - Bank: Payer/Payee Name

This action is the default.

- **Insert text** – The Memo field in the created transactions contains a value you specify. In the **Value** field, enter text for the memo.

 **Warning:** You can only have one Memo action per rule. If you try to add additional memo actions, you'll get an error when you save.

10. To view or modify the memorized transaction record associated with the rule, click the link underneath the actions grid. Use the memorized transaction record to change fields or add custom fields.
11. To save the auto-create rule, click **Save**.
The new rule appears under the User Rules heading.
12. To assign the order in which NetSuite runs the rules, use the icon to drag the rules into the desired order.

The next time bank data is imported into NetSuite, Intelligent Transaction Matching includes your new rule. To run a rule, see [Running an Auto-Create Rule](#).

Manually Running Reconciliation Rules

You can manually run reconciliation rules from the Match Bank Data page. For permission details, see [Permissions for Banking Features](#).

 **Important:** NetSuite doesn't run the Automated Cash Application feature when you manually run reconciliation rules from the Match Bank Data page.

To manually run reconciliation rules:

1. Go to Transactions > Bank > Match Bank Data.
2. From the **Account** list, select the appropriate account.

 **Note:** If NetSuite is currently running reconciliation rules against the selected account, a warning notification appears. Do not run additional reconciliation rules against the selected account until the previous rule running request is complete. After the request is complete, refresh the page. You can track your import status on the Process Status page at Setup > Company > Bulk Processing Status List.

3. Click **Run Reconciliation Rules**.

A confirmation window appears.

Note: If NetSuite is already running reconciliation rules against the selected account, a warning notification appears. Refresh the page when the request is complete and rerun the rules if needed.

4. Specify the date range you want the system to run rules against. This date range is based on when transactions were imported, not the transaction date. By default, the date range is set to the previous 30 days. Make sure the end date isn't later than today.

Tip: If you run reconciliation rules across a large date range (such as several years of unprocessed transactions), processing time may increase. For best results, consider running reconciliation rules in smaller batches.

5. If you're sure, click **Run Reconciliation Rules** to initiate the reconciliation rule running process. After the process begins, you cannot cancel. If you need to stop a process in progress, contact NetSuite Support.

A notification appears to indicate the process has started. The message includes a **Track your status** link, which you can click to view the processing status. All active system and user reconciliation rules run against transactions that have been imported during the date range you specified. Also, the built-in rule for matching in-transit payments is run.

To see your results, refresh the page and reload your account.

Note: If a rule finds two or more possible matches, NetSuite can't choose one, so you need to pick and match the correct transaction yourself.

For example, say you import a \$70 bank deposit dated 03/22/2023. NetSuite finds two possibilities: a \$70 deposit from 02/14/2023 and another from 01/16/2023. Because both are the right amount and at or before the imported deposit's date, the system can't decide. You need to choose and match the right transaction yourself.

For troubleshooting information, see [Troubleshooting Manual Reconciliation Rule Running Issues](#).

To view and submit matched transactions for reconciliation, see [Submitting Matched or User-Cleared Transactions](#).

Troubleshooting Manual Reconciliation Rule Running Issues

You can only run reconciliation rules on the Match Bank Data page for an account if the following are true:

- **No other reconciliation rules are currently running on that account.**

Note: If a rule-running request is in progress, you'll see a warning notification if you try to select that account or run rules against it. Wait for the process to complete, and then refresh the page before trying again. You can track your status on the Process Status page at Setup > Company > Bulk Processing Status List (the warning includes a link).

- **The selected date range is valid.** The first date must be before the second date, and the end date cannot be later than today.

- **There are unmatched imported transactions whose import date falls within the selected date range.**

Below you'll find common error and warning messages, with recommended actions:

Error or Warning Scenario	Message Text	Recommended Actions
You select an account that NetSuite is currently running reconciliation rules against.	Reconciliation rules running We're processing your transactions for the selected account, so please avoid running additional rules until we're done. After processing is complete, refresh the page.	Wait for the current process to finish before running additional rules. Refresh the page after completion.
You try to run reconciliation rules for an account that NetSuite is already running reconciliation rules against.	Previous request still processing A previous reconciliation rule request is in progress. Refresh the page when complete. Rerun the rules if needed.	Wait for the current process to finish. Refresh the page after completion, and then rerun the rules if needed.
You specify an invalid date range in the confirmation window.	Invalid date range We couldn't run any reconciliation rules because the selected date range isn't valid. Make sure the first date comes before the second date.	Click Run Reconciliation Rules again. In the Run Reconciliation Rules confirmation window, select a valid date range where the start date comes before the end date and the end date isn't later than today.
You specify a date range with no imported transactions in the confirmation window.	No transactions found We couldn't find any imported transactions for the configured date range. Try setting a different date range.	Click Run Reconciliation Rules again. In the Run Reconciliation Rules confirmation window, select a date range that includes imported transactions.
An unexpected system error occurs.	Unexpected error We couldn't run any reconciliation rules because something went wrong. Please try again, and contact NetSuite Support if the issue continues.	Try running reconciliation rules again. If the issue continues, contact NetSuite Support for help.

Additional Tips and Important Information

- **Only one reconciliation rules process can be in progress for any given account at a time.**

 **Note:** You can, however, run reconciliation rules for different accounts simultaneously.

- **The default date range for running reconciliation rules is the previous 30 days.**
- **The end date in your selected range cannot go beyond today's date.**
- **If you select a large date range (such as several years), processing time may increase.** For most people, typical processing times shouldn't change.

 **Tip:** If you have a high volume of unprocessed transactions, consider running reconciliation rules in multiple, smaller date ranges for better performance.

- **After starting, you cannot cancel a reconciliation rules process.**

 **Tip:** If you need to stop a process in progress, contact NetSuite Support.

- Each import now appears as a separate line on the Processed Records page for easier status tracking.

For step-by-step instructions to run reconciliation rules, see [Manually Running Reconciliation Rules](#).

Viewing Reconciliation Rules

NetSuite uses system rules to automatically match imported bank lines with account transactions. These default rules run on all transactions. You can find them in the System Rules list on the Reconciliation Rules page. For descriptions of the rules, see [Intelligent Transaction Matching for Bank Data](#).

In the User Rules list, you can add and edit your own custom matching rules, as well as edit auto-create rules. You can assign the order in which NetSuite runs user matching and auto-create rules.

Note: NetSuite has a built-in rule for matching imported bank lines with in-transit payments, but it isn't visible to you. This rule is applied if the following criteria are met:

- The transaction numbers exactly match.
- The dollar amounts exactly match.
- The imported bank line is a Payment type.

To view reconciliation rules:

1. Go to Transactions > Bank > Reconciliation Matching Rules.
The Reconciliation Rules page has two sections: System Rules and User Rules. You cannot reorder system rules, but you can inactivate them.
2. To create user matching rules, see [Creating User Transaction Matching Rules](#). To generate auto-create rules, see [Generating Auto-Create Rules](#).
3. To assign the order in which NetSuite runs the user matching and auto-create rules, use the icon to drag the rules into the desired order.
4. To edit custom matching and auto-create rules, see [Creating User Transaction Matching Rules](#) and [Editing Auto-Create Rules](#).
5. To delete a user rule, click the **Delete** icon.

Inactivating Reconciliation Rules

Instead of deleting transaction reconciliation rules, you can temporarily make them inactive.

You cannot delete system rules, but you can inactivate them.

To inactivate reconciliation rules:

1. Go to Transactions > Bank > Reconciliation Rules.
2. Under the **Active** column, in the row for the matching or auto-create rule you want to inactivate, clear the box.
NetSuite stops running the rule for subsequent imports, but the rule is still in the list.
3. To activate the rule again, check the box.

Bank Transaction Matching Types

The Intelligent Transaction Matching feature uses matching rules to automatically create matches through the system (default) or user matching rules. For any remaining unmatched transactions, you can manually create matches.

Note: If a rule finds two or more possible matches, NetSuite can't choose one, so you need to pick and match the correct transaction yourself.

For example, say you import a \$70 bank deposit dated 03/22/2023. NetSuite finds two possibilities: a \$70 deposit from 02/14/2023 and another from 01/16/2023. Because both are the right amount and at or before the imported deposit's date, the system can't decide. You need to choose and match the right transaction yourself.

NetSuite supports the following types of matches:

- [One-to-One Transaction Matches](#)
- [Many-to-One Transaction Matches](#)
- [One-to-Many Transaction Matches](#)
- [Many-to-Many Transaction Matches](#)

To enable NetSuite to automatically create account transactions from incoming transactions and match them, see [Generating Auto-Create Rules](#).

One-to-One Transaction Matches

The Intelligent Transaction Matching feature automatically creates matches through the system or custom matching rules. For any remaining unmatched transactions, you can manually create matches.

There are two types of one-to-one matching.

Unique Reference

For most matches, the transaction ID in the set of imported bank lines clearly matches the check number in the set of account transactions.

Note: The check number corresponds to the following:

- Check # on Bill Payments, Checks, and Customer Payments.
- Deposit # on Deposits.
- Transfer # on Transfers.
- Entry No. on Journal Entries.
- Reference # on Credit Card Charges and Credit Card Refunds.

Unique Reference by Combination

For some transactions, there isn't a single unique number. In that case, combine other details to match the imported bank line to the right account transaction.

These unique references may use a combination of fields—like date and memo.

Many-to-One Transaction Matches

The Intelligent Transaction Matching feature automatically creates matches through the system or custom matching rules. For any remaining unmatched transactions, you can manually create matches.

Sometimes, there's no unique reference between the two sets of transactions. The same reference may appear in several imported transactions. For example, a financial clerk may combine several bank transfers into a single journal entry in NetSuite.

The [Match on Transaction Number and Amount](#) rule groups imported bank lines by transaction number and matches them to a single NetSuite account transaction with the same number.

For details on how NetSuite groups transactions, see [Grouping Multiple Transactions](#).

One-to-Many Transaction Matches

The Intelligent Transaction Matching feature automatically creates matches through the system or custom matching rules. For any remaining unmatched transactions, you can manually create matches.

Sometimes, you can match one imported transaction with multiple transactions in the NetSuite general ledger account.

There may be no clear reference to match, but you can still create a match.

For example, you may group two NetSuite transactions with several matching fields and compare their sum to a single amount in the imported statement. Make sure no other match is possible—even if the date is two business days before or after—since there's no unique reference between the two sides.

For details on how NetSuite groups transactions, see [Grouping Multiple Transactions](#).

Many-to-Many Transaction Matches

The Intelligent Transaction Matching feature automatically creates matches through the system or custom matching rules. For any remaining unmatched transactions, you can manually create matches.

The most complex matching matches multiple imported transactions with multiple transactions in the NetSuite general ledger account.

In these situations, different key elements (including transaction numbers) in both sets can provide a unique reference for your match.

For example, the [Match on Transaction Number and Amount](#) rule groups imported bank lines by transaction number and matches them to a single NetSuite account transaction with the same number.

For matching and grouping, you may also use codes for cost centers, projects, or other items in the memo.

For details on how NetSuite groups transactions, see [Grouping Multiple Transactions](#).

Grouping Multiple Transactions

The Intelligent Transaction Matching feature automatically creates match groups through the system or custom matching rules. For any remaining unmatched transactions, you can manually create match groups.

NetSuite first groups imported bank lines and account transactions, and then matches the two groups.

NetSuite only groups multiple transactions if the transaction numbers match (imported ID and check number). Intelligent Transaction Matching doesn't group them if:

- The transaction number is missing.
- The relevant value is in the memo field.

Reconciling Bank and Credit Card Statements

Note: This section pertains to the redesigned reconciliation feature. The original reconciliation feature isn't supported as of NetSuite 2021.1. If you're still using it and don't want to switch yet, see [Bank Account Reconciliation and Reporting](#). To use the redesigned reconciliation feature, see [Editing Accounts to Use the Match Bank Data and Reconcile Account Statement Pages](#).

To reconcile your bank or credit card statement, from beginning to end:

- If necessary, import your bank or credit card data. See [Bank Data Import](#).

Note: As of NetSuite 2021.1, because you can mark transactions without matching bank lines as cleared, this import step is no longer required.

- Use the Automated Cash Application feature to generate customer payments from imported bank lines (if applicable). The feature automatically matches and clears these payments. See [Generating Customer Payments](#).
- Manually match any remaining imported bank lines, or clear account transactions that don't have matching imported bank lines. See [Matching Bank Data](#).
- Submit the transaction matches. See [Submitting Matched or User-Cleared Transactions](#).
- Reconcile the transactions. See [Reconciling Transactions](#).

Editing Accounts to Use the Match Bank Data and Reconcile Account Statement Pages

The Reconcile Bank Statement and Reconcile Credit Card Statement pages still work but aren't supported. If you're still using them, edit your accounts to use the Match Bank Data and Reconcile Account Statement pages. When you migrate a held statement, NetSuite clears and moves all held transactions to the Reconcile Account Statement page.

Note: A held statement is one you started reconciling but chose to finish later.

To edit accounts to use the Match Bank Data and Reconcile Account Statement pages:

1. Go to Lists > Accounting > Accounts.
2. Click the **Edit** link to the left of the account you want to modify.
The Account page appears.
3. Check the **Use Match Bank Data and Reconcile Account Statement Pages** box.

Note: As of NetSuite 2021.1, the system checks this box for all new accounts.

If this account contains a held statement that you have begun to reconcile but have chosen to complete later, a confirmation message appears. NetSuite gives you two options:

- If you want NetSuite to delete all held statements, click **OK**.
NetSuite checks the box. After you save, NetSuite moves any cleared transactions to the **Review** and **Reconcile** subtabs on the Reconcile Account Statement page. These transactions are cleared and ready for reconciliation.
In the **Review** subtab, these transactions display a **Cleared** label. In the **Reconcile** subtab, check the box next to each transaction and reconcile the statement.

- To reconcile all held statements first, click **Cancel**.

The box stays cleared, and the account is only in the Account list of the old pages.

Warning: The Reconcile Bank Statement and Reconcile Credit Card Statement pages still work but are no longer supported.

If this account contains matched or user-cleared transactions pending submission on the Match Bank Data page, you cannot clear the box until you do one of the following:

- Submit all transactions for the account. See [Submitting Matched or User-Cleared Transactions](#).
- Undo the match or cleared status of each transaction for the account. See [Undoing the Cleared Status of Transactions](#).

4. If you modified your account record, click **Save**.

To match transactions on the Match Bank Data page, see [Matching Bank Data](#). To reconcile cleared transactions on the Reconcile Account Statement page, see [Reconciling Transactions](#).

If your account contains a held statement and you clicked **Cancel** in the confirmation window, reconcile your held statements (see [Reconciling Bank Statements](#)). Then, repeat the steps in the above procedure.

For information about editing accounts in general, see the help topic [Editing an Account](#).

Matching Bank Data

When you import bank data into NetSuite, the Intelligent Transaction Matching feature does the following, based on your reconciliation rules:

- Automatically matches the imported bank lines with the existing account transactions in NetSuite.
- Automatically creates and matches account transactions with imported bank lines.

For details, see [Intelligent Transaction Matching for Bank Data](#).

For any unmatched transactions, filter the grids and manually match them. If some account transactions don't have a matching imported bank line, you can mark them as cleared.

Note: Before matching your data, first use the Automated Cash Application feature to generate and match customer payments from imported bank lines. For more information, see [Automated Cash Application](#).

Important: NetSuite clears the matched or cleared status from a transaction—and any in its group—if you do any of the following:

- Edit the transaction amount.
- Void the transaction without a reversing journal entry. If you void the transaction with a reversing journal entry, the transaction remains matched or user-cleared.
- Delete the transaction.

To match and reconcile custom transactions, go to Accounting Preferences and then check the **Show All Transaction Types In Reconciliation** box. See the help topic [General Accounting Preferences](#).

To match imported bank lines with account transactions:

1. If you haven't already, import your bank data (see [Bank Data Import](#)).
2. Go to Transactions > Bank > Match Bank Data.
3. From the **Account** list, select the bank or credit card account for which you want to perform matching, if not already selected.

Note: As of NetSuite 2021.1, all newly-created accounts automatically appear in the **Account** list. If your account doesn't appear, see [Editing Accounts to Use the Match Bank Data and Reconcile Account Statement Pages](#).

The following fields are populated:

- **Subsidiary** (if applicable).
- **Bank Balance**, if your most recent account statement contains an account balance and statement date.
- **Balance As Of**, if the statement contains a statement date.

If NetSuite failed to import data for the account, a popup displays the most recent error. For more error details, go to Transactions > Bank > Banking Import History.

If NetSuite successfully imported data, the grids are filled with the imported bank lines and account transactions that still need manual matching.

Note: Any bank lines that were processed from the Automated Cash Application page no longer appear on the Match Bank Data page. The corresponding customer payments are automatically cleared in the system and ready for reconciliation.

4. In the Account Transactions grid, identify in-transit payments by looking for the  icon in the row. One or more in-transit payments must be matched with only one imported bank line. For more information about in-transit payments, see the help topic [In-Transit Payments](#). To enable the In-Transit Payments feature, see the help topic [Enabling the In-Transit Payments Feature](#).

Note: The system uses a built-in rule to automatically match an imported bank line with an in-transit payment if the following criteria are met:

- The transaction numbers exactly match.
- The dollar amounts exactly match.
- The imported bank line is a Payment type.

5. To filter the grids, see [Filtering Imported Bank Data and Account Transactions](#).
6. If you require more information about the account transactions, click the links in the Account Transactions grid. See [Viewing Details of Account Transactions](#).
7. On the **To Be Matched** subtab, match transaction items:

Note: Dimmed bank lines are still processing. You can't check the box next to them until they're done. To check, refresh the Imported Bank Data grid.

- a. Check the box for one or multiple transactions from the Imported Bank Data grid, and then select one or multiple transactions from the Account Transactions grid. To check or clear all the boxes for transactions visible on the current page of the Account Transactions grid, use the box in the grid header.

 **Note:** The Imported Bank Data grid header has a similar box. Only use it if you want to match all visible transactions as one group, or exclude all at the same time.

 **Tip:** To avoid slowdowns or timeouts with lots of transactions, make smaller match groups instead of matching everything at the same time.

For details about the type of matches you can perform, see [Bank Transaction Matching Types](#).

As you select transactions, NetSuite displays them in the bottom section and updates the **Difference** field.

If there are too many items in the bottom section, use the arrows to see more results. The **Number of Rows In List Segments** setting controls how many rows display (up to 500 per page).

 **Tip:** If you're missing an account transaction, you can quickly add and match it right from this page. See [Manual Creation of Account Transactions During the Matching Process](#).

- b. When the difference between the selected imported bank line items and account transactions is zero (in the **Difference** field), click **Match**.

If the **Make Auto-Create Rule from Selected Transactions** box is active, the system creates an auto-create rule. The next time reconciliation rules run, NetSuite creates and matches corresponding transactions automatically. See [Automatic Creation of Account Transactions](#).

NetSuite removes the matched transactions from the **To Be Matched** grid.

8. If some account transactions don't have a matching imported bank line, you can mark them as cleared. See [Marking Transactions as Cleared](#).
9. To exclude imported bank line items from the matching process, see [Excluding Imported Bank Lines From the Matching Process](#).
10. To complete matching later, you can go to another page.
NetSuite automatically saves the work for the account as you go.
11. When you finish matching transactions and marking transactions as cleared, submit them. See [Submitting Matched or User-Cleared Transactions](#).
12. (Optional) To view transactions pending submission, click the **Review** subtab. See [Viewing Transactions To Be Submitted](#).

Updating Imported Bank Data

On the Match Bank Data page, you can manually update your bank data for a financial institution account. Only do this if your NetSuite account doesn't have the latest data from your bank, or there was an import error. Otherwise, wait for the next scheduled import. For details on automatic importing, see [Automatic Bank Data Import](#).

Note: To do this procedure, automatic bank data import must be set up for your financial institution. For details, see [Creating Financial Institution Records](#).

Warning: If you're using an SFTP connection (like the Auto Bank Statement Import SuiteApp) to get data for multiple accounts, don't do this procedure. The system only gets data for the account you select. Data from other accounts won't be updated and may get lost.

To update imported bank data:

1. Go to Transactions > Bank > Match Bank Data.
2. From the **Account** list, select the bank or credit card account for which you want to update your data.

Note: As of NetSuite 2021.1, all newly-created accounts automatically appear in the **Account** list. If your account does not appear, see [Editing Accounts to Use the Match Bank Data and Reconcile Account Statement Pages](#).

The following fields are populated:

- **Subsidiary** (if applicable).
- **Bank Balance**, if your most recent account statement contains an account balance and statement date.
- **Balance As Of**, if the statement contains a statement date.

If NetSuite failed to import data for the account, a popup messages displays the latest error. For more error details, go to Transactions > Bank > Banking Import History. See [Banking Import History](#).

If NetSuite imported data successfully, the grids fill with the latest imported bank lines and account transactions.

3. At the top of the page, click **Update Imported Bank Data**.

If successful, NetSuite displays a message that an import's in process and gets the latest data from your account. To view the processing status of your import, click **Track your status**.

If unsuccessful, NetSuite updates your imported bank data at the next scheduled import. A manual update fails when:

- You have not selected an account.
- Your account data is up to date.
- Your account is not configured with a bank connection.
- You have imported bank data within the last 60 minutes.

Note: In previous releases, the threshold was 30 minutes

- There was an error during the data retrieval process.

4. To see the latest data, refresh the Imported Bank Data grid by clicking the Refresh icon.

If the import is done, the grid shows your latest data. Dimmed lines are still processing—you can't select them yet. To check if they're done, refresh the grid again. Processing takes longer with lots of imported lines.

The Intelligent Transaction Matching feature automatically matches newly imported data with existing account transactions in NetSuite. To match and reconcile your data, see [Reconciling Bank and Credit Card Statements](#).

Filtering Imported Bank Data and Account Transactions

On the Match Bank Data page, you can filter the Imported Bank Data and Account Transactions grids. You can filter by date range and transaction type, or you can use the Search field to locate specific text or number values. You can also filter content by sorting by columns.

To filter imported bank data and account transactions:

1. If you haven't already, do the following:
 - a. Go to Transactions > Bank > Match Bank Data.
 - b. From the **Account** list, select the bank or credit card account.

In the Imported Bank Data and Account Transactions grids, NetSuite displays the imported bank lines and account transactions that still need manual matching.
2. From the **To Be Matched** subtab, you can do the following:
 - To set the date range for transactions in the lists, enter or select the dates in the **From** and **To** fields at the top of the panes.
 - To filter by transaction type, from the **Select Type** list, select a transaction type.
 - To search, start typing in the Search field. As you type, NetSuite narrows down the results.

When entering a date, use a date format consistent with the displayed format in the page (as set in the User Preferences). For example, if you use a long date format (May 1, 2018), enter **May** to search for a date in May. When entering a year, use four digits (for example, 2018). If you use a short date format, always use two digits for the month or day (for example, 05/01/2018).

 - To sort by column, click the column header.
 - To reorder a column, drag it to a new location
 - If there are too many items in the grids, use the arrows to see more results.
 - If there are too many items in the bottom section, use the arrows to see more. The **Number of Rows In List Segments** setting controls how many rows per page (up to 500 max).

Viewing Details of Account Transactions

If you need more details about account transactions while matching, click the links in the Account Transactions grid.

To view the details of account transactions in NetSuite:

1. If you haven't already, do the following:
 - a. Go to Transactions > Bank > Match Bank Data.
 - b. From the **Account** list, select the bank or credit card account.

In the Imported Bank Data and Account Transactions grids, NetSuite displays the imported bank lines and account transactions that require manual matching.
2. From the **To Be Matched** or **Review** subtab, you can do the following:
 - To view the record of an account transaction, in the row, click the date in the **Date** column or the transaction number in the **Tran No.** column.

NetSuite opens the transaction record in a new window.

- To view the record of the payer or payee on an account transaction, in the row, click the text in the **Name** column.
- To see full details that don't fit, point to the field or widen the column by dragging its right border. You can also re-size columns in the Imported Bank Data grid.

 **Note:** The memos that appear in the Account Transactions grid are the Memo field values from the transaction headers, not the transaction line-level memos.

Viewing Transactions To Be Submitted

When you open the Match Bank Data page, it displays the To Be Matched subtab. Here, you'll see transactions to match or mark as cleared. When you do, they move to the Review subtab.

The Review subtab displays all transactions pending submission, which can include the following:

- Automatically-matched transactions processed from the Match Bank Data page.

 **Note:** Customer payments from the Automated Cash Application are automatically matched, submitted, and ready for reconciliation. The transaction appears in the Review subtab of the Reconcile Account Statement page.

Transactions created by an auto-create rule are labeled To Be Generated, and are generated in your general ledger account when you submit them.

- Manually-matched transactions.
- User-cleared transactions.

When you submit a transaction, the system clears it so you can reconcile. You can see and reconcile it on the Reconcile Account Statement page.

 **Important:** NetSuite removes the cleared or matched status from a transaction (and any other transactions from its match group) if you do any of the following:

- Edit the transaction amount.
- Void the transaction without a reversing journal entry. If you void the transaction with a reversing journal entry, the transaction remains matched or user-cleared.
- Delete the transaction.

To view transactions to be submitted:

1. Go to Transactions > Bank > Match Bank Data.
2. From the **Account** list, select the bank or credit card account.

In the Imported Bank Data and Account Transactions grids, NetSuite displays the imported bank lines and account transactions that require manual matching.

3. Click the **Review** subtab.

NetSuite displays all transactions pending submission.

Matched and user-cleared transactions are indicated by the Matched and Cleared label in the View Details column.

 **Note:** Transactions that are automatically created and matched by an auto-create rule are indicated by the label, To Be Generated. These transactions are generated in your general ledger account when you submit them.

4. To filter the transactions grid by date or to use the search functionality, see [Filtering Imported Bank Data and Account Transactions](#).

5. To view all the transactions in a match, click **Matched** (previously called View) in the View Details column (previously called Match Details).

The Matched Transaction popup window displays the transactions in the match group, including date, type, transaction number, name, and amount. If there are too many, use the arrows to see more.

To undo the cleared status, click **Undo Clear**. NetSuite moves the transaction back to the **To Be Matched** subtab.

To undo several matches at the same time, select them and click **Undo Selected**. For more details, see [Undoing Matched Transactions](#).

6. To view a transaction that has been marked as cleared pending submission, click **Cleared** in the View Details column.

The Cleared Transaction popup window displays transaction details, including transaction date, type, transaction number, name, and amount.

To undo the cleared status of the transaction, click **Undo Clear**. NetSuite moves the transaction back to the **To Be Matched** subtab.

To undo multiple cleared transactions at the same time, select them and then click **Undo Selected**. For more details, see [Undoing the Cleared Status of Transactions](#).

7. To close the Matched Transaction or Cleared Transaction popup window, click **Cancel**.
8. To go back to transactions that have not been matched or marked as cleared, click the **To Be Matched** subtab.

To reconcile all the pending transactions, you must submit them and then reconcile the statement. For details, see [Submitting Matched or User-Cleared Transactions](#) and [Reconciling Transactions](#).

To see a summary report, go to Reports > Banking/Budgeting > Reconciliation. From the **Account** and **Statement Date** dropdown lists, select an account and statement date, and then click **Refresh**. For more information, see [Reconciliation Summary Report](#).

Viewing Unmatched Transactions

On the Match Bank Data page, you can view unmatched imported bank data and account transactions on the To Be Matched subtab. When you match or clear a transaction, it moves to the Review subtab.

To view unmatched transactions:

1. Go to Transactions > Bank > Match Bank Data.
2. From the **Account** list, select the bank or credit card account.
In the Imported Bank Data and Account Transactions grids on the **To Be Matched** subtab, NetSuite displays the list of imported bank data and account transactions for the selected account.
3. To filter the transactions grid by date or to use the search functionality, see [Filtering Imported Bank Data and Account Transactions](#).

Undoing Matched Transactions

After matching, you can still undo matches if the transactions haven't been submitted or reconciled.

After matches are submitted and cleared, you can still undo them from the **Matched** subtab on the Reconcile Account Statement page. See [Undoing Submitted Transaction Matches](#).

Important: NetSuite unmatches a transaction (and any other transactions from its match group) if you do any of the following:

- Edit the transaction amount.
- Void the transaction without a reversing journal entry. If you void the transaction with a reversing journal entry, the transaction remains matched.
- Delete the transaction.

To undo matches:

1. Go to Transactions > Bank > Match Bank Data.
2. From the **Account** list, select the bank or credit card account.
In the Imported Bank Data and Account Transactions grids, NetSuite displays the imported bank lines and account transactions that require manual matching.
3. Click the **Review** subtab.
NetSuite displays the list of pending transactions that you can submit.
4. For the transaction match you want to undo, click **Matched** in the View Details column.
The Matched Transaction popup window appears. If there are too many transactions, use the arrows to see more.
5. Click **Undo Match**.
NetSuite moves the transactions back to the **To Be Matched** subtab.
Alternatively, to undo multiple matches at the same time, use any of the following methods:
 - Manually select the boxes next to the matched transactions you want to unmatch, and then click **Undo Selected**.
 - If you want to unmatch all matched transactions visible on the current page but cleared transactions are also visible, click the **Select Matched Transactions** button, and then click **Undo Selected**.
 - If all transactions on the current page are matched and you want to unmatch them, check the box in the grid header to select them, and then click **Undo Selected**.

A confirmation dialog appears so you can check details and confirm or cancel.

Tip: If you're using the **Undo Selected** action, you can still click the link in the View Details column to review the details of any match before unmatching.

If you have transactions that have been marked as cleared but you want to remove the cleared status, see [Undoing the Cleared Status of Transactions](#).

Excluding Imported Bank Lines From the Matching Process

Exclude the imported bank line items that you don't want from the matching process.

 **Tip:** Excluding imported bank data helps reduce clutter. You can hide bank lines you don't want to match or no longer need. Transactions you exclude aren't ever deleted.

To exclude imported bank line items from the matching process:

1. Go to Transactions > Bank > Match Bank Data.
2. From the **Account** list, select the bank or credit card account.
In the Imported Bank Data and Account Transactions grids, NetSuite displays the imported bank lines and account transactions that require manual matching.
3. From the **To Be Matched** subtab, check the boxes for items in the Imported Bank Data grid you want to exclude from matching. You can use the box in the grid header to select all processed imported bank lines visible on the current page. This option should only be used if none of the imported transactions on the page are needed for reconciliation.

 **Note:** Dimmed transactions are still processing and can't be selected until they're done. To check, refresh the Imported Bank Data grid by clicking the Refresh icon. Processing takes longer if you have a lot of imported lines.

4. Click **Exclude**.
NetSuite moves the selected items to the Excluded subtab and removes them from the matching process. If you selected all items using the box in the grid header, all visible imported bank lines on the current page are excluded.

 **Note:** You can only exclude imported bank data. If you select an account transaction, the Exclude button is inactivated and the Match button becomes active.

To restore imported bank data, see [Restoring Excluded Imported Bank Lines](#).

Restoring Excluded Imported Bank Lines

If you've excluded imported bank line items, you can restore them so they're included in matching.

To restore excluded bank data:

1. Go to Transactions > Bank > Match Bank Data.
2. From the **Account** list, select the bank or credit card account.
In the Imported Bank Data and Account Transactions grids, NetSuite displays the imported bank lines and account transactions that require manual matching.
3. Click the **Excluded** subtab.
4. Select the transactions you want to restore and click **Restore**. You can use the box in the grid header to select all transactions visible on the current page.
The transactions you selected move back to the **To Be Matched** subtab. If you selected all transactions using the box in the grid header, all transactions visible on the current page are restored.

Adding Account Transactions During the Matching Process

If account transactions are missing from the Account Transactions grid on the Match Bank Data page, you can do the following:

- Use the Automated Cash Application feature to generate customer payments (if needed) and automatically match and clear them. See [Generating Customer Payments](#).
- Use auto-create rules to automatically generate and match account transactions for future imported bank lines. An auto-create rule can create and match these types:
 - Deposits and charges for general ledger bank accounts
 - Charges and refunds for general ledger credit card accounts

See [Automatic Creation of Account Transactions](#).

- Manually add account transactions for unmatched imported bank lines during matching, and then match them. You can add a new journal entry, charge, deposit, or credit card refund. See [Manual Creation of Account Transactions During the Matching Process](#).

Note: If an account transaction has extra required fields, you can't add it on the Match Bank Data page. Create it outside the page instead. For details, see the following help topics:

- [Making Deposits](#)
- [Writing Checks](#)
- [Entering Company Credit Card Charges](#)

Automatic Creation of Account Transactions

Instead of manually creating and matching account transactions, you can automate these steps using auto-create rules. Auto-create rules let you create and match:

- Deposits and charges for general ledger bank accounts
- Charges and refunds for general ledger credit card accounts

Tip: If you have imported bank lines with corresponding customer payments not recorded in NetSuite, you can use the Automated Cash Application feature to generate those payments. When generated, payments are automatically applied to open invoices and matched, cleared, and ready for reconciliation. See [Automated Cash Application](#).

You can also use auto-create rules to create and match customer payments for both existing and future imported bank lines. However, you need to reconcile these payments and apply them to invoices yourself.

If you import bank lines with a recurring Payor/Payee or Memo, auto-create rules look for lines with the right transaction type and Payor/Payee. If there's no Payor/Payee, the rules check the Memo instead.

You don't need to manually create an auto-create rule. Instead, you can configure the system to generate one from a transaction match when certain criteria are met. For details, see [Generating Auto-Create Rules](#).

Note: NetSuite won't generate an auto-create rule unless you check the **Make Auto-Create Rule From Selected Transactions** box on the Match Bank Data page. The box is cleared by default, so you need to check it every time you want a new auto-create rule.

When an auto-create rule is generated, it creates new account transactions from future imports with the specified values and matches them.

For example, if you import a bank line with the payor Ben and there's no matching transaction, the system creates and matches one automatically.

Transactions that are automatically created and matched won't impact your general ledger until you submit them on the Match Bank Data page. For details on submitting transactions, see [Submitting Matched or User-Cleared Transactions](#).

To edit an auto-create rule, see [Editing Auto-Create Rules](#).

To run an auto-create rule, see [Running an Auto-Create Rule](#).

For troubleshooting information, see [Troubleshooting Automatic Transaction Creation Rules](#).

Generating Auto-Create Rules

When you create and manually match an account transaction to an imported bank line, you can click the **Make Auto-Create Rule From Selected Transactions** box.

 **Note:** An auto-create rule can only be applied to a single account.

NetSuite can generate auto-create rules from matches on the Match Bank Data page when these criteria are met:

- You have the **Matching Rules for Online Banking** permission, with create-level access at a minimum.
- You are performing a one-to-one match of a Check, Deposit, Credit Card Charge, or Credit Card Refund.
- Your imported bank line contains a Payer/Payee or Memo.
- The transaction amount is not zero.
- The match difference is zero.
- The account transaction contains only one line item.

 **Note:** Deposits must have a single Other Deposits line item.
All other transactions must have a single Expenses line item.

- The account transaction doesn't contain a tax code.

 **Note:** Auto-create rules are not currently compatible with tax codes.

If these criteria are met, then the box to automatically create general ledger transactions becomes active. If you check the box, the system generates an auto-create rule after you match the transaction.

The Intelligent Transaction Matching Feature runs this auto-create rule—along with other matching rules—on future imports. For details, see [Running an Auto-Create Rule](#).

You can add more conditions to the rule and define its action. For more information, see [Editing Auto-Create Rules](#).

To generate an auto-create rule:

1. If you haven't already:
 - a. Import bank or credit card data into your account in NetSuite. See [Bank Data Import](#).
 - b. Go to Transactions > Bank > Match Bank Data.
 - c. From the **Account** list, select the bank or credit card account.

The following fields are populated:

- **Subsidiary** (if applicable).
- **Bank Balance**, if your most recent account statement contains an account balance and statement date.
- **Balance As Of**, if the statement contains a statement date.

If you select an account for which NetSuite failed to import data during the latest import, a popup message displays the latest error. For more error details, go to Transactions > Bank > Banking Import History. See [Banking Import History](#).

If NetSuite imported data successfully, the Imported Bank Data and Account Transactions grids fill with the latest imported bank lines and account transactions.

2. Create a new account transaction to match with an imported bank line.

To add a new account transaction directly on the Match Bank Data page, see the following help topics:

- [Adding New Charges During Matching](#)
- [Adding New Deposits During Matching](#)
- [Adding New Credit Card Refunds During Matching](#)

After you've added the new account transaction, NetSuite displays it in the section below the data grids, as the first entry.

If you cannot add the transaction on the Match Bank Data page because it contains additional required fields, you need to create one using a transaction entry form. See the following help topics:

- [Making Deposits](#)
- [Writing Checks](#)
- [Entering Company Credit Card Charges](#)

3. If you added the transaction outside of the matching process, go back to the Match Bank Data page, and then select the newly created account transaction and the corresponding imported bank line.

NetSuite displays the items in the bottom section of the page, below the data grids.

4. If you added a new transaction directly on the Match Bank Data page without selecting a corresponding imported bank line first, select one now.

Note: Dimmed items are still processing. You can't check the box for a dimmed transaction until processing is complete. To see if processing is complete, refresh the Imported Bank Data grid by clicking the Refresh icon above it.

5. When the difference between the selected imported bank data item and account transaction is zero (in the **Difference** field), check the **Make Auto-Create Rule From Selected Transactions** box. If this box isn't active, the criteria for an auto-create rule are not met. See the criteria outlined before this procedure.

Note: The **Make Auto-Create Rule From Selected Transactions** box is cleared by default. You must check the box every time you want to generate an auto-create rule.

6. Click **Match**.

An auto-create rule is generated from the transaction match. If NetSuite fails to generate an auto-create rule, see [Troubleshooting Automatic Transaction Creation Rules](#).

The account transaction moves to the **Review** subtab.

To run the auto-create rule, see [Running an Auto-Create Rule](#).

To see the newly generated rule, go to the Reconciliation Rules page.

To submit your matched transactions, see [Submitting Matched or User-Cleared Transactions](#).

Troubleshooting Automatic Transaction Creation Rules

If you encounter errors generating an auto-create rule when you click Match, see the following table, which provides error scenarios and troubleshooting steps:

Error	Cause	Recommended Action
Your bank data was matched, but an auto-create rule could not be created. Please enter value(s) for: <i>FieldName1</i> , <i>FieldName2</i> .	The transaction you're matching is missing required fields, so NetSuite can't create the memorized template.	Make sure all required fields are set on the transaction you're matching.
Your bank data was matched, but an auto-create rule could not be created. The transaction date you specified is not within the date range of your accounting period.	The current day isn't in a valid accounting period, and no default accounting period is set.	Add a valid accounting period for today, or set a default accounting period. See the help topic Accounting Period Management .
Your bank data was matched, but an auto-create rule could not be created. Try to generate the rule again. For details, see Generating Auto-Create Rules .	This general error appears when NetSuite can't return a translatable string. It may be caused by a service outage, or by NetSuite trying to generate a rule even though the match doesn't meet the needed criteria (for example, if there are multiple transaction lines).	Try again later. If the problem keeps happening, contact NetSuite Support.

If you're able to generate an auto-create rule when you click Match but are unable to submit the match, see the following table:

Error	Cause	Recommended Action
The Memorized Transaction Record account differs from the imported bank line's account.	The account on the memorized transaction record for the rule is different from the rule's account.	Go to the memorized transaction record and update the account to match the rule's account. If you meant to use the new account, create a new rule for a transaction with that account. See Generating Auto-Create Rules .
The Memorized Transaction Record has more than one line item.	You edited or added lines in the memorized transaction record for the rule.	Go to the memorized transaction record. If there's more than one line, remove the extras.
SuiteScript API error: Please enter value(s) for: <i>FieldName1</i> , <i>FieldName2</i> .	You added required fields to the form that aren't set yet in the memorized transaction record. You may have added custom required fields.	Go to the memorized transaction record and set the required fields.
SuiteScript API error: Currency is not valid for entity.	You created a rule for a record that doesn't let you set the account currency.	Go to the memorized transaction record. For the selected entity, pick the same currency as the account.

Running an Auto-Create Rule

To run an auto-create rule, along with any active matching rules, you need to initiate the Intelligent Transaction Matching Feature. You can do so by manually running reconciliation rules or through a bank

data import, since the matching process automatically runs against an import. For detailed instructions on setting up automatic bank imports, see [Automating Imports for Bank Reconciliation](#). For manual import options, see [Manual Bank Data Import](#).

To run an auto-create rule by manually running reconciliation rules:

1. Go to Transactions > Bank > Match Bank Data.
2. From the **Account** list, select the appropriate account.
3. Click **Run Reconciliation Rules**.
4. In the confirmation window, use the date picker to specify the date range you want the system to run rules against. This date range is based on when transactions were imported, not the transaction date. For large date ranges, processing time may increase. For best results, consider running reconciliation rules in smaller batches.
5. If you're sure, click **Run Reconciliation Rules** to initiate the matching process.

 **Note:** After the process starts, it cannot be canceled.

All active system and user rules, including auto-create rules, run on the imports from your selected date range.

6. To see the results, refresh the page and reload your account.

For more details, see [Manually Running Reconciliation Rules](#).

Manual Creation of Account Transactions During the Matching Process

If a transaction's missing from the Account Transactions grid on the Match Bank Data page, you can add it manually during matching.

 **Tip:** Before adding new transactions yourself, use the Automated Cash Application feature to generate matching customer payments if you can—they'll be matched and cleared automatically. Also, see if auto-create rules can help with future imported bank lines. For more information about generating customer payments and using auto-create rules, see [Generating Customer Payments](#) and [Automatic Creation of Account Transactions](#).

Based on your requirements, you can add a new transaction in one of the following ways:

- Create a new journal entry. See [Adding New Journal Entries During Matching](#).
- For bank or credit card accounts, create a new charge. See [Adding New Charges During Matching](#).
- For bank accounts, create a new deposit. See [Adding New Deposits During Matching](#).
- For credit card accounts, create a new credit card refund. See [Adding New Credit Card Refunds During Matching](#).

If you've added a new journal entry, you need to refresh the Account Transactions grid to see it.

If you've added any other kind of transaction, NetSuite displays it in the Account Transactions grid and in the bottom section for matching.

To match your data, see [Matching Bank Data](#).

If your imported bank lines have a recurring Payee/Payor or Memo, you can automate posting transactions for them. For details, see [Automatic Creation of Account Transactions](#).

Adding New Journal Entries During Matching

You can create a new journal entry for imported bank data right from the Match Bank Data page.

To create a journal entry during the matching process:

1. Go to Transactions > Bank > Match Bank Data.
2. From the **Account** list, select the bank or credit card account.
3. (Optional) To provide matching data for the new journal entry, from the Imported Bank Data grid, check a box to select an item.

 **Note:** Dimmed items are still processing, so you can't check the box until that's done. To check, refresh the Imported Bank Data grid.

4. Click **Add Journal Entry**.

NetSuite opens your preferred Journal Entry in a new window and sets a default Date:

- If there are one or more imported bank lines in the bottom section of the Match Bank Data page, the default is the date of the earliest imported line.
- If there are no imported bank lines in the bottom section of the Match Bank Data page, the default is the current date.

 **Note:** The memos that appear in the Account Transactions grid on the Match Bank Data page are the Memo field values from the Journal Entry headers, not the transaction line-level memos.

5. Enter the details. If you selected imported bank lines, some fields are filled in for you.
6. When you're done, click **Save**.
NetSuite saves the journal entry.
7. To refresh the Account Transactions grid, click the refresh icon above the pane on the right.
The new journal entry appears in the grid.

For details on creating journal entries, see the help topic [Journal Entries](#).

Adding New Charges During Matching

For bank or credit card accounts, you can create a new charge for imported bank data right from the Match Bank Data page.

 **Note:** Tax codes and rates aren't available in the Add Charge popup window. If you have a default tax code, the charge gets created with it, but the tax rate defaults to zero so the amounts match.

If tax codes are required, create your charges on the Check or Credit Card Transaction page, and then match them. See [Writing Checks](#) or [Entering Company Credit Card Charges](#).

For information about tax codes, see the help topic [Tax Codes Overview](#).

To add a new charge during the matching process:

1. Go to Transactions > Bank > Match Bank Data.

2. From the **Account** list, select the bank or credit card account.
3. (Optional) To provide matching data for the new charge, from the Imported Bank Data grid, check a box to select an item.

 **Note:** Dimmed items are still processing, so you can't check the box until they're done. Refresh the Imported Bank Data grid to check.

4. Click **Add Charge**.
NetSuite displays the Add Charge popup window.
If it's a credit card account, a charge means a debit.
5. Enter the charge details. If you selected an imported bank line, some fields are filled in for you.
If the Duplicate Number Warnings preference is set to **Warning** or **Warning and Block** and you enter a check number that already exists, you receive an error popup window. To replace your entry with the next available check number, click **OK**.

 **Note:** The **Payor** list displays available entity types. Start typing a payor's name to limit scrolling and narrow the results.

6. Click **Add**.
7. To refresh the Account Transactions grid, click the refresh icon above the pane on the right.
The Account Transactions grid displays the new charge, and NetSuite adds it to the bottom section for matching.

For details on adding charges, see [Writing Checks](#) or [Entering Company Credit Card Charges](#).

Adding New Deposits During Matching

For bank accounts, you can create a new deposit for imported bank data right from the Match Bank Data page.

 **Note:** Tax codes and rates aren't available in the Add Deposit popup window. If you have a default tax code, the deposit gets created with it, but the tax rate is set to zero so the amounts match.

If tax codes are required, create your deposits from the Deposit page, and then match them. See [Making Deposits](#).

For information about tax codes, see the help topic [Tax Codes Overview](#).

To add a new deposit during the matching process:

1. Go to Transactions > Bank > Match Bank Data.
2. From the **Account** list, select the bank or credit card account.
3. (Optional) To provide matching data for the new deposit, from the Imported Bank Data grid, check a box to select an item.

 **Note:** Dimmed items are still processing, so you can't check the box until they're done. Refresh the Imported Bank Data grid to check.

4. Click **Add Deposit**.

NetSuite displays the Add Deposit popup window.

5. Enter the deposit details. If you selected an imported bank line, some fields are filled in for you.

Note: The **Payor** list displays available entity types. Start typing a payor's name to limit scrolling and narrow the results.

6. Click **Add**.
7. To refresh the Account Transactions grid, click the refresh icon above the pane on the right.
The Account Transactions grid displays the new deposit, and NetSuite adds it to the bottom section for matching.

For details on adding deposits, see [Making Deposits](#).

For information about deposits in general, see [Deposits](#).

Adding New Credit Card Refunds During Matching

For credit card accounts, you can create a new credit card refund right from the Match Bank Data page.

Note: Tax codes and rates aren't available in the Add Credit popup window. If you have a default tax code, the credit gets created with it, but the tax rate is set to zero so the amounts match.

If tax codes are required, create your credits on the Credit Card Transaction page, and then match them. See [Writing Checks](#) or [Entering Company Credit Card Charges](#).

For information about tax codes, see the help topic [Tax Codes Overview](#).

To add a new credit card refund during the matching process:

1. Go to Transactions > Bank > Match Bank Data.
2. From the **Account** list, select the credit card account.
3. (Optional) To provide matching data for the new credit card refund, from the Imported Bank Data grid, check a box to select an item.

Note: Dimmed items are still processing, so you can't check the box until they're done. Refresh the Imported Bank Data grid to check.

4. Click **Add Credit**.
NetSuite displays the Add Credit popup window.
5. Enter the refund details. If you selected an imported bank line, some fields are filled in for you.

Note: The **Payor** list displays available entity types. Start typing a payor's name to limit scrolling and narrow the results.

6. Click **Add**.
7. To refresh the Account Transactions grid, click the refresh icon above the pane on the right.
The Account Transactions grid displays the new transaction and NetSuite adds it to the bottom section for matching.

For details on adding credits (or charges), see [Entering Company Credit Card Charges](#).

Marking Transactions as Cleared

If account transactions don't have matching imported bank lines, you can mark them as cleared (pending submission) from the Match Bank Data page. Cleared transactions show up in the Review subtab on the Match Bank Data page. Like matches, user-cleared transactions are pending until you submit. After you do, the system clears them and you can reconcile them on the Reconcile Account Statement page.

Marking a transaction as cleared may be needed in these cases:

- You recorded an account transaction for a check that was later voided with or without a reversing journal entry:
 - If you voided a check with a reversing journal entry, the system records a reversing entry to cancel the GL impact. Both the voided check and reversing entry appear as account transactions on the Match Bank Data page. Clear both to get a zero balance.
 - If you voided a check without a reversing entry, you need to clear the voided check. If there are any matching imported bank lines, match them to account transactions. If no corresponding account transactions exist, create them.
- You want to clear a transaction without importing bank data—for example, to handle an old transaction when uploading the statement is difficult or not possible.

To mark an account transaction as cleared:

1. Go to Transactions > Bank > Match Bank Data.
2. From the **Account** list, select the bank or credit card account.
In the Imported Bank Data and Account Transactions grids, NetSuite displays the imported bank lines and corresponding account transactions that require manual matching.
3. From the **To Be Matched** subtab, in the Account Transactions grid, check the box next to each transaction you want to clear without matching. If you want to select all visible items in the current page at the same time, check the box in the grid header.
The bottom section of the page shows all selected account transactions on the right. They shouldn't have matching imported bank lines.
4. Beneath the Account Transactions grid, click **Clear**.

Note: The Clear button isn't active if an imported bank line or in-transit transaction is selected.

The selected transactions move to the **Review** subtab.

5. Click **Submit**.
The transactions are cleared in the system and move to the **Reconcile** subtab. They're automatically selected for reconciliation.

You can undo the cleared status of a transaction that has been marked as cleared before or after submitting it. For details, see [Undoing the Cleared Status of Transactions](#) and [Undoing the Cleared Status of Submitted Transactions](#).

Undoing the Cleared Status of Transactions

You can undo the cleared status for transactions from the **Review** subtab on the Match Bank Data page if the transactions are still pending.

After the transactions are submitted and cleared, you can still undo their cleared status from the **Review** subtab on the Reconcile Account Statement page. See [Undoing the Cleared Status of Submitted Transactions](#).

Important: NetSuite removes the cleared status if you do any of the following:

- Edit the transaction amount.
- Void the transaction without a reversing journal entry. If you void the transaction with a reversing journal entry, the transaction remains user-cleared.
- Delete the transaction.

To undo the cleared status of a transaction:

1. Go to Transactions > Bank > Match Bank Data.
 2. From the **Account** list, select the bank or credit card account.
In the Imported Bank Data and Account Transactions grids, NetSuite displays the imported bank lines and corresponding account transactions that require manual matching.
 3. Click the **Review** subtab.
NetSuite displays the list of pending transactions you can submit.
 4. Next to the transaction for which you want to undo the cleared status, click **Cleared** in the View Details column.
The Cleared Transaction popup window appears.
 5. Click **Undo Clear**.
NetSuite moves the transaction back to the **To Be Matched** subtab.
Alternatively, to undo multiple cleared transactions at the same time, use any of the following methods:
 - Manually select the boxes next to the cleared transactions you want to undo, and then click **Undo Selected**.
 - If you want to undo all cleared transactions visible on the current page but matched transactions are also visible, click the **Select Cleared Transactions** button, and then click **Undo Selected**.
 - If all transactions on the current page are cleared and you want to undo their cleared status, check the box in the grid header to select them, and then click **Undo Selected**.
- A confirmation dialog appears so you can check details and confirm or cancel.

Tip: If you're using the **Undo Selected** action, you can still click the link in the View Details column to review the details of any transaction before undoing it.

If you have transaction matches you want to undo, see [Undoing Matched Transactions](#).

Submitting Matched or User-Cleared Transactions

When you finish matching and marking transactions as cleared, submit them and move on to reconciliation.

Note: As of NetSuite 2021.2, when you edit your account to use the redesigned reconciliation feature, any previously-held transactions are automatically cleared and appear in the **Reconcile** subtab. See [Editing Accounts to Use the Match Bank Data and Reconcile Account Statement Pages](#).

If you use the In-Transit Payments feature, NetSuite also converts the in-transit payments to confirmed payments. For details, see the help topic [Enabling the In-Transit Payments Feature](#).

Important: NetSuite removes the cleared or matched status from a transaction—and others in its match group—if you do any of the following:

- Edit the transaction amount.
- Void the transaction without a reversing journal entry. If you void the transaction with a reversing journal entry, the transaction remains matched or user-cleared.
- Delete the transaction.

To submit transactions:

1. Go to Transactions > Bank > Match Bank Data.
2. From the **Account** list, select the bank or credit card account for which you want to submit matches, if not already selected.
3. To see the grid of pending account transactions you can submit, click the **Review** subtab.

NetSuite displays all transactions pending submission, which can include:

- Automatically-matched transactions that weren't generated using the Automated Cash Application feature.

Note: When a customer payment is generated by the Automated Cash Application feature, it's automatically matched, submitted, and ready for reconciliation. It appears in the **Review** subtab of the Reconcile Account Statement Page.

Transactions auto-created and matched by an auto-create rule are labeled To Be Generated, and generated in your general ledger when you click **Submit**.

- Manually-matched transactions.
- User-cleared transactions.

For more information, see [Viewing Transactions To Be Submitted](#).

4. After you've reviewed matched or cleared transactions visible on the current page of the transaction grid, submit them.
 - a. To submit all transactions in the **Review** subtab, click the **Submit All** button at the top or bottom of the grid. A confirmation pop-up appears where you can confirm or cancel the action.
 - b. To submit some but not all transactions, select the transactions you want to submit and click the **Submit Selected** button at the top or bottom of the grid. A confirmation pop-up appears indicating the number of transactions to be submitted, where you can confirm or cancel the action. **Submit Selected** submits all selected transactions in the grid, including those on different pages or not visible due to filters. Use the following options to help you select transactions for submission.

Note: You can also use these options to help you select transactions for the **Undo Selected** action if you want to undo a matched or cleared transaction.

- **Select Matched Transactions** – Selects all matched transactions on the current page. You can deselect them by clicking **Deselect Matched Transactions**.
- **Select Cleared Transactions** – Selects all user-cleared transactions on the current page. You can deselect them by clicking **Deselect Cleared Transactions**.
- **Box in header** – Selects all transactions on the current page.

- **Selection boxes** – Selects transactions using the box next to each transaction.

NetSuite processes and clears your submitted transactions. If you use In-Transit Payments, NetSuite converts the in-transit payments to confirmed payments. This can take some time.

If transactions labeled To Be Generated fail to be submitted, see [Troubleshooting Automatic Transaction Creation Rules](#).

Tip: To view the processing status of your batch of transactions, go to Transactions > Bank > Match Bank Data > Status.

5. When processing completes, click **Reconcile Account Statement** in the upper right-hand corner of the page. See [Reconciling Transactions](#).

Checking the Process Status for Submitted Transactions

After you submit a batch of matches or cleared transactions, you can check its processing status on the Process Status page. Transactions are processed in the background, so you can keep working in NetSuite and check back for updates.

The Process Status page displays the following information:

- **Submission ID** – A unique identifier of the batch processing job.
- **Process Type** – When submitting matches to clear account transactions, the process type is Confirm Transactions.
- **Submission Status:**
 - **Not Started** – The batch job has been submitted but hasn't started yet.
 - **In Progress** – Transactions in the batch are being processed now. The Percent Complete column indicates progress.
 - **Complete** – All transactions in the batch have been processed. If there were any errors, you can see the error count in the Message column.
- **Percent Complete** – The percentage of records processed.
- **Message** – Indicates the number of errors that occurred during the processing.
- **Date Created** – The date and time the bulk processing was started.
- **Created By** – The user that submitted the bulk process job.

You can also use these columns as filters to find batches you want to view.

You can also filter by creation date.

To check the processing status of transactions:

1. Go to Transactions > Bank > Match Bank Data > Status.
2. To choose the time period for which you want to view bulk fulfillment jobs, click **Filters**. NetSuite uses the current date by default.
3. To view the details of a batch, click the status link in the Submission Status column. NetSuite displays the Processed Records page.
4. If there were any errors, you can see the error count in the Message column. Click the link to open the Bulk Processing Errors page and view the errors.

For more information about errors, see [Resolving Bulk Processing Errors](#).

5. To view the latest status of the bulk processing jobs, click **Refresh**.

After the batch is done, view the results on the Processed Records page. It shows the submission ID, line number, transaction, status, result, and error message (if there is one). Submitted transactions are now on the Reconcile Account Statement page.

Resolving Bulk Processing Errors

You may receive one of the following errors:

Error Message	Possible Cause	Solution
One or more account transactions are invalid because they've been deleted or modified. We've unmatched these transactions and undone the cleared status if they were marked as cleared.	This error may occur in the following scenarios: - One or more transactions in a match group were deleted or changed during bulk processing, so NetSuite undid the match group. - One or more user-cleared transactions were deleted or changed during bulk processing, so NetSuite removed the cleared status from them.	If the system unmatched a match group, match the transactions again and submit them. If NetSuite removed the cleared status due to a modification, mark it as cleared and submit it again. If the transaction was deleted, you don't need to do anything.
NetSuite couldn't submit all your matched or user-cleared transactions due to a system error. Submit them again. If the problem keeps happening, contact Support.	If NetSuite can't submit a transaction, and it's not because the transaction was changed or deleted, you see this message. This error can be caused when a matched or user-cleared vendor bill payment was already confirmed on a vendor bill payment record. NetSuite may have already moved this transaction to the Reconcile subtab.	On the Review subtab, submit any unconfirmed transactions if needed.

To correct the errors:

1. Go to Transactions > Bank > Match Bank Data.
2. From the **Account** list, select the bank or credit card account, if not already selected.
3. To filter the transactions by date, enter or select the dates in the **From** and **To** fields above the panes.
4. On the **To Be Matched** subtab, match or clear the transactions again that weren't confirmed on the Process Status page, if applicable. See [Matching Bank Data](#) and [Marking Transactions as Cleared](#).
5. If required, you can view the transaction matches or user-cleared transactions on the **Review** subtab. Some matched or user-cleared transactions might fail processing but keep their status.
6. After reviewing the matched or user-cleared transactions, click **Submit**.
7. To view the processing status of the new batch, go back to Transactions > Bank > Match Bank Data > Status.

Viewing Submitted Transactions

On the Reconcile Account Statement page, you can view the following transactions:

- Manually-matched and user-cleared transactions you submitted from the Review subtab of the Match Bank Data page.
- Automatically-matched transactions processed from the Match Bank Data or Automated Cash Application page. Payments generated from the Automated Cash Application page are matched, cleared, and ready for reconciliation.

If you undo a match or cleared status, NetSuite moves the transaction (and corresponding imported bank line) back to the To Be Matched subtab.

Important: NetSuite removes the cleared or matched status from a transaction—and others in its match group—if you do any of the following:

- Edit the transaction amount.
- Void the transaction without a reversing journal entry. If you void the transaction with a reversing journal entry, the transaction remains matched or user-cleared.
- Delete the transaction.

To view transactions that haven't been submitted yet, see [Viewing Transactions To Be Submitted](#).

To view submitted transactions:

1. Go to Transactions > Bank > Reconcile Account Statement.
2. From the **Account** list, select the bank or credit card account.

Note: As of NetSuite 2021.1, all newly-created accounts automatically appear in the **Account** list. If your account doesn't appear, see [Editing Accounts to Use the Match Bank Data and Reconcile Account Statement Pages](#).

In the **Statement End Date** and **Ending Statement Balance** fields, NetSuite displays the end date and closing balance from the most recent account statement containing a statement date.

Note: If no account statements contain a statement date, the **Statement End Date** field is populated with the current date. The **Ending Statement Balance** field is populated with the closing balance from the last reconciliation statement.

3. Click the **Review** subtab.
NetSuite shows the list of submitted transactions that were matched or cleared.
4. To filter the transactions list by date, enter or select the dates in the **From** and **To** fields above the pane.
5. To search, start typing in the Search field. NetSuite narrows the results as you type.
When entering a date, use the format shown on the page. For long formats (May 1, 2018), type **May** for May dates. Use four digits for years. For short formats, use two digits for month or day (05/01/2018).
6. To view all the transactions in a submitted match, click **Matched** (previously called View) in the View Details column.
The Matched Transaction popup window displays the bank lines and account transactions in the match group. Details include date, type, transaction number, name, and amount.
If there are too many items, use the arrows to see more. The **Number of Rows In List Segments** preference sets the per-page display (up to 1000). This limit is for all grids in the **To Be Matched** and **Review** subtabs.

To undo a match, click **Undo Match**. NetSuite moves the transactions back to the **To Be Matched** subtab on the Match Bank Data page. To access the Match Bank Data page, you can click the **Match Bank Data** link (upper right).

To undo multiple matches at the same time, select them and then click the **Undo Selected** button at the top or bottom of the grid. For more details, see [Undoing Submitted Transaction Matches](#).

7. To view a submitted transaction that was marked as cleared instead of matched, click **Cleared** in the View Details column.

The Cleared Transaction popup window displays details, including the transaction date, type, transaction number, name, and amount.

To undo the cleared status, click **Undo Clear**. NetSuite moves the transaction back to the **To Be Matched** subtab on the Match Bank Data page.

To undo multiple cleared transactions at the same time, select them and then click the **Undo Selected** button at the top or bottom of the grid. For more details, see [Undoing the Cleared Status of Submitted Transactions](#).

8. To close the Matched Transaction or Cleared Transaction popup window, click **Cancel**, or close the window.

Undoing Submitted Transaction Matches

After you've matched and submitted transactions, you can still undo matches.

If you undo submitted matches, NetSuite moves the transactions—and the corresponding bank lines—back to the To Be Matched subtab on the Match Bank Data page.

If the bank lines were on the Automated Cash Application page, they won't show there again. Submitting a matched transaction on the Match Bank Data page permanently removes the bank line from that page.

Important: NetSuite unmatches a transaction (and any other transactions from its match group) if you do any of the following:

- Edit the transaction amount.
- Void the transaction without a reversing journal entry. If you void the transaction with a reversing journal entry, the transaction remains matched.
- Delete the transaction.

To undo submitted transaction matches:

1. Go to Transactions > Bank > Reconcile Account Statement.
2. From the **Account** list, select the bank or credit card account.
3. Click the **Review** subtab.

NetSuite displays the list of pending transactions you can submit.

4. For the transaction match you want to undo, click **Matched** in the View Details column.

The Matched Transaction popup window displays the bank lines and account transactions that are part of the match group. Details include date, type, transaction number, name, and amount.

If there are too many items, use the arrows to see more. The **Number of Rows In List Segments** preference sets how many rows show per page (up to 1000). This limit applies to all grids in the **To Be Matched** and **Review** subtabs.

5. Click **Undo Match**.

NetSuite moves the transactions back to the **To Be Matched** subtab on the Match Bank Data page.

Alternatively, to undo multiple matches at the same time, use any of the following methods:

- Manually select the boxes next to the matched transactions you want to unmatch, and then click **Undo Selected**.
- If you want to unmatch all matched transactions visible on the current page but cleared transactions are also visible, click the **Select Matched Transactions** button, and then click **Undo Selected**.
- If all transactions on the current page are matched and you want to unmatch them, check the box in the grid header to select them, and then click **Undo Selected**.

A confirmation dialog appears so you can check details and confirm or cancel.

Tip: If you're using the **Undo Selected** action, you can still click the link in the View Details column to review the details of any match before unmatching.

In addition to undoing submitted transaction matches, you can also undo a reconciled statement. For details, see [Deleting Reconciled Statements](#).

If you've submitted transactions that were marked as cleared during matching, you can undo the cleared status. See [Undoing the Cleared Status of Submitted Transactions](#).

Undoing the Cleared Status of Submitted Transactions

After you've marked and submitted transactions for clearing, you can still undo the cleared status.

If you undo the cleared status of a submitted transaction, NetSuite moves it back to the To Be Matched subtab on the Match Bank Data page.

Important: NetSuite removes the cleared status from a transaction if you do any of the following:

- Edit the transaction amount.
- Void the transaction without a reversing journal entry. If you void the transaction with a reversing journal entry, the transaction remains user-cleared.
- Delete the transaction.

To undo the cleared status of submitted transactions:

1. Go to Transactions > Bank > Reconcile Account Statement.
2. From the **Account** list, select the bank or credit card account.
3. Click the **Review** subtab.
NetSuite displays the list of cleared, submitted transactions. Transactions you cleared during matching are automatically selected for reconciliation.
4. Next to the transaction for which you want to undo the cleared status, click **Cleared** in the View Details column.
The Cleared Transaction popup window appears.
5. Click **Undo Clear**.

NetSuite moves the transaction back to the **To Be Matched** subtab on the Match Bank Data page. Alternatively, to undo multiple cleared transactions at the same time, use any of the following methods:

- Manually select the boxes next to the cleared transactions you want to undo, and then click **Undo Selected**.
- If you want to undo all cleared transactions visible on the current page but matched transactions are also visible, click the **Select Cleared Transactions** button, and then click **Undo Selected**.
- If all transactions on the current page are cleared and you want to undo their cleared status, check the box in the grid header to select them, and then click **Undo Selected**.

A confirmation dialog appears so you can check details and confirm or cancel.

Tip: If you're using the **Undo Selected** action, you can still click the link in the View Details column to review the details of any transaction before undoing it.

If you want to undo matched transactions that have been submitted, see [Undoing Submitted Transaction Matches](#).

Reconciling Transactions

After you've submitted matched or cleared transactions, you can reconcile your account statement at Transactions > Bank > Reconcile Account Statement.

If you check or clear the box for each transaction on the Reconcile subtab, NetSuite saves your work as you go. You can leave and return later—the page will show your progress.

If you change a previously reconciled transaction's amount, it becomes unreconciled. Open the correct statement period and reconcile it again.

To troubleshoot reconciliation issues, see [Troubleshooting Reconciliation Issues](#).

If you reconcile a statement and then get more transactions you want to include, delete the reconciled statement for that period and start over. See [Deleting Reconciled Statements](#).

You can view account reconciliation reports for reconciled statements. See [Account Reconciliation Reports](#). To print the reports, see [Printing Reconciliation Reports](#).

Note: If you change the transaction's account, it doesn't become unreconciled.

To reconcile a statement:

1. Go to Transactions > Bank > Reconcile Account Statement.
2. From the **Account** list, select the bank or credit card account, if not already selected.

Note: As of NetSuite 2021.1, all newly-created accounts automatically appear in the **Account** list. If your account does not appear, see [Editing Accounts to Use the Match Bank Data and Reconcile Account Statement Pages](#).

NetSuite displays the currency for the selected account.

In the **Statement End Date** and **Ending Statement Balance** fields, NetSuite displays the end date and closing balance from the most recent account statement with a statement date.

Note: If no statement has a statement date, the **Statement End Date** field gets the current date, and the **Ending Statement Balance** field gets the balance from the last reconciliation.

3. If not already selected, in the **Statement End Date** field, enter or select the end date.

Note: If you receive more transactions for a reconciled date range, and you want to include them, delete the reconciled statement and create a new reconciliation. To delete the reconciled statement, see [Deleting Reconciled Statements](#). You should choose a Statement End Date in the past (for example, the day before the current date).

4. In the **Ending Statement Balance** field, enter or edit the closing balance on the statement, if required.

The field uses the ending balance from the imported statement, if there is one.

The **Last Reconciled Balance** field provides the balance of this account from the last reconciled statement.

NetSuite updates the **Reconciled This Statement** field as you include or exclude transactions in the **Reconcile** subtab.

5. If needed, review your transactions on the **Review** subtab. For details, see [Viewing Submitted Transactions](#).

Note: The **Review** subtab is only for reviewing or undoing transactions. The selection options on the **Review** subtab only impact the action of undoing a transaction. To reconcile transactions, go to the next step.

6. If not already open, click the **Reconcile** subtab.

NetSuite displays cleared, submitted transactions that are ready for reconciliation. The Reconcile subtab displays transactions from the Match Bank Data page.

Note: As of NetSuite 2021.2, when you edit your account to use the redesigned reconciliation feature, any previously-held transactions are automatically cleared and appear in the **Reconcile** subtab. See [Editing Accounts to Use the Match Bank Data and Reconcile Account Statement Pages](#).

7. To filter the list of transactions:

- To set the date range for transactions in the list, enter or select the dates in the **From** and **To** fields at the top of the pane.
- From the **Type** list, select a transaction type.
- To switch from a list of all transactions to only the included transactions, click **Show Included Only**.
- In the **Search** field, start typing the text or number value on which to search. As you type, NetSuite narrows the search results in the list.

When entering a date, use a date format consistent with the displayed format in the page (as set in the User Preferences). For example, if you use a long date format (May 1, 2018), enter **May** to search for a date in May. When entering a year, use four digits (for example, 2018). If you use a short date format, always use two digits for the month or day (for example, 05/01/2018).

- To sort by column, click the column header.

If the number of transactions in the list exceeds the page limit, click the arrows to see the next or previous page of results.

8. To include or exclude all of the transactions, check or clear the box in the column header.

If filters are active, checking the box selects all filtered transactions on the current page. Selections persist as you go between pages. If any selected transaction is part of a match group, all transactions in that group are included as well.

For example, if you filtered the list by a date range and type, the filtered transactions and their match groups are selected on all the pages.

9. To include or exclude a transaction from the statement, check or clear the box next to the transaction.

On the **Review** subtab, you can also use the buttons at the bottom of the transaction grid to include or exclude a transaction from the statement. The **Select Matched Transactions** button selects all matched transactions on the current page, and the **Deselect Matched Transactions** button clears those selections. The **Select Cleared Transactions** and **Deselect Cleared Transactions** buttons work the same way for cleared transactions. These options help you choose which transactions to include in your reconciliation, especially when working with large lists. You can use these buttons for both the **Reconcile** action and the **Undo Selected** action.

Note: If a transaction is part of a match group that contains multiple NetSuite transactions (a one-to-many or many-to-many match), you cannot exclude it. The box is unavailable.

Excluded transactions retain their matches and cleared status, but NetSuite excludes them from the reconciliation.

NetSuite only reconciles transactions you've included.

Tip: To switch from a list of all transactions to only the included transactions, click **Show Included Only**.

10. Make sure you've selected all transactions you want, and then click **Reconcile**. You can reconcile a statement even if the amount isn't zero.

If you don't select any transactions, clicking **Reconcile** includes them all.

NetSuite displays the Close Statement popup window.

Warning: You can't change the Statement End Date later. This date becomes the Close Date, which NetSuite uses to run the Reconciliation report and Reconciliation History reports.

If you reconcile with today's date, and get more transactions that day, you can't pick them for your next reconciliation. To avoid this, use a Statement End Date in the past.

11. Click **OK**.

NetSuite takes you to the Reconciled Statements list page.

Troubleshooting Reconciliation Issues

If you modify, void, or delete a reconciled transaction, NetSuite may do the following:

- Make the transaction unreconciled.
- Unmatch the transaction.
- Remove the cleared status from the transaction.

The following table outlines what happens in these scenarios and the action required to resolve any issues that arise.

Note: These scenarios also apply to matched or user-cleared transactions that have yet to be reconciled.

Scenario	Result	Action Required
A reconciled transaction has its amount modified.	If the transaction was matched, it becomes unmatched and unreconciled (including others in the group). If it was only cleared (not matched), it becomes unreconciled and the cleared status is removed. Note: Unmatched transactions, or those with cleared status removed, move to the To Be Matched subtab.	If the transaction was matched before, create a new match group, submit, and reconcile. To create a match group, do one of the following: - Match an existing account transaction or transactions to the imported bank line associated with the transaction that had its amount modified. - Create a new account transaction or transactions and match to the imported bank line associated with the transaction that had its amount modified. If it was cleared, clear it again, submit, and then reconcile.
A reconciled transaction is voided with a reversing journal entry.	The transaction stays reconciled and matched or user-cleared. The reversing journal entry appears on the To Be Matched subtab.	If there's a matching imported bank line, match it. Otherwise, clear the reversing entry. After that, submit and reconcile.
A reconciled transaction is voided without a reversing journal entry.	NetSuite sets the transaction's amount to zero. If it was matched, it becomes unmatched and unreconciled (with any in the group). If it was cleared, it becomes unreconciled and loses cleared status.	On the To Be Matched subtab, mark the voided transaction as cleared, and then submit and reconcile it.

Scenario	Result	Action Required
	 Note: Unmatched or cleared transactions removed move to the To Be Matched subtab.	 Warning: Do not match the voided transaction. If the voided transaction had a matching bank line, match it to a valid account transaction, submit, and reconcile. To create a match group, do one of the following: ■ Match an existing account transaction or transactions to the corresponding imported bank line associated with the voided transaction. ■ Create a new account transaction or transactions and match to the imported bank line associated with the voided transaction.
A reconciled transaction is deleted.	If the transaction was matched, the transaction becomes unmatched and unreconciled (along with any transactions in the match group). If the transaction was marked as cleared, the transaction becomes unreconciled and has its cleared status removed. The deleted transaction is no longer visible anywhere in NetSuite. Any transactions belonging to the same match group move to the To Be Matched subtab.	Match, submit, and reconcile any unmatched transactions that belonged to the same group as the deleted transaction, if needed.  Note: If it was marked as cleared before, you don't need to do anything.

To match transactions, see [Matching Bank Data](#). To mark transactions without matching imported bank lines as cleared, see [Marking Transactions as Cleared](#).

To reconcile transactions, see [Reconciling Transactions](#).

If you are still using the original reconciliation pages, see [Reconciling Bank Statements](#) and [Reconciling Credit Card Statements](#).

Viewing the List of Reconciled Statements

You can view the list of reconciled statements. These only contain the reconciled transactions. For details on reconciling a statement, see [Reconciling Bank and Credit Card Statements](#).

To view unmatched transactions or matched transactions not yet submitted, go to Transactions > Bank > Match Bank Data. For details, see [Matching Bank Data](#).

To view unreconciled transactions, go to Transactions > Bank > Reconcile Account Statement.

Important: A transaction becomes unmatched or unreconciled (or loses cleared status) if you do any of the following:

- Edit the transaction amount.
- Void the transaction without a reversing journal entry. If you void the transaction with a reversing journal entry, the transaction remains reconciled.
- Delete the transaction.

If it was matched before, any other transactions in the same match group also become unmatched and unreconciled.

For troubleshooting information, see [Troubleshooting Reconciliation Issues](#).

To view reconciled statements:

1. Go to Transactions > Bank > Reconcile Account Statement > List.
2. To filter the list on the Reconciled Statements page:
 - From the **Filter By Account** dropdown list, select the appropriate account.
 - To sort by column, click the column header.

Deleting Reconciled Statements

If you reconcile a statement and then get more transactions you want to include, you can delete the reconciled statement and start over.

When you delete a statement, its transactions become unreconciled but stay matched and submitted. You can't generate reconciliation reports for that period anymore.

You can only delete the latest statement, whether it's reopened or closed. To delete an earlier one, delete the most recent statements first.

To delete a statement:

1. Go to Transactions > Bank > Reconcile Account Statement > List.
2. To filter the list on the Reconciled Statements page:
 - From the **Filter By Account** dropdown list, select the appropriate account.
 - To sort by the date column, click the **Date** column header.

Tip: Because you can only delete the latest statement, sort the date column by descending order, to see the latest statement row at the top of the page.

3. In the row of the statement you want to delete, click **Delete**.
NetSuite displays the confirmation popup window.
4. Click **OK**.
On the Reconciled Statements page, the statement is no longer listed.
The transactions from the deleted statement are now unreconciled, but still matched.

To create a new reconciliation, see [Reconciling Bank and Credit Card Statements](#).

Account Reconciliation Reports

You can view the Bank Register, Reconciliation Summary, Reconciliation Details, and Reconciliation History reports for reconciled statements.

- To view the Bank Register report for an account, go to Reports > Banking/Budgeting > Bank Register. See [Bank Register Report](#).
- To view the Reconciliation Summary report for an account, go to Reports > Banking/Budgeting > Reconciliation. If you're on the Reconcile Account Statement page and have selected an account, click **Reconciliation Summary** in the top-right corner. See [Reconciliation Summary Report](#).
- To view the Reconciliation Detail report for an account, go to Reports > Banking/Budgeting > Reconciliation > Detail. See [Reconciliation Detail Report](#).
- To view previous reconciliations (Reconciliation History report):
 - If your account uses the redesigned reconciliation pages, go to Transactions > Bank > Reconcile Account Statement. Select an account and then click **Reconciliation History Report** in the top-right corner of the page.
 - If your account uses the original reconciliation pages, go to Transactions > Bank > Reconcile Bank Statement or Transactions > Bank > Reconcile Credit Card Statement. Then, click **History**.

For more information, see [Reconciliation History Report](#).

Print your reconciliation report before you reconcile another account because you can't recapture the same information.

To print the report, click the print icon at the bottom of the page. For details on exporting, see the help topic [Exporting Reports, Searches, and Lists](#).

Bank Register Report

The Bank Register report lists all transactions for a specific bank account, such as checking, savings, or petty cash. Use it to view transactions. You can click a row to see the source transaction. The report is view-only.

All cash accounts are treated as bank accounts in NetSuite, even if you don't keep real money there. For example, you might use a bank account to track petty cash and record withdrawals or payments as line items for easier tracking.

To view the Bank Register report:

Go to Reports > Banking/Budgeting > Bank Register.

A message appears indicating that your report is loading. The status bar in the footer of the report indicates the progress as your report loads. You can click Cancel Report next to the status bar to stop the report from loading.

The report includes the following:

- Account – Bank account number and name
- Number – Transaction number or reference
- Payee – Person or company

- Account – Financial account affected by transaction
- Deposit – Amount of deposit
- Payment – Amount of withdrawal or payment
- Balance – Previous balance amount plus or minus the transaction amount

You can customize the report to add fields or change the layout, but you can't customize the check register.

To print the report, click the print icon at the bottom of the page. For details on exporting, see the help topic [Exporting Reports, Searches, and Lists](#).

To change the bank account for the Bank Register report:

1. Go to Home > Set Preferences.
2. In the Reporting section of the **Analytics** subtab, select the bank account you want to view in the **Default Bank Account** field.

Reconciliation Summary Report

The Reconciliation reports displays cleared and outstanding transactions for the account you choose.

The Reconciliation Summary report summarizes your reconciliation and displays balances for each item. In addition to reconciled and unreconciled items, included are:

- Balances for transactions with no prior reconciliation history
- Totals of your cleared and outstanding transactions during the time period
- Difference between all reconciled balances and the unreconciled balance
- Previous bank balances
- Ending bank balance
- Current reconciled balance
- Reconciled balance as of a specific date

You can only view this report after you've reconciled the bank account in NetSuite with either the new or original reconciliation pages. For details on using the redesigned reconciliation pages, see [Reconciling Bank and Credit Card Statements](#). For details on using the original reconciliation pages, see [Reconciling Bank Statements](#) and [Reconciling Credit Card Statements](#).

This report is critical for companies that need a paper trail for accurate and complete data.

Note: Transactions cleared but not yet reconciled appear on Reconciliation Summary reports under the appropriate heading.

Print your Reconciliation report before you reconcile another account because you can't recapture the same information.

To print the report, click the print icon at the bottom of the page. For details on exporting, see the help topic [Exporting Reports, Searches, and Lists](#).

To view the Reconciliation Summary report:

Go to Reports > Banking/Budgeting > Reconciliation. If you're on the Reconcile Account Statement page and have selected an account, you can click **Reconciliation Summary** in the top-right corner.

A message appears indicating that your report is loading. The status bar in the footer of the report indicates the progress as your report loads. You can click **Cancel Report** next to the status bar to stop the report from loading.

Note: This report does not support reporting by period even when the Report by Period preference is set to All Reports. You can configure the Report by Period preference at Home > Set Preferences, in the **Analytics** subtab.

Reconciliation Detail Report

The Reconciliation Detail report lists reconciled (cleared and uncleared) items for a bank account for the chosen statement period.

Note: You can customize the report to remove columns you don't want to see in print. Removing columns helps if your report looks crowded.

For the statement period, the report organizes and lists transactions by type, date, number, entity, memo, and balance, using data from the reconciliation page.

- **Reconciled** – Lists all the cleared and reconciled transactions, grouped into subcategories (Deposits and Other Credits, Checks and Payments), along with category totals.
- **No Previous Reconciled Balance** – Only appears if there is no previous reconciled balance for the selected account and statement date, instead of Last Reconciled Balance, and displays a zero balance total.
- **Last Reconciled Statement Balance - <date>** – Balance of the last reconciled statement for this account. This field is only available if this is not your first reconciled statement.
- **Current Reconciled Balance** – Difference between Last Reconciled Statement Balance and Total - Reconciled.
- **Reconcile Statement Balance - <date>** – Closing balance for the statement.
- **Difference** – Difference between Current Reconciled Balance and Reconcile Statement Balance.
- **Unreconciled** – List of all transactions that are in the system but are not reconciled or reflected in your statement.

You can see this report only after you've reconciled that bank account in NetSuite with either the redesigned or original reconciliation pages. For details on using the redesigned reconciliation pages, see [Reconciling Bank and Credit Card Statements](#). For details on using the original reconciliation pages, see [Reconciling Bank Statements](#) and [Reconciling Credit Card Statements](#).

This report is critical for companies that need a paper trail to show data is accurate and complete.

For details on reconciling, see [Reconciling Bank Statements](#).

Note: Transactions cleared but not yet reconciled appear on Reconciliation Detail reports under the appropriate heading.

Print your Reconciliation report before reconciling another account because you can't recapture the same information.

To print the report, click the print icon at the bottom of the page. For details on exporting, see the help topic [Exporting Reports, Searches, and Lists](#).

To see a Reconciliation Detail report:

1. Go to Reports > Banking/Budgeting > Reconciliation > Detail.
2. From the **Account** dropdown list, select the account for which you want to see a report.
3. From the **Statement Date** dropdown list, select the statement date for which you want to see a report.
4. Click **Refresh**.
NetSuite loads and displays your report.

Note: This report does not support reporting by period even when the Report by Period preference is set to All Reports. The Report by Period preference can be configured at Home > Set Preferences, the Analytics subtab.

Reconciliation History Report

The Reconciliation History report lists completed reconciliations for a bank account in a given date range. Use it to view statement balances, link to detail reports, and track history for audits. This report is critical for companies that need a paper trail for accurate and complete data.

For each reconciliation, the report displays the statement date, bank account, statement balance, amount reconciled for this statement, previous reconciled balance, and any differences.

Note: Transactions cleared but not yet reconciled don't appear on Reconciliation History reports. Reconciliation History reports only display reconciled items.

This report only shows completed, saved bank reconciliations, and you can't open it from the Reports menu.

To view the Reconciliation History report:

1. Go to Transactions > Bank > Reconcile Account Statement. If your account uses the original reconciliation pages, go to Transactions > Bank > Reconcile Bank Statement or Transactions > Bank > Reconcile Credit Card Statement.
2. From the **Account** dropdown list, select the appropriate account.
3. Click **Reconciliation History Report** in the top-right corner. If you are on the Reconcile Bank Statement or Reconcile Credit Card Statement page, click **History**.
A message appears indicating that your report is loading. The status bar in the footer of the report indicates the progress as your report loads. You can click **Cancel Report** next to the status bar to stop the report from loading.
4. To print the report, click the print icon at the bottom of the page. For details on exporting, see the help topic [Exporting Reports, Searches, and Lists](#).

Note: This report does not support reporting by period even when the Report by Period preference is set to All Reports. The Report by Period preference can be configured at Home > Set Preferences, the Analytics subtab.

Troubleshooting Reconciliation History Reports

Note: This topic is only applicable if your account uses the Reconcile Bank Statement and Reconcile Credit Card Statement pages.

Reconciliation History reports only display reconciled items.

Transactions cleared in a register, but not reconciled, appear on Reconciliation Summary and Reconciliation Detail reports, but not in Reconciliation History reports.

The register lets you manually mark a transaction as cleared, but doesn't assign a statement date. These transactions won't appear in the report, because reconciliation reports track by statement date.

Bank Account Reconciliation and Reporting

Reconcile your bank statement against your bank account register to keep your NetSuite account accurate. You can also enter new transactions while reconciling. If you begin but want to finish your reconciliation later, NetSuite preserves the reconciliation until you resume at a later time.

Note: This is the original reconciliation feature, which is no longer supported as of NetSuite 2021.1. A redesigned version of bank data matching and statement reconciliation is available, which enables you to match and reconcile account transactions without requiring Microsoft Excel or third-party tools. For details, see [Bank Data Matching and Reconciliation](#).

If you have accounts that still use the original reconciliation feature, you can edit your accounts to use the redesigned feature. See [Editing Accounts to Use the Match Bank Data and Reconcile Account Statement Pages](#).

Information on bank account reconciliation in this topic includes:

- [Reconciling Bank Statements](#)
- [Entering Transactions While Reconciling](#)
- [Completing a Reconciliation at a Later Time](#)
- [Deleting a Reconciliation](#)
- [Printing Reconciliation Reports](#)
- [Bank Register Report](#)
- [Reconciliation Summary Report](#)
- [Reconciliation Detail Report](#)
- [Reconciliation History Report](#)

Reconciling Bank Statements

Note: This is the original reconciliation feature, which is no longer supported as of NetSuite 2021.1. A redesigned version of bank data matching and statement reconciliation is available, which enables you to match and reconcile account transactions without requiring Microsoft Excel or third-party tools. For details, see [Bank Data Matching and Reconciliation](#).

If you have accounts that still use the original reconciliation feature, you can edit your accounts to use the redesigned feature. See [Editing Accounts to Use the Match Bank Data and Reconcile Account Statement Pages](#).

Reconcile your bank statement against your bank account register to keep your NetSuite account accurate.

If the items have cleared the bank, but do not yet appear on a statement, you can manually mark transactions as cleared in the check register. Go to Reports > Financial > Chart of Accounts. Click the name of the account. Check the box in the Clr column if a transaction is cleared, but not yet reconciled. A manually cleared transaction is not associated with a statement date and does not appear on a Bank

Reconciliation Report. The account register shows if a cleared transaction is reconciled and identifies the reconciliation date. Transactions that require reconciliation have a Reconcile link in the Reconcile column.

Note: If the Clr column contains YES or NO instead of a check box, the account is using the redesigned version of transaction matching and statement reconciliation. To clear transactions, you must go to the Match Bank Data page. For details, see [Bank Data Matching and Reconciliation](#) and [Reconciling Bank and Credit Card Statements](#).

Checks written in a previous month that are not cleared display on the Reconcile Bank Statement page on the Deposits and Credits subtab. Until these checks are cleared they do not appear on a Bank Reconciliation Report.

For information about reconciling transactions that were previously reconciled and subsequently canceled, see [Troubleshooting Reconciliation History Reports](#).

If you void a check, reconcile the voiding journal entry. For details on voiding checks, see [Voiding a Check](#).

If you change the amount of a previously reconciled transaction, the transaction becomes unreconciled again. Open the correct statement period for the transaction and reconcile the transaction again.

Note: If you change the account of the transaction, the transaction does not become unreconciled.

Transfers to and from bank accounts appear on your bank statement as other transactions and are reconciled in the same method. Enter deposits and credits, and checks and payments as required.

When you reconcile a bank account, all reconciled transactions are automatically marked cleared. To close a period, not all transactions have to be reconciled.

Tip: You can remove the cleared status from a transaction through the register for the bank account. Click Actions, then click Go To Register. On the account register, locate the transaction and clear the Clr box.

If the Clr column contains YES or NO instead of a check box, the account is using the redesigned version of transaction matching and statement reconciliation. To clear transactions, you must go to the Match Bank Data page. For details, see [Bank Data Matching and Reconciliation](#) and [Reconciling Bank and Credit Card Statements](#).

Note: International users may be required to use alternative methods for reconciling bank statements. For example, you might be required to make adjustments to accommodate special taxes on new transactions such as the Goods and Services Tax (GST) in Australia. For more information, see the help topic [Tax Accounting Overview](#).

You can begin an account reconciliation and then resume at a later time. NetSuite preserves the reconciliation until you return to save it or save and print it. For more information, see [Completing a Reconciliation at a Later Time](#).

For permissions to reconcile bank statements, see the help topic [Standard Roles Permissions Table](#).

To reconcile custom transactions, go to Accounting Preferences and then check the **Show All Transaction Types In Reconciliation** box. See the help topic [General Accounting Preferences](#).

To reconcile your bank statement:

1. Go to Transactions > Bank > Reconcile Bank Statement.

2. In the **Account** field, select the bank account you are reconciling.

If your account does not appear, on your account record, you need to clear the **Use Match Bank Data and Reconcile Account Statement Pages** box (see the help topic [Editing an Account](#)). As of NetSuite 2021.1, this box is automatically checked for newly-created accounts.

Warning: The Reconcile Bank Statement and Reconcile Credit Card Statement pages are no longer supported and will be removed in the future. For information about the redesigned reconciliation feature, see [Bank Data Matching and Reconciliation](#).

The selected bank account determines the default subsidiary and currency. This filters the open transactions at the line level.

Note: If you enter transactions and then change bank accounts, NetSuite changes the currency and subsidiary and clears all line item transactions.

The **Last Reconciled Balance** field provides the balance of this account from the last time you reconciled your bank statement.

3. In the **Statement Date** field, enter or pick the date of the statement.
4. In the **Start Date** field, enter the beginning of the reconciliation period. Unreconciled transactions before this date do not display on the subtabs.
5. In the **Ending Statement Balance** field, enter the closing balance on the statement.

The **Reconciled This Statement** and **Difference** fields update as you check the reconcile box next to transactions.

The **Difference** field displays the amount that you must reconcile; when the difference is zero, reconciliation is complete.

NetSuite calculates the **Difference** field amount by subtracting the combined amounts of the **Last Reconciled Balance** and **Reconciled This Statement** from the **Ending Statement Balance**.

Tip: You can specify the number of items that display on the page at Home > Set Preferences > General > Number of Rows in List Segments.

Deposits and Credits

1. Click the **Deposits and Credits** subtab.

This subtab shows deposits and credits to be reconciled.

A **Yes** shows in the **Cleared** column for all transactions that have been marked as cleared through the bank on the account register.

If you use NetSuite OneWorld, note that only transactions for the subsidiary associated with the bank account are listed.

2. Check the boxes next to the transactions you want to reconcile.

As you check transactions, the **Reconciled This Statement** field is updated, and the total of those transactions shows on the **Deposits and Credits** subtab.

- To reconcile all deposits and credits, click **Mark All**.
- If you mark bank transactions as **Cleared** on an ongoing basis, when you open a reconciliation you can click **Mark All Cleared to Reconcile**, which updates all transactions already cleared to be marked for reconciliation. Then, each transaction does not need to be marked individually.

 **Note:** Click the **Date** or **Tran No.** links to view the original transaction. Click the **Payor** link to view the entity record.

Checks and Payments

1. Click the **Checks and Payments** subtab.

This subtab shows checks and payments that need to be reconciled. Credit card refund transactions also show on this subtab.

A **Yes** shows in the **Cleared** column for all transactions that have been marked as cleared through the bank on the account register. Transactions must be both cleared and reconciled to close out a period.

If you use NetSuite OneWorld, note that only transactions for the subsidiary associated with the bank account are listed.

2. Check the boxes next to the transactions you want to reconcile.

As you check transactions, the **Reconciled This Statement** field is updated, and the total of those transactions shows on the subtab.

- To reconcile all checks and payments, click **Mark All**.
- If you mark bank transactions as **Cleared** on an ongoing basis, when you open a reconciliation you can click **Mark All Cleared to Reconcile**, which updates all transactions that are already cleared to be marked for reconciliation. Then, each transaction does not need to be marked individually

 **Note:** Click the **Date** or **Check No.** links to view the original transaction. Click the **Payee** link to view the entity record.

New Charges

1. Click the **New Charges** subtab.
2. Fill in the appropriate information for a reconciled charge, and then click **Add**.

You can enter a charge with a date after the statement date for the reconciliation, and the charge remains reconciled with this statement.

If you use NetSuite OneWorld, note the following:

- **Payee** (vendor or other entity) must be associated with the same subsidiary as the bank account.

 **Note:** If you have shared vendors and customers with multiple subsidiaries and this subsidiary is a secondary subsidiary to one or more shared entities, the **Payee** field lists all of the entities to which this subsidiary is assigned. Selecting a shared entity payee enables you to enter line items for all of the entity's open transactions as well as the open transactions belonging to this subsidiary. For more information about shared records, see the help topics [Assigning Subsidiaries to a Vendor](#) and [Assigning Subsidiaries to a Customer](#).

- **Accounts** are restricted to non-bank accounts associated with the same subsidiary and currency as the selected bank account.
- Only classes, departments, and locations associated with the same subsidiary as the bank account are available.

3. Repeat this process for each reconciled charge.

An example of an other charge is your bank service charge.

As you add transactions, the Reconciled This Statement field is updated, and the total of all the other charges is shown on the subtab.

New Deposits

1. Click the **New Deposits** subtab.
2. Fill in the appropriate information for the deposit, and then click **Add**.

You can enter a deposit with a date after the statement date for the reconciliation, and the deposit remains reconciled with this statement.

An example of an other income is the interest your bank pays you.

If you use NetSuite OneWorld, note the following:

- **Payor** (vendor, customer, or other entity) must be associated with the same subsidiary as the bank account.

 **Note:** If you have shared vendors and customers with multiple subsidiaries and this subsidiary is a secondary subsidiary to one or more shared entities, the **Payor** field lists all of the entities to which this subsidiary is assigned. Selecting a shared entity payor enables you to enter deposits for the entity as well as this subsidiary.

- **Accounts** are restricted to non-bank accounts associated with the same subsidiary and currency as the selected bank account.
- Only classes, departments, and locations associated with the same subsidiary as the bank account are available.

As you add transactions, the **Reconciled This Statement** field is updated, and the total of all the other charges is shown on the subtab.

3. Repeat this process for each reconciled deposit.

 **Note:** When you have cleared all the transactions listed on the statement and entered any additional charges or deposits, the **Ending Statement Balance** should equal the **Reconciled This Statement** balance plus the **Last Reconciled Balance**. Use the **Difference** field to track your progress in matching these balances.

When finished, choose one of three options:

- Click **Save** to reconcile your bank statement.
- Click **Save & Print** to save and print your reconciliation.
- Click **Complete Later** to save your reconciliation until you return to submit or print it.

To view your previous reconciliations, go to Transactions > Bank > Reconcile Bank Statement. Click **History**.

Entering Transactions While Reconciling

When reconciling your bank or credit card statement, you can enter new transactions that are not previously recorded. For example, enter bank service charges and then reconcile your bank statement for that transaction.

Note: You can enter new charges and credits that have dates later than the statement date you are using for the reconciliation. These charges and credits remain reconciled to the statement.

To enter new transactions while reconciling a bank statement:

1. Go to Transactions > Bank > Reconcile Bank Statement.
2. Select the transactions you want to reconcile on the **Deposits and Credits** or **Checks and Payments** subtabs.
3. Click the **New Charges** subtab.
4. Fill in the appropriate information for the new charge transaction, and click **Add**.
5. Click the **New Deposits** subtab.
6. Fill in the appropriate information for the new deposit transaction, and click **Add**.
7. When you have finished, choose one of three options:
 - Click **Save & Print** to save and print your reconciliation.
 - Click **Save** to reconcile your bank statement.
 - Click **Complete Later** to save your reconciliation until you return to submit or print it.

For more information, see [Bank Account Reconciliation and Reporting](#).

To enter new transactions while reconciling a credit card statement:

1. Go to Transactions > Bank > Reconcile Credit Card Statement.
2. Select the transactions you want to reconcile on the **Payments and Credits** or **Charges and Cash Advances** subtabs.
3. Click the **New Charges** subtab.
4. Fill in the appropriate information for the new charge transaction, and click **Add**.
5. Click the **New Credits** subtab.
6. Fill in the appropriate information for the new credit transaction, and click **Add**.
7. When you have finished, choose one of three options:
 - Click **Save & Print** to save and print your reconciliation.
 - Click **Save** to reconcile your bank statement.
 - Click **Complete Later** to save your reconciliation until you return to submit or print it.

For more information, see [Reconciling Credit Card Statements](#).

Completing a Reconciliation at a Later Time

You can begin an account reconciliation and then resume at a later time. NetSuite preserves the reconciliation until you return to save it or save and print it.

To preserve a reconciliation for completion at a later time, make note of the date in the Statement Date field, then click Complete Later on the Reconcile Bank Statement or Reconcile Credit Card Statement page. When you resume the reconciliation for the bank or credit card account, enter the noted date in the Statement Date field, if necessary. The transactions that were originally marked reconciled are also marked cleared. In the Reconcile column, continue reconciling transactions. When you complete the reconciliation, click Save or Save & Print. You can also click Complete Later if you must again resume reconciliation at a later time.

Important: You can preserve **only one** reconciliation for completion at a later time. When you go back to Transactions > Bank > Reconcile Bank Statement or Transactions > Bank > Reconcile Credit Card Statement, the preserved reconciliation reappears. If you make changes to the preserved reconciliation including changes to dates and then click Complete Later again, NetSuite deletes the previously preserved reconciliation and replaces it with the updated reconciliation. **If you change the account from that of the preserved account reconciliation, NetSuite displays a message indicating that the preserved reconciliation is erased and all work is lost.**

Be aware that transactions marked reconciled are **not** reconciled until you save the reconciliation, even though the transactions in the account register show the Reconciled Date as the noted date from the Statement Date field on the Reconcile Account Statement page.

Deleting a Reconciliation

Important: This topic pertains to the original reconciliation feature, which is no longer supported as of NetSuite 2021.1. If you want to delete a reconciled statement on the redesigned Reconcile Account Statement page, see [Deleting Reconciled Statements](#).

For more information on the Reconcile Account Statement page, see [Bank Data Matching and Reconciliation](#).

After completing a bank or credit card statement reconciliation, you can delete the reconciliation. For example, if you discover that a statement contains an error such as an incorrect date, you can delete the reconciliation and then enter a new one.

To delete a statement reconciliation:

1. Depending on the type of statement you need to delete, do one of the following:
 - For bank statements, go to Transactions > Bank > Reconcile Bank Statement.
 - For credit card statements, go to Transactions > Bank > Reconcile Credit Card Statement.
2. Enter the date of the reconciled statement.
This is the date from the **Statement Date** field.
3. From the **Actions** menu, click **Delete**.
You are prompted to confirm deletion of the reconciliation.
4. Click **OK** to confirm the deletion.

Note: Previously cleared transactions remain **Cleared** on the bank or credit card account register even if the reconciliation is deleted.

To verify that a reconciliation was deleted, go to Reports > Banking/Budgeting > Reconciliation. Confirm that the statement date is no longer available in the report.

Warning: Although you can edit a previously saved reconciliation statement, you should delete the statement and create a new one. Editing a previously saved reconciliation statement can cause future reconciliation imbalances.

Printing Reconciliation Reports

In NetSuite, you can print your current and previous bank and credit card statement reconciliation reports.

To change the width of one column, drag the boundary on the right side of the column heading until the column is the preferred width.

To print a bank statement reconciliation report:

1. Go to Transactions > Bank > Reconcile Bank Statement.
2. To print your current statement:
 - a. Click **Save & Print**.
The Reconciliation Detail report appears.
 - b. Click the print icon to print the report.
3. To print a previous statement:
 - a. On the Reconcile Bank Statement page, click **History**.
The Reconciliation History report appears.
 - b. Select a bank statement reconciliation. Change the date range, if needed, to find the reconciliation.
The Reconciliation Detail report appears.
 - c. Click the print icon to print the report.

To print a credit card statement reconciliation report:

1. Go to Transactions > Bank > Reconcile Credit Card Statement.
2. To print your current statement:
 - a. Click **Save & Print**.
The Reconciliation Detail report appears.
 - b. Click the print icon to print the report.
3. To print a previous statement:
 - a. On the Reconcile Credit Card Statement page, click **History**.
The Reconciliation History report appears.
 - b. Select a credit card statement reconciliation. Change the date range, if needed, to find the reconciliation.
The Reconciliation Detail report appears.
 - c. Click the print icon to print the report.

For information about account reconciliation reports, see [Account Reconciliation Reports](#).

Bank Feeds SuiteApp

Important: Not every financial institution connection experience is the same and not all financial institutions can be accessed, or accessed reliably, using the Bank Feeds SuiteApp. Several factors may affect whether the Bank Feeds SuiteApp can connect to your financial institutions, including factors outside of NetSuite's control.

Also, the Bank Feeds SuiteApp only supports certain bank or payment accounts. Selecting an unsupported account type such as a loan, mortgage, or investment may not work with your bank feeds setup.

To see what you need to know before using the Bank Feeds SuiteApp to connect to your financial institution, see the **Important Things to Note** section of [Setting Up Bank Feeds Integration](#).

The Bank Feeds SuiteApp enables you to automate the transfer of your bank data from certain financial institution accounts into NetSuite. The SuiteApp uses the Financial Institution Connectivity Plug-In and an authorized account information service provider to securely access your online financial institution data.

Watch the following video for a brief overview of the Bank Feeds SuiteApp:

[Bank Feeds SuiteApp Overview](#)

The SuiteApp retrieves bank data daily to ensure that everything in your bank account shows up in NetSuite. It then imports the data into your account to help with bank reconciliation. This process saves you from having to manually import and match your banking data in NetSuite.

This SuiteApp lets you connect to certain financial institutions that operate globally, and some that are country-specific. For some connected financial institutions, the SuiteApp enables you to:

- Receive cleared and processed bank transactions daily from your financial institution accounts
- Automate the import of bank transactions and account balances daily from your financial institution accounts into NetSuite
- Manually start a real-time import of your bank transactions and account balances into NetSuite

Supported Financial Institution Account Types

The account types that the Bank Feeds SuiteApp support depends on several factors, including which country your financial institution is in. Refer to the following table for a list of supported account types.

U.S. and Canada	PSD2 Regulated Countries Within Europe	Non-PSD2 Regulated Countries Within Europe	Other Countries (New Zealand, Philippines, Singapore, and Thailand)
Credit Card	Payment Accounts (Credit Card, Debit Card, and Ewallet)	Payment Accounts (Credit Card, Debit Card, and Ewallet)	Payment Accounts (Credit Card, Debit Card, and Ewallet)
Checking and Savings	Bank Deposit Accounts (Savings and Checking)	Bank Deposit Accounts (Savings and Checking)	Bank Deposit Accounts (Savings and Checking)

The SuiteApp connects to your financial institution through either of the following, depending on your financial institution's requirements:

- **Simple login** – Enter your username and password to connect to your financial institution.
- **Multifactor authentication (MFA)** – In addition to your username and password, you'll need to provide authentication information, like a one-time password or two-factor authentication (2FA), to confirm your identity.

Read the following topics to learn more about the Bank Feeds SuiteApp:

- [Installing the Bank Feeds SuiteApp](#)
- [Roles and Permissions for Bank Feeds](#)
- [Limitations of Using the Bank Feeds SuiteApp](#)
- [Setting Up Bank Feeds Integration](#)
- [Bank Feeds Data Import](#)
- [Bank Feeds SuiteApp FAQ](#)

Installing the Bank Feeds SuiteApp

This section includes the prerequisites and instructions for installing the Bank Feeds SuiteApp.

Prerequisites

Before you install the Bank Feeds SuiteApp, go to Setup > Company > Setup Tasks > Enable Features, and then click the SuiteCloud tab. Make sure that the following features are enabled on your account:

- Custom Records
- Client SuiteScript
- Server SuiteScript

Before you use the SuiteApp, make sure that the bank accounts that you want to connect are set up for online banking.

You must also enable popups in your browser so the configuration window can open during bank feeds setup.

Installation

Any role with access to the SuiteApp Marketplace in NetSuite can install the Bank Feeds SuiteApp. For more information about the SuiteApp Marketplace, see the help topic [SuiteApp Marketplace in NetSuite](#).

To install the Bank Feeds SuiteApp:

1. Go to SuiteApps.

Note: The SuiteApps menu is not available for the following centers:

- Advanced Partner Center
- Customer Center
- Employee Center
- Partner Center
- Support Center
- Vendor Center

2. In the **Search SuiteApps** field, enter **Bank Feeds**, then press enter.

3. Click the Bank Feeds SuiteApp tile.
4. Go to the top right area of the Bank Feeds SuiteApp details page and click **Install**.

For more information about installing a SuiteApp from the SuiteApp Marketplace, see the help topic [Installing from the SuiteApp Marketplace](#).

Note: Starting NetSuite 2021.1, you can uninstall the SuiteApp even if you've already set up bank feeds integration. After you uninstall the SuiteApp, NetSuite does the following:

- Removes the connectivity and parser plug-in from the format profiles set up by the Bank Feeds SuiteApp. The **Connectivity Method** field in the format profiles changes to Manual Import, and the **Transaction Parser** field is cleared.
- Inactivates the format profiles set up by the Bank Feeds SuiteApp. To reactivate the format profiles, you'll need to select a new parser plug-in for each record. See [Modifying Format Profiles](#). If you no longer need a format profile, you should delete it. See [Deleting a Format Profile](#).

The Bank Feeds SuiteApp is a managed SuiteApp that's automatically updated whenever new features or enhancements are added.

Roles and Permissions for Bank Feeds

Only roles with Administrator access or a custom role with Financial Institution Records permission can set up bank feeds integration.

To access the Bank Feeds Format Profile pages and import transactions using custom roles, you must set the following permissions:

Subtab	Permission	Level
Lists	Certificate Access	View
Lists	Custom Record Entries	Create
Lists	Documents and Files	View
Setup	Custom Lists	View

For a list of permissions you need to access the necessary records and forms to use Bank Feeds, see [Permissions for Banking Features](#).

Limitations of Using the Bank Feeds SuiteApp

Important: Not every financial institution connection experience is the same and not all financial institutions can be accessed, or accessed reliably, using the Bank Feeds SuiteApp. Several factors may affect whether the Bank Feeds SuiteApp can connect to your financial institutions, including factors outside of NetSuite's control.

Also, the Bank Feeds SuiteApp only supports certain bank or payment accounts. Selecting an unsupported account type such as a loan, mortgage, or investment may not work with your bank feeds setup.

To see what you need to know before using the Bank Feeds SuiteApp to connect to your financial institution, see the **Important Things to Note** section of [Setting Up Bank Feeds Integration](#).

When you use the Bank Feeds SuiteApp, keep in mind the following limitations:

- You can only connect to financial institutions in the following countries with the Bank Feeds SuiteApp:
 - Canada
 - Countries in Europe (includes United Kingdom)
 - New Zealand
 - Philippines
 - Singapore
 - Thailand
 - United States

For the list of supported financial institutions, see [Supported Financial Institutions for Bank Feeds SuiteApp](#).

- The Bank Feeds SuiteApp supports NetSuite's Multi-Language feature, but there are some limitations depending on your format profile configuration.
 - **Bank Feeds Configuration for U.S. and Canada (Yodlee and MX)** – The setup on the popup window of these format profiles only supports English.
 - **Bank Feeds Configuration for Europe (PSD2 and Non-PSD2 Regulated) and Other Countries** – The setup under the Connectivity Configuration subtab and in the popup window of these format profiles support the Multi-Language feature. However, some legal terms and financial institution websites don't support all NetSuite user interface languages. In this case, some text will remain in English or the website's respective language.
- Manual initiation of bank data import is only allowed every 60 minutes. For example, NetSuite won't import data from the same format profile twice within a 60-minute period.

U.S. and Canada Bank Feeds Integration

When you set up the U.S. and Canada bank feeds in NetSuite, the SuiteApp is mainly designed to cater to small and medium-sized companies only.

You have two format profile options for connecting to banks in the U.S. and Canada:

- **U.S. and Canada Accounts (Yodlee) Format Profile** – This format profile lets you have up to 20 accounts (of any type), 10,000 transactions, or a combination of both per unique login credential for a financial institution.

If you connect to a financial institution with more than these limits per unique login credential, you may experience slower performance or time out errors.

If you have more than 20 accounts under one login and need to connect them all to NetSuite, ask your bank to split access across multiple credentials. For example, if you have 30 accounts in one bank, a good setup would be three bank login credentials with 10 accounts each.

 **Note:** Starting with version 22.1.0, the maximum 20 accounts limitation doesn't apply if you're connecting to a financial institution that uses open banking technology. However, it's best to keep each import under 10,000 transactions to maintain performance.

- **U.S. and Canada Accounts (MX) Format Profile** – This format profile has higher limits, so you can pull data from up to 100 accounts with a maximum of 25 credentials. The AISP for this format profile also supports more banks and financial institutions using Open Authorization (OAuth) technology. This means you get more stable and secure connections, and you won't have to reauthorize as often.

To avoid performance degradation, don't set up a bank data import with more than 10,000 transactions.

If the financial institution you want to connect exceeds the current limit, you should use the following SuiteApps instead:

- [Auto Bank Statement Import SuiteApp](#)
- [Bank Statement Parsers SuiteApp](#)

Europe and Other Countries Bank Feeds Integration

The SuiteApp lets you connect up to 100 financial institutions and link 450 accounts across all your financial institution connections.

 **Important:** The authorized Account Information Service Provider (AISP) of NetSuite takes up to 20 minutes to retrieve bank data from a financial institution. However, the response time of a financial institution can affect the bank data retrieval process.

For example, when the financial institution takes more than 20 minutes to send bank and credit card information to the AISP. You may see import errors or miss some transactions in NetSuite because the retrieval took too long.

To avoid performance degradation, don't set up a bank data import with more than 10,000 transactions. If an import reaches the transaction limit, the rest of the transactions are imported during the next scheduled or manually started import. To start a manual bank transaction import, see [Updating Imported Bank Feeds Data](#).

Setting Up Bank Feeds Integration

When you install the Bank Feeds SuiteApp, the following records are automatically added to your NetSuite account:

- **Bank Feeds** – A preinstalled financial institution record that's locked and can't be modified.
- **U.S. and Canada Accounts (Yodlee)** – A preinstalled format profile record where you can set up your bank feeds for financial institutions in the United States and Canada.
- **U.S. and Canada Accounts (MX)** – A preinstalled format profile record where you can set up your bank feeds for financial institutions operating in the United States and Canada. This format profile uses MX Technologies, Inc. as the authorized AISP.
- **Regulated Europe Accounts (Salt Edge)** – A preinstalled format profile record where you can set up your bank feeds for financial institutions for PSD2-regulated financial institutions in Europe. The revised Payment Services Directive (PSD2) is the regulation for payment systems in Europe, and this is the preferred profile when connecting to European banks financial institutions.

- **Nonregulated Europe Accounts (Salt Edge)** – A preinstalled format profile record where you can set up your bank feeds for European financial institutions that aren't regulated by PSD2.
- **Accounts in Other Countries (Salt Edge)** – A preinstalled format profile record where you can set up your bank feeds for financial institutions in New Zealand, Philippines, Singapore, and Thailand.

These SuiteApp components let NetSuite connect directly to your financial institutions and retrieve bank data.

You can access the preinstalled records through the Setup Manager (Setup > Accounting > Financial Institution > List). For more information about Financial Institution and Format Profile Records, see [Financial Institution Records](#).

Important: Only the preinstalled records can be used with the Bank Feeds SuiteApp. Using a custom financial institution and format profile is not allowed and will result to an error during setup.

To set up your bank feeds, first connect your NetSuite account to your financial institution using an authorized Account Information Service Provider (AISP). When the connection is established, all your bank and credit card accounts with your financial institution are automatically connected to your NetSuite account.

Important Things to Note:

- Not every financial institution connection experience is the same and not all financial institutions can be accessed, or accessed reliably, using the Bank Feeds SuiteApp. Several factors may affect whether the Bank Feeds SuiteApp can connect to your financial institutions, including factors outside of NetSuite's control.
Also, the Bank Feeds SuiteApp only supports certain bank or payment accounts. Selecting an unsupported account type such as a loan, mortgage, or investment may not work with your bank feeds setup.
- Before setting up your bank connection, contact your financial institution to make sure your bank or credit card account is authorized for a bank feed connection.
- NetSuite imports posted transactions only. The system doesn't import any pending transactions are not yet cleared for posting by your financial institution.
- Posting and availability of transactions for importing depends on your financial institution. Some transactions may show up on your financial institution's website, but can't be downloaded until they're completely posted to your account.
- If you notice missing transactions, wait at least 24 hours in case your financial institution's posting schedule and your time zone don't match.
- Some financial institutions in Asia and New Zealand handle pending transactions differently. To avoid duplicate transactions from these financial institutions, the system's AISP waits 3–4 days before updating the transaction status as Posted. This action may cause delays in bank transaction import.

To set up your bank feeds:

1. Connect to your compatible financial institution by configuring the following format profile records for your country.
 - **U.S. and Canada Accounts (Yodlee)** – Edit this format profile record if you're connecting to a financial institution in the United States or Canada through Yodlee. For the steps, see [Connecting a U.S. or Canada \(Yodlee\) Financial Institution to NetSuite](#).
 - **U.S. and Canada Accounts (MX)** – Edit this format profile record if you're connecting to a financial institution in the United States and Canada through MX Technologies. For the steps, see [Connecting a U.S. or Canada \(MX\) Financial Institution to NetSuite](#).

- **Regulated Europe Accounts (Salt Edge)** – Edit this format profile record if you're connecting a regulated financial institution in Europe (including the United Kingdom). You can also use this format profile record to connect financial institutions that operate globally and aren't country specific. For the steps, see [Connecting a Regulated Europe \(Salt Edge\) Financial Institution to NetSuite](#).
 - **Nonregulated Europe Accounts (Salt Edge)** – Edit this format profile record if you're connecting a financial institution in Europe that isn't regulated by PSD2. For the steps, see [Connecting a Nonregulated Europe \(Salt Edge\) Financial Institution to NetSuite](#).
 - **Accounts in Other Countries (Salt Edge)** – Edit this format profile record if you're connecting a financial institution in New Zealand, Philippines, Singapore, or Thailand. You can also use this format profile record to connect financial institutions that operate globally and aren't country specific. . For the steps, see [Connecting a Financial Institution in Other Supported Countries \(Salt Edge\) to NetSuite](#).
2. After you configure the connection to your financial account, you must link the corresponding GL accounts to your bank accounts in NetSuite. For more information, see [Linking Accounts for Financial Institution Connectivity](#).
 3. Click **Save** on the format profile record.

When you finish setting up bank feeds, the automated bank data retrieval and import process starts. You'll see a progress message on the Bank Feeds financial institution record, and you can click the **Track your status** link to check the processing status of your import.

Connecting a U.S. or Canada (Yodlee) Financial Institution to NetSuite

The following procedure describes how to connect one or more compatible financial institutions in the United States or Canada to NetSuite through Yodlee.

Important Things to Note

Before you connect your financial institution to NetSuite, take note of the following:

- Not every financial institution connection experience is the same and not all financial institutions can be accessed, or accessed reliably, using the Bank Feeds SuiteApp. Several factors may affect whether the Bank Feeds SuiteApp can connect to your financial institutions, including factors outside of NetSuite's control.

Also, the Bank Feeds SuiteApp only supports certain bank or payment accounts. Selecting an unsupported account type such as a loan, mortgage, or investment may not work with your bank feeds setup.
- You'll need Administrator access or a custom role with required permissions to set up bank feeds. For more information, see [Roles and Permissions for Bank Feeds](#).
- You must enable popups in your browser so the configuration window can open during bank feeds setup.
- When you're setting up your connection, the Format Profile page session generally expires after 15 minutes. To keep editing your format profile, refresh the page to see the content of your Connectivity Configuration subtab.
- Some financial institutions may require authorization, a PIN, or additional setup before you can connect to NetSuite. Contact your financial institution for assistance.

To connect NetSuite to a financial institution operating in the United States or Canada through Yodlee:

1. Go to Setup > Accounting > Financial Statements > Financial Institution > List.
2. On the Financial Institution page, click **View** next to the **Bank Feeds** financial institution record.
3. On the **Format Profile: Configuration** subtab, click **Edit** next to **U.S. and Canada Accounts (Yodlee)**.
4. On the U.S. and Canada Accounts (Yodlee) Format Profile page, click the **Connectivity Configuration** subtab.
5. If you're connecting to a financial institution for the first time, you'll see the following notices before you can start the configuration:
 - a. **Disclaimer of Warranties and Terms of Use of Oracle** – Read and acknowledge by clicking the **Accept** button at the bottom of the page.
 - b. **Authorized Information Service Provider (AISP) User Agreement of NetSuite** – Read and acknowledge by clicking the **Accept** button at the bottom of the page.
6. Click **Connect New Institution**.
The connection configuration setup popup window appears.
7. In the configuration setup window, select your financial institution from the list. You can also use the search box at the top of the financial institution list to enter a name or a keyword.
The Connectivity Configuration subtab is masked, and you can't make any changes until you have completed the configuration setup. If you want to go back to the Connectivity Configuration subtab, close the window by clicking X in the upper-right corner of the browser window.
8. If a consent information appears, read the notice on data sharing and then acknowledge by clicking **Continue**.
9. Depending on your selected financial institution, perform the following actions:
 - If you're asked to enter your login credentials on the configuration setup page, do the following:
 1. Enter your financial institution account's login credentials.
 2. Click **Continue**.
 3. If you're setting up a multifactor authentication (MFA) account which requires additional validation, enter the required confirmation.
 4. Click **Continue**.
If your credentials are valid, the system retrieves all bank and credit card accounts from your financial institution and automatically connects them to your NetSuite account.
 - If the system redirects you to your financial institution's website to authenticate, do the following:
 1. Enter your financial institution account's login credentials.
 2. If you're setting up a multifactor authentication (MFA) account which requires additional validation, enter the required confirmation.
 3. On your financial institution's authorization page, review and select the bank and credit card accounts you want to connect to NetSuite.
 4. Grant NetSuite access to your financial institution account. You'll need to do this before the system can start establishing a secure connection.
The system automatically redirects you back to the bank feeds configuration setup page in NetSuite.
10. Review the list of bank and credit card accounts associated with your financial institution connection.

To exclude an account from your connection, clear the box next to the account name.

Note: The box next to the financial institution account name only becomes available if you didn't select a bank or credit card account from the financial institution's website.

If you don't see the box on the summary page, you can add or exclude an account from your financial institution connection after you finish the setup. Perform any of the following actions:

- Rebuild your connection. Read [Managing U.S. and Canada \(Yodlee\) Financial Institution Connections](#) to know how to rebuild your financial institution connection.
- Exclude an account from the Connectivity Configuration subtab on your format profile page. For more information, see [Managing U.S. and Canada \(Yodlee\) Bank and Payment Accounts for Bank Feeds](#).

11. To complete the configuration setup and go back to the format profile page, click **Save and Finish**.
To add another financial institution account in NetSuite, click **Save and Connect More Accounts**. You can connect to a different financial institution or the same financial institution with a different login credential.
The Connectivity Configuration subtab refreshes with your new connection. All active financial institution connections are listed under the Connections subtab, and all connected bank and credit card accounts are listed under the Accounts subtab.
12. Go to the **Account Linking** subtab. From the **Linked GL Account** dropdown list, select a bank or credit card account in NetSuite you want to link to the adjacent accounts. For more information, see [Linking Accounts for Financial Institution Connectivity](#).
13. Click **Save** on the format profile record.

Managing U.S. and Canada (Yodlee) Financial Institution Connections

On the U.S. and Canada Accounts (Yodlee) format profile page, you can do any of the following:

- Update your multifactor authentication (MFA) token
- Rebuild your existing connection
- Delete connection

To manage your financial institution connections:

1. Go to Setup > Accounting > Financial Statements > Financial Institution > List.
2. On the Financial Institution page, click **View** next to the Bank Feeds financial institution record.
3. On the **Format Profile: Configuration** subtab, click **Edit** next to U.S. and Canada Accounts (Yodlee).
4. On the U.S. and Canada Accounts (Yodlee) Format Profile page, click the **Connectivity Configuration** subtab.
5. Click the **Connections** subtab.

The following table shows the columns you'll find under the Connections subtab.

Column Name	Icon	Description
Financial Institution	—	Shows a list of active financial institutions connected to your NetSuite account.
Connection ID	—	Shows the unique ID for each financial institution connection. If you have multiple connections to the same financial institution with different login credentials, each connection gets its own unique ID.
Accounts	—	Shows the number of connected bank and payment accounts associated with your financial institution account.
 Note: If the Accounts column shows zero (0) for a connection, this means the setup wasn't successful. You can rebuild or delete the connection and try again.		
Update MFA		Shows a Refresh icon for each financial institution that requires MFA token update. For more information about how MFA accounts are handled by the SuiteApp, see Multifactor Authentication in Bank Feeds. A Check icon appears when the connection's MFA token is up to date.  Tip: To display the configuration window, make sure popups are enabled in your browser. To update a connection's MFA token: - On the Connections subtab, click the Refresh icon in the Update MFA column. - The configuration popup window appears. Enter a valid MFA token. - Click Continue. The system retrieves all bank and credit card accounts from your financial institution and automatically connects them to your NetSuite account. - On the configuration setup window, click Save and Finish. On the Connectivity Configuration subtab, a Check icon replaces the Refresh icon to show that the MFA token for the connection is updated.
Rebuild Connection		Shows a Rebuild icon for each financial institution connection. Click the icon to reconfigure your financial institution connection to NetSuite. When you rebuild a connection, the system imports bank data starting from the last successful import. If you rebuild a connection with zero accounts connected, the system imports the last 60 calendar days of bank data. The import starts after you click Save on the format profile. An Error icon will appear beside the Rebuild icon if there's a problem with the connection. Connection errors can happen for any of the following reasons: - You recently updated your login credentials on the bank's website - The last MFA token update wasn't successful - Your consent has expired - The connection configuration is incorrect For example, closing the configuration window before you finish the configuration process, or entering incorrect login credentials. Click the Rebuild icon to fix the connection errors.

Column Name	Icon	Description
-------------	------	-------------

Tip: To display the configuration window, make sure popups are enabled in your browser.

To rebuild a connection:

1. On the **Connections** subtab, click the Rebuild icon in the Rebuild Connection column.
2. In the configuration popup window, enter your login password.
In some instances, the page shows a list of associated bank and credit card accounts connected to NetSuite instead.
3. Click **Update**.
4. Some connections may require you to renew your account information consent to rebuild your connection. If that happens, perform the following actions:
 - a. Read the data sharing notice and click **Continue** to acknowledge it.
 - b. Enter your login credentials on the financial institution's website.
 - c. On your financial institution's authorization page, review the bank and credit card accounts associated with your connection. Add or remove accounts as needed.
 - d. On the same page, grant NetSuite access to your account. You'll need to do this before the system can start establishing a secure connection.
 - e. Click **Continue**.

5. The system retrieves all bank and credit card accounts from your financial institution and automatically connects them to your NetSuite account.

On the summary page, if you want to exclude an account from your connection, clear the box next to the account name.

Note: The box next to the financial institution account name only becomes available if you didn't select a bank or credit card account from the financial institution's website.

If you don't see the box on the summary page, you can add or exclude an account from your financial institution connection after you finish the setup. Perform any of the following actions:

- Rebuild your connection. Read [Managing U.S. and Canada \(Yodlee\) Financial Institution Connections](#) to know how to rebuild your financial institution connection.
- Exclude an account from the Connectivity Configuration subtab on your format profile page. For more information, see [Managing U.S. and Canada \(Yodlee\) Bank and Payment Accounts for Bank Feeds](#).

6. Click **Save and Finish**.

Delete Connection		Shows a Trash icon for each financial institution connection. Click the icon to delete a financial institution connection in NetSuite.
-------------------	---	--

Column Name	Icon	Description
To delete a connection:		
		- On the Connections subtab, click the Trash icon in the Delete Connections column for the financial institution you want to remove from bank feeds. Deleting a financial institution connection disconnects all its accounts, and you will no longer receive daily updates. - When the confirmation message appears, click Delete to confirm your action.

Managing U.S. and Canada (Yodlee) Bank and Payment Accounts for Bank Feeds

Manage which U.S. or Canada bank or payment accounts you want to include or exclude for automatic daily bank data import.

The following table shows the columns you'll find under the Accounts subtab on the U.S. and Canada (Yodlee) Format Profile page.

Column Name	Icon	Description
Account Name	—	Shows a list of bank and credit card accounts associated with your financial institution connections.
Account Type	—	Shows the type of financial institution account.
Financial Institution	—	Shows the financial institution associated with the bank or credit card account.
Connection ID	—	Shows the unique ID for the financial institution connection associated with the bank or credit card account.
 Note: If you have multiple connections to the same financial institution with different login credentials, each connection gets its own unique ID.		

Exclude Account		Shows a Trash icon for each financial institution connection. Click the icon to exclude a bank or credit card account from bank feeds.
-----------------	---	--

To exclude a U.S. or Canada bank or payment account:

- On the **Accounts** subtab, click the Trash icon in the Exclude Account column for the bank or payment account you want to remove from bank feeds.
If you exclude an account, you won't receive daily updates from the bank or credit card account in NetSuite.
- When the confirmation message appears, click **Exclude** to confirm your action.

Adding New U.S. or Canada Bank Accounts for Bank Feeds

If you already have a financial institution connection, you can update your list of connected bank and credit card accounts.

To connect a new U.S. or Canada bank or credit card account:

- Go to Setup > Accounting > Financial Statements > Financial Institution > List.
- On the Financial Institution page, click **View** next to the Bank Feeds financial institution record.
- On the **Format Profile: Configuration** subtab, click **Edit** next to **U.S. and Canada Accounts (Yodlee)**.

 **Note:** If you installed an earlier version of the Bank Feeds SuiteApp, this format profile is displayed as **Link Bank Accounts**.

4. On the U.S. and Canada Accounts (Yodlee) Format Profile page, click the **Connectivity Configuration** subtab.
5. On the **Connections** subtab, click the Rebuild icon to reconfigure your financial institution connection.
To understand how to rebuild your connection, see [Managing U.S. and Canada \(Yodlee\) Financial Institution Connections](#).
After you rebuild your connection, the Connectivity Configuration subtab refreshes to show your configured connection and updated accounts.
6. Click the **Account Linking** subtab.
7. From the **Linked GL Account** list, select a bank or credit card account in NetSuite you want to link to the adjacent accounts.
For more information, see [Linking Accounts for Financial Institution Connectivity](#).
8. Click **Save** on the format profile record.

After you click Save, the system starts to retrieve and import the last 60 days of transactions for the bank account you added. The automated process also updates any existing bank accounts linked to NetSuite.

You'll see a progress message on the Bank Feeds financial institution record, and you can click the **Track your status** link to check the status of your import. You can also go directly to the Banking Import History page by going to Transactions > Bank > Banking Import History.

Connecting a U.S. or Canada (MX) Financial Institution to NetSuite

The following procedure describes how to connect one or more compatible financial institutions in the United States or Canada to NetSuite through MX Technologies.

Important Things to Note

Before you connect your financial institution to NetSuite, take note of the following:

- Not every financial institution connection experience is the same and not all financial institutions can be accessed, or accessed reliably, using the Bank Feeds SuiteApp. Several factors may affect whether the Bank Feeds SuiteApp can connect to your financial institutions, including factors outside of NetSuite's control.
Also, the Bank Feeds SuiteApp only supports certain bank or payment accounts. Selecting an unsupported account type such as a loan, mortgage, or investment may not work with your bank feeds setup.
- You'll need Administrator access or a custom role with required permissions to set up bank feeds. For more information, see [Roles and Permissions for Bank Feeds](#).
- You must enable popups in your browser so the configuration window can open during bank feeds setup.
- When you're setting up your connection, the Format Profile page session generally expires after 15 minutes. To keep editing your format profile, refresh the page to see the content of your Connectivity Configuration subtab.
- Some financial institutions may require authorization, a PIN, or additional setup before you can connect to NetSuite. Contact your financial institution for assistance.

- You should not set up connections using both U.S. and Canada format profiles. If you already have connections, delete them first before setting up connections in the U.S. and Canada Accounts (MX) format profile. To delete connections, see [Managing U.S. and Canada \(Yodlee\) Financial Institution Connections](#).

To connect NetSuite to a financial institution operating in the United States or Canada through MX:

1. Go to Setup > Accounting > Financial Statements > Financial Institution > List.
2. On the Financial Institution page, click **View** next to the **Bank Feeds** financial institution record.
3. On the **Format Profile: Configuration** subtab, click **Edit** next to **U.S. and Canada Accounts (MX)**.
4. On the U.S. and Canada Accounts (MX) format profile page, click the **Connectivity Configuration** subtab.
5. If you're connecting to a financial institution for the first time, you'll see the following notices before you can start the configuration:
 - **MX – Additional Terms and Conditions** – Read and acknowledge by clicking the **Register** button at the bottom of the page.

6. Click **Connect New Institution**.

The connection configuration setup popup window appears.

7. In the configuration setup window, select your financial institution from the list. You can also use the search box at the top of the financial institution list to enter a name or a keyword.

The Connectivity Configuration subtab is masked, and you can't make any changes until you have completed the configuration setup. If you want to go back to the Connectivity Configuration subtab, close the window by clicking X in the upper-right corner of the browser window.

8. If a consent information appears, read the notice on data sharing and then acknowledge by clicking **Continue**.
9. Depending on your selected financial institution, do one of the following:
 - If you're asked to enter your login credentials on the configuration setup page, do the following:
 1. Enter your financial institution account's login credentials.
 2. Click **Continue**.
 3. If you're setting up a multifactor authentication (MFA) account which requires additional validation, enter the required confirmation.
 4. Click **Continue**.

If your credentials are valid, the system retrieves all bank and credit card accounts from your financial institution and automatically connects them to your NetSuite account.
 - If the system redirects you to your financial institution's website to authenticate, do the following:

1. Enter your financial institution account's login credentials.
2. If you're setting up a multifactor authentication (MFA) account which requires additional validation, enter the required confirmation.
3. On your financial institution's authorization page, review and select the accounts you want to connect to NetSuite.
4. Grant NetSuite access to your financial institution account. You'll need to do this before the system can start establishing a secure connection.

The system automatically redirects you back to the bank feeds configuration setup page in NetSuite.

10. To add another financial institution account in NetSuite, repeat Steps 6 to 9. You can connect to a different financial institution or the same financial institution with a different login credential. The Connectivity Configuration subtab refreshes with your new connection. All active financial institution connections are listed under the Connections subtab, and all connected accounts are listed under the Accounts subtab.
11. Go to the **Account Linking** subtab. From the **Linked GL Account** list, select an account in NetSuite you want to link to the adjacent accounts. For more information, see [Linking Accounts for Financial Institution Connectivity](#).
12. Click **Save** on the format profile record.

Managing U.S. and Canada (MX) Financial Institution Connections

On the U.S. and Canada Accounts (MX) format profile page, you can do any of the following:

- Update your multifactor authentication (MFA) token
- Rebuild your existing connection
- Delete connection

To manage your financial institution connections under MX:

1. Go to Setup > Accounting > Financial Statements > Financial Institution > List.
2. On the Financial Institution page, click **View** next to the Bank Feeds financial institution record.
3. On the **Format Profile: Configuration** subtab, click **Edit** next to U.S. and Canada Accounts (MX).
4. On the U.S. and Canada Accounts (MX) format profile page, click the **Connectivity Configuration** subtab.

The following table shows the columns you'll find under the Connections subtab.

Column Name	Icon	Description
Financial Institution	—	Shows a list of active financial institutions connected to your NetSuite account.
Connection ID	—	Shows the unique ID for each financial institution connection. If you have multiple connections to the same financial institution with different login credentials, each connection gets its own unique ID.
Accounts	—	Shows the number of connected bank and payment accounts associated with your financial institution account.
 Note: If the Accounts column shows zero (0) for a connection, this means the setup wasn't successful. You can rebuild or delete the connection and try again.		
Update MFA		Shows a Refresh icon for each financial institution that requires MFA token update. For more information about how MFA accounts are handled by the SuiteApp, see Multifactor Authentication in Bank Feeds .
 Tip: To display the configuration window, make sure popups are enabled in your browser.		
To update a connection's MFA token: 1. On the Connections subtab, click the Refresh icon in the Update MFA column.		

Column Name	Icon	Description
		- The configuration popup window appears. Enter a valid MFA token. - Click Continue. The system retrieves all connected accounts associated with your financial institution and automatically connects them to your NetSuite account. - On the configuration setup window, click Done. On the Connectivity Configuration subtab, a Check icon replaces the Refresh icon to show that the MFA token for the connection is updated. When the page is refreshed, the Check icon disappears.
Rebuild Connection		Shows a Rebuild icon for each financial institution connection. Click the icon to reconfigure your financial institution connection to NetSuite. When you rebuild a connection, the system imports bank data starting from the last successful import. If you rebuild a connection with zero accounts connected, the system imports the last 60 calendar days of bank data. The import starts after you click Save on the format profile. An Error icon will appear beside the Rebuild icon if there's a problem with the connection. Connection errors can happen for any of the following reasons: - You recently updated your login credentials on the bank's website - The last MFA token update wasn't successful - Your consent has expired - The connection configuration is incorrect For example, closing the configuration window before you finish the configuration process, or entering incorrect login credentials. Click the Rebuild icon to fix the connection errors.  Tip: To display the configuration window, make sure popups are enabled in your browser.
To rebuild a connection: - On the Connections subtab, click the Rebuild icon in the Rebuild Connection column. - In the configuration popup window, enter your login password. In some instances, the page shows a list of associated accounts connected to NetSuite instead. - Click Continue. - Some connections may require you to renew your account information consent to rebuild your connection. If that happens, do the following actions: - Read the data sharing notice and click Continue to acknowledge it. - Enter your login credentials on the financial institution's website. - On your financial institution's authorization page, review the accounts associated with your financial institution connection. Add or remove accounts as needed. - On the same page, grant NetSuite access to your account. You'll need to do this before the system can start establishing a secure connection. - Click Done.		

Column Name	Icon	Description
		The system retrieves all accounts from your financial institution and automatically connects them to your NetSuite account.
		Note: You can still exclude an account from your financial institution connection after completing the rebuild. See Managing U.S. and Canada (MX) Connected Accounts for Bank Feeds to know how to exclude an account from the Connectivity Configuration subtab.
		Click Done.

Delete Connection		Shows a Trash icon for each financial institution connection. Click the icon to delete a financial institution connection in NetSuite.
To delete a connection: - On the Connections subtab, click the Trash icon in the Delete Connections column for the financial institution you want to remove from bank feeds. Deleting a financial institution connection disconnects all its accounts, and you will no longer receive daily updates. - When the confirmation message appears, click Delete to confirm your action.		

Managing U.S. and Canada (MX) Connected Accounts for Bank Feeds

Manage which U.S. or Canada accounts you want to include or exclude for automatic daily bank data import.

The following table shows the columns you'll find under the Accounts subtab on the U.S. and Canada (MX) format profile page.

Column Name	Description
Account Name	Shows a list of accounts associated with your financial institution connections.
Account Type	Shows the type of financial institution account.
Financial Institution	Shows the financial institution associated with the account.
Connection ID	Shows the unique ID for the financial institution connection associated with the account.
	Note: If you have multiple connections to the same financial institution with different login credentials, each connection gets its own unique ID.
Include Account	Shows a checked box for each connected account. To exclude an account from bank feeds, clear the appropriate box.

To exclude a U.S. or Canada account from bank feeds:

- On the **Accounts** subtab, clear the corresponding box in the Include Account column for each account you want to remove from bank feeds.
If you exclude an account, you won't receive daily updates from the account in NetSuite.
- Click **Submit**.
- Click **Save** on the format profile record.

Adding New U.S. or Canada Bank Accounts for Bank Feeds

If you already have a financial institution connection, you can update your list of connected accounts.

 **Note:** This procedure applies when you're adding new accounts under the same bank login credentials in an existing connection.

To connect new accounts with different credentials, see [Connecting a U.S. or Canada \(MX\) Financial Institution to NetSuite](#).

To connect a new U.S. or Canada account:

1. Go to Setup > Accounting > Financial Statements > Financial Institution > List.
2. On the Financial Institution page, click **View** next to the Bank Feeds financial institution record.
3. On the **Format Profile: Configuration** subtab, click **Edit** next to **U.S. and Canada Accounts (MX)**.
4. On the U.S. and Canada Accounts (MX) format profile page, go to the **Connectivity Configuration** subtab.
5. On the **Connections** subtab, click the Rebuild icon to reconfigure your financial institution connection.
To understand how to rebuild your connection, see [Managing U.S. and Canada \(MX\) Financial Institution Connections](#).
After you rebuild your connection, the Connectivity Configuration subtab refreshes to show your configured connection and updated accounts.
6. Click the **Account Linking** subtab.
7. From the **Linked GL Account** list, select an account in NetSuite you want to link to the adjacent accounts.
For more information, see [Linking Accounts for Financial Institution Connectivity](#).
8. Click **Save** on the format profile record.

After you click Save, the system starts to retrieve and import the last 60 days of transactions for the bank account you added. The automated process also updates any existing bank accounts linked to NetSuite.

You'll see a progress message on the Bank Feeds financial institution record, and you can click the **Track your status** link to check the status of your import. You can also go directly to the Banking Import History page by going to Transactions > Bank > Banking Import History.

Connecting a Regulated Europe (Salt Edge) Financial Institution to NetSuite

 **Important:** The Bank Feeds SuiteApp includes third-party applications provided by Salt Edge Limited. Your access to and use of such portions of the SuiteApp may be subject to separate terms and conditions and a separate privacy policy between you and Salt Edge Limited. Any such separate terms will be made available for your review before you enable the relevant portion of the SuiteApp.

You must carefully read these terms before enabling this functionality, and if you're not willing to be bound by these terms or you're not authorized to accept these terms on behalf of your company or organization, don't enable this functionality.

The following procedure describes how to connect one or more PSD2 regulated financial institutions in Europe to NetSuite. You can use the same procedure if you want to connect to financial institutions that operate globally and aren't country-specific.

Important Things to Note

Before you proceed with connecting your financial institution to NetSuite, take note of the following:

- Not every financial institution connection experience is the same and not all financial institutions can be accessed, or accessed reliably, using the Bank Feeds SuiteApp. Several factors may affect whether the Bank Feeds SuiteApp can connect to your financial institutions, including factors outside of NetSuite's control.

Also, the Bank Feeds SuiteApp only supports certain bank or payment accounts. Selecting an unsupported account type such as a loan, mortgage, or investment may not work with your bank feeds setup.

- You'll need Administrator access or a custom role with required permissions to set up bank feeds. For more information, see [Roles and Permissions for Bank Feeds](#).
- You must enable popups in your browser so the configuration window can open during bank feeds setup.

To connect NetSuite to a regulated financial institution operating in Europe:

1. Go to Setup > Accounting > Financial Statements > Financial Institution > List.
2. On the Financial Institution page, click **View** next to the **Bank Feeds** financial institution record.
3. On the **Format Profile: Configuration** subtab, click **Edit** next to **Regulated Europe Accounts (Salt Edge)**.
4. On the Regulated Europe Accounts (Salt Edge) Format Profile page, click the **Connectivity Configuration** subtab.
5. Register your account with NetSuite's authorized Account Information Service Provider (AISP).

If you're connecting to a financial institution for the first time, you'll need to register your NetSuite email address with Salt Edge Limited, the AISP of NetSuite.

- a. Read and acknowledge the information on the page. Make sure you're authorized to register your NetSuite account with Salt Edge Limited. Contact your Administrator for more information.
- b. Check the value on the **Email** field. The Email field automatically populates with the email address you're using to log in to NetSuite.

 **Note:** The email address you use to register binds your NetSuite account with the AISP. Make sure the email address is unique and belongs to someone in your company who's authorized to accept the AISP's terms and conditions on your behalf.

- c. Click **Register**.
- d. You'll receive an email to confirm your registration and access to your Salt Edge Dashboard account. On the Salt Edge Dashboard, you can review and delete configuration consents.

 **Important:** You must reregister your integration if the email address belongs to an employee who has left your company or has a new role and doesn't manage bank feeds for your company.

To reregister, first unregister your Europe connections, and then connect again.

To unregister, see [Bank Feeds - Unregister Europe Accounts](#).

6. In the popup window, do the following actions:
 - a. Search for your financial institution by entering a name or keyword.

- b. Select your preferred financial institution from the list of results.

The Connectivity Configuration subtab is masked, and you can't make any changes until you have completed the configuration setup. To close the popup window, click **Cancel**, or close the window to go back to the Connectivity Configuration subtab.

- 7. Depending on your selected financial institution, enter your log in credentials or grant NetSuite access to your account.

Click the Show Instructions expandable content for more information.

- 8. Click **Next**.
- 9. To comply with Europe's anti-money laundering and KYC (Know Your Customers) requirements, you must validate your identity during registration. Enter your full name or select the ownership type for the NetSuite account you're registering. In some cases, you must provide both information.

 **Note:** Additional information may be required as part of the KYC requirements.

- 10. Click **Proceed**.
- 11. Read the data sharing notice and then acknowledge by checking the box on the page to grant consent to Salt Edge Limited.

- 12. Click **Confirm**.

The system will then validate your login credentials and start setting up a secure connection to your financial institution.

You may also be redirected to your financial institution's website to give NetSuite access to your account before the system can set up a secure connection.

- 13. A progress of your configuration process appears.
If you're setting up a multifactor authentication (MFA) account which requires additional validation, enter the required confirmation and then click **Next**.
- 14. The setup retrieves all bank and credit card accounts from your financial institution. In some situations, your financial institution will require you to select accounts you want to include for bank feeds integration.

To proceed, check the box next to each bank or payment account you want to include.

 **Note:** Select only bank or payment accounts supported by the Bank Feeds SuiteApp. Selecting an unsupported account type such as a loan, mortgage, and investment may not apply to your bank feeds setup.

When the configuration process is done, the configuration window closes automatically and you'll be redirected back to the Connectivity Configuration subtab.

The Connectivity Configuration subtab refreshes with your new connection. All active financial institution connections are listed under the Connections subtab, and all connected bank and credit card accounts are listed under the Accounts subtab.

- 15. To add another financial institution account in NetSuite, click **Connect New Institution**. You can connect to a different financial institution or the same financial institution with a different login credential.
- 16. After entering the required configuration data, go to the **Account Linking** subtab. From the **Linked GL Account** list, select a bank or credit card account in NetSuite you want to link to the adjacent accounts.

For more information, see [Linking Accounts for Financial Institution Connectivity](#).

- 17. Click **Save** on the format profile record.

Managing Regulated Europe (Salt Edge) Financial Institution Connections

On the Regulated Europe Accounts (Salt Edge) format profile page, you can do any of the following:

- Update your multifactor authentication (MFA) token
- Rebuild your existing connection
- Delete connection

To manage your financial institution connections

1. Go to Setup > Accounting > Financial Statements > Financial Institution > List.
2. On the Financial Institution page, click **View** next to the Bank Feeds financial institution record.
3. On the **Format Profile: Configuration** subtab, click **Edit** next to Regulated Europe Accounts (Salt Edge).
4. On the Regulated Europe Accounts (Salt Edge) Format Profile page, click the **Connectivity Configuration** subtab.
5. Click the **Connections** subtab.

The following table shows the columns you'll find under the Connections subtab.

Column Name	Icon	Description
Financial Institution	—	Shows a list of active financial institutions connected to your NetSuite account.
Connection ID	—	Shows the unique ID for each financial institution connection. If you have multiple connections to the same financial institution with different login credentials, each connection gets its own unique ID.
Accounts	—	Shows the number of connected bank and payment accounts associated with your financial institution account.
 Note: If the Accounts column shows zero (0) for a connection, this means the setup wasn't successful. You can rebuild or delete the connection and try again.		
Connection Expiry Date	—	Shows when your financial institution connection expires. The connection expiration date is when your connection consent is no longer valid. If a connection expires, you'll need to rebuild or reconfigure your financial institution connection to continue receiving daily bank data. The date format you see follows the Date Format setting under Home > Set Preferences > General under the Formatting section.
Update MFA		Shows a Refresh icon for each financial institution that requires MFA token update.
 Tip: To display the configuration window, make sure popups are enabled in your browser.		

To update a connection's MFA token:

1. On the **Connections** subtab, click the Refresh icon in the Update MFA column.
2. The configuration popup window appears. Enter the MFA token required and then click **Next**.

Column Name	Icon	Description
		A progress of your configuration process is displayed. If successful, the configuration popup window closes automatically and you'll be redirected back to the Connectivity Configuration subtab. Then, a Check icon replaces the Refresh icon to show that the MFA token for the connection is updated.
Rebuild Connection		Shows a Rebuild icon for each financial institution connection. Click the icon to reconfigure your financial institution connection to NetSuite. When you rebuild a connection, the system imports bank data starting from the last successful import. If you rebuild a connection with zero accounts connected, the system imports the last 60 calendar days of bank data. The import starts after you click Save on the format profile. An Error icon will appear beside the Rebuild icon if there's a problem with the connection. Connection errors can happen for any of the following reasons: ■ You recently updated your login credentials on the bank's website ■ The last MFA token update wasn't successful ■ Your consent has expired ■ The connection configuration is incorrect For example, closing the configuration window before you finish the configuration process, or entering incorrect login credentials. Click the Rebuild icon to fix the connection errors.  Tip: To display the configuration window, make sure popups are enabled in your browser. To rebuild a connection: 1. On the Connections subtab, click the Rebuild icon in the Rebuild Connection column. 2. In the configuration popup window, enter your login credentials or grant NetSuite access to your account. 3. Click Next. 4. Perform Steps 11 to 14 in Connecting a Regulated Europe (Salt Edge) Financial Institution to NetSuite. 5. Click Save on the format profile record.
Delete Connection		Shows a Trash icon for each financial institution connection. Click the icon to delete a financial institution connection in NetSuite. To delete a connection: 1. On the Connections subtab, click the Trash icon in the Delete Connections column for the financial institution you want to remove from bank feeds. Deleting a financial institution connection disconnects all its accounts, and you will no longer receive daily updates. 2. When the confirmation message appears, click Delete to confirm your action.

Managing Regulated Europe (Salt Edge) Bank and Payment Accounts for Bank Feeds

Manage which European bank or payment accounts you want to include or exclude for automatic daily bank data import.

The following table shows the columns you'll find under the Accounts subtab of the Regulated Europe Accounts (Salt Edge) Format Profile page.

Column Name	Description
Include Account	By default, when you've set up your connection to a financial institution, all associated accounts are automatically included and enabled for bank feeds. To include or exclude a regulated Europe bank or payment account: - On the Accounts subtab, do the following: - Check the box next to the account you'd like to include in bank feeds. - Clear the box next to the account you'd like to exclude from bank feeds. - Click Submit. A confirmation message appears to let you know that all selected accounts are now included in bank feeds. - If you've included a new account, make sure you go to the Account Linking subtab next to link a GL account in NetSuite. For more information, see Linking Accounts for Financial Institution Connectivity.
Account Name	Shows a list of accounts associated with your financial institution connections.
Account Type	Shows the type of financial institution account.
Financial Institution	Shows the financial institution associated with the account.
Connection ID	Shows the unique ID for the financial institution connection associated with the account.

Column Name	Description
	 Note: If you have multiple connections to the same financial institution with different login credentials, each connection gets its own unique ID.

Connecting a Nonregulated Europe (Salt Edge) Financial Institution to NetSuite

Important: The Bank Feeds SuiteApp includes third-party applications provided by Salt Edge Limited. Your access to and use of such portions of the SuiteApp may be subject to separate terms and conditions and a separate privacy policy between you and Salt Edge Limited. Any such separate terms will be made available for your review before you enable the relevant portion of the SuiteApp.

You must carefully read these terms before enabling this functionality, and if you're not willing to be bound by these terms or you're not authorized to accept these terms on behalf of your company or organization, don't enable this functionality.

The following procedure describes how to connect one or more non-PSD2 regulated financial institutions in Europe to NetSuite.

Important Things to Note

Before you connect your financial institution to NetSuite, take note of the following:

- Not every financial institution connection experience is the same and not all financial institutions can be accessed, or accessed reliably, using the Bank Feeds SuiteApp. Several factors may affect whether the Bank Feeds SuiteApp can connect to your financial institutions, including factors outside of NetSuite's control.
Also, the Bank Feeds SuiteApp only supports certain bank or payment accounts. Selecting an unsupported account type such as a loan, mortgage, or investment may not work with your bank feeds setup.
- You'll need Administrator access or a custom role with required permissions to set up bank feeds. For more information, see [Roles and Permissions for Bank Feeds](#).
- You must enable popups in your browser so the configuration window can open during bank feeds setup.

To connect NetSuite to a non-PSD2 regulated financial institution operating in Europe:

1. Go to Setup > Accounting > Financial Statements > Financial Institution > List.
2. On the Financial Institution page, click **View** next to the **Bank Feeds** financial institution record.
3. On the **Format Profile: Configuration** subtab, click **Edit** next to **Nonregulated Europe Accounts (Salt Edge)**.
4. On the Nonregulated Europe Accounts (Salt Edge) Format Profile page, click the **Connectivity Configuration** subtab.
5. Click **Connect New Institution**.
6. In the popup window that appears, do the following actions:
 - a. Search your financial institution by entering a name or a keyword.

- b. Select your preferred financial institution from the list of results.

The Connectivity Configuration subtab is masked, and you can't make any changes until you have completed the configuration setup. To close the popup window, click **Cancel**, or close the window to go back to the Connectivity Configuration subtab.

- 7. Depending on your selected financial institution, enter your log in credentials or grant NetSuite access to your account.

Click the Show Instructions expandable content for more information.

- 8. Click **Next**.

- 9. Read the data sharing notice and then acknowledge by clicking **Confirm** to grant consent to Salt Edge Limited.

The system will then validate your login credentials and start setting up a secure connection to your financial institution.

You may also be redirected to your financial institution's website to give NetSuite access to your account before the system can set up a secure connection.

- 10. A progress of your configuration process appears.

If you're setting up a multifactor authentication (MFA) account which requires additional validation, enter the required confirmation and then click **Next**.

- 11. The setup retrieves all bank and credit card accounts from your financial institution. In some situations, your financial institution will require you to select accounts you want to include for bank feeds integration.

To proceed, check the box next to each bank or payment account you want to include.

Note: Select only bank or payment accounts supported by the Bank Feeds SuiteApp. Selecting an unsupported account type such as a loan, mortgage, and investment may not apply to your bank feeds setup.

When the configuration process is done, the configuration window closes automatically and you'll be redirected back to the Connectivity Configuration subtab.

The Connectivity Configuration subtab refreshes with your new connection. All active financial institution connections are listed under the Connections subtab, and all connected bank and credit card accounts are listed under the Accounts subtab.

- 12. To add another financial institution account in NetSuite, click **Connect New Institution**. You can connect to a different financial institution or the same financial institution with a different login credential.
- 13. After entering the required configuration data, go to the **Account Linking** subtab. From the **Linked GL Account** list, select a bank or credit card account in NetSuite you want to link to the adjacent accounts.

For more information, see [Linking Accounts for Financial Institution Connectivity](#).

- 14. Click **Save** on the format profile record.

Managing Nonregulated Europe (Salt Edge) Financial Institution Connections

On the Nonregulated Europe Accounts (Salt Edge) format profile page, you can do any of the following:

- Update your multifactor authentication (MFA) token
- Rebuild your existing connection
- Delete connection

To manage your financial institution connections:

1. Go to Setup > Accounting > Financial Statements > Financial Institution > List.
2. On the Financial Institution page, click **View** next to the Bank Feeds financial institution record.
3. On the **Format Profile: Configuration** subtab, click **Edit** next to Nonregulated Europe Accounts (Salt Edge).
4. On the Nonregulated Europe Accounts (Salt Edge) Format Profile page, click the **Connectivity Configuration** subtab.
5. Click the **Connections** subtab.

Column Name	Icon	Description
Financial Institution	—	Shows a list of active financial institutions connected to your NetSuite account.
Connection ID	—	Shows the unique ID for each financial institution connection. If you have multiple connections to the same financial institution with different login credentials, each connection gets its own unique ID.
Accounts	—	Shows the number of connected bank and payment accounts associated with your financial institution account.
		Note: If the Accounts column shows zero (0) for a connection, this means the setup wasn't successful. You can rebuild or delete the connection and try again.
Connection Expiry Date	—	Shows when your financial institution connection expires. The connection expiration date is when your connection consent is no longer valid. If a connection expires, you'll need to rebuild or reconfigure your financial institution connection to continue receiving daily bank data. The date format you see follows the Date Format setting under Home > Set Preferences > General under the Formatting section.
Update MFA		Shows a Refresh icon for each financial institution that requires MFA token update.
		Tip: To display the configuration window, make sure popups are enabled in your browser.
Rebuild Connection		Shows a Rebuild icon for each financial institution connection. Click the icon to reconfigure your financial institution connection to NetSuite. When you rebuild a connection, the system imports bank data starting from the last successful import. If you rebuild a connection with zero accounts connected, the system imports the last 60 calendar days of bank data. The import starts after you click Save on the format profile.

To update a connection's MFA token:

1. On the **Connections** subtab, click the Refresh icon in the Update MFA column.
2. The configuration popup window appears. Enter the MFA token required and then click **Next**.

A progress of your configuration process is displayed. If successful, the configuration popup window closes automatically and you'll be redirected back to the **Connectivity Configuration** subtab.

Then, a Check icon replaces the Refresh icon to show that the MFA token for the connection is updated.

Column Name	Icon	Description
		An Error icon will appear beside the Rebuild icon if there's a problem with the connection. Connection errors can happen for any of the following reasons: ■ You recently updated your login credentials on the bank's website ■ The last MFA token update wasn't successful ■ Your consent has expired ■ The connection configuration is incorrect For example, closing the configuration window before you finish the configuration process, or entering incorrect login credentials. Click the Rebuild icon to fix the connection errors.  Tip: To display the configuration window, make sure popups are enabled in your browser. To rebuild a connection: 1. On the Connections subtab, click the Rebuild icon in the Rebuild Connection column. 2. In the configuration popup window, enter your login credentials or grant NetSuite access to your account. 3. Click Next. 4. Perform Steps 9 to 11 in Connecting a Nonregulated Europe (Salt Edge) Financial Institution to NetSuite. 5. Click Save on the format profile record.

Delete
Connection

Shows a Trash icon for each financial institution connection. Click the icon to delete a financial institution connection in NetSuite.

To delete a connection:

1. On the **Connections** subtab, click the Trash icon in the Delete Connections column for the financial institution you want to remove from bank feeds.
Deleting a financial institution connection disconnects all its accounts, and you will no longer receive daily updates.
2. When the confirmation message appears, click **Delete** to confirm your action.

Managing Nonregulated Europe (Salt Edge) Bank and Payment Accounts for Bank Feeds

Manage which bank or payment accounts from your financial institutions in non-PSD2 regulated European countries you want to include or exclude for automatic daily bank data import.

The following table shows the columns you'll find under the Accounts subtab of the Nonregulated Europe Accounts (Salt Edge) Format Profile page.

Column Name	Description
Include Account	By default, when you've set up your connection to a financial institution, all associated accounts are automatically included and enabled for bank feeds. To include or exclude a Non-PSD2 regulated Europe bank or payment account:

Column Name	Description
	- On the Accounts subtab, do the following: - Check the box next to the account you'd like to include in bank feeds. - Clear the box next to the account you'd like to exclude from bank feeds. - Click Submit. A confirmation message appears to let you know that all selected accounts are now included in bank feeds. - If you've included a new account, make sure you go to the Account Linking subtab next to link a GL account in NetSuite. For more information, see Linking Accounts for Financial Institution Connectivity.
Account Name	Shows a list of accounts associated with your financial institution connections.
Account Type	Shows the type of financial institution account.
Financial Institution	Shows the financial institution associated with the account.
Connection ID	Shows the unique ID for the financial institution connection associated with the account.
	 Note: If you have multiple connections to the same financial institution with different login credentials, each connection gets its own unique ID.

Connecting a Financial Institution in Other Supported Countries (Salt Edge) to NetSuite

 **Important:** The Bank Feeds SuiteApp includes third-party applications provided by Salt Edge Limited. Your access to and use of such portions of the SuiteApp may be subject to separate terms and conditions and a separate privacy policy between you and Salt Edge Limited. Any such separate terms will be made available for your review before you enable the relevant portion of the SuiteApp.

You must carefully read these terms before enabling this functionality, and if you're not willing to be bound by these terms or you're not authorized to accept these terms on behalf of your company or organization, don't enable this functionality.

The following procedure describes how to connect one or more financial institutions in other countries to NetSuite. The SuiteApp lets you connect to financial institutions in the following countries:

- New Zealand
- Philippines
- Singapore
- Thailand

You can use the same procedure if you want to connect to financial institutions that operate globally and aren't country-specific.

Important Things to Note

Before you connect your financial institution to NetSuite, take note of the following:

- Not every financial institution connection experience is the same and not all financial institutions can be accessed, or accessed reliably, using the Bank Feeds SuiteApp. Several factors may affect

whether the Bank Feeds SuiteApp can connect to your financial institutions, including factors outside of NetSuite's control.

Also, the Bank Feeds SuiteApp only supports certain bank or payment accounts. Selecting an unsupported account type such as a loan, mortgage, or investment may not work with your bank feeds setup.

- You'll need Administrator access or a custom role with required permissions to set up bank feeds. For more information, see [Roles and Permissions for Bank Feeds](#).
- You must enable popups in your browser so the configuration window can open during bank feeds setup.

To connect NetSuite to a financial institution operating in other countries:

1. Go to Setup > Accounting > Financial Statements > Financial Institution > List.
2. On the Financial Institution page, click **View** next to the **Bank Feeds** financial institution record.
3. On the **Format Profile: Configuration** subtab, click **Edit** next to **Accounts in Other Countries (Salt Edge)**.
4. On the Accounts in Other Countries (Salt Edge) Format Profile page, click the **Connectivity Configuration** subtab.
5. Click **Connect New Institution**.
6. In the popup window, do the following actions:
 - a. Search for your financial institution by entering a name or keyword.
 - b. Select your preferred financial institution from the list of results.

The Connectivity Configuration subtab is masked, and you can't make any changes until you have completed the configuration setup. To close the popup window, click **Cancel**, or close the window to go back to the Connectivity Configuration subtab.

7. Depending on your selected financial institution, enter your log in credentials or grant NetSuite access to your account.

Click the Show Instructions expandable content for more information.

8. Click **Next**.
9. Read the data sharing notice and then acknowledge by clicking **Confirm** to grant consent to Salt Edge Limited.

The system will then validate your login credentials and start setting up a secure connection to your financial institution.

You may also be redirected to your financial institution's website to give NetSuite access to your account before the system can set up a secure connection.

10. A progress of your configuration process appears.

If you're setting up a multifactor authentication (MFA) account which requires additional validation, enter the required confirmation and then click **Next**.
11. The setup retrieves all bank and credit card accounts from your financial institution. In some situations, your financial institution will require you to select accounts you want to include for bank feeds integration.

To proceed, check the box next to each bank or payment account you want to include.

Note: Select only bank or payment accounts supported by the Bank Feeds SuiteApp. Selecting an unsupported account type such as a loan, mortgage, and investment may not apply to your bank feeds setup.

When the configuration process is done, the configuration window closes automatically and you'll be redirected back to the **Connectivity Configuration** subtab.

The Connectivity Configuration subtab refreshes with your new connection. All active financial institution connections are listed under the **Connections** subtab, and all connected bank and credit card accounts are listed under the **Accounts** subtab.

12. To add another financial institution account in NetSuite, click **Connect New Institution**. You can connect to a different financial institution or the same financial institution with a different login credential.
13. After entering the required configuration data, go to the **Account Linking** subtab. From the **Linked GL Account** list, select a bank or credit card account in NetSuite you want to link to the adjacent accounts. For more information, see [Linking Accounts for Financial Institution Connectivity](#).
14. Click **Save** on the format profile record.

Managing Financial Institution Connections in Other Countries (Salt Edge)

On the Accounts in Other Countries (Salt Edge) format profile page, you can do any of the following:

- Update your multifactor authentication (MFA) token
- Rebuild your existing connection
- Delete connection

To manage your financial institution connections:

1. Go to Setup > Accounting > Financial Statements > Financial Institution > List.
2. On the Financial Institution page, click **View** next to the Bank Feeds financial institution record.
3. On the **Format Profile: Configuration** subtab, click **Edit** next to Accounts in Other Countries (Salt Edge).
4. On the Accounts in Other Countries (Salt Edge) Format Profile page, click the **Connectivity Configuration** subtab.
5. Click the **Connections** subtab.

The following table shows the columns you'll find under the Connections subtab.

Column Name	Icon	Description
Financial Institution	—	Shows a list of active financial institutions connected to your NetSuite account.
Connection ID	—	Shows the unique ID for each financial institution connection. If you have multiple connections to the same financial institution with different login credentials, each connection gets its own unique ID.
Accounts	—	Shows the number of connected bank and payment accounts associated with your financial institution account.
 Note: If the Accounts column shows zero (0) for a connection, this means the setup wasn't successful. You can rebuild or delete the connection and try again.		
Connection Expiry Date	—	Shows when your financial institution connection expires. The connection expiration date is when your connection consent is no longer valid. If a connection expires, you'll need to rebuild or reconfigure your financial institution connection to continue receiving daily bank data.

Column Name	Icon	Description
		The date format you see follows the Date Format setting under Home > Set Preferences > General under the Formatting section.

Update MFA

Shows a Refresh icon for each financial institution that requires MFA token update.

Tip: To display the configuration window, make sure popups are enabled in your browser.

To update a connection's MFA token:

1. On the **Connections** subtab, click the Refresh icon in the Update MFA column.
2. The configuration popup window appears. Enter the MFA token required and then click **Next**.

A progress of your configuration process is displayed. If successful, the configuration popup window closes automatically and you'll be redirected back to the **Connectivity Configuration** subtab.

Then, a Check icon replaces the Refresh icon to show that the MFA token for the connection is updated.

Rebuild Connection

Shows a Rebuild icon for each financial institution connection. Click the icon to reconfigure your financial institution connection to NetSuite.

When you rebuild a connection, the system imports bank data starting from the last successful import. If you rebuild a connection with zero accounts connected, the system imports the last 60 calendar days of bank data. The import starts after you click Save on the format profile.

An Error icon will appear beside the Rebuild icon if there's a problem with the connection. Connection errors can happen for any of the following reasons:

- You recently updated your login credentials on the bank's website
- The last MFA token update wasn't successful
- Your consent has expired
- The connection configuration is incorrect

For example, closing the configuration window before you finish the configuration process, or entering incorrect login credentials.

Click the Rebuild icon to fix the connection errors.

Tip: To display the configuration window, make sure popups are enabled in your browser.

To rebuild a connection:

1. On the **Connections** subtab, click the Rebuild icon in the Rebuild Connection column.
2. In the configuration popup window, enter your login credentials or grant NetSuite access to your account.
3. Click **Next**.
4. Perform Steps 9 to 11 in [Connecting a Financial Institution in Other Supported Countries \(Salt Edge\) to NetSuite](#).
5. Click **Save** on the format profile record.

Column Name	Icon	Description
Delete Connection		This column displays a Trash icon for each financial institution connection. Click the icon to delete an existing financial institution connection in NetSuite.

To delete a connection:

1. On the **Connections** subtab, click the Trash icon in the Delete Connections column for the financial institution you want to remove from bank feeds.
Deleting a financial institution connection disconnects all its accounts, and you will no longer receive daily updates.
2. When the confirmation message appears, click **Delete** to confirm your action.

Managing Bank and Payment Accounts in Other Countries (Salt Edge) for Bank Feeds

Manage which bank or payment accounts associated with your financial institutions from other countries you want to include or exclude for automatic daily bank data import.

The following table shows the columns you'll find under the Accounts subtab of the Accounts in Other Countries (Salt Edge) Format Profile page.

Column Name	Description
Include Account	By default, when you've set up your connection to a financial institution, all associated accounts are automatically included and enabled for bank feeds. To include or exclude a bank or payment account: 1. On the Accounts subtab, you can do the following: a. Check the box next to the account you'd like to include in bank feeds. b. Clear the box next to the account you'd like to exclude from bank feeds. 2. Click Submit. A confirmation message appears to let you know that all selected accounts are now included in bank feeds. 3. If you've included a new account, make sure you go to the Account Linking subtab next to link a GL account in NetSuite. For more information, see Linking Accounts for Financial Institution Connectivity.
Account Name	Shows a list of accounts associated with your financial institution connections.
Account Type	Shows the type of financial institution account.
Financial Institution	Shows the financial institution associated with the account.
Connection ID	Shows the unique ID for the financial institution connection associated with the account.

Column Name	Description
	 Note: If you have multiple connections to the same financial institution with different login credentials, each connection gets its own unique ID.

Multifactor Authentication in Bank Feeds

Financial institution accounts that support multifactor authentication (MFA) require additional proof to make sure it's you when you log in or do other transactions. Examples of MFA accounts include those that need two-factor authentication (2FA) or a one-time password.

The validity of your account's MFA token varies depending on your financial institution. Bank data import won't work if the system sees your MFA token is invalid or needs an update.

For example, some MFA account credentials are valid only for a certain number of login sessions or transactions. In this scenario, you'll need to reenter your login details and provide additional information in the bank feeds configuration setup to continue receiving daily bank updates.

Go to the Banking Import History page to check your bank data import status and see which financial institution needs reauthentication. To get to the Banking Import History page, go to Transactions > Bank > Banking Import History.

To update your MFA token, go to the Connectivity Configuration subtab of your format profile record. Then, under the Connections subtab, click the Refresh icon in the Update MFA column. For more information, see the following topics:

- For U.S. and Canada bank feeds integration, see [Managing U.S. and Canada \(Yodlee\) Financial Institution Connections](#)
- For U.S. and Canada bank feeds integration using MX, see [Managing U.S. and Canada \(MX\) Financial Institution Connections](#)
- For regulated Europe bank feeds integration, see [Managing Regulated Europe \(Salt Edge\) Financial Institution Connections](#)
- For Non-PSD2 regulated Europe bank feeds integration, see [Managing Nonregulated Europe \(Salt Edge\) Financial Institution Connections](#)
- For bank feeds integration with other countries, see [Managing Financial Institution Connections in Other Countries \(Salt Edge\)](#)

After you save the configuration, the system will perform a new bank data retrieval and import process.

Bank Feeds Data Import

The Bank Feeds SuiteApp's automated bank data import feature helps you manage your bank and credit card transactions in NetSuite more efficiently.

Track your daily import status on the Banking Import History page. The SuiteApp also lets you update your imported bank data manually on the Match Bank Data page.

This section includes the following topics:

- [Automated Bank Data Import for Bank Feeds](#)
- [Updating Imported Bank Feeds Data](#)
- [Viewing Bank Feeds Import Details](#)
- [Using the Bank Feeds Audit Trail](#)

- [Handling Bank Feeds Data Import and Connection Errors](#)

Automated Bank Data Import for Bank Feeds

The Bank Feeds SuiteApp uses the Financial Institution Connectivity Plug-in to automatically retrieve bank data and import it into your NetSuite account. When a format profile is saved for the first time, take note of the following:

- NetSuite downloads the last 60 calendar days of available bank data from your financial institution.
- NetSuite creates a schedule to automatically import your data. Every day, NetSuite imports any new data from your financial institution to your accounts on the Match Bank Data page. If the data import fails, NetSuite requests for data starting from the last successful update plus seven calendar days back.

For more information how to match your imported bank lines with account transactions in NetSuite, see [Matching Bank Data](#).

You can check your import status on the Banking Import History page. To get to the Banking Import History page, go to Transactions > Bank > Banking Import History.

For more information, see [Automatic Bank Data Import](#).

Updating Imported Bank Feeds Data

The SuiteApp imports bank transactions into NetSuite daily through an automated import schedule. Depending on the number of posted transactions and how fast your bank responds, not all transactions may get imported into NetSuite.

Note: NetSuite's authorized Account Information Service Provider (AISP) retrieves bank transactions within a maximum time frame. For more information, see [Limitations of Using the Bank Feeds SuiteApp](#).

To retrieve and import remaining transactions from the initial daily import, do one of the following actions. You should only do this if you want to check for remaining transactions or if there was an import error.

- **Update the Bank Feeds Format Profile Records** – Edit and save the format profile record without making any changes. Each time you save a format profile, the system starts the bank data retrieval and import process.

Note: To avoid errors from consecutive requests, you can only request for a bank data refresh every 60 minutes. The 60-minute waiting interval doesn't apply if a data import fails.

- Click **Update Imported Bank Data** on the Match Bank Data page.

In some cases, your bank may post transactions after the SuiteApp finishes its scheduled daily import. When this happens, the system won't import them until the next scheduled daily import. If you want these transactions available immediately in NetSuite, you can rebuild your financial institution connection.

For steps on how to rebuild your connection, read the following topics:

- For U.S. and Canada Bank Feeds integration, see [Managing U.S. and Canada \(Yodlee\) Financial Institution Connections](#)
- For U.S. and Canada bank feeds integration using MX, see [Managing U.S. and Canada \(MX\) Financial Institution Connections](#)

- For regulated Europe Bank Feeds integration, see [Managing Regulated Europe \(Salt Edge\) Financial Institution Connections](#)
- For Non-PSD2 regulated Europe bank feeds integration, see [Managing Nonregulated Europe \(Salt Edge\) Financial Institution Connections](#)
- For bank feeds integration with financial institutions in other countries, see [Managing Financial Institution Connections in Other Countries \(Salt Edge\)](#)

Viewing Bank Feeds Import Details

Go to the Banking Import History page (formerly Imported Statement List) to see the status and details of your imported bank transactions. For more information, see [Banking Import History](#).

The Match Bank Data page (Transactions > Bank > Match Bank Data) also gets updated with your account's latest bank data after each successful import. You can see your updated account balance and match or confirm your bank transaction data with your NetSuite transactions. For more information, see [Bank Data Matching and Reconciliation](#).

For more information about automatic bank data import through Financial Connectivity Plug-in, see [Automatic Bank Data Import](#).

Using the Bank Feeds Audit Trail

 **Note:** You'll need Administrator access or a custom role with required permissions to set up bank feeds. For more information, see [Roles and Permissions for Bank Feeds](#).

The Bank Feeds Audit Trail is a custom record that helps you keep track of your NetSuite account's bank feeds activity within a 90-day period. Every time you connect to your financial institution or do a manual or automated bank data import, the system creates an audit trail log.

To view the Bank Feeds Audit Trail:

1. Go to Customization > Lists, Records, & Fields > Record Types.
2. Look for **Bank Feeds Audit Trail**.
3. Click **List** to see the audit trail records.

You can also create a custom saved search for this record type. For more information, see the help topic [Defining a Saved Search](#).

The following table describes the bank feeds audit trail fields:

Field	Description
Name	Shows the name of the action the SuiteApp started.
Date Created	Shows the date and time the action occurred.
Interpretation	Shows the following information: ■ Connection and account status ■ Error messages
API Type	Shows the type of third-party provider that started the action.

Field	Description
URL Endpoint	Shows the URL used for the action.
Post Parameters	Shows the JSON object sent as a body of the HTTP call. This field is only populated if the HTTP method is POST.

You'll also see a **Third-Party Response** subtab on the Bank Feeds Audit Trail log. The subtab shows the raw API response details for the audit log.

Handling Bank Feeds Data Import and Connection Errors

During a daily or manual import, bank data import will fail if there are errors such as missing MFA token or connection issues.

When handling bank data import errors, take note of the following:

- View the Banking Import History page to see the status and details of your bank data import. If the status is set to **Partially Completed**, this means NetSuite successfully imported data for some, but not all, of your bank or credit card accounts.

In the expanded details, you'll see why the import failed and which accounts were affected. For more information, see [Banking Import History](#).

- On your format profile configuration, under the Account Linking subtab, bank and payment accounts that failed to connect show up with warning icons.

Connectivity Configuration Account Linking Code Type Mapping System Notes			
There was a problem linking one or more of your accounts. For an account-specific error, hover over the warning icon. If needed, go to the Connectivity Configuration subtab to reauthenticate accounts that could not be linked. If the issue persists, contact Support.			
BANK ACCOUNT	CURRENCY	ACCOUNT TYPE	LINKED GL ACCOUNT
IQ Bank			
BLUE CASH EVERYDAY - x5364_CREDIT_xxxx5364	USD	CREDIT_CARD	
CashRewardOld - x7866_CREDIT_xxxx7866			
The login credentials for IQ Bank is incorrect. To resolve, go to the Connectivity Configuration subtab and enter the correct credentials.			
Iq Bank Core Checking - x3571_CHECKING_xxxx3571	USD	BANK	1000 Checking

Hover over the warning icon for more information about the error. You can choose to fix the error or continue the connectivity configuration. The bank data import process will still proceed, but the status will be Partially Completed if one or more accounts failed to connect. Until the financial institution connection error is fixed, you won't receive daily bank updates from the bank or credit card account.

- To learn how you can prevent and fix common financial institution connection errors, read SuiteAnswers article [Resolving Financial Institution Connection Errors When Using the Bank Feeds SuiteApp](#).

Bank Feeds SuiteApp FAQ

The following questions are frequently asked about configuring the Bank Feeds integration with NetSuite.

General

How much does the Bank Feeds SuiteApp cost?

The Bank Feeds SuiteApp is a free managed SuiteApp that automatically updates whenever there are new features or enhancements.

How do I check if a bank is supported for Bank Feeds?

The list of supported financial institutions can be found in [SuiteAnswers ID 90911](#).

If my bank is not included in the list, can I add them manually?

There is no way to add a new bank to the Bank Feeds SuiteApp. If your financial institution isn't on the list, you should connect to your bank using the Auto Bank Statement Import SuiteApp or use a custom connectivity plug-in instead.

How do I import banking data from financial institutions operating outside the current supported countries for Bank Feeds?

NetSuite supports international banking file formats (ISO20022 CAMT053, SWIFT MT940, BAI2, and OFX/QFX) which can be imported both manually as well as through a secure file transfer protocol (SFTP). For more information, see [Auto Bank Statement Import SuiteApp](#) and [Bank Statement Parsers SuiteApp](#).

What about financial institutions that are not yet supported by Bank Feeds?

The Financial Institution Connectivity API supports custom connectivity plug-ins to financial institutions that aren't available through our financial data aggregation partner. For more information about alternative bank integration solutions, see [Auto Bank Statement Import SuiteApp](#) and [Bank Statement Parsers SuiteApp](#).

How is Bank Feeds SuiteApp different from other NetSuite Banking SuiteApps?

The Bank Feeds SuiteApp automates the import of bank transactions from your preferred financial institutions in the U.S, Canada, Europe, New Zealand, and Southeast Asia. The SuiteApp uses a Financial Institution Connectivity Plug-in to process the automated daily import schedule of your bank data. Configuring the connection only requires your banking credentials.

The Auto Bank Statement Import (ABSI) SuiteApp requires an SFTP connection to connect to your bank. Configuring the connection requires SFTP server credentials and import file details. The SuiteApp also works in conjunction with Bank Statement Parsers SuiteApp to upload bank data into NetSuite. The ABSI and Bank Statement Parsers SuiteApps are available in all regions.

Can I use custom bank integration with the Bank Feeds SuiteApp?

You can use Financial Institution Connectivity API to integrate with other banks. For more information, see the help topic [Financial Institution Connectivity Plug-in Interface Overview](#).

Are multifactor authentication (MFA) accounts required to be authenticated every time or is this a one-time setup?

Depending on your bank, you must reauthenticate every time you want to get the latest transactions from your bank. If this is not feasible for you, you should connect to your MFA bank accounts using the Auto Bank Statement Import (ABSI) and Bank Statement Parsers SuiteApp instead.

What if I have a token key device to access my online banking?

You'll need your administrator or a user with appropriate permissions to enter the multifactor authentication (MFA) code for the import to run successfully. If this is not feasible for you, you can connect to your MFA bank accounts using the Auto Bank Statement Import (ABSI) SuiteApp instead.

Is there an ability to connect to a demo bank server or run the Bank Feeds SuiteApp in test mode?

No. Demo bank accounts are not available.

The setup will download the last 60 days of your bank data into NetSuite. What happens if the same transactions were already imported into NetSuite through manual import?

You'll be able to exclude imported transactions that are not detected by the system as duplicates.

Can I get real-time feeds from my financial institution?

The system runs an automated daily import schedule to ensure you have an updated account balance in NetSuite. The SuiteApp also lets you manually request and import bank data into NetSuite for on-demand bank transaction data.

Can the import schedule be customized to multiple times a day?

The automated daily import schedule can't be customized.

When do I use the Bank Feeds SuiteApp?

The Bank Feeds SuiteApp takes bank connectivity a step further by allowing automatic daily imports of the most up to date bank data. Additionally, the SuiteApp lets you connect multiple bank accounts from different financial institutions.

What will happen if a credit card GL account in NetSuite and a connected bank account have different currencies?

The NetSuite GL currency must be the same as the bank account currency. Otherwise, the import of bank data will fail.

Can I customize the Bank Feeds Parser?

No, only the standard Bank Feeds Parser is compatible with the SuiteApp.

Will I be able to send an electronic payment file to my bank or financial institution?

Transfer of payment files electronically through SFTP (Secure File Transfer Protocol) connection is delivered by the SFTP Connector SuiteApp. For more information, see the help topic [SFTP Connector SuiteApp](#).

Does it need a dedicated user for the upload?

A user with an Administrator role or any custom role with required Bank Feeds SuiteApp permission can set up bank feeds in NetSuite. Automatic bank data imports don't require a dedicated user as it occurs automatically after configuring your financial institution connection in NetSuite.

My financial institution data successfully imported to NetSuite, but why am I unable to see it on the Match Bank Data page?

Make sure that the Use Match Bank Data and Reconcile Account Statement Pages box is checked for each bank or credit card account that will be imported using Bank Feeds.

What happens if an existing import bank transactions feature is already available in my NetSuite account?

This is an alternative way to import bank data into NetSuite. The SuiteApp removes the manual process of uploading the bank data into NetSuite as everything is done automatically.

Will my imported bank data automatically create transactions in NetSuite?

Starting with NetSuite 2020.2, you can do this using autocreate rules. For more information, see [Automatic Creation of Account Transactions](#).

Is it possible to run the matching process on my existing transactions but not trigger a new import?

You can manually run reconciliation rules against transactions from multiple imports from the Match Bank Data page, based on the date range you specify. For more information, see [Manually Running Reconciliation Rules](#). For troubleshooting details, see [Troubleshooting Manual Reconciliation Rule Running Issues](#).

Can I test or set up the Bank Feeds SuiteApp in a non-production account? Example, a Sandbox or a Release Preview account?

Connecting a new account or removing an existing account on your connectivity configuration will override the current Bank Feeds configuration in your production account. Any changes you make in your non-Production environment also applies to your Production environment.

Bank Feeds U.S. and Canada

Who can use the Bank Feeds SuiteApp?

The Bank Feeds SuiteApp caters to small and medium-sized companies that require direct connection to their financial institutions operating within Canada and the United States.

If you expect high-volume of transactions, use the NetSuite Auto Bank Statement Import SuiteApp and the Bank Statement Parsers SuiteApp.

Does Bank Feeds support financial institutions in the U.S. and Canada that has multifactor authentication?

Yes. However, due to the nature of multifactor authentication (MFA) accounts, failed daily imports of MFA accounts will occur when the security token needs to be refreshed. To get your latest data, you are required to reauthenticate for the bank retrieval and the import process to be successful. For more information, see [Multifactor Authentication in Bank Feeds](#).

What is the difference between the two format profiles used to connect to financial institutions in the U.S. and Canada?

While both format profiles let you connect to banks in the U.S. and Canada, they differ in the number of supported banks and account limits. The U.S. and Canada Accounts (MX) format profile has higher account limits and supports more financial institutions. For more information, see [Limitations of Using the Bank Feeds SuiteApp](#) and [Supported Financial Institutions for Bank Feeds SuiteApp](#).

Can I set up connections using both format profiles at the same time?

You shouldn't set up connections using both format profiles. The same transactions will be imported from both connections and cause duplicates during reconciliation.

I want to switch to the other format profile. What will happen to my existing connections using the old profile?

Imported transactions from the old profile will be retained. However, connections using the new profile will import transactions from the last 60 days and will cause duplicates during reconciliation. The duplicate transactions will have to be manually excluded.

How will I know if my bank has migrated to an Open Banking site?

Starting with version 22.1.0, the SuiteApp enables you to connect with and import your bank data from financial institutions that use Open Banking technology. For the list of supported open banking sites, see [SuiteAnswers ID 1013000](#).

What is the difference between connecting my NetSuite account to open banking sites versus screen scraping sites?

When you connect to screen scraping sites for bank feeds, you provide your banking login credentials to the Authorized Information Service Provider (AISP) through your format profile. Then, the AISP logs in on your behalf and retrieves your bank transactions for import.

When you connect to open banking sites, you're prompted to log in directly to the financial institution site instead of providing your credentials to the AISP. After authenticating, you must also grant the AISP access and allow to retrieve your bank transactions for import to NetSuite.

Bank Feeds Europe and Other Countries

Does Bank Feeds support financial institutions in Europe that require multifactor authentication?

Yes. However, because of how multifactor authentication (MFA) accounts work, daily imports can fail if your token needs updating or your consent expires. To continue receiving daily updates from your financial institution, update your MFA token on the Connectivity Configuration subtab of your format profile record. For more information, see [Managing Regulated Europe \(Salt Edge\) Financial Institution Connections](#).

I see that the SuiteApp is free but are there any fees from Salt Edge Limited?

No. The service is free of charge.

Does the SuiteApp require any setup on the financial institution's site?

No. If Salt Edge Limited supports the financial institution you're trying to connect, you need to log in to your financial institution using the Bank Feeds SuiteApp.

If an employee sets up the registration for Bank Feeds and then eventually leaves the business, how does this affect the connection configuration?

There is a separate Dashboard provided by Salt Edge Limited which allows the user to change the email address mapped to the Bank Feeds account. Access to this dashboard is included in the email sent after initial registration. It's suggested that before the employee leaves the business, the access is transferred. Transferring access doesn't affect the data that has been previously connected to NetSuite.

Are there any limitations on the amount of transactions in an account?

To avoid performance degradation, don't set up a bank data import with more than 10,000 transactions. If an import process reaches the transaction limit, the remaining transactions are imported on the next scheduled or manually initiated import. To manually initiate the system to import bank transactions, see [Updating Imported Bank Feeds Data](#). For more information about the SuiteApp's current limitations, see [Limitations of Using the Bank Feeds SuiteApp](#).

Since U.K. is no longer part of the European Union, is the SuiteApp compatible with financial institutions operating in the U.K.?

Yes.

Is there an alert notification when the expiry date of a connection is already due?

Notification isn't supported. The expiry date of a financial institution connection is available on the Connectivity Configuration subtab of the Regulated Europe Accounts (Preferred) format profile.

Does the SuiteApp allow connection to U.K. bank accounts?

Yes. Please refer to [SuiteAnswers ID 90911](#) for the full list of supported financial institutions.

Are the following fields: Connection Expiry Date and Last Successful Import, searchable through saved search or analytics?

The Consent Expiry Date field is not searchable. For the Last Successful Import, refer to topic [Banking Import History](#).

Auto Bank Statement Import SuiteApp

The Auto Bank Statement Import (ABSI) SuiteApp lets you to automatically import bank statement files into NetSuite every day.

This feature uses a Financial Institution Connectivity Plug-in to securely connect to your financial institution's server through SFTP (Secure File Transfer Protocol).

The ABSI SuiteApp works together with the Bank Statement Parser Plug-ins to read the content of imported bank statement files. It uses a transaction parser to find the transactions in each file and pulls them into NetSuite for matching and reconciliation.

The SuiteApp enables you to perform the following tasks:

- Set up your SFTP connection right on your format profile record.
Connect to your bank's server by entering your banking credentials. Set a file name pattern so the system knows which files to import into NetSuite.
- Automate daily imports of bank statement files into NetSuite.
When you save a format profile for SFTP for the first time, NetSuite sets up a schedule to import your bank statement files automatically. Each day, NetSuite brings in any new data from your bank into your accounts on the Match Bank Data page. This feature lets finance users focus more on reconciling bank and credit card transactions between NetSuite and your banks.
- Manually trigger the bank statement files import process to get real-time bank data updates.

The ABSI SuiteApp supports all languages available in the Multi-Language feature of NetSuite. To set the language preference in NetSuite, see the help topic [Choosing a Language for Your NetSuite User Interface](#).

Read the following topics to learn more about the ABSI SuiteApp:

- [Installing Auto Bank Statement Import SuiteApp](#)
- [Roles and Permissions for Auto Bank Statement Import](#)
- [Limitations of Using the Auto Bank Statement Import SuiteApp](#)
- [Setting Up Auto Bank Statement Import](#)
- [Bank Statement File Import](#)
- [Auto Bank Statement Import Error Messages](#)

Installing Auto Bank Statement Import SuiteApp

This section covers what you need and how to install the Auto Bank Statement Import (ABSI) SuiteApp.

Prerequisites

Before installing the ABSI SuiteApp, go to Setup > Company > Setup Tasks > Enable Features, then click the SuiteCloud tab. Make sure these features are enabled on your account:

- Custom Records
- Client SuiteScript
- Server SuiteScript

Installation

Any role with access to the SuiteApp Marketplace in NetSuite can install the Auto Bank Statement Import SuiteApp. For more information about the SuiteApp Marketplace, see the help topic [SuiteApp Marketplace in NetSuite](#).

To install the Auto Bank Statement Import SuiteApp:

1. Go to the SuiteApps tab.

Note: The SuiteApps menu isn't available for the following centers:

- Advance Partner Center
- Employee Center
- Partner Center
- Vendor Center

2. In the Search Apps field, enter **Auto Bank Statement Import SuiteApp**.
3. Click the Auto Bank Statement Import SuiteApp tile.

4. Go to the top right area of the Auto Bank Statement Import SuiteApp details page and click **Install**.

For more information about installing a SuiteApp from the SuiteApp Marketplace, see the help topic [Installing from the SuiteApp Marketplace](#).

- Note:** Starting NetSuite 2021.1, you can uninstall the SuiteApp even after it's been used to import a bank statement file. After you uninstall the SuiteApp, NetSuite does the following:
- Removes the SFTP Connectivity plug-in and parser plug-in from all format profiles that use the SuiteApp. The **Connectivity Method** field in the format profiles changes to Manual Import, and the **Transaction Parser** field is cleared.
 - Inactivates all format profiles that use the SuiteApp. To reactivate them, you'll need to select a new parser plug-in for each record. See [Modifying Format Profiles](#). If you don't need a format profile anymore, you should delete it. See [Deleting a Format Profile](#).

The ABSI SuiteApp is a managed SuiteApp and gets updated automatically whenever new features or enhancements are added.

Roles and Permissions for Auto Bank Statement Import

Only the Administrator role can use the Auto Bank Statement Import (ABSI) SuiteApp to set up an SFTP connectivity configuration.

To configure a format profile record that uses SFTP connection and to successfully import transactions using custom roles, you must set the following permissions:

Permission Subtab	Permission	Level
Transactions	Import Online Banking File	Edit
Transactions	Reconcile	Create
Reports	SuiteAnalytics Workbook	Edit
Lists	Accounts	View
Lists	Certificate Access	View
Lists	Custom Record Entries	Full
Lists	Currency	View
	Note: If Multi-Currency feature is enabled.	
Lists	Documents and Files	View
Lists	Key Access	View
Lists	Perform Search	View
Setup	Financial Institution Records	Full
Setup	Set Up Company	View
Setup	SuiteScript	View

Permission Subtab	Permission	Level
Custom Record	SFTP Connectivity File Import	Create

For a list of permissions to access the necessary records and forms to use ABSI, see [Permissions for Banking Features](#).

Limitations of Using the Auto Bank Statement Import SuiteApp

When you use the Auto Bank Statement Import SuiteApp, keep these limitations in mind:

- The SuiteApp doesn't support:
 - IP address allowlisting
 - Importing of bank statement files in ZIP format
 - Importing of PGP (Pretty Good Privacy) encrypted files
- The time zone you set for your SFTP connectivity might be different from the time zone used for automatic bank data imports. For more information, see [Automatic Bank Statement Files Import Schedule](#).
- To avoid performance issues, don't set up a bank data import with more than 10,000 transactions or 500 linked accounts.

Setting Up Auto Bank Statement Import

With the Auto Bank Statement Import (ABSI) SuiteApp, you can create your own financial institution record and set up your format profile for SFTP connection.

To set up the Auto Bank Statement Import feature:

1. Create a financial institution record. See [Creating Financial Institution Records](#).
2. Add a format profile to the financial institution record. For more information, see [Creating Format Profiles for Bank Reconciliation](#).

When you create a format profile that uses SFTP, set these fields:

- a. **Connectivity Method** – Select **SFTP Connectivity**.
- b. **Transaction Parser** – Select any standard or custom Bank Statement Parser Plug-in.
For more information about the available standard parser plug-ins you can use for the ABSI SuiteApp, see [Bank Statement Parsers SuiteApp](#).
3. Set up your SFTP credentials on the **Connectivity Configuration** subtab of the format profile. For details, see steps 5 – 6 of [Configuring SFTP Connection for Auto Bank Statement Import](#).
4. Go to the **Account Linking** subtab to map your financial institution data to the right GL accounts in NetSuite. For more information, see [Linking Accounts for Financial Institution Connectivity](#).
If you're using a standard bank statement parser and need more information about mapping keys, see [Identifying Unique Account IDs for Standard Bank Statement Parsers](#).
5. (Optional) Map custom bank codes to the correct bank data types. For details, see [Mapping Custom Bank Codes](#).

If you're using a standard bank statement parser, standard transaction codes are already mapped. For MT940, for example, standard SWIFT codes are included. Only do this step if your bank uses custom transaction codes or you want to override the standard mapping.

To see which transaction codes are supported for each format, read [Supported Transaction Codes for Bank Statement Parsers SuiteApp](#).

6. If you're using a standard BAI2 or MT940 transaction parser, set it up on the Parser Configuration subtab of your format profile. For details, see [Configuring Standard Bank Transaction Parsers](#).
7. Click **Save**.

If successful, you'll be redirected to the financial institution page, and NetSuite will show a message that the import process has started. To check the status, click **Track your status**.

Configuring SFTP Connection for Auto Bank Statement Import

When you use the Auto Bank Statement Import (ABSI) SuiteApp, you'll need an SFTP connection to link NetSuite to your bank's server. You can set up your SFTP connection in NetSuite by providing either or both of the following:

- Digital Certificate or Private Key
- Password

If your bank needs two-factor authentication, make sure you provide both to connect successfully.

You can also set a file name pattern so the SFTP Connectivity plug-in knows which files to import into NetSuite.

To configure your SFTP connection on the format profile record:

1. Go to Setup > Accounting > Financial Statements > Financial Institutions > List.
2. On the Financial Institutions page, click **View** next to your financial institution record.
3. On the **Format Profile: Configuration** subtab, click the format profile you want to use for SFTP.
4. On the format profile page, click **Edit** to set up your connectivity configuration.
5. On the **Connectivity Configuration** subtab, set the following fields:

- **URL** – Enter your bank's URL.

 **Note:** If you edit the URL in an existing format profile, the Password field will be cleared. Make sure you reenter your SFTP password before submitting.

- **Username** – Enter your SFTP username.
- **Digital Certificate or Private Key** – If your bank needs authentication with a certificate or key, select the right ID here.

You can use a digital certificate or private key instead of a password to connect to your bank's server. Find digital certificates in Setup > Company > Preferences > Certificates, and private keys in Setup > Company > Preferences > Keys.

For more information about storing and managing them, see the help topics [Uploading Digital Certificates](#) and [Uploading Private SSH Keys](#).

- **Password** – If your bank needs a password for authentication, enter your SFTP password.

 **Note:** When you create a new SFTP configuration, the Password field is disabled by default. To enable it, enter a value in the URL field first.

- **Host Key** – Enter your bank's SFTP host key. You'll need this even if you use a digital certificate or private key instead of a password.

Read the following topics for more information about SFTP Host Keys:

- [Obtaining the Host Key](#)
- [Host Key Verification](#)
- [Retrieving the Host Key of an External SFTP Server](#)
- **Host Key Type** – Select the host key type: **RSA**, **DSA**, or **ECDSA**.
- **Port** – Enter the port number that will connect to the remote account. Port number value must range from 0 to 65535.
- **Download Filename Pattern** – Set up a file name pattern using regular expressions and reserved words. Use reserved words in curly brackets as date variables, and they'll be replaced with the right dates in the final file name.

 **Note:** When you use reserved words, you'll need to set the **Bank Server Time Zone (GMT)** and **Date Format for Reserved Word** fields.

If you leave this field blank, the system will match and grab whatever file is available on the bank's server.

Sample Filename Pattern: MyBank_[0-9]{5}_{DateToday}.txt

Filename: MyBank_00198_08042019.txt

The reserved words are available in the following table. The sample values below assumes that the current date is August 4, 2019, and the date format is MMDDYYYY.

Reserved Word	Description	Sample Value
DateToday	This reserved word will be replaced with the date today.	08042019
DateLastBusinessDay	This reserved word will be replaced with the date of the previous business day. Only the days between, and including, Monday through Friday are considered business days.	08022019
DateYesterday	This reserved word will be replaced with the date yesterday.	08032019
DateLastMonthEnd	This reserved word will be replaced with the date of the previous month's last day.	07312019

Reserved Word	Description	Sample Value
DateStartOfTheMonth	This reserved word will be replaced with the date of the current month's first day.	08012019

- **Bank Server Time Zone (GMT)** – Select the time zone to use for the date that will replace the reserved word in the file name pattern. If left blank, NetSuite will use the time zone from your User Preferences.
Valid time zones are between -12:00 to +13:00, in 15-minute intervals, with leading zeros if needed, and a plus or minus sign. For example, +08:00 and -08:15 are valid.
- **Date Format for Reserved Word** – Enter a date format for the reserved words in your filename pattern. This is required if your filename pattern uses reserved words.
This field defaults to **YYYYMMDD** by default.
A valid date format can use:
 - 2 – 3 **M** (month) characters
 - 2 **D** (day) characters
 - 2 or 4 **Y** (year) characters
 - may include a hyphen (-) separator
- **Download Directory** – Enter the path to the folder with the bank statement file. By default, this a relative path.
- **Use Absolute Path** – Check this box if your bank uses an absolute path. The system will treat the URL format entered in the Download Directory field as an absolute path.
- **Download Timeout** – Enter how many seconds to allow for the file to download. The value must be between 1 and 300.
This field defaults to **300**.

6. Click **Submit**.

After you set up your SFTP connection on the Connectivity Configuration subtab, go to the Account Linking subtab. See step 4 of [Setting Up Auto Bank Statement Import](#) for more information.

Bank Statement File Import

There are two ways to let the system import your bank statement files into NetSuite with the Auto Bank Statement Import (ABSI) SuiteApp:

- **Automatic import** – Use the Format Profile page to set up your daily bank statement file imports. For more information, see [Automatic Bank Statement File Import](#).
- **Manual import request** – Ask the system to import your latest bank statement files from your bank server for an updated account balance. For more information, see [Updating Imported Bank Statement Files](#).

The SuiteApp uses the file name pattern you set up in your SFTP connectivity configuration to figure out which bank statement files to import into NetSuite. If you want to learn more about how the system imports your bank statement files in different situations, see [Bank Statement File Name Matching for Import](#).

You can find details for each imported bank file on the Imported Statement List and SFTP Connectivity File Import List pages. For more information about managing your bank statement file imports, see [Managing SFTP Connectivity for File Imports](#).

When your bank statement files are imported, the parser plug-in reads them, and pulls the transaction information into NetSuite. The system automatically matches your data to account transactions in

NetSuite on the Match Bank Data page. After import's done, you can also match any leftover transactions there. For more information, see [Matching Bank Data](#).

After you submit the transactions and they're cleared in the system, you reconcile them on the Reconcile Account Statement page. For details, see [Bank Data Matching and Reconciliation](#).

Automatic Bank Statement File Import

The Auto Bank Statement Import (ABSI) SuiteApp lets you to automate bank statement file imports by setting up a format profile that uses a Financial Institution Connectivity Plug-in to start an SFTP connection.

The first time a format profile that uses SFTP connectivity is saved:

- NetSuite matches the file name pattern you set on your bank's server and imports the matching bank statement file into NetSuite.
- NetSuite then sets up a daily schedule to import your bank statement files. Every day, NetSuite automatically brings in any new bank statement files that match your file name pattern from your bank into your accounts on the Match Bank Data page.

Updating Imported Bank Statement Files

The Auto Bank Statement Import (ABSI) SuiteApp lets you manually initiate the import process to aid in updating your account balance in NetSuite. To manually request the system to import your bank statement files, you can do any of the following:

- Update the Format Profile Record** – Edit and save the format profile that uses SFTP, even if you don't change anything. Every time you save the record, the system starts the bank statement file retrieval and import process.

 **Note:** To avoid errors from back-to-back requests, you can only refresh your bank data every 60 minutes. The 60-minute wait doesn't apply to failed imports.

- Update the Match Bank Date page** – Get the latest bank data for your account by clicking the **Update Imported Bank Data** button on the Match Bank Data page. For more information, see [Updating Imported Bank Data](#).

 **Warning:** If you're using the Auto Bank Statement Import SuiteApp for more than one account, don't choose this option. If you click **Update Imported Bank Data**, the system only gets the latest data from the account you picked. Data from your other accounts won't be retrieved and could get lost.

Bank Statement File Name Matching for Import

The Auto Bank Statement Import (ABSI) SuiteApp uses the file name pattern you set in your SFTP connection to find and import the right bank statement files into NetSuite. The table below shows how the system handles your bank data imports in different situations.

Scenario	Result
No file match or no available file on your bank's server.	The bank statement import won't work.
File matches, but the system sees that the same file name was already imported from this bank.	The bank statement import won't work.

Scenario	Result
	If files aren't uploaded because of parsing errors, you'll need to delete the failed import records before you can upload them again. For more information, see Deleting Failed SFTP Connectivity Import Records.
File has a parsing error and the same name as a file you already imported from another bank.	The bank statement import won't work. First, check why your import failed so you can fix the error. Then, delete the failed import record so the system can import a file with a similar name from another bank.  Note: To find which import record to delete, look for the Internal ID or Configuration ID in the execution log of the failed import. For more information, see Deleting Failed SFTP Connectivity Import Records. After you delete the failed import record, you can ask the system to try importing again. To do this, see Updating Imported Bank Statement Files.
A file matched and was imported into NetSuite, but there are still matching files on your bank's server that haven't been imported.	This can happen if the system finds more than one file that matches your file name pattern. If there are several matching files, the system only imports the first one. The rest are imported during the next scheduled import, or you can get them right away by asking the system import again. To upload the rest manually, see Updating Imported Bank Statement Files. If you're an Administrator, you can check the execution log of your import details record to see if there are files still waiting to be imported into NetSuite. To do this: 1. As an Administrator, go to Customization > Plug-ins > Plug-In Implementations. 2. Click the SFTP Connectivity plug-in implementation. 3. On the Execution Log subtab, look for the log related to your import detail record. 4. In the Details column, you'll see a message if there are files still waiting on your bank's server.
The Download Filename Pattern field on your SFTP connectivity configuration is blank	If there's more than one file on your bank's server, the system only imports the first file that's not already in NetSuite. The rest of the files are imported during the next scheduled import, or you can get them right away by asking the system to import again. To upload the rest manually, see Updating Imported Bank Statement Files. If you're an Administrator, you can check the execution log of your import details to see if there are files still waiting to be imported into NetSuite. To do this: 1. As an Administrator, role, go to Customization > Plug-ins > Plug-In Implementations. 2. Click the SFTP Connectivity plug-in implementation. 3. On the Execution Log subtab, look for the log related to your import detail record. 4. In the Details column, you'll see a message if there are files still waiting on your bank's server.

Managing SFTP Connectivity for File Imports

When SFTP connectivity is in place, you can monitor the status of every bank statement file imported into NetSuite and resolve any failed attempts. The topics below show you how to:

- review detailed import records, and
- delete failed import entries so that NetSuite can import the same file again.

Read the following topics to learn more about managing your bank statement file imports in NetSuite:

- [Viewing SFTP Connectivity Import Details](#)
- [Deleting Failed SFTP Connectivity Import Records](#)

Viewing SFTP Connectivity Import Details

Every time you save a format profile, you'll see a progress message on the financial institution record. Click the **Track your status** link to check how your import's going.

You can also go straight to the Banking Import History page to check the status and details of each imported bank statement. To get to the Banking Import History page, go to Transactions > Bank > Banking Import History.

SFTP Connectivity File Import Record

Check the SFTP Connectivity File Import List page if you want to see all the bank statement files you've imported into NetSuite using SFTP Connectivity.

To view an SFTP Connectivity File Import record:

1. Go to Customization > Lists, Records, & Fields > Record Types.
2. On the Record Types page, click **List** on the **SFTP Connectivity File Import** line.
3. Click **View** next to the SFTP Connectivity File Import record you want to view. Each imported file record contains the following information:
 - Filename
 - Configuration ID
 - URL

Deleting Failed SFTP Connectivity Import Records

The SFTP Connectivity plug-in uses the file name pattern you set to look for files to import from your bank's server. It imports the first file that matches. If files aren't uploaded because of parsing errors, you'll need to delete the failed import records before you can upload them again.

To delete failed SFTP Connectivity file import records:

1. Go to Transactions > Bank > Upload File > List.
2. On the Imported Statement List, you'll see all the SFTP Connectivity imports and their status. Make note of any import detail record with a **Failed** status.
3. Check the error details to find out what went wrong. Fix the error, then move on to delete the records.

You can also check the execution logs of your failed import to figure out which SFTP Connectivity File Import to delete. To do this:

- a. Using the Administrator role, go to Customization > Plug-ins > Plug-In Implementations.
 - b. Click the **SFTP Connectivity** plug-in implementation.
 - c. Click the **Execution Logs** subtab to see the audit log details for your imports.
4. Go to Customization > Lists, Records, & Fields > Record Types.
5. On the Record Types page, click the **List** link on the **SFTP Connectivity File Import** line.
6. On the SFTP Connectivity File Import List page, find the records you want to delete and click **Edit**.
7. On the SFTP Connectivity File Import page, hover over **Actions**, and click **Delete**.

Note: If **Inline Editing** is enabled on your account, click the **Edit** slider to turn on inline editing. Hover under the New column to see more options, then click **Delete Record**.

Auto Bank Statement Import Error Messages

This section lists some common errors you might see when using the Auto Bank Statement Import (ABSI) SuiteApp and what you can do to fix them.

- [Connectivity Configuration Error Messages](#)
- [Banking Import History Error Messages](#)

Connectivity Configuration Error Messages

Error Message	Cause	Solution
There was a problem connecting to your financial institution. Your current role does not have permission to edit this connectivity configuration. Please contact your administrator.	You tried to edit a format profile that uses SFTP with a role that doesn't have the right permissions.	Contact your administrator. For more information about the permissions you need for the ABSI SuiteApp, see Roles and Permissions for Auto Bank Statement Import .
Missing required fields. Depending on the authentication requirements, enter a password or select a value for the Digital Certificate or Private Key field to complete the configuration. For banks that require dual authentication, you must provide both information.	You didn't enter a value for one or both of these fields: ■ Digital Certificate or Private Key ■ Password	Depending on your bank's requirements, you'll need to provide one or both: ■ Digital Certificate or Private Key ■ Password
You may only enter numbers into this field.	You entered something other than numbers for the port number.	Make sure you only use numbers in the Port Number field.
Invalid port number. The value must be between 0 and 65535.	The port number you entered isn't valid.	Enter a valid port number between 0 and 65535.
Invalid date format. A valid date format must have a combination of 2-3 M (month) characters, 2 D (day) characters, 2 or 4 Y (year) characters, and may include a hyphen separator.	The date format you entered isn't valid.	Enter a valid date format.
Please enter a download timeout value that is between 1 and 300.	The download timeout value you entered is less than 1 or more than 300.	Enter a download timeout value between 1 and 300.

Banking Import History Error Messages

Error Message	Cause	Solution
Please enter value(s) for: {*}.  Note: Depending on which fields are blank, the value for {*} may contain one or more of the required fields.	This error shows up if you don't enter values for any of these required fields: ■ URL ■ Username ■ Host Key ■ Port ■ Date Format For Reserved Word ■ Download Timeout	Make sure you fill in all required fields before submitting your configuration.
The server URL "{*}" is incorrect or does not exist. Make sure you entered the correct URL, and try again.  Note: {*} will be replaced with the URL you entered.	The value you entered for the URL field is one of the following: ■ Numeric URL ■ Incorrect URL	Double-check the URL in your SFTP Connectivity Configuration. If you're not sure, ask your bank for the right URL.
The certificate or private key ID does not exist. Check your certificate or private key record, and try again.	The Digital Certificate or Private Key ID you entered isn't valid.	Make sure your Digital Certificate or Private Key ID is valid. For more information about Digital Certificates, see the help topic Uploading Digital Certificates. For more information about Private Keys, see the help topic Uploading Private SSH Keys.
The provided host key and port number does not match the remote server's fingerprint. Please enter the correct host key and port number.	The Host Key and Port Number don't match your bank's server fingerprint.	Ask your bank for the correct port number. For more information about obtaining the correct Host Key, see the help topic Obtaining the Host Key.
The host key and host key type do not match the remote server's fingerprint. Enter the correct host key and host key type on the SFTP connectivity configuration.	The Host Key and Host Key Type don't match your bank's server fingerprint.	Make sure your host key matches the host key type you selected in your configuration. For more information about obtaining the correct Host Key, see the help topic Obtaining the Host Key.
The host key is invalid. A valid host key must be a Base64 string that is at least 96 bytes in length.	The host key you entered has extra characters.	In your SFTP connectivity configuration, make sure the host key is valid

Error Message	Cause	Solution
		and doesn't have extra characters. For more information about obtaining the correct Host Key, see the help topic Obtaining the Host Key .
There was a problem connecting to your financial institution. No such file or directory.	The directory can't be recognized.	In your SFTP connectivity configuration, make sure the Download Directory value is correct. Ask your bank to confirm the correct download directory.
The file name in the configuration record did not match any bank statement file names. No files were uploaded.	■ The file wasn't found in your bank's server directory. ■ There's an unrecognized reserved word.	Check your bank's site to see if there really aren't any statement files to import. Check your SFTP connectivity file name pattern and make sure it's in the right format.
The file matching the configuration record has already been uploaded.	The file was already uploaded.	Check your imported bank statement files in NetSuite. See SFTP Connectivity File Import Record .
Enter the correct directory on the SFTP connectivity configuration record then try again. If you continue to receive this message, contact your bank to resolve the issue.	The directory wasn't found.	Ask your bank to confirm the correct download directory.
There is no connectivity configuration setup found for SFTP connectivity. Edit the format profile to set up your connectivity configuration.	SFTP connectivity configuration is missing. This happens if you save a format profile for SFTP connectivity without setting up the configuration.	Make sure you set up your connectivity configuration before saving a format profile that uses SFTP Connectivity.
Unable to establish a connection to the SFTP server. Check your SFTP connectivity configuration and ensure all fields are valid, then try again. If you continue to receive this message, contact your financial institution.	The SFTP Connectivity plug-in can't connect to your bank's server.	Check your SFTP connectivity configuration and make sure all the fields are filled in correctly. For more information, see Configuring SFTP Connection for Auto Bank Statement Import .

Bank Statement Parsers SuiteApp

The Bank Statement Parsers SuiteApp delivers standard parser plug-ins that read bank and credit card statement files and import the data in NetSuite to aid with bank reconciliation. If the Financial Institution and Format Profiles are set up correctly, the SuiteApp can identify multiple bank accounts in a single file. For more information, see [Creating Financial Institution Records](#) and [Format Profile Creation](#).

The SuiteApp also includes sample scripts you can download and use as a reference when you create custom parsers. For more information, see [Downloading Sample Bank Statement Parsers Scripts](#).

 **Note:** The SuiteApp will not create NetSuite transactions from the imported bank statement files.

The Bank Statement Parsers SuiteApp includes parser plug-ins for the following file formats in (Unicode) UTF-8 and UTF-8 BOM encoding:

- [BAI2 Parser](#) – This plug-in recognizes standard BAI2 bank-transaction codes and lets you set the decimal precision.
- [CAMT.053 Parser](#) – This plug-in parses CAMT.053.001.02 or CAMT.053.001.08 format, provides default XML-to-field mappings, and supports only UTF-8 encoding.
- [CSV Parser](#) – This plug-in parses UTF-8 CSV statement files using the supplied template or your own mapping to NetSuite fields.
- [MT940 Parser](#) – This plug-in recognizes standard SWIFT MT940 transaction codes and converts embedded remittance information into a readable format.
- [OFX/QFX Parser](#) – This plug-in parses OFX/QFX files in versions 102, 103, 211, and 220 and supports either a period or a comma as the decimal separator.

Installing the Bank Statement Parsers SuiteApp

Prerequisites

Before you install the Bank Statement Parsers SuiteApp, go to Setup > Company > Setup Tasks > Enable Features, then click the SuiteCloud tab. Make sure these features are enabled on your account:

- Custom Records
- Client SuiteScript
- Server SuiteScript

Installation

To install the Bank Statement Parsers SuiteApp, go to Customization > SuiteBundler > Search & Install Bundles, then click **Advanced**.

Use the following information to search for the SuiteApp:

- **Bundle Name:** Bank Statement Parsers
- **Bundle ID:** 293699

For information about installing SuiteApps, see the help topic [Installing a Bundle](#).

Roles and Permissions for Bank Statement Parsers

By default, these standard roles can use the Bank Statement Parsers to import statement files:

- Administrator
- CEO
- CFO

To access the Upload File page (previously named Statement File Import) and import transactions with custom roles, you need to set these permissions:

 **Note:** You must have an Administrator role to assign permissions to custom roles. For details, see the help topic [Setting Permissions](#).

Permission Subtab	Permission	Level
Transactions	Import Online Banking File	Full or Edit
Custom Record	BSP Configuration Value	Full
Custom Record	BSP CSV Parser Configuration	Edit

For a list of permissions needed to access the records and forms for Bank Statement Parsers, see [Permissions for Banking Features](#).

Setting Up Standard Bank Statement Parsers

To set up standard bank statement parsers for your account, follow these steps:

1. Create a financial institution record. For details, see [Creating Financial Institution Records](#).
2. Next, create a format profile record. Follow steps 1- 8 in [Creating Format Profiles for Bank Reconciliation](#).

In step 8, from the **Transaction Parser** list, select a parser plug-in provided by the Bank Statement Parsers SuiteApp.

 **Note:** You can't delete format profiles linked to a bank statement parser, but you can set the format profile to inactive if you don't want to use it anymore.

3. Map bank data from your financial institution to the right GL accounts in NetSuite. Follow step 2 in [Linking Accounts for Manual Import](#).

For information about the mapping keys to use for bank statement parsers, see [Identifying Unique Account IDs for Standard Bank Statement Parsers](#).

4. (Optional) Map custom bank transaction codes to their matching bank data type or exclude standard transaction codes. For details, see [Mapping Custom Bank Codes](#).

Standard transaction codes are already mapped to the parsers. For MT940, standard SWIFT codes are included. Do this step only if your bank uses custom transaction codes or you want to override the standard mapping.

To see which transaction codes each file format supports, read [Supported Transaction Codes for Bank Statement Parsers SuiteApp](#).

5. Set up standard bank transaction parsers.

The configuration values and settings under the Parser Configuration subtab depend on the parser you select. Here's how the values are populated based on your parser:

- **BAI2, MT940, and CAMT.053** – During setup, the configuration values appear only after you save the Format Profile record. To change the defaults, you must click Save & Edit on the format profile.

See the following configuration topics for more information:

- ▢ [Configuring BAI2 Parser](#)
 - ▢ [Configuring MT940 Parser](#)
 - ▢ [Configuring CAMT.053 Parser](#)
 - **OFX/QFX** – No configuration required.
 - **CSV** – Configuration values become available and can be changed after you select the parser. For more information, see [Configuring CSV Parser](#).
6. Save the Format Profile page.
 7. Go to Transactions > Bank > Banking Import History > Upload File page to import your data. Follow steps 3 – 9 in [Importing Data Using a Financial Institution Record](#).

Important: When naming a file for import, keep the file name, including extension, under 50 characters.

Identifying Unique Account IDs for Standard Bank Statement Parsers

You'll need the Unique Account ID when mapping bank accounts in the format profile record. If you're using parsers in the Bank Statement Parsers SuiteApp, here's how you can identify unique account IDs:

BAI2 Unique Account ID

For BAI2-formatted files, use the **Customer Account Number** field in the Account Identifier record (Record 03, field 2).

Sample:

```
01,121140399,999999999,171013,0533,1,80,1,2/
02,999999999,121140399,1,171012,0533,USD,2/
03,8505874910,,015,262595881,,,100,147865183,,,400,147180270,,,/
16,575,119595,,6,0,/
```

OFX/QFX Unique Account ID

For OFX or QFX-formatted files, use these unique account IDs:

- For bank accounts, use the **Account Number** in the Bank Statement section as the unique account ID.

Sample:

```
<BANKACCTFROM>
<BANKID>0341
<ACCTID>0872314012
<ACCTTYPE>CHECKING
</BANKACCTFROM>
```

- For credit card accounts, the unique account ID is the last 4 digits of the Account Number (ACCTID) tag, an underscore, and the Currency Code. In the following example, the account ID is **6008_USD**.

Sample:

```

<CCSTMTRS>
<CURDEF>USD</CURDEF>
<CCACCTFROM>
<ACCTID>76008</ACCTID>
</CCACCTFROM>

```

MT940 Unique Account ID

For MT940-formatted files, use the **Account Identification** in Tag 25.

Sample:

```

:20:STATEMENT
:25:GB32ESSE40486562136016
:28C:242
:60F:C181231USD596416,02
:61:1812311231C11,55NMSCNONREF//INT TRANSFER FRO
:86:INT TRANSFER FROM 3302038958

```

CAMT.053 Unique Account ID

For CAMT.053 files, the unique account ID is the account number in either the IBAN or Other tag, under Account Identifier.

Sample (IBAN):

```

<BkToCstmrStmnt>
  <GrpHdr>
    <Stmnt>
      <Id>059018800</Id>
      <ElctrncSeqNb>000000000000080093</ElctrncSeqNb>
      <CreDtTm>2019-05-04T20:50:57.47+02:00 </CreDtTm>
      <Acct>
        <Id>
          <IBAN>NL444123458977</IBAN>
        </Id>
      </Acct>
    </Stmnt>
  </GrpHdr>
</BkToCstmrStmnt>

```

Sample (Other Identifier):

```

<BkToCstmrStmnt>
  <GrpHdr>
    <Stmnt>
      <Id>AAAASESS-FP-STAT001</Id>
      <CreDtTm>2010-10-18T17:00:00+01:00 </CreDtTm>
      <FrToDt>
        <Acct>
          <Id>
            <Othr>
              <Id>00807599099123</Id>
            </Othr>
          </Id>
        </Acct>
      </FrToDt>
    </Stmnt>
  </GrpHdr>
</BkToCstmrStmnt>

```

CSV Unique Account ID

For CSV formatted files, the unique account ID is the account number in the Account Number column of your bank statement file.

Downloading Sample Bank Statement Parsers Scripts

You can find copies of the scripts used in the Bank Statement Parsers SuiteApp in the file cabinet. The scripts show how statement file data maps to NetSuite fields. Download these scripts as a reference if you want to create your own parser.

To download the Bank Statement Parsers scripts:

1. Go to Documents > Files > File Cabinet.
2. On the left pane of the File Cabinet, click SuiteBundles > Bundle 293699 > com.netsuite.bsp > lite.
3. Click the **Download** link for the parser scripts you want to customize.

To create your own custom parsers, see the help topic [Bank Statement Parser Plug-in](#).

Bank Statement Parser Reference

This section is your main reference for all standard parser plug-ins in the Bank Statement Parsers SuiteApp. Each parser plug-in converts its statement format into data NetSuite bank reconciliation can read.

Review the following topics to configure, identify supported transaction codes, map fields, and fix file import issues for each file format:

- [BAI2 Parser](#)
- [CAMT.053 Parser](#)
- [CSV Parser](#)
- [MT940 Parser](#)
- [OFX/QFX Parser](#)

BAI2 Parser

The BAI2 parser plug-in recognizes default and standard BAI2 bank transaction codes and supports account total and record count import validation. The SuiteApp also lets you set the decimal precision for the BAI2 parser plug-in.

The following topics show how you can set up your BAI2 bank transaction parser:

- [Configuring BAI2 Parser](#)
- [BAI2 Transaction Codes](#)
- [BAI2 File Import Error Messages](#)

Configuring BAI2 Parser

When you choose a standard BAI2 transaction parser, the Parser Configuration subtab of your format profile automatically shows your active currencies.

With the SuiteApp, you can set the decimal precision for the BAI2 parser plug-in. The default precision value is **2**.

Configuring the Decimal Precision for the BAI2 Parser

You can set the decimal precision for each currency if you use the standard BAI2 parser.

To configure the decimal precision:

1. Go to Setup > Accounting > Financial Institution > List.
2. Next to the financial institution record where you'd like to add or edit a format profile, click **View**. For more information, see [Format Profile Creation](#).
3. On the Financial Institution page, click the format profile you want to edit.
4. On the Format Profile page, click **Edit**.
5. Under the Parser Configuration subtab, in the **Precision** field, enter a value from 0-9.
You should change the decimal precision only in these situations:
 - The decimal precision of the currency associated to your bank account has changed.
 - The bank has updated their system to generate bank statement files with a new decimal precision setting.
6. Click **Save**.

BAI2 Transaction Codes

In BAI2 files, you'll find the transaction code in the second field of Record 16. For example:

```
03,543679888899,,015,262595881,,,100,147865183,,,400,147180270,,,/
16,575,119595,,6,0,/
88,scrubbed MEMO/
16,575,5755187,,6,0,/
88,scrubbed MEMO/
```

The following table lists the supported transaction codes for the BAI2 parser:

100	187	241	342	383	468	526	578	674
108	189	242	344	384	469	527	581	676
115	191	243	345	386	472	529	595	677
116	195	244	346	387	474	531	597	678
118	196	246	347	388	475	533	616	679
121	198	247	348	391	476	535	622	681
122	201	248	349	392	477	540	627	682
123	202	249	351	393	479	541	629	683
135	206	252	353	394	481	542	631	684
136	208	254	354	395	484	543	633	686
142	212	255	357	397	485	544	634	687
143	213	257	358	398	487	546	641	688

176	237	306	379	462	518	574	669	726
176	238	308	381	464	522	575	672	727
184	240	331	382	466	524	577	673	728

BAI2 File Import Error Messages

The following table lists some common file import errors and how you can fix them.

Error Message	Cause or Scenario	Solution
The file upload failed because the file contains an incorrect date format. BAI2 Statement files use the <YYMMDD> date format. Contact your bank to correct the error, and re-upload the file again.	Wrong date format.	Contact your financial institution for help.
The file upload failed because the file contains an incorrect Funds Type. Expected Funds Type values are 0, 1, 2, S, V, D, or Z. Contact your bank to correct the error, and re-upload the file again.	Wrong Funds Type value	Contact your financial institution for help.
The file upload failed because it contains multiple file header records. The file must only have one File Header. Contact your bank to correct the error, and re-upload the file again.	The statement file has multiple file headers.	Contact your financial institution for help.
The file upload failed because the total sum of transactions imported per account does not match the Account Control Total amount in the file. Contact your bank to correct the error, and re-upload the file again.	The Account Control Total value in the Account Trailer (49) record is wrong.	Contact your financial institution for help.
The file upload failed because the total number of records per account does not match with the Account Trailer Control in the file. Contact your bank to correct the error, and re-upload the file again.	The number of records in the Account Trailer record is wrong.	Contact your financial institution for help.

Error Message	Cause or Scenario	Solution
The file upload failed because the total sum of transactions per group does not match the Group Control Total in the file. Contact your bank to correct the error, and re-upload the file again.	The Group Control Total value in the Group Trailer record is wrong.	Contact your financial institution for help.
The file upload failed because the total number of Account Records per group does not match the Number of Accounts in the Group Account Trailer record in the file. Contact your bank to correct the error, and re-upload the file again.	The Number of Accounts value in the Group Trailer record is wrong.	Contact your financial institution for help.
The file upload failed because the total number of records per group does not match with the Group Trailer Control in the file. Contact your bank to correct the error, and re-upload the file again.	The number of records in the Group Trailer record is wrong.	Contact your financial institution for help.
The file upload failed because the total sum of transactions imported does not match the File Control Total amount in the file. Contact your bank to correct the error, and re-upload the file again.	The File Control Total value is wrong.	Contact your financial institution for help.
The file upload failed because the total number of Group Headers in the file does not match the Number of Groups in the File Trailer record. Contact your bank to correct the error, and re-upload the file again.	The Number of Groups value in the File Trailer is wrong.	Contact your financial institution for help.
The file upload failed because the total number of records in the file does not match the total number of records in the File Trailer record. Contact your bank to correct the error, and re-upload the file again.	The number of records in the File Trailer is wrong.	Contact your financial institution for help.
The file upload failed because it contains an extra Record 88 with no preceding record. Contact your bank to correct the error, and re-upload the file again.	The Continuation (88) record doesn't have a preceding record type.	Contact your financial institution for help.
The file upload failed because the file contains extra fields in one or more records. Contact your bank to correct the error, and re-upload the file again.	The record has extra fields. For example, the (49) record only needs 3 fields but the statement file has extra field values.	Contact your financial institution for help.
The file upload failed because it contains one or more incorrectly formatted record. Every record in the file must end with a forward slash. Contact your bank to correct the error and re-upload the file again.	The records or lines in the file don't end with a forward slash.	Contact your financial institution for help.
The file upload failed because the Customer Account Number field is missing. A complete BAI2 file must contain Records 01, 02, 03, 16, 88, 49, 98, or 99 including all the mandatory fields. Contact your bank to correct the error, and re-upload the file again.	A required field is missing.	Contact your financial institution for help.
The file upload failed because the Amount field has an invalid field data: "100.00". Contact your bank to correct the file, and re-upload it again.	A field has invalid data. For example, the Amount field expects a number, but the field has a different data type.	Contact your financial institution for help.
The file upload failed because the record code is invalid. Expected record code values for BAI2 files are 01, 02, 03,	The record code is not valid.	Contact your financial institution for help.

Error Message	Cause or Scenario	Solution
16, 88, 49, 98, or 99. Contact your bank to correct the error, and re-upload the file again.		
The file upload failed because the record code is missing. A complete BAI2 file must contain Records 01, 02, 03, 16, 88, 49, 98, or 99. Contact your bank to correct the error, and re-upload the file again.	One of the records in the file doesn't have a record code.	Contact your financial institution for help.
The file upload failed because the file is blank. Contact your bank to correct the error, and re-upload the file again.	The file is empty.	Contact your financial institution for help.
The file upload failed because file format is incorrect. Contact your bank to correct the error, and re-upload the file again.	The file format is wrong.	Contact your financial institution for help.
The file upload failed because the file is incomplete. A complete BAI2 file must contain Records 01, 02, 03, 16, 88, 49, 98, or 99. Contact your bank to correct the error, and re-upload the file again.	The file is missing one or more records.	Contact your financial institution for help.
The file upload failed because of an internal error. Please contact support if the problem persists.	An internal or unexpected error occurred.	Contact Support for help.
The file upload failed because of <error> error at line number <line number>. If you have repeatedly received this error message, contact customer support.	An internal or unexpected error occurred.	Contact Support for help.
The file upload failed because one of the records in the file has missing fields. Contact your bank to correct the file, and re-upload it again.	One of the records has missing fields.	Contact your financial institution for help.
The file upload failed because the parser has not completed processing a previous record due to an error. A new record cannot be processed. Contact customer support.	Can't create a new record because of a previous error.	Contact Support for help.
The file upload failed because the Group Header and Account Identifier are missing. A complete BAI2 file must contain Records 01, 02, 03, 16, 88, 49, 98, or 99. Contact your bank to correct the error, and re-upload the file again.	Can't import the bank statement file because the Group Header and Account Identifier are missing.	Contact your financial institution for help.
The file upload failed because the Group Header, Account Identifier, and Transaction Detail are missing. A complete BAI2 file must contain Records 01, 02, 03, 16, 88, 49, 98, or 99. Contact your bank to correct the error, and re-upload the file again.	Can't import the bank statement file because the Group Header, Account Identifier, and Transaction Detail are missing.	Contact your financial institution for help.

CAMT.053 Parser

The CAMT.053 parser plug-in parses bank statement files in the CAMT.053.001.02 or CAMT.053.001.08 format. It also recognizes standard ISO bank transaction codes. The plug-in provides default mappings between XML elements and NetSuite fields, and you can create new mappings or override the defaults.

Note: The CAMT.053 parser plug-in only supports (Unicode) UTF-8 encoding. Some editors add the BOM (Byte Order Marker) to the start of the file. You might need to use a third-party editor to convert your file to UTF-8 before importing it into NetSuite.

The following topics show how you can set up your CAMT.053 bank transaction parser:

- [Configuring CAMT.053 Parser](#)
- [Enabling Validations on the CAMT.053 Sample Script](#)
- [CAMT.053 Transaction Codes](#)
- [CAMT.053 File Import Error Messages](#)

Configuring CAMT.053 Parser

When you choose a standard CAMT.053 transaction parser, the Parser Configuration subtab of your format profile gets automatically populated with default mapping values. The default values map XML elements to NetSuite fields. You can add new mappings or override the default values.

The following table lists the default mapping values for CAMT.053 parser.

NetSuite Field	File Mapping	Transaction Type
Account Mapping ID	<BkToCstmrStmt> <Stmt> <Acct> <Id> <IBAN>	—
Account Mapping ID	<BkToCstmrStmt> <Stmt> <Acct> <Id> <Othr> <Id>	—
Statement Date	<BkToCstmrStmt> <Stmt> <CreDtTm>	—
Opening Balance Code	<BkToCstmrStmt> <Stmt> <Bal> <Tp> <CdOrPrtry> <Cd>	—
Closing Balance Code	<BkToCstmrStmt> <Stmt> <Bal> <Tp> <CdOrPrtry> <Cd>	—
Opening Balance	<BkToCstmrStmt> <Stmt> <Bal> <Amt>	—
Closing Balance	<BkToCstmrStmt> <Stmt> <Bal> <Amt>	—
Credit/Debit Indicator for Opening Balance	<BkToCstmrStmt> <Stmt> <Bal> <CdtDbtInd>	—
Credit/Debit Indicator for Closing Balance	<BkToCstmrStmt> <Stmt> <Bal> <CdtDbtInd>	—
Transaction Date	<BkToCstmrStmt> <Stmt> <Ntry> <BookgDt> <DtTm>	—
Transaction Date	<BkToCstmrStmt> <Stmt> <Ntry> <ValDt> <DtTm>	—
Transaction Date	<BkToCstmrStmt> <Stmt> <Ntry> <BookgDt> <Dt>	—
Transaction Date	<BkToCstmrStmt> <Stmt> <Ntry> <ValDt> <Dt>	—
Credit/Debit Indicator for Transaction Amount	<BkToCstmrStmt> <Stmt> <Ntry> <CdtDbtInd>	—
Transaction Amount	<BkToCstmrStmt> <Stmt> <Ntry> <Amt>	—
Transaction Currency	<BkToCstmrStmt> <Stmt> <Ntry> <Amt>	—
Financial Institution ID	<BkToCstmrStmt> <Stmt> <Ntry> <AcctSvcrRef>	—
Source ID	<BkToCstmrStmt> <Stmt> <Ntry> <AcctSvcrRef>	—
Transaction ID or Number	<BkToCstmrStmt> <Stmt> <Ntry> <TxDtIs> <Refs> <PmtInflId>	—
Transaction ID or Number	<BkToCstmrStmt> <Stmt> <Ntry> <TxDtIs> <Refs> <InstrId>	—

NetSuite Field	File Mapping	Transaction Type
Transaction ID or Number	<BkToCstmrStmnt> <Stmnt> <Ntry> <TxDtls> <Refs> <EndToEndId>	—
Transaction ID or Number	<BkToCstmrStmnt> <Stmnt> <Ntry> <TxDtls> <Refs> <ChqNb>	—
Transaction ID or Number	<BkToCstmrStmnt> <Stmnt> <Ntry> <TxDtls> <Refs> <ClrSysRef>	—
Transaction ID or Number	<BkToCstmrStmnt> <Stmnt> <Ntry> <TxDtls> <Refs> <TxId>	—
Transaction ID or Number	<BkToCstmrStmnt> <Stmnt> <Ntry> <NtryDtls> <Btch> <PmtInflId>	—
Transaction Code (Proprietary)	<BkToCstmrStmnt> <Stmnt> <Ntry> <BkTxCd> <Prtry> <Cd>	—
Transaction Code (Domain ISO)	<BkToCstmrStmnt> <Stmnt> <Ntry> <BkTxCd> <Domn> <Cd>	—
Transaction Code (Family ISO)	<BkToCstmrStmnt> <Stmnt> <Ntry> <BkTxCd> <Domn> <Fmly> <Cd>	—
Transaction Code (Sub-Family ISO)	<BkToCstmrStmnt> <Stmnt> <Ntry> <BkTxCd> <Domn> <Fmly> <SubFmlyCd>	—
Memo (Unstructured)	<BkToCstmrStmnt> <Stmnt> <Ntry> <NtryDtls> <TxDtls> <RmtInf> <Ustrd>	—
Memo (Structured - Referred Document Information)	<BkToCstmrStmnt> <Stmnt> <Ntry> <NtryDtls> <TxDtls> <RmtInf> <Strd> <RfrdDocInf> <Nb>	—
Memo (Structured - Credit Reference Information)	<BkToCstmrStmnt> <Stmnt> <Ntry> <NtryDtls> <TxDtls> <RmtInf> <Strd> <CdtrRefInf> <Ref>	—
Memo (Structured - Additional Remittance Information)	<BkToCstmrStmnt> <Stmnt> <Ntry> <NtryDtls> <TxDtls> <RmtInf> <Strd> <AddtlRmtInf>	—
Memo (Additional Entry Information)	<BkToCstmrStmnt> <Stmnt> <Ntry> <AddtlNtryInf>	—
Payer/Payee	<BkToCstmrStmnt> <Stmnt> <Ntry> <NtryDtls> <TxDtls> <RltdPties> <InitgPty> <Pty> <Nm>	—
Payer/Payee	<BkToCstmrStmnt> <Stmnt> <Ntry> <NtryDtls> <TxDtls> <RltdPties> <InitgPty> <Nm>	—
Payer/Payee	<BkToCstmrStmnt> <Stmnt> <Ntry> <NtryDtls> <TxDtls> <RltdPties> <Dbtr> <Pty> <Nm>	Credit
Payer/Payee	<BkToCstmrStmnt> <Stmnt> <Ntry> <NtryDtls> <TxDtls> <RltdPties> <UltmtDbtr> <Pty> <Nm>	Credit
Payer/Payee	<BkToCstmrStmnt> <Stmnt> <Ntry> <NtryDtls> <TxDtls> <RltdPties> <Dbtr> <Nm>	Credit
Payer/Payee	<BkToCstmrStmnt> <Stmnt> <Ntry> <NtryDtls> <TxDtls> <RltdPties> <UltmtDbtr> <Nm>	Credit
Payer/Payee	<BkToCstmrStmnt> <Stmnt> <Ntry> <NtryDtls> <TxDtls> <RltdPties> <Cdtr> <Pty> <Nm>	Debit

NetSuite Field	File Mapping	Transaction Type
Payer/Payee	<BkToCstmrStmt> <Stmt> <Ntry> <NtryDtls> <TxDtls> <RltdPties> <UltmtCdtr> <Pty> <Nm>	Debit
Payer/Payee	<BkToCstmrStmt> <Stmt> <Ntry> <NtryDtls> <TxDtls> <RltdPties> <Cdtr> <Nm>	Debit
Payer/Payee	<BkToCstmrStmt> <Stmt> <Ntry> <NtryDtls> <TxDtls> <RltdPties> <UltmtCdtr> <Nm>	Debit
Payer/Payee	<BkToCstmrStmt> <Stmt> <Ntry> <NtryDtls> <TxDtls> <RltdPties> <TradgPty> <Pty> <Nm>	—
Payer/Payee	<BkToCstmrStmt> <Stmt> <Ntry> <NtryDtls> <TxDtls> <RltdPties> <TradgPty> <Nm>	—
Transaction Status	<BkToCstmrStmt> <Stmt> <Ntry> <Sts> <Cd>	—
Transaction Status	<BkToCstmrStmt> <Stmt> <Ntry> <Sts>	—
Invoice Number	<BkToCstmrStmt> <Stmt> <Ntry> <NtryDtls> <TxDtls> <RmtInf> <Strd> <RfrdDocInf> <Nb>	—
Invoice Number	<BkToCstmrStmt> <Stmt> <Ntry> <NtryDtls> <TxDtls> <RmtInf> <Strd> <CdtrRefInf> <Ref>	—

Configuring the Transaction Field Mappings for the CAMT.053 Parser

To handle different versions and information in bank files, you create new field mappings or override existing ones. This option lets you to import all relevant information in the statement file.

To add a new or update field mappings:

1. Go to Setup > Accounting > Financial Statements > Financial Institution > List.
2. Next to the financial institution record where you'd like to add or edit a format profile, click **View**. For more information, see Creating Format Profiles.
3. On the Financial Institution page, click the CAMT format profile you want to edit.
4. On the Format Profile page, click **Edit**.
5. Under the Parser Configuration subtab, do any of the following:
 - To add a new mapping:
 1. Scroll to the bottom of the list and select the NetSuite field.
 2. In the Field Mapping, enter the XML path element to get the information from the file. Separate each element with a space.
 3. Click **Add**.

 **Note:** Keep the following in mind when adding a new mapping:

- If the payment file contains elements mapped to the same NetSuite field, the parser maps the field to the first tag in the file. This scenario doesn't apply to the memo field. If several tags are mapped to the memo field, the parser maps all the information in the memo field, separated by a space. If the information exceeds 4k, the text is automatically truncated.
- You can only map a transaction type to a Payer/Payee field.
The payer or payee name comes from the order of the Payer/Payee field and the transaction type set on the Parser Configuration subtab.

- To update an existing mapping:
 1. Click the field mapping that you want to update.
 2. Enter the XML path of the new mapping in the File Mapping field.
 3. Click **OK**.
- To delete a field mapping:
 1. Click the field mapping that you want to delete.
 2. Click **Remove**.

 **Note:** There should be at least one mapping for each NetSuite transaction field. If all mappings for a field are removed, you can restore the default file mapping or enter a new one.

6. Click **Save**.

Enabling Validations on the CAMT.053 Sample Script

Download the sample CAMT parser script from the File Cabinet and customize it as needed. The CAMT script file doesn't include validation by default. If you'd like to enable this feature, you'll need to provide your own XSD validation file.

To enable validation on the CAMT.053 script:

1. Download the **bsp_lite_parser_camt053** script from the File Cabinet. For more information, see [Downloading Sample Bank Statement Parsers Scripts](#).
2. On your computer, open the CAMT.053 parser script file and find **module.parseBankStatement**.

```

module.parseBankStatement = function(context){
  module.fileContents = context.input.file.getContents();
  var xmlDOM = xml.Parser.fromString({text: module.fileContents});

  /*
  try{
    xml.validate({
      xml : xmlDOM,
      xsdFilePathOrId : '{placeholderText}'
    });
  }catch(e){
    if(e.name === 'SSS_XML_DOES_NOT_CONFORM_TO_SCHEMA')
      throw 'The file upload failed because it does not conform with the valid CAMT053.001.02 XML Format.
      Contact your bank to correct the error, and re-upload the file again.';
    throw e.message || e;
  }
  */
}

```

3. In the **module.parseBankStatement** code block, do the following:

- Remove the `/ *` and `* /` characters to enable validations on the script.
- Replace `{placeholderText}` with the path to your uploaded XSD file validation. For more information, see the help topic [xml.validate\(options\)](#)

Note: You can use the standard XSD validation file for the CAMT parser. Download it from the File Cabinet by going to SuiteBundles > Bundle 293699 > com.netsuite.bsp > src > validation. If you plan to upload a custom parser, rename the validation file before you upload it to avoid conflicts.

4. Save your file.
5. Deploy the modified script files as a plug-in implementation. For more information, see the help topic [Adding the Plug-in Implementation](#).

CAMT.053 Transaction Codes

By default, the CAMT.053 parser includes standard ISO Bank Transaction Codes, which combine the Domain, Family, and Sub-family codes. You'll find the transaction codes in these tags in a CAMT.053 file:

- ISO bank transaction code:

```

<BkTxCd>
  - <Domn>
    <Cd>PAYM</Cd>
    - <Fmly>
      <Cd>0001</Cd>
      <SubFmlyCd>0005</SubFmlyCd>
    </Fmly>
  </Domn>
</BkTxCd>

```

- Custom or proprietary code:

```

<BkTxCd>
  - <Prtry>
    <Cd>NCSH</Cd>
    <Issr>SWIFT</Issr>
  </Prtry>
</BkTxCd>

```

- Combination of ISO transaction code and custom bank codes

```

<BkTxCd>
- <Domn>
  <Cd>PMNT</Cd>
  - <Fmly>
    <Cd>RCDT</Cd>
    <SubFmlyCd>ESCT</SubFmlyCd>
  </Fmly>
</Domn>
- <Prtry>
  <Cd>N658</Cd>
  <Issr>ABNAMRO</Issr>
</Prtry>
</BkTxCd>

```

Note: If both ISO and proprietary bank transaction codes are in the file, the parser uses the proprietary code to identify the transaction.

For a list of the supported CAMT.053 transaction codes, click [here](#).

Note: To override standard bank transaction codes for CAMT.053 files, enter the Domain, Family and Sub-Family codes, separated by a comma and a space.

CAMT.053 File Import Error Messages

The following table lists some common file import errors and how you can fix them.

Error Message	Cause or Scenario	Solution
The file upload failed because it does not conform with the valid (CAMT.053.001.02 XML/CAMT053.001.08) Format. Contact your bank to correct the error, and re-upload the file again.	One or more elements in the XML file you uploaded don't conform to the following schemas: ■ camt.053.001.02.xsd ■ camt.053.001.08.xsd For more information, compare your XML file with the official schemas in the ISO 20022 Messages Archive.	Contact your financial institution for assistance.
The file mapping must begin with "<BkToCstmrStmt> <Stmt>" to import the transactions from the file to NetSuite.	Incorrect parser configuration.	In the Format Profile record, under the Parser Configuration subtab, verify that the File Mapping value for each NetSuite mapped field begins with <BkToCstmrStmt><Stmt>.
Each tag used in the file mapping must be enclosed in "<" and ">", and must be separated by a space. For example, <BkToCstmrStmt> <Stmt> <Acct> <Id> <IBAN>.	The file mapping values in the Parser Configuration subtab don't follow the required tag format.	Tags must follow these rules: ■ Enclose each tag in angle brackets (< >). ■ Separate tags with a single space.
The configurations for the following field(s) will be removed:	All mappings for the field are missing from the Parser Configuration subtab.	Verify that your parser configuration includes all standard NetSuite fields.

Error Message	Cause or Scenario	Solution
<NetSuite field names> Click OK to restore the default file mapping or click Cancel to manually configure the file mapping for the affected fields.		For the list of default CAMT.053 mapping values, see Configuring CAMT.053 Parser.
The Credit/Debit value is sourced from the statement file to determine the GL Impact of the transaction. Click OK to set the value to N/A and use the indicator in the file or click Cancel to override the amount indicator in the file.	The Credit/Debit field in the Transaction Code Mapping subtab is set to a value other than N/A.	Check your parser configuration.
The bank statement file contains {number} transactions that are not yet posted or booked in your bank account. Only booked or posted transactions are imported.	NetSuite imports only transactions that have Book status.	Verify the transaction status in your CAMT file. CAMT.053.001.02 (version 2) format <pre> 1 <Document> 2 <BkToCstmrStmt> 3 <Stmt> 4 <Ntry> 5 <Sts>BOOK</Sts> 6 </Ntry> 7 </Stmt> 8 </BkToCstmrStmt> 9 </Document> </pre> CAMT.053.001.08 (version 8) format <pre> 1 <Document> 2 <BkToCstmrStmt> 3 <Stmt> 4 <Ntry> 5 <Sts><Cd>BOOK</Cd></Sts> 6 </Ntry> 7 </Stmt> 8 </BkToCstmrStmt> 9 </Document> </pre>  Note: If the status is not Book, contact your financial institution for assistance.
The file mapping {file mapping value} for NetSuite Field {NetSuite field value} already exists. Please enter a unique file mapping path.	Duplicate file mapping rows exist in the Parser Configuration subtab.	In the Format Profile record, under the Parser Configuration subtab, remove any duplicate file mapping rows.

CSV Parser

The CSV parser plug-in parses bank statement files in CSV format. The plug-in includes a CSV Bank Statement Template you can use to format your bank statement files. Default mappings to NetSuite fields and formatting preferences are preconfigured based on the template file. Or, you can use your own CSV file and set up your format profile by mapping the file to NetSuite fields and updating the formatting preferences.

Note: The CSV parser plug-in only supports (Unicode) UTF-8 encoding. Some editors add the BOM (Byte Order Marker) to the start of the file. You might need to use a third-party editor to convert your file to UTF-8 before importing it into NetSuite.

The following topics show how you can set up your CSV bank transaction parser:

- [Preparing CSV Parser Bank Statement Files for Import](#)
- [Configuring CSV Parser](#)
- [CSV Transaction Codes](#)
- [CSV File Import Error Messages](#)

Preparing CSV Parser Bank Statement Files for Import

To import your CSV bank statement file successfully, make sure it follows the correct specifications and is UTF-8 encoded.

Convert your CSV file to UTF-8 using any of the following:

- If you're using Excel, click **Save As** and select **CSV UTF-8** from the list.
- If you're using Notepad, click File > Save As, select **UTF-8** from the Encoding dropdown, then click **Save** in the Save As window.

You can download a CSV template from the NetSuite File Cabinet or the Parser Configuration subtab of the Format Profile page, or create your own CSV file with the required columns and specifications.

Note: Your CSV file can have transactions for one or more accounts.

Keep the following in mind when preparing your CSV column data:

Column Data	Important Things to Note
Account Number	The limit is 80 characters. Important: For compliance, you can't enter a credit card number. NetSuite removes all non-numeric characters to make sure the unique account ID doesn't contain a credit card number, ■ If the remaining string is less than 13 or more than 20 characters, NetSuite accepts the unique account ID. ■ If the string is between 13 and 20 characters, NetSuite runs a Luhn check. If it passes, you can't use that account ID. If it fails, NetSuite accepts it.
Date	■ This is the transaction date. Use any of these supported date formats: □ 2 – 3 M (month), 2 D (day), and 2 or 4 Y (year) characters with no separators Example: MMDDYY, DDMMYYYY, or MMMDDYYYY □ 1 D (day) or 1 M (month) character but must include a separator Example: M-D-YYYY, YYYY-MM-D, or M-DD-YYYY □ You can use hyphen (-), slash (/), period (.), or space as separators □ Use English month abbreviations

Column Data	Important Things to Note
	- Long date formats and 3-letter Month abbreviations are not supported. Example, Month D, YYYY, which interprets to March 1, 2021 or Mon D, YYYY, which interprets to Jan 1, 2021. - The parser automatically removes anything before or after the date, like time or time zone. The SuiteApp removes them because only the transaction date is needed for bank reconciliation.
Amount	- The SuiteApp supports CSV files with any of these Amount column setups: - Single Amount column – Positive amounts are Credit, negative amounts are Debit. Negative entries must have a negative sign or be in parentheses. - Single Amount column with a separate amount indicator – Amount entries shouldn't be signed or in parentheses. - Two Amount columns (Credit and Debit) – Debit column entries can be unsigned. - If your file shows transaction amounts as absolute values, do the following: - Map the Amount Indicator field to mark entries as positive or negative. - Then, set the Credit Indicator and Debit Indicator preferences under Formatting Preferences.
Credit Amount	Include this column if the transaction amount is an absolute value and you have separate credit and debit columns. The amount can also be a signed positive number, for example, +100.
Debit Amount	Include this column if the transaction amount is an absolute value and you have separate debit and credit columns. The amount can also be a signed negative value, for example, -100.
Amount Indicator	Include this column if the transaction amount is an absolute value.
Transaction Number	Unique transaction or reference number. You can also use the check number here.
Amount Currency	- Make sure the transaction amount's currency matches the NetSuite GL account currency to avoid import errors. - The system ignores any currency symbol before or after the transaction amount.
Memo	The limit is 4,000 characters. If your Memo column goes over the limit, the import still works, but the data is cut off at 4,000 characters.
Financial Institution ID	Unique number assigned to a financial institution transaction.
Customer Name	This is the NetSuite customer name.
Customer ID	This is the NetSuite internal customer ID.
Invoice Numbers	If a transaction has more than one invoice number, separate them with a comma.
Account Closing Balance	The system recognizes the last transaction line for each unique bank and credit card account.
Closing Balance Date	The system recognizes the last transaction line for each unique bank and credit card account.

Remove these:

- Empty columns (with no data) between filled columns
- Empty rows (with no data) between filled rows
- Any columns not listed in the template or CSV Parser Configuration mapping fields

The system automatically ignores any account summary before the column title headers during import.

Configuring CSV Parser

For CSV, configuration fields become available after selecting the parser from the Transaction Parser field.

The next sections show how you can set up your CSV parser.

Configuring the Transaction Field Mappings for the CSV Parser

The Parser Configuration subtab displays a link to a downloadable CSV Bank Statement Template when the format profile is in Edit mode. You can use the template to format your bank statement files for import. You can also get the template from the NetSuite File Cabinet at Documents > Files > File Cabinet. Then, in the **SuiteBundles** folder, go to Bundle 293699 > com.netsuite.bsp, then click the **template** folder. Or, you can use your own CSV bank statement file.

 **Note:** The CSV parser plug-in only supports UTF-8 (Unicode) encoding.

The Field Mapping subtab values default to the column headers of the CSV Bank Statement Template file. If you're using your own file, be sure to update and map the fields to avoid import errors.

To map your CSV file column headers to NetSuite:

1. On the **Parser Configuration** subtab of your format profile, click the **Field Mapping** subtab.
2. The following table lists the available mapping fields and details on how to enter appropriate values for each field. Enter the matching column header titles in your CSV file for these fields. Field mapping field values are not case-sensitive.

Field Mapping	Description
Account Number	Enter the column header that represents the bank account number in your CSV bank statement file.
Date	Enter the column header that represents the transaction date in your CSV bank statement file.
Amount	Enter the column header that represents the transaction amount in your CSV bank statement file. If the transaction amount displays an absolute value, you must also map the Amount Indicator field to mark a positive or negative entry. Then, set the Credit Indicator and Debit Indicator preferences under the Formatting Preferences subtab.
Credit Amount	Enter the column header that represents the credit amount in your CSV bank statement file. Map this field if you've got a separate column for debit and credit amount entry.
Debit Amount	Enter the column header that represents the debit amount in your CSV bank statement file. Map this field if you've got a separate column for debit and credit amount entry.
Amount Indicator	Enter the column header that represents the amount indicator in your CSV bank statement file. Map this field if the transaction amount shows as an absolute value. You'll also need to set the Credit Indicator and Debit Indicator preferences under the Formatting Preferences subtab.
Payee or Payer Name	Enter the column header that represents the transaction payee or payer in your CSV bank statement file.

Field Mapping	Description
Transaction Number	Enter the column header that represents the transaction number or ID in your CSV bank statement file.
Amount Currency	Enter the column header that represents the currency of the transaction amount in your CSV bank statement file. Make sure the amount's currency matches the NetSuite GL account currency to avoid data import errors
Memo	Enter the column header that represents the transaction memo in your CSV bank statement file.
Transaction Type	Enter the column header that represents the transaction type in your CSV bank statement file. To see the list of supported transaction types, see Transaction Types in Matching Rules .
Financial Institution ID	Enter the column header that represents the financial institution ID in your CSV bank statement file. The Financial Institution ID helps the system identify duplicate transactions based on data import history.
Customer Name	Enter the column header that represents the customer name in NetSuite from your CSV bank statement file. Map this field if you're using the automatic creation of payment transactions feature in NetSuite.
Customer ID	Enter the column header that represents the customer ID in NetSuite from your CSV bank statement file. Map this field if you are using the automatic creation of payment transactions feature in NetSuite.
Invoice Numbers	Enter the column header for invoice numbers of received payments in your CSV file. If a line has more than one invoice number, separate them with a comma. Map this field if you are using the automatic creation of payment transactions feature in NetSuite.
Account Closing Balance	Enter the column header that represents the account's closing balance in your CSV bank statement file.
Closing Balance Date	Enter the column header that represents the closing balance date in your CSV bank statement file.

3. Click **Submit**.

Configuring the Formatting Preferences for the CSV Parser

By default, the Formatting Preferences subtab uses your account preference (Home > Set Preferences). Make sure your file matches these preferences to avoid import errors.

To set the formatting preferences for the CSV parser:

1. On the **Parser Configuration** subtab of your format profile, click the **Formatting Preferences** subtab.
2. The following table lists the available formatting preferences and how to enter appropriate values for each preference.

Formatting Preferences	Description
Date Format	Enter the date format used in your CSV bank statement file. By default, this field uses MM/DD/YYYY. You can use these date format combinations:

Formatting Preferences	Description
	2 – 3 M (month), 2 D (day), and 2 or 4 Y (year) characters with no separators Example: MMDDYY, DDMMYYYY, or MMMDDYYYY 1 D (day) or 1 M (month) character but must include a separator Example: M-D-YYYY, YYYY-MM-D, or M-DD-YYYY - You can use hyphen (-), slash (/), period (.), or space as separators. Long date formats and 3-letter month abbreviations are not supported. Example, Month D, YYYY, which interprets to March 1, 2021 or Mon D, YYYY, which interprets to Jan 1, 2021.  Note: The CSV parser plug-in only supports English date abbreviations.
Number Format	Select the number format for thousands separator and decimals. This preference determines the number format of your transaction amount in your CSV bank statement file. By default, this field uses the Number Format from Home > Set Preferences > Formatting.
Negative Number Format	Select the format to display negative numbers.. This preference determines the negative number format of your transaction amount in your CSV bank statement file. By default, this field uses the Negative Number Format from Home > Set Preferences > Formatting.
CSV Column Delimiter	Select the symbol used as a column separator in your CSV bank statement file. By default, this field uses the CSV Column Delimiter from Home > Set Preferences > Formatting.
Text Qualifier	Select the character used in your CSV bank statement file to enclose column values.
Credit Indicator	Enter the character or code used in your CSV bank statement file for credit transactions. Set this preference if you are mapping the Amount Indicator field.  Note: This preference is case-sensitive. Make sure the character or code matches the credit indicator value in your CSV file.
Debit Indicator	Enter the character or code used in your CSV bank statement file for debit transactions. Set this preference if you are mapping the Amount Indicator field.  Note: This preference is case-sensitive. Make sure the character or code matches the debit indicator value in your CSV file.
Footer Lines	If your bank statement has footer lines, you can configure the parser to automatically remove them. Enter the number of footer lines in your bank statement file. This can be any positive number or zero. If your bank sometimes sends files with a different number of footer lines, check your footer lines settings before importing them into NetSuite.

3. Click **Submit**.

CSV Transaction Codes

The table below lists the supported transaction codes for the CSV parser:

ACH	CHECK	CREDIT
DEBIT	DEPOSIT	FEE
INTEREST	PAYMENT	TRANSFER
OTHER		

CSV File Import Error Messages

This page describes some common file import errors and how you can fix them.

CSV Files with Errors

If your CSV file has invalid characters or other errors, the import fails and an error shows on the Banking Import History page. In the Import Status details, you can see the reasons for the failure and download a CSV file with an extra column showing errors for each transaction row.

You can also see the list of CSV import error files at Documents > Files > File Cabinet > SuiteBundles > Bundle 293699 > com.netsuite.bsp > CSV Files with Errors.

The CSV import error file doesn't include the transaction's account number and is deleted automatically every 90 days.

Error Message	Cause or Scenario	Solution
Invalid date value: {date}. Verify that the Date Format on the Formatting Preferences subtab of your format profile matches the date in the uploaded file.	The parse doesn't accept the date for one of these reasons: ■ The Date Format field value doesn't match the date in the uploaded CSV file. ■ The uploaded files is corrupted or has missing date values.	To fix this, do the following: 1. On the Parser Configuration subtab of your format profile, click the Formatting Preferences subtab. 2. Check the Date Format field. Make sure it matches the date format in your statement file. Update if needed.
The file upload failed due to one of the following reasons: ■ One or more column CSV column headers do not match the format profile's Field Mapping subtab values. ■ The uploaded CSV file is not in UTF-8 encoded format. Check your CSV file and then try again.	The CSV import failed because the column headers don't match the mapping configuration, or the file isn't UTF-8 encoded.	To fix this, do the following: 1. Check your parser configuration. a. On the Parser Configuration subtab of your format profile, click the Field Mapping subtab. b. Make sure the CSV column headers match the field mapping values in NetSuite. Update if needed. 2. Make sure your CSV file is UTF-8 encoded. For details on converting your file, see Preparing CSV Parser Bank Statement Files for Import.
Invalid transaction line: {line number}. Verify that only one of the following	The CSV file has more than one amount value.	Check your CSV file and make sure only one of these fields has a value:

Error Message	Cause or Scenario	Solution
fields has a value: Amount, Debit Amount, or Credit Amount.		- Amount - Debit Amount - Credit Amount
Invalid format for value: {number}. The following format preferences are in the configuration: Number Format: {number format}, Negative Number Format: {negative number format}. Either update your Formatting Preferences or the number format in the bank statement file.	The number field in file doesn't match the Number Format and Negative Number Format in the Format Preferences.	Check your parser configuration to match the number format in your CSV file.
One or more required column values are missing: {file mapping field}.	The CSV file is missing mapped field values.	Check your CSV file and make sure these field values are present: - Required mapping fields, like Date, Account Number, or Transaction Type. - Conditional required fields, like Amount, Credit Amount, Debit Amount, and Amount Indicator.
One or more lines in the uploaded CSV file contain errors. To see the list of transactions with errors, see {URL}. For files with more than 100 transactions, only the first 100 transactions with errors are shown.	One or more lines in the CSV file have errors.	Click the link to see the transaction error details.
The Credit Amount value cannot be a negative amount.	Amount Credit column has a negative amount.	Update the amount in your CSV file to a positive value.
Verify that the Transaction Type matches the value provided in the transaction amount.	The transaction type doesn't match the amount value in the transaction.	Check the Transaction Type field in your parser configuration. Make sure it matches the transaction amount in your CSV file.
The file could not be imported, because {code} is not one of the recognized bank transaction codes. {code} must be mapped to a bank data type in NetSuite. For details, contact your administrator. For a list of custom bank transaction codes, your administrator must contact your financial institution.	The CSV file has an invalid transaction type or code.	To see the list of supported transaction codes, see CSV Transaction Codes .
The Amount value cannot be a negative amount when using the Amount Indicator field.	The Amount column has a negative number.	In your formatting preferences, if you set a value in the Amount Indicator field, the amount in your CSV file must always be an absolute value.
Invalid Amount Indicator value: {amount indicator}. Verify that the Credit Indicator and Debit Indicator values on the Formatting Preferences subtab of your format profile matches the data in the uploaded file.	The amount indicator in CSV file doesn't match the Amount Indicator preference in the format profile.	To fix this, check your parser configuration: - On the Parser Configuration subtab of your format profile, click the Field Mapping subtab. - In Amount Indicator, check if the value matches your CSV file. You must also set

Error Message	Cause or Scenario	Solution
		the Credit Indicator and Debit Indicator preferences under the Formatting Preferences subtab when mapping the Amount Indicator field.

MT940 Parser

The MT940 parser plug-in recognizes standard SWIFT transaction bank codes and supports using a period (.) or comma (,) as a decimal separator. The plug-in also decodes remittance information from the bank and display it in a more readable format.

The following topics show how you can set up your MT940 bank transaction parser:

- [Configuring MT940 Parser](#)
- [MT940 Transaction Codes](#)
- [MT940 File Import Error Messages](#)

Configuring MT940 Parser

When you choose a standard MT940 transaction parser, the Parser Configuration subtab of your format profile automatically shows a list of common bank keywords.

Remittance Code	Description	Transaction Field Mapping
/EREF/	End to End Reference	Transaction Number
/BENM//NAME/	Beneficiary Name	Transaction Payee
/BENM//ID/	Beneficiary ID	Transaction Payee
/BENM/	Beneficiary	Transaction Payee
/CRED/	Creditor	Transaction Payee
/CSID/	Creditor ID	Transaction Payee
/DEBT/	Debtor	Customer Name
/INV/	Invoice	Invoices
/ORDP//NAME/	Name of the Debtor	Customer Name
/ORDP//ID/	Debtor ID	Customer ID
/ORDP/	Ordering Party	Customer Name
/PREF/	Payment Reference	Transaction Number
/ULTD//NAME/	Ultimate Name	Transaction Payee
/ULTB//ID/	Identification of the Ultimate Counter Party	—
/ULTC/	Ultimate Creditor	Transaction Payee
/ULTD/	Ultimate Debtor	Customer Name

Remittance Code	Description	Transaction Field Mapping
/ACCW/	Counterparty Account and Bank	—
/ADDR/	Address	—
/CHGS/	Charges	—
/COAM/	Compensation Amount	—
/EXCH/	Exchange Rate	—
/IREF/	Instruction ID	—
/ISDT/	Settlement Date	—
/KREF/	Client/Orderer Reference	—
/MARF/	Mandate ID	—
/NBTR/	No. of Transactions in the File	—
/OCMT/	Original Amount	—
/OTHR/	Interest Compensation	—
/ORDT/	Original Due Date of the Collection	—
/PURP/	Purpose Code	—
/REMI//CDTRREFTP//CD/SCOR/ISSR/CUR/CDTRREF/	Structured Remittance Information	—
/REMI//CD/	Creditor Reference Type Code	—
/REMI/	Remittance Information	—
/RTRN/	Return Reason	—
/SVCL/	Identification Code of the Scheme	—
/BBK/	Beneficiary Bank ID	—
/IBK/	Intermediary Bank	—
/OBK/	Ordering Bank ID	—
/CD/	Purpose Code	—
/ID/	Identification	—

Configuring Bank Keywords for the MT940 Parser

The MT940 parser reads bank keywords and shows them in a more readable format in the Memo field of the transaction record. If you select a standard MT940 transaction parser, you can add or edit keywords. By default, the MT940 parser includes common keywords and descriptions for SEPA transactions.

To configure the bank keywords:

1. Go to Setup > Accounting > Financial Institution > List.

2. Next to the financial institution record where you'd like to add or edit a format profile, click **View**. For more information, see [Format Profile Creation](#).
3. On the Financial Institution page, click the format profile you want to edit.
4. On the Format Profile page, click **Edit**.
5. Under the Parser Configuration subtab, enter new keywords or edit the existing ones:
 - **Remittance Code** – Enter the keyword used in the bank statement file.
Each keyword must start and end with a forward slash "/". If there's no slash at the start and end, the keywords won't convert properly. If the keywords appear in a row, use a double forward slash between them. For example, **/BENM//NAME/**.
 - **Description** – Enter a description for the remittance code. It'll show up in the Memo field instead of the remittance.
 - **Transaction Field Mapping** – Select the field where you want to map the remittance code.

Note: If the bank file has keywords mapped to the same field, the parser maps the field to the first keyword in the file.

Example:

Bank File	Memo Field
:61:1507310731C257,97NTRFEREF//0001500002870 :86:/EREF/1234567890ABCD/BENM//NAME/XYZ Corporation :86:/REMI/PURCHASE OF GOODS/ISDT/2012-12-30:86:/CSID/4500900868	End-to-end Reference: 1234567890ABCD, Beneficiary Name: XYZ Corporation, Remittance Information: Purchase of Goods, Settlement Date: 2012-12-30, Creditor ID: 4500900868

6. Click **Save**.

MT940 Transaction Codes

In MT940 files, the transaction code starts with F,S, or N, followed by a 3-character SWIFT or bank code. For example:

```
:20:STATEMENT
:25:3300907685
:28C:242
:60F:C181231USD596416,02
:61:1812311231C11,55NMSCNONREF//INT TRANSFER FRO
:86:INT TRANSFER FROM 3302038958
```

The following table lists the supported transaction codes for the MT940 parser:

BNK	CMP	DIV	MSC	RTI	TCM
BOE	CMS	EQA	NWI	SAL	TRA
BRF	CMT	EXT	ODC	SEC	TRF
CAR	CMZ	FEX	OPT	SLE	TRN
CAS	COL	INT	PCH	STO	UWC

CHG	COM	LBX	POP	STP	VDA
CHK	CPN	LDP	PRN	SUB	WAR
CLR	DCR	MAR	REC	SWP	
CMI	DDT	MAT	RED	TAX	
CMN	DIS	MGT	RIG	TCK	

MT940 File Import Error Messages

The following table lists some common file import errors and how you can fix them.

Error Message	Cause or Scenario	Solution
The file upload failed because the calculated Closing Balance does not match the Closing Amount in the file. Contact your bank to correct the error, and re-upload the file again.	The opening balance (tag :60:) plus the statement amount (tag :61:) doesn't equal the closing balance (tag :62:).	Contact your financial institution for help.
The file could not be imported because the currency code [code] for an account does not match the currency code for the same account in NetSuite.	The account currency on your bank statement file doesn't match the mapped account's currency in NetSuite.	Check which currency should be used. For details on checking account information in NetSuite, Viewing the Chart of Accounts . To fix the bank statement file, contact your financial institution.
The file upload failed because the file contains an incorrect data at line [number] for [tag :X:]. Amounts must include only one comma or period as a decimal separator. Contact your bank to correct the error, and re-upload the file again.	Multiple commas were found.	To remove extra decimal separators, contact your financial institution.
The file could not be imported, because the account [name] in the file does not match an account in NetSuite.	The Transaction Account (tag :25:) value in your MT940 file is missing from your format profile.	Check the account mapping in your format profile. Under the Account Linking subtab, make sure each account ID is linked to a GL account.
The file upload failed because the file contains an incorrect Amount Indicator. Expected Amount Indicator values are C, D, RC, or RD. Contact your bank to correct the error, and re-upload the file again.	The Amount Indicator has an unknown value.	The Amount Indicator must be C, D, RC, or RD. To fix the file, contact your financial institution.
The file upload failed because the file contains an incorrect date format. MT940 statement files use the <YYMMDD> date format. Contact your bank to correct the error, and re-upload the file again.	Wrong date format for tag :61:.	Check your bank statement file and make sure the date in tag :61: is in YYMMDD format. Contact your financial institution for help.
The file upload failed because the file contains an incorrect booking date format. MT940 statement files use the <MMDD> date format in the Booking Date field. Contact your bank to correct the error, and re-upload the file again.	Wrong booking date format.	Check your bank statement file and make sure the booking date in tag :61: is in MMDD format. Contact your financial institution for help.
The file upload failed because it contains an unknown transaction code [XYZ]. Update you format profile to add non-Swift transactions codes and re-upload the file again.	There's an unknown transaction code.	Contact your financial institution for help.

OFX/QFX Parser

The OFX/QFX parser plug-in parses bank and credit card statement files that use OFX/QFX versions 102, 103, 211, and 220. The parser recognizes default and standard OFX/QFX bank transaction codes and supports using a period (.) or comma (,) as a decimal separator.

No configuration is required.

To identify the supported OFX/QFX transaction codes, see [OFX/QFX Transaction Codes](#). For help with import errors, see [OFX/QFX File Import Error Messages](#).

OFX/QFX Transaction Codes

In OFX/QFX files, the transaction code is inside the TRNTYPE tag for every transaction. For example:

```
<STMTRN>
<TRNTYPE>CREDIT</TRNTYPE>
<TRNAMT>185.29</TRNAMT>
<FITID>320191970533635843</FITID>
<REFNUM>320191970533635843</REFNUM>
<NAME>POINTS FOR AMEX TRVL</NAME>
</STMTRN>
```

The following table lists the supported transaction codes for the OFX/QFX parser:

CREDIT	DEP	CASH
DEBIT	ATM	DIRECTDEP
INT	POS	DIRECTDEBIT
DIV	XFER	REPEATPMT
FEE	CHECK	OTHER
SRVCHG	PAYMENT	

OFX/QFX File Import Error Messages

The following table lists some common file import errors and how you can fix them.

Error Message	Cause or Scenario	Solution
The file cannot be imported because the currency code [code] in the file does not match the currency code for the same account in NetSuite. Check your format profile record or contact your bank to correct the error and re-upload the file again.	The account currency in your bank statement file doesn't match the mapped account's currency in NetSuite.	Check which currency should be used. For details on checking account information in NetSuite, see the help topic Viewing the Chart of Accounts . To fix the bank statement file, contact your financial institution.
The file upload failed because the file contains an incorrect date format. OFX Statement files use	Invalid date format.	To fix the date format in your bank statement file, contact your financial institution.

Error Message	Cause or Scenario	Solution
<YYYY-MM-DD> date format. Contact your bank to correct the error, and re-upload the file again.		
The file cannot be imported because the account [ID] in the file does not match an account in NetSuite. Check the Account Mapping in the format profile record or contact your bank to correct the error and re-upload the file again.	There's no matching account in NetSuite.	Check the account mapping in your format profile. Under the Account Linking subtab, make sure each account ID is linked to a GL account.
The file upload failed because it contains transactions that were not successfully posted in the bank's system. Contact your bank to correct the error and re-upload the file again.	The Status code in your bank statement file isn't 0 (zero) or Success .	Contact your financial institution to check the correct status of your transactions.

Supported Transaction Codes for Bank Statement Parsers SuiteApp

Here are the topics where you'll find the supported standard transaction codes for each file format:

- [BAI2 Transaction Codes](#)
- [CAMT.053 Transaction Codes](#)
- [CSV Transaction Codes](#)
- [MT940 Transaction Codes](#)
- [OFX/QFX Transaction Codes](#)

Cash 360

Cash 360 lets you effectively manage cash flow by providing a real-time view of your company's cash position and the ability to generate fast and accurate near-term forecasts.

The SuiteApp has a cash management dashboard that allows you to do the following:

- Inspect real-time cash projections using charts and graphs.
- View the current balances for transactions, payables, and receivables.
- View the A/P and A/R aging summary pie charts.
- View cash projections for each subsidiary.
- View cash projections for consolidated subsidiaries.
- Click on links to view invoices and bills, approve invoices, view A/R and A/P aging summary reports, and view account categories.
- Set subsidiary-wide forecast preferences.

You can also do the following in the Cash 360 SuiteApp:

- Set the forecast period to days, weeks, or months. This shows the impact of future cash inflows and outflows on your company's cash position over different periods.
- Automate forecasts based on your general ledger history. You can define account categories (based on one or several GL accounts) to forecast at your preferred level of detail.
- Add ad hoc cash inflow and outflow transaction lines, such as finance inflow or capital investments, into the cash forecast.
- View the Cash Forecast table to show the projection of financial inflows and outflows. The data in the table enables you to predict your company's cash requirements and analyze your company's liquidity status.
- Include installment transactions in cash projections. You can view installment details for receivable and payable transactions from the Cash Forecast table. Installment transactions are included in the Cash 360 dashboard calculations, graphs, and tables.
- Include sales orders in the computation of inflow amounts, as shown in the Cash Forecast table and Cash 360 dashboard.
- Include purchase orders in the computation of outflow amounts, as shown in the Cash Forecast table and Cash 360 dashboard.
- Exclude bank accounts from bank balance calculations in the Cash Forecast table and in the Cash 360 dashboard.
- Export the opening balance, undeposited/future-period funds, receivable, and payable transaction details in a CSV file.

Cash forecasts are generated directly from NetSuite data. There is no need to set up or import external data.

With this SuiteApp, receivable transactions for your company such as interest and dividend payments, non-recurring cash flow such as financing and sale of assets can be set as additional inflow transactions. Payable transactions such as cash disbursements for purchases, payroll, taxes, interest, dividends, rent, and any projected debt repayments can be set as additional outflow transactions.

Cash 360 is available by default only on NetSuite Classic and Accounting Centers.

This SuiteApp is available in all languages that NetSuite supports. For more information, see the help topic [Configuring Multiple Languages](#).

Availability

Cash 360 is a public and managed SuiteApp. As a managed SuiteApp, it is automatically updated when enhancements or new features are added.

For instructions on installing this SuiteApp, see [Installing Cash 360](#).

Cash 360 Prerequisites

- To obtain accurate reports in the Cash 360 dashboard, an administrator must do the following before installing the Cash 360 SuiteApp:

- To use aging reports in this SuiteApp, set the **Aging Reports Use** preference.

Go to Setup > Accounting > Accounting Preferences > General and select the **Due Date** option under the **Aging Reports Use** preference.

- To approve invoices while using this SuiteApp:
 - Enable the following required features. For instructions on enabling features, read the help topic [Enabling Features](#).

Subtab	Feature
Employees	Approval Routing
SuiteCloud	Client SuiteScript Server SuiteScript SuiteFlow

- Set the **Invoices Approval Routing** preference.

Go to Setup > Accounting > Accounting Preferences > Approval Routing and check the **Invoices** box.

- To include installment transactions in the Cash 360 calculations, enable the Installments feature from the **Accounting** subtab. For instructions on enabling features, read the help topic [Enabling Features](#).
- If your company uses multiple currencies, enable the following features. For instructions on enabling features, read the help topic [Enabling Features](#).

Subtab	Feature
Company	Multiple Currencies
SuiteCloud	SuiteCloud Development Framework

- Ensure there are no access restrictions to the Subsidiary record. Remove any value selected in the **Subsidiary** field under Set Preferences > Restrict View > Subsidiary.

If there is a value selected in the Subsidiary field, it means your access is restricted only to that selected subsidiary and consolidated subsidiary cash forecasts may not work properly.

- Set the **Report by Period** user preference to accurately display values in the Cash 360 tiles. Go to Set Preferences > Analytics > Reporting and select **Financials Only** in the **Report By Period** field.

Installing Cash 360

Cash 360 requires a NetSuite OneWorld account.

Before installing this SuiteApp, read [Cash 360 Prerequisites](#).

To install the Cash 360 SuiteApp:

1. Go to **SuiteApps**.

The **SuiteApps** tab is not available for the following centers:

- Advanced Partner Center
 - Customer Center
 - Employee Center
 - Partner Center
 - Support Center
 - Vendor Center
2. In the **Search SuiteApps** field, enter **Cash 360** to search for the SuiteApp.
 3. Click the Cash 360 SuiteApp tile.
 4. On the top right corner of the page, click **Install**.

For information about the installation status, see the help topic [Viewing SuiteApp Installation or Uninstallation Status](#).

Cash 360 Terms and Definitions

Term	Definition
Inflow	These are transactions where money flows into your company. The following are examples of inflow transactions: ■ Dividend payments ■ Non-recurring cash flow such as financing and sale of assets
Outflow	These are transactions where money flows out of your company. The following are examples of outflow transactions: ■ Purchases ■ Payroll ■ Taxes ■ Rent
Accounts receivable	These are accounts with receivable amounts that fall on a given period. For example: Open invoices
Accounts payable	These are accounts with payable amounts that fall on a given period. For example: Open vendor bills
Future-period funds	These are funds from transactions that fall on the next period but is within the same forecast period. For example, you have a forecast period that is set to 6 or 12 weeks, a report that starts on the last week of October 2025, and bank transactions for November 1, 2025. The total bank transactions for October 1 are counted as future-period funds.
Opening balance	This is the amount of cash available at the start of a period. The initial opening balance amount is the sum of all accounts in the chart of accounts with the type equal to bank (except for those excluded from Cash 360 calculations) for the selected subsidiary or consolidated subsidiary up to the current posting period. The succeeding opening balance amounts are taken from the closing balance amounts from the previous periods.
Closing balance	This is the cash forecast at the end of a period.

Term	Definition
	The closing balance is calculated as the opening balance amount, plus undeposited/future-period funds, plus the total forecast inflow amount, minus the total forecast outflow amount. Closing balance = Opening balance + Undeposited/Future-period funds + Total forecast inflow – Total forecast outflow amount
Net balance	The net balance is calculated as the total forecast inflow amount minus the total forecast outflow amount for a given period. Net balance = Total forecast inflow amount – Total forecast outflow amount

Cash 360 Roles and Permissions

There are no custom roles included with this SuiteApp. An administrator must create custom roles for financial users in the company, give access to the role, and set the required permissions for those roles. For more information about creating custom roles and setting permissions, see the help topic [Customizing or Creating NetSuite Roles](#).

Giving a Role Access to Cash 360

An administrator must give access to roles that will use the Cash 360 SuiteApp. When access is not given, the role has no permission to view and use the SuiteApp.

Note: Access can only be given to custom roles and is not available for standard roles.

To give a role access to Cash 360:

1. Go to Setup > Users/Roles > Manage Roles.
2. Click **Edit** beside the custom role.
3. In the Authentication section, check the **Cash 360 Access** box.
Checking this box gives the role permissions to view transactions, cash forecasts, and other relevant financial information in the Cash 360 SuiteApp.
4. Click **Save**.

Setting Permissions and Subsidiary Restrictions for a Cash 360 Custom Role

An administrator must set permissions and subsidiary restrictions so users can fully access Cash 360.

If the required permissions are not set and subsidiary restrictions are not set up correctly, the following may happen for the custom role.

- Cannot fully access Cash 360.
- Cannot access account category pages.
- Consolidated subsidiary forecasts may not work properly.

To set permissions and subsidiary restrictions for a Cash 360 custom role:

1. Go to Setup > Users/Roles > Manage Roles.

2. Click **Edit** beside the custom role.
3. Under the **Subsidiary Restrictions** section, in the **Accessible Subsidiaries** field, select the subsidiaries that are accessible for the custom role.

Be sure to set the correct subsidiary restrictions to ensure that consolidated subsidiary forecast will work properly for the custom role.

For more information, see the help topic [Restricting Role Access to Subsidiaries \(OneWorld Only\)](#).

4. Set the required permissions.
 - a. Click the **Permissions** subtab.

See the following table for a list of required permissions

Custom Role	Subtab	Permission	Permission Level
CFO CEO Financial controller	Lists	Custom Record Entries	Full
		Accounts	View
	Setup	SuiteScript	View
		Custom List	View
	Custom Record	Cash 360 Account	View
		Cash 360 Account Category	Full

- b. Click **Add**.
5. Click **Save**.

Enabling Support for Custom Transactions

If you have custom transactions to include in the Cash 360 forecast, an administrator must do the following steps to enable support for these custom transactions.

Omit these steps if you do not have custom transactions to include in the cash forecast.

To enable support for custom transactions:

1. Go to Customization > Lists, Records & Fields > Transaction Types.
2. Click the transaction name to edit it.
3. On the **Statuses** tab, check the **Posting** box.

Note: If there are transaction statuses listed, make sure you check the **Posting** box for each transaction status line.

4. On the **Permissions** tab, select **Cash 360 – Service Role** and set **View** as its permission level.
5. Click **Add**.
6. Click **Save**.

Cash 360 Excluded Transactions

Some transactions are excluded from the cash forecasts. See [Transactions Excluded From the Cash Forecast](#) for a list of these transactions, listed per NetSuite edition.

To include these transactions in the cash forecast, an administrator must do the following:

1. Enable the following required features. For information about enabling features, read the help topic [Enabling Features](#).

Subtab	Feature
Company	Multiple Currencies
SuiteCloud	SuiteCloud Development Framework

2. Create a customized service role. Permissions for the excluded transactions must then be manually added to the customized service role. For more information, see [Adding Permissions for Transactions Excluded From the Cash 360 Forecast](#).
3. Update script deployments. Set the **Execute as Role** field to point to the customized service role. For more information, see [Updating Scripts for the Cash 360 Customized Service Role](#).

Transactions Excluded From the Cash Forecast

Note: The following table is a non-exhaustive list of transactions excluded from the cash forecast, listed per NetSuite edition.

NetSuite Edition	Transaction Name
Australia Edition	Pay Tax Liability
Canada Edition	Process GST Refund
	Pay Tax Liability
	Pay Sales Tax
Japan Edition	Pay Tax Liability
	Tegata Payable
	Tegata Receivable
U.K. Edition	Pay Tax Liability
	Pay Sales Tax
	Tegata Payable
	Tegata Receivable
U.S. Edition	Pay Sales Tax
International Edition	Pay Tax Liability

Adding Permissions for Transactions Excluded From the Cash 360 Forecast

Some transactions, depending on your NetSuite edition, are excluded from the cash forecast. For a list of these transactions, see [Transactions Excluded From the Cash Forecast](#).

To include these transactions in the cash forecast, an administrator must enable required features and create a customized service role for these transactions. Permissions for these transactions must then

be manually added to the customized service role. After adding permissions for these transactions, an administrator must update script deployments for the customized service role. For more information, see [Cash 360 Excluded Transactions](#).

To add permissions for excluded transactions:

1. Go to Setup > Users/Roles > Manage Roles.
2. Click **Customize** beside **Cash 360 – Service Role**.
3. In the **Name** field, enter a name for the customized service role.
For example: Customized Service Role
4. (Optional) In the **ID** field, enter an ID for the customized service role.
5. In the **Center Type** field, select **Classic Center**.
6. In the **Permissions** tab, under the **Transactions** subtab, do the following and add each excluded transaction.
 - a. In the **Permission** column, select the transaction you want to add.
For a list of transactions that must be added, listed per NetSuite Edition, see [Transactions Excluded From the Cash Forecast](#).
 - b. In the **Level** column, select **View** as the permission level for the transaction.
 - c. Click **Add**.
7. Click **Save**.

Updating Scripts for the Cash 360 Customized Service Role

Some transactions, depending on your NetSuite edition, are excluded from the cash forecast. For a list of these transactions, see [Transactions Excluded From the Cash Forecast](#).

To include these transactions in the cash forecast, an administrator must enable required features and create a customized service role for these transactions. Permissions for these transactions must then be manually added to the customized service role. For more information, see [Cash 360 Excluded Transactions](#).

After adding permissions for these transactions, an administrator must update script deployments and set the Execute as Role field to point to the customized service role.

To update scripts for the customized service role:

1. Go to Customization > Scripting > Scripts.
2. Look for the following deployment scripts.

Script Name	Script ID
Cash 360 – Application Data	customscript_cash360_su_application_data
Cash 360 – AR and AP Data	customscript_cash360_su_arap
Cash 360 – Inflow and Outflow Data	customscript_cash360_su_inflow_outflow
Cash 360 – Opening Balance Data	customscript_cash360_su_opening_balance
Cash 360 – Preference Data	customscript_cash360_su_preference

3. Do the following for each of the scripts in step 2.
 - a. Click **View**.

- b. On the Script page, click the **Deployments** subtab.
- c. In the **Title** column, click the script deployment name link.
- d. On the Script Deployment page, click **Edit**.
- e. In the **Execute as Role** field, select the customized service role you created.

For more information about the customized service role, see [Adding Permissions for Transactions Excluded From the Cash 360 Forecast](#).

- f. Click **Save**.

Cash 360 Account Categories

Automate forecasts based on your general ledger history. Define account categories based on one or several GL accounts to forecast at your preferred level of detail. Account categories in the Cash 360 SuiteApp let you classify chart of accounts, set them as inflow or outflow accounts, and include them in the cash forecast.

 **Note:** An administrator must set permissions so users can access the Cash 360 account category pages. For more information, see [Setting Permissions and Subsidiary Restrictions for a Cash 360 Custom Role](#).

Read the following topics to know more about the Cash 360 account categories:

- [Adding Cash 360 Account Categories](#)
- [Displaying the Cash 360 Account Category List](#)
- [Searching for Cash 360 Account Categories](#)

Adding Cash 360 Account Categories

Add account categories to classify chart of accounts as inflow or outflow transactions and include them in the cash forecast.

 **Note:** An administrator must set permissions so users can access the Cash 360 account category pages. For more information, see [Setting Permissions and Subsidiary Restrictions for a Cash 360 Custom Role](#).

To add Cash 360 account categories:

1. Go to Financial > Cash 360 > Account Category > New.
2. In the **Name** field, enter a name for the account category.
For example: Salaries and wages
3. In the **Subsidiary** field, select a subsidiary for the account category.
You can select from subsidiaries that are assigned to your role.
4. (Optional) Check the **Inactive** box to make the account category inactive.

 **Note:** Only check the **Inactive** box if you will not use the account category.

5. In the **Type** field, select the account category type. Select from **Inflow** or **Outflow**.

Note: The SuiteApp only supports **Inflow** and **Outflow** account categories.

Inflow accounts are accounts with cash projected to flow into your company, such as dividend income. Outflow accounts are accounts with cash projected to flow out of your company, such as utility expenses.

6. In the **Chart of Accounts** list, select a chart of account for the category.

Note: Take note of the following:

- You must select an appropriate chart of account to associate with your account category. For example, you can only select an inflow type chart of account for inflow account categories.
For inflow account categories, you can only add chart of accounts with the type equal to income or other income. For outflow account categories, you can only add chart of accounts with the type equal to expense, other expense, and cost of goods sold (COGS).
- You can associate each chart of account with only one account category.
- You can add a maximum of 1000 chart of account values to a single category.

7. Check the **Use in Forecasting** box to include the chart of account in the cash forecast.
When this box is checked, data, amounts, and transactions for the chart of account are included in the cash forecast.
8. Click **Add**.
9. Click **Save**.

Displaying the Cash 360 Account Category List

You can display all Cash 360 account categories in a single list to edit or view them.

Note: An administrator must set permissions so users can access the Cash 360 account category pages. For more information, see [Setting Permissions and Subsidiary Restrictions for a Cash 360 Custom Role](#).

To display the Cash 360 account category list:

1. Go to Financial > Cash 360 > Account Category.
All Cash 360 account categories are displayed.
2. (Optional) Expand the Filters section and select a subsidiary to filter account categories by subsidiary.
3. Click **Edit** or **View** beside the account category to edit or view it.

Searching for Cash 360 Account Categories

You can use a saved search form to search for account categories. Search for account categories before creating them to ensure you are not creating duplicates.

Note: An administrator must set permissions so users can fully access the Cash 360 account categories. For more information, see [Setting Permissions and Subsidiary Restrictions for a Cash 360 Custom Role](#).

To search for Cash 360 account categories:

1. Go to Financial > Cash 360 > Account Category > Search.
2. Fill out any or all of the following search criteria to display the corresponding results:
 - a. In the **Name** field, select a filter and enter the name of the account category.
 - b. In the **Script ID** field, select a filter and enter the script ID for the account category.
 - c. In the **Date Created** field, select a filter and enter dates or pick dates from the calendar popup window.
 - d. In the **Last Modified** field, select a filter and enter dates or pick dates from the calendar popup window.
 - e. Choose **Either**, **Yes**, or **No** to select the inactive status of the account.
 - f. In the **Subsidiary** list, select a filter and select a subsidiary.
3. Click **Submit**.

Setting Cash 360 Preferences

The preferences you specify determine the cash forecast display in the Cash Forecast table and in the Cash 360 dashboard. Set Cash 360 preferences to define the forecast period, the display in the Cash Forecast table, and what and how account categories and additional values are used in the cash forecast.

To set Cash 360 preferences:

1. Go to Financial > Cash 360 > Dashboard.
2. On the left pane, click **Preferences**.
3. In the General Preferences section, specify forecast preferences:

General preferences are shared across all custom roles that have access to the SuiteApp within the same subsidiary.

- a. In the **Forecast Period** field, select a forecast period.
 This field lets you specify the period to include in the cash forecast. The default forecast period is 3 months.
 The forecast period is counted from the current day, week, or month.
- b. Check the **Include Opening Balance** box to display the opening balance, undeposited/ future-period funds, closing balance, and net balance in the Cash Forecast table.
- c. Check the **Include Sales Orders** box to include sales orders in forecast computations.
 When this box is checked, sales orders are included in the computation of inflow amounts and in the cash forecasts, as shown in the Cash Forecast table and in the Cash 360 dashboard.
 Only sales orders without billing schedules, installments, and subscriptions are included in forecast computations.
- d. Check the **Include Purchase Orders** box to include purchase orders in forecast computations.

When this box is checked, purchase orders are included in the computation of outflow amounts and in the cash forecasts, as shown in the Cash Forecast table and in the Cash 360 dashboard.

Only purchase orders without billing schedules, installments, and subscriptions are included in forecast computations.

4. In the **Subsidiary-Wide Preferences** section, set preferences for your selected subsidiary.
 - a. In the **Subsidiary** selector, select a subsidiary where to apply the account categories and additional values.
 - b. (Optional) In the **Account Categories** tab, specify what and how account categories are used in the cash forecast.

Note: You must first add account categories before you can specify them for inclusion and set preferences for them in this tab. For information, see [Adding Cash 360 Account Categories](#).

- i. In the **Category** column, select an account category.
Account categories are arranged by category type. Inflow and outflow account categories are grouped together. Inflow account categories appear first and the outflow account categories next.
- ii. In the **Use In Forecasting** column, check the box for the account category if you want to include it in the cash forecast.
- iii. In the **Data To Use** column, specify the time frame of the data you want to use in the cash forecast.

You can use the historical average for the last 3 months or the last 6 months.

Note: The cash forecast does not include the current month but considers the last full 3 or 6 months before the current month. For example, if the current date is June 22, and you want to use data for the last 3 months, the cash forecast considers data from March, April, and May.

- iv. In the **% Movement** column, specify the movement of cash flow in percent for the account category.
The percentage of cash movement represents the increment or decrement of cash flow. A positive value indicates increment and a negative value indicates decrement. The value specified is evenly applied to the account category and is not cumulative. The movement of cash flow is calculated considering the average amount for each category and the value specified in the **Data To Use** column. In the Cash Forecast table, the percent movement is only applied to the succeeding periods and not to the current date, month, or week.
- v. Click **Add**.
- c. (Optional) In the **Additional Values** tab, add additional values to include in the cash forecast. This tab lets you add values that have no corresponding chart of account items.

Note: The additional values are shared across users within the same subsidiary.

- i. In the **Name** column, add a name for the additional value.
- ii. In the **Date** column, enter or select a date from the calendar popup window.
- iii. In the **Amount** column, enter an amount for the additional value.
- iv. In the **Type** column, select the account type.

Select from **Inflow** or **Outflow**.

Inflow accounts are accounts with cash projected to flow into your company, such as dividend income. Outflow accounts are accounts with cash projected to flow out of your company, such as utility expenses.

- v. In the **Recurrence** column, enter a number to specify how often the additional value is used in the cash forecast.

You can enter a number from 1 through 12.

- vi. In the **Recurrence Type** column, select the frequency the additional value is used in the cash forecast.

For example, if you entered **2** in the **Recurrence** column and selected **Monthly** in the **Recurrence Type** column, the additional value appears in two consecutive months starting from the date specified in the **Date** column and is included as such in the cash forecast.

- vii. Click **Add**.

- d. (Optional) In the **Order Billing Lead Time** tab, manually enter the order billing lead time for customers without closed sales orders and vendors without closed purchase orders.

Order billing lead time is the average number of days it takes to fully bill sales orders and purchase orders for each customer and vendor. This value is system-calculated for all fully billed and closed sales orders and purchase orders. The system-calculated order billing lead time is displayed in the customer record for sales orders and in the vendor record for purchase orders. For more information, see [Viewing the System-Calculated Order Billing Lead Time](#).

For customers without closed sales orders and vendors without closed purchase orders, you can manually enter the order billing lead time in this tab. The preferences you set here apply to all customers without closed sales orders and all vendors without closed purchase orders for the selected subsidiary.

The order billing lead time is added to the sales order or purchase order transaction date along with payment terms (if any) to calculate forecast dates as shown in the Cash Forecast table and in the Cash 360 dashboard.

If both the manually entered and system-calculated order billing lead time values are specified, the system-calculated value takes precedence over the manually entered one and is used to calculate forecast dates.

- i. In the **Sales Order Billing Lead Time** field, enter the order billing lead time in days for sales orders. You can enter a maximum of 999 days.
- ii. In the **Purchase Order Billing Lead Time** field, enter the order billing lead time in days for purchase orders. You can enter a maximum of 999 days.

- 5. Click **Save**.

Excluding Bank Accounts from Cash 360 Calculations

By default, all accounts in the chart of accounts with the type equal to Bank are included in the Cash 360 bank balance calculations and cash forecasts. You can exclude bank accounts from bank balance calculations and cash forecasts from the account record. Excluded bank accounts are not considered when displaying the bank balance in the Cash 360 dashboard and when displaying the opening balance amount in the Cash Forecast table.

To exclude bank accounts from Cash 360 calculations:

1. Go to Setup > Accounting > Chart of Accounts.
2. Click **Edit** next to the bank account that you want to exclude from Cash 360 calculations and cash forecasts.
3. In the Account record, check the **Exclude from Cash 360** box.
4. Click **Save**.

Cash 360 Subsidiary Consolidation

Cash 360 lets you see the cash forecast for a single subsidiary or for a consolidated subsidiary.

Single subsidiary and consolidated subsidiary reports are available on the Cash 360 dashboard and in the Cash Forecast table. To change reports by subsidiary or to view reports for a consolidated subsidiary, go to the upper right corner of the page and select the subsidiary or consolidated subsidiary.

If you select Parent Company (Consolidation) or any designated parent company, the corresponding Internal ID must have a numerical value of 1. Cash 360 does not support consolidation for a parent company with an Internal ID other than 1.

 **Note:** Inactive subsidiaries are not included in the list of subsidiary options. However, all posting transaction amounts from inactive subsidiaries are included in the cash forecast when viewing reports for a consolidated subsidiary. For more information about consolidated reports in OneWorld accounts, see the help topic [Consolidated Reporting in OneWorld](#).

Subsidiary Consolidation and Currencies

Transactions in subsidiaries follow the currency exchange rate set for the transaction currency, based on the effective date. When viewing consolidated reports, transaction amounts in child subsidiaries, which may be in another currency, are converted to the currency of the parent company or consolidated subsidiary using consolidated exchange rates.

Read the following topics to view related information about subsidiary consolidation and currencies:

- [Consolidated Cash Forecast Computation for Account Categories](#)
- [Consolidated Cash Forecast Computation for Additional Values](#)
- [Consolidated Exchange Rates vs. Currency Exchange Rates](#)

Viewing the System-Calculated Order Billing Lead Time

The system-calculated order billing lead time is defined for each customer and vendor for all fully billed and closed sales orders and purchase orders. It is the average number of days between the sales order or purchase order transaction date and the transaction date of the last related invoice or bill. The system-calculated order billing lead time measures the average time it takes to fully bill sales orders and purchase orders for each customer and vendor for the past 12 months. The system-calculated order billing lead time is displayed in the customer record for sales orders and in the vendor record for purchase orders.

You can also view the Cash 360 Entity custom record for a list of the system-calculated order billing lead time for each customer and vendor for all fully billed and closed sales orders and purchase orders. This custom record is only available if your role has a custom records permission. To view the Cash 360 Entity custom record, go to Customization > Lists, Records, & Fields > Record Types.

The SuiteApp calculates the order billing lead time using a map/reduce script that runs daily. You can change the frequency of the script run, depending on your preference. For more information, see [Rescheduling the Order Billing Lead Time Script Run](#). The map/reduce script processes all customers and vendors that have fully billed and closed sales orders and purchase orders in its initial run. Subsequent runs of the script only process new customer and vendor records that have fully billed and closed sales orders and purchase orders and those customer and vendor records that have changes to transactions.

The order billing lead time is added to the sales order or purchase order transaction date along with payment terms (if any) to calculate forecast dates as shown in the Cash Forecast table and in the Cash 360 dashboard.

For customers without closed sales orders and vendors without closed purchase orders, you can manually enter sales order and purchase order billing lead time values on the Cash 360 Preferences page. For more information, see [Setting Cash 360 Preferences](#).

If both values are specified, the system-calculated order billing lead time takes precedence over the manually entered value and is used to calculate forecast dates.

To view the system-calculated order billing lead time:

1. Open the customer or vendor record.
 - To open the customer record, go to Lists > Relationships > Customers and select the customer record.
 - To open the vendor record, go to Lists > Relationships > Vendors and select the vendor record.
2. Click the **Financial** subtab.
3. View the order billing lead time for sales orders and purchase orders.
 - To view the order billing lead time for sales orders, expand the Balance Information section in the customer record and locate the **Order Billing Lead Time** field.
 - To view the order billing lead time for purchase orders, expand the Vendor Bill Matching section in the vendor record and locate the **Order Billing Lead Time** field.

For customers without closed sales orders and vendors without closed purchase orders, the **Order Billing Lead Time** field displays a hyphen (-).

Rescheduling the Order Billing Lead Time Script Run

The system calculates the order billing lead time using a map/reduce script that runs daily. You can change the frequency of the script run, depending on your preference. The optimal schedule of the script run is daily at the end of your business day.

This map/reduce script processes all customers and vendors with fully billed and closed sales orders and purchase orders in its initial run. Subsequent runs of the script only process new customers and vendors with closed sales orders and purchase orders, and any customer and vendor records with updated transactions.

To reschedule the order billing lead time script run:

1. Go to Customization > Scripting > Scripts and locate the **Cash 360 | MR SO PO Order Lead Time Calc** script.
2. Click **View** beside the script name.
3. Click the **Deployments** subtab.
4. Click **Cash 360 | MR SO PO Order Lead Time Calc**.
5. Click **Edit**.
6. In the **Schedule** subtab, specify the new schedule of the script run.

 **Note:** When you make changes to the schedule of the script run, ensure that the value in the **Last Entity Internal ID** field under the **Parameters** subtab remains blank.

7. Click **Save**.

Cash Forecasts in Cash 360

The cash forecast computation varies for account categories and for additional values. The computation also varies for a single subsidiary and for a consolidated subsidiary.

For more information, read the following topics:

- [Cash Forecast Computation for Account Categories in a Single Subsidiary](#)
- [Cash Forecast Computation for Additional Values in a Single Subsidiary](#)
- [Consolidated Cash Forecast Computation for Account Categories](#)
- [Consolidated Cash Forecast Computation for Additional Values](#)

The following table shows the factors affecting the cash forecast computation for a single subsidiary and for a consolidated subsidiary.

Single Subsidiary	Consolidated Subsidiary
Account categories	Account categories
Additional values	Additional values
Cash forecast preferences	Cash forecast preferences
	Consolidated exchange rate type
	Consolidated exchange rate

See the following topics to view related information:

- [Adding Cash 360 Account Categories](#)
- [Setting Cash 360 Preferences](#)
- [Viewing Consolidated Exchange Rates](#)

Cash Forecast Computation for a Single Subsidiary

The cash forecast computation for a single subsidiary varies for account categories and additional values. Read the following topics to know more.

- [Cash Forecast Computation for Account Categories in a Single Subsidiary](#)
- [Cash Forecast Computation for Additional Values in a Single Subsidiary](#)

Cash Forecast Computation for Account Categories in a Single Subsidiary

The cash forecast computation for account categories in a single subsidiary varies depending on the **Data To Use** and **% Movement** values on the SuiteApp's Preferences page. For more information, see [Setting Cash 360 Preferences](#).

The following table shows how the cash forecast for account categories is calculated when there is no subsidiary consolidation.

Forecast Period	Cash Forecast Computation Without % Movement	Cash Forecast Computation with % Movement
Daily	The total amount for the account category, divided by the Data To Use value in months, multiplied by 12 months, and divided by 365 days. Daily Cash Forecast = (Total Amount for the account category ÷ Data To Use in months) × 12 months ÷ 365 days	The daily cash forecast amount for the account category, multiplied by the percentage of movement, plus the daily cash forecast amount. Daily Cash Forecast with % Movement = (Daily Cash Forecast × % Movement) + Daily Cash Forecast
Weekly	The total amount for the account category, divided by the Data To Use value in months, multiplied by 12 months, and divided by 52 weeks. Weekly Cash Forecast = (Total Amount for the account category ÷ Data To Use in months) × 12 months ÷ 52 weeks	The weekly cash forecast amount for the account category, multiplied by the percentage of movement, plus the weekly cash forecast amount. Weekly Cash Forecast with % Movement = (Weekly Cash Forecast × % Movement) + Weekly Cash Forecast
Monthly	The total amount for the account category divided by the Data To Use value in months. Monthly Cash Forecast = Total amount for account category ÷ Data To Use in months	The monthly cash forecast amount for the account category, multiplied by the percentage of movement, plus the monthly cash forecast amount. Monthly Cash Forecast with % Movement = (Monthly Cash Forecast × % Movement) + Monthly Cash Forecast

Note: In the Cash Forecast table, the **% Movement** values are not applied to the current day, month, or week but are only applied to succeeding periods.

Cash Forecast Computation for Additional Values in a Single Subsidiary

The following factors affect the cash forecast computation for additional values in a single subsidiary:

- Whether the amount is considered as outflow or inflow
- Forecast period
- Recurrence
- Recurrence Type

These factors can be set on the SuiteApp's Preferences page. For more information, see [Setting Cash 360 Preferences](#).

The following table shows examples of how the cash forecast for additional values is calculated when there is no subsidiary consolidation.

Date	Amount	Type	Recurrence	Recurrence Type	Forecast Period	Cash Forecast
Today	1000	Inflow	5	Daily	5 Days	1000 appears on the cash forecast as an outflow amount for five days starting on the current date.
Today	2000	Outflow	3	Weekly	4 Weeks	2000 appears on the cash forecast as an outflow amount for three weeks starting on the current week.
Today	3000	Inflow	6	Monthly	6 Months	3000 appears on the cash forecast as an inflow amount for six months starting on the current month.

Cash Forecast Computation for a Consolidated Subsidiary

The cash forecast computation for a consolidated subsidiary varies for account categories and additional values. Read the following topics to know more.

- [Consolidated Cash Forecast Computation for Account Categories](#)
- [Consolidated Cash Forecast Computation for Additional Values](#)

Consolidated Cash Forecast Computation for Account Categories

The cash forecast for account categories in a consolidated subsidiary is dependent on the consolidated exchange rate, the type of exchange rate used to translate foreign currency amounts for the chart of account, and the **Data To Use** and **% Movement** values set on the Preferences page of this SuiteApp. For more information, see [Setting Cash 360 Preferences](#).

To calculate the cash forecast for account categories in a consolidated subsidiary:

1. Determine the type of exchange rate used to translate foreign currency amounts for the chart of account.
 - a. Go to Setup > Accounting > Manage G/L > Chart of Accounts.
 - b. Click **View** beside the name of the chart of account.
 - c. Go to the **General Rate Type** field to determine the type of exchange rate used to translate foreign currency amounts for the chart of account.

For more information, see the help topic [Consolidated Exchange Rate Types](#).

2. Determine the consolidated exchange rate to use for consolidation. The consolidated exchange rate to use varies depending on the **General Rate Type** field value set for the chart of account.
 - If the **General Rate Type** value is **Current**, use the consolidated exchange rate of the current posting period.
 - If the **General Rate Type** value is **Historical** or **Average**, use the consolidated exchange rate of the posting period on the transaction.

For instructions to view the consolidated exchange rate, see the help topic [Viewing Consolidated Exchange Rates](#).

3. Compute the cash forecast using the equations in the following table.

Forecast Period	Consolidated Cash Forecast Computation for Account Categories Without % Movement
Daily	The sum of all transaction amounts multiplied by the consolidated exchange rate (depending on the general rate type), divided by the Data To Use value in months, multiplied by 12 months, and divided by 365 days. Consolidated Daily Cash Forecast = (Sum of transaction amount × Consolidated exchange rate depending on the General Rate Type) ÷ Data To Use in months × 12 months ÷ 365 days
Weekly	The sum of all transaction amounts multiplied by the consolidated exchange rate (depending on the general rate type), divided by the Data to Use value in months, multiplied by 12 months, and divided by 52 weeks. Consolidated Weekly Cash Forecast = (Sum of transaction amount × Consolidated exchange rate depending on the General Rate Type) ÷ Data To Use in months × 12 months ÷ 52 weeks
Monthly	The sum of all transaction amounts multiplied by the consolidated exchange rate (depending on the general rate type) and divided by the Data To Use value in months. Consolidated Monthly Cash Forecast = (Sum of transaction amount × Consolidated exchange rate depending on the General Rate Type) ÷ Data To Use in months

Consolidated Cash Forecast Computation for Additional Values

The cash forecast for additional values in a consolidated subsidiary is dependent on the consolidated exchange rate, whether the amount is considered as outflow or inflow, the forecast period, recurrence, and recurrence type as specified on the SuiteApp's Preferences page. For more information, see [Setting Cash 360 Preferences](#).

The consolidated exchange rate type used for additional values is always the **Current** consolidated exchange rate. For more information about the consolidated exchange rate types, see the help topic [Consolidated Exchange Rate Types](#).

The consolidated cash forecast for additional values is calculated as the additional value amount multiplied by the current consolidated exchange rate. The recurrence, recurrence type, and forecast period determines how the cash forecast is displayed on the Cash Forecast table and on the dashboard.

Consolidated cash forecast for additional values = Additional value amount × Current consolidated exchange rate

The following table shows examples of how the cash forecast for additional values is calculated for consolidated subsidiaries.

Date	Amount	Type	Recurrence	Recurrence Type	Sample Current Consolidated Exchange Rate	Forecast Period	Consolidated Cash Forecast
Today	1000	Inflow	1	Daily	0.934	5 days	934 appears on the cash forecast as an inflow amount for the current date.
1st day of June	2000	Outflow	8	Weekly	0.848 for June 0.995 for July	12 weeks	1696 appears on the Cash Forecast table as an outflow amount for four weeks starting on the 1st week of June. 1990 appears on the Cash Forecast table as an outflow amount for four weeks starting on the first week of July.
1st day of September	3000	Inflow	2	Monthly	.779 for September .834 for October	6 months	2337 appears on the cash forecast as an inflow amount for the month of September. 2502 appears on the cash forecast as an inflow amount for the month of October.

Viewing Cash Forecasts

Note: An administrator must give access to roles that will use the Cash 360 SuiteApp. When access is not given, the role has no permission to view the cash forecasts. For more information, see [Giving a Role Access to Cash 360](#).

You can display the cash forecast for a single subsidiary or for consolidated subsidiaries in the Cash Forecast table. To change reports by subsidiary or to view consolidated reports, go to the upper right corner of the page and select the subsidiary or consolidated subsidiary.

Dates in the Cash Forecast table are based on the time zone preferences of the of the logged-in user. For more information, see the help topic [Setting Your Calendar Time Zone](#).

Note: Inactive subsidiaries are not included in the list of subsidiary options. However, all posting transaction amounts from inactive subsidiaries are included in the cash forecast when viewing reports for a consolidated subsidiary. For more information about consolidated reports in OneWorld accounts, see the help topic [Consolidated Reporting in OneWorld](#).

To view cash forecasts:

1. Go to Financial > Cash 360 > Dashboard.
2. On the left pane, click **Cash Forecast** to display the Cash Forecast table.

The default display of the Cash Forecast table is always based on the currently logged-in user's subsidiary. To display the table for another subsidiary, select the subsidiary in the upper right corner of the page.

The Cash Forecast table displays the following information.

Table Heading	Table Element	Description
Account Category	Column header	This column displays the account categories and additional values. The account categories are sorted per type, whether they are inflow or outflow. Additional values are marked with an asterisk (*). Accounts receivable and accounts payable are also displayed in this column.
Amount (Currency)	Column header	This column is divided into subcolumns that show the cash forecast amount for the date range specified in the SuiteApp's Preferences page. The cash forecast amount is shown in the currency of the selected subsidiary or consolidated subsidiary.
Date, Week, Month	Column subheader	This is the date range specified in the Forecast Period field on the SuiteApp's Preferences page. Each column shows the forecast amount for the date range and starts with the current date, week, or month. If you selected 3 Months in the Forecast Period field, the SuiteApp computes the next full 3 months after the current date. For example, if the current date is October 20, the table displays the next full 3 months of data after October. That is, data from November to January.

Table Heading	Table Element	Description
Opening Balance	Row header	This row displays the opening balance amount for the date range specified in the SuiteApp's Preferences page. For more information, see Setting Cash 360 Preferences. The initial opening balance amount is the sum of all accounts in the chart of accounts with the type equal to bank (except for those excluded from Cash 360 calculations) for the selected subsidiary or consolidated subsidiary up to the current posting period. For more information about excluding bank accounts from the opening balance calculations, see Excluding Bank Accounts from Cash 360 Calculations. The succeeding opening balance amounts are taken from the closing balance amounts from the previous periods. This row is only displayed if the Include Opening Balance box is checked in the SuiteApp's Preferences page. Click the opening balance amount to open a window that lists all accounts included in the opening balance amount calculation. You can only click the opening balance amount if it is greater than zero. For more information, see Viewing the Opening Balance Details.
Undeposited/Future-Period Funds	Row header	This row displays the total undeposited funds and bank transaction amounts for the date range specified that fall on the succeeding posting period. This row displays values if there are undeposited funds or if there is an overlap in the accounting periods within the same forecast period. For example, you have a forecast period that is set to 6 or 12 weeks, a report that starts on the last week of October 2025, and bank transactions for November 1, 2025. Any undeposited funds and any bank transaction amounts for November 1 is shown on this row. This row is only displayed if the Include Opening Balance box is checked in the SuiteApp's Preferences page. For more information, see Setting Cash 360 Preferences.
Inflow	Row separator	All entries below this row are inflow account categories, additional values, accounts receivables, and sales orders. The forecast amount for the account categories are based on historical averages as set in the Forecast Period field on the SuiteApp's Preferences page. When there is no data available for the period specified, the forecast amount will contain zero values. If the Cash Forecast table displayed is for a consolidated subsidiary, the inflow amounts are grouped together for each subsidiary. Expand the subsidiary name to show the account categories or additional values for that subsidiary. Additional values are marked with an asterisk. For information about how to add additional values, see Setting Cash 360 Preferences.
Accounts Receivable	Row	This row displays the accounts receivable from all A/R posting transactions that fall on the date, week, or month specified. If there are receivable installment transactions, the installment amount is included on the month, week, or date when the installment amount is received.

Table Heading	Table Element	Description
		The amounts in this row include transactions with due dates in the future. Where due dates are not specified for transactions, the transaction date is used in place of the due date. This row is displayed even if there are no A/R posting transactions, account categories, or additional values entered. The first column in this row includes all the accounts receivable amount up to the current date, week, or month. Click the accounts receivable amount to open a window that lists all accounts included in the accounts receivable amount calculation. You can only click the accounts receivable amount if it is greater than zero. For more information, see Viewing the Accounts Receivable Details.
Sales Orders	Row	The first column in this row displays the total open amount (up to the current date, week, or month) from all open and partially billed sales orders. The succeeding columns in this row display the total open amount for all open and partially billed sales orders with forecast dates that fall on the date, week, or month specified. The following sales order statuses are included in the calculation of the total open amount: partially fulfilled, pending billing, and pending fulfillment. Sales orders with billing schedules, installments, and subscriptions are not included in the calculation of amounts in this row. Click the sales order amount (if greater than zero) to open a window listing all related sales orders and their details. For more information, see Viewing the Sales Order Details. This row is only displayed if the Include Sales Orders box is checked in the SuiteApp's Preferences page. For more information, see Setting Cash 360 Preferences.
Outflow	Row separator	All entries below this row are outflow account categories, additional values, accounts payables, and purchase orders. The forecast amount for the account categories are based on historical averages as set in the Forecast Period field on the SuiteApp's Preferences page. When there is no data available for the period specified, the forecast amount will contain zero values. If the Cash Forecast table displayed is for a consolidated subsidiary, the outflow amounts are grouped together for each subsidiary. Expand the subsidiary name to show the account categories or additional values for that subsidiary. Additional values are marked with an asterisk. For information about how to add additional values, see Setting Cash 360 Preferences.
Accounts Payable	Row	This row displays the accounts payable from all A/P posting transactions that fall on the date, week, or month specified. If there are payable installment transactions, the installment amount is included on the month, week, or date when the installment amount is paid.

Table Heading	Table Element	Description
		The amounts in this row include transactions with due dates in the future. Where due dates are not specified for transactions, the transaction date is used in place of the due date. This row is displayed even if there are no A/P posting transactions, account categories, or additional values entered. Click the accounts payable amount to open a window that lists all accounts included in the accounts payable amount calculation. You can only click the accounts payable amount if the it is greater than zero. For more information, see Viewing the Accounts Payable Details.
Purchase Orders	Row	The first column in this row displays the total open amount (up to the current date, week, or month) from all open purchase orders. The succeeding columns in this row display the total open amount for all open and partially billed purchase orders with forecast dates that fall on the date, week, or month specified. The following purchase order statuses are included in the calculation of the total open amount: partially received, pending billing, and pending receipt. Click the purchase order amount (if greater than zero) to open a window listing all related purchase orders and their details. For more information, see Viewing the Purchase Orders Details. This row is only displayed if the Include Purchase Orders box is checked in the SuiteApp's Preferences page. For more information, see Setting Cash 360 Preferences.
Net Balance	Row header	This row displays the net balance amount for a given period. The net balance amount is calculated as the total forecast inflow amount minus the total forecast outflow amount for a given period. This row is only displayed if the Include Opening Balance box is checked in the SuiteApp's Preferences page. For more information, see Setting Cash 360 Preferences.
Closing Balance	Row header	This row shows the closing balance amount for a given period. The closing balance amount is calculated as the opening balance amount, plus the undeposited/future-period funds, plus the total forecast inflow amount, minus the total forecast outflow amount for a given period. Closing balance = Opening balance amount + Undeposited/Future-period funds + Total forecast inflow amount – Total forecast outflow amount This row is only displayed if the Include Opening Balance box is checked in the Preferences page of this SuiteApp. For more information, see Setting Cash 360 Preferences.

Viewing the Opening Balance Details

Click the opening balance amount in the Cash Forecast table to open a window that lists all accounts included in the opening balance amount calculation. Bank accounts excluded from the Cash 360 calculations are not included in the list. For more information, see [Excluding Bank Accounts from Cash 360 Calculations](#). You can only click the opening balance amount if it is greater than zero.

The row that displays the opening balance amount is only displayed if the **Include Opening Balance** box is checked in the SuiteApp's Preferences page. For more information, see [Setting Cash 360 Preferences](#).

To view the opening balance details:

1. Go to Financial > Cash 360 > Dashboard.
2. On the left pane, click **Cash Forecast** to display the Cash Forecast table.
The default display of the Cash Forecast table is always based on the currently logged-in user's subsidiary. To display the table for another subsidiary, select the subsidiary in the upper right corner of the page.
3. Click the opening balance amount for the current day, week, or month.

Note: Take note of the following:

- The Opening Balance row is only displayed if the **Include Opening Balance** box is checked in the SuiteApp's Preferences page. For more information, see [Setting Cash 360 Preferences](#).
- You can only click the current opening balance amount and not the opening balance for the succeeding days, weeks, or months.

The Opening Balance window opens and displays the following information:

Item	Description
Account Category	This field displays the account category for the amount. For example, if the amount is the opening balance amount, this field displays Opening Balance.
Total Amount	This field displays the total opening balance amount that fall on the date, week, or month specified.
Period	This field displays the period covered for the total opening balance amount.
Currency	This field displays the currency of the total opening balance amount.
Subsidiary	This column displays the subsidiary of the account that contributed to the total opening balance amount calculation.
Account Name	This column displays the account name that contributed to the total opening balance amount calculation.
Transaction Amount (Currency)	This column displays the amount that contributed to the total opening balance amount calculation. The amount is shown in the currency of the selected subsidiary or consolidated subsidiary.

4. (Optional) Under the Opening Balance Details section, click the **Export to** icon and select **CSV** to export the report as a CSV file.

The Opening Balance window displays up to 100 recent transactions. Use Export to CSV to view all transactions.

Viewing Details of Undeposited/Future-Period Funds

Click the undeposited/future-period funds amount in the Cash Forecast table to open a window that lists all accounts included in the undeposited/future-period funds amount calculation. You can only click the undeposited/future-period funds amount if it is greater than zero.

The row that displays the undeposited/future-period funds amount is only displayed if the **Include Opening Balance** box is checked in the SuiteApp's Preferences page. For more information, see [Setting Cash 360 Preferences](#).

To view the details of undeposited/future-period funds:

1. Go to Financial > Cash 360 > Dashboard.
2. On the left pane, click **Cash Forecast** to display the Cash Forecast table.

The default display of the Cash Forecast table is always based on the currently logged-in user's subsidiary. To display the table for another subsidiary, select the subsidiary in the upper right corner of the page.

3. Click the undeposited/future-period funds amount.

Note: The Undeposited/Future-Period Funds row is only displayed if the **Include Opening Balance** box is checked in the SuiteApp's Preferences page. For more information, see [Setting Cash 360 Preferences](#).

The Undeposited/Future-Period Funds window opens and displays the following information:

Item	Description
Account Category	This field displays the account category for the amount. For example, if the amount is an undeposited/future-period amount, this field displays Undeposited/Future-Period Funds.
Total Amount	This field displays the total undeposited/future-period funds amount that fall on the date, week, or month specified.
Period	This field displays the period covered for the total undeposited/future-period funds amount.
Currency	This field displays the currency of the undeposited/future-period funds amount.
Subsidiary	This column displays the subsidiary of the account that contributed to the total undeposited/future-period funds amount calculation.
Transaction Number	This column displays the ID of the transaction that contributed to the total undeposited/future-period funds amount calculation. Click the transaction ID to open the transaction record.
Transaction Type	This column displays the type of transaction that contributed to the to the total undeposited/future-period funds amount calculation. For example: Payment
Entity	This column displays the entity for the transaction that contributed to the total undeposited/future-period funds amount calculation. Entity can be a customer name, vendor name, employee name, or other entities.
Account Name	This column displays the account name that contributed to the total undeposited/future-period funds amount calculation.
Transaction Amount (Currency)	This column displays the transaction amount that contributed to the total undeposited/future-period funds amount calculation.

Item	Description
	The amount is shown in the currency of the selected subsidiary or consolidated subsidiary.

- (Optional) Under the Undeposited/Future-Period Funds Details section, click the **Export to** icon and select **CSV** to export the report as a CSV file.

The Undeposited/Future-Period Funds window displays up to 100 recent transactions. Use Export to CSV to view all transactions.

Viewing the Accounts Receivable Details

Click the accounts receivable amount in the Cash Forecast table to open a window that lists all accounts included in the accounts receivable amount calculation. You can only click the accounts receivable amount if it is greater than zero.

To view the accounts receivable details:

- Go to Financial > Cash 360 > Dashboard.
- On the left pane, click **Cash Forecast** to display the Cash Forecast table.
The default display of the Cash Forecast table is always based on the currently logged-in user's subsidiary. To display the table for another subsidiary, select the subsidiary in the upper right corner of the page.
- Click the accounts receivable amount.

The Accounts Receivable window opens and displays the following information:

Item	Description
Account Category	This field displays the account category for the amount. For example, if the amount is an accounts receivable amount, this field displays Accounts Receivable.
Total Amount	This field displays the total accounts receivable amount that falls on the date, week, or month specified.
Period	This field displays the period covered for the total accounts receivable amount.
Currency	This field displays the currency of the total accounts receivable amount.
Subsidiary	This column displays the subsidiary of the transaction that contributed to the total accounts receivable amount calculation.
Transaction Number	This column displays the ID of the transaction that contributed to the total accounts receivable amount calculation. Click the transaction ID to open the transaction record.
Transaction Type	This column displays the type of transaction that contributed to the total accounts receivable amount calculation. For example: Invoice
Entity	This column displays the entity for the transaction that contributed to the total accounts receivable amount calculation. Entity can be a customer name, vendor name, employee name, or other entities.
Transaction Date	This column displays the date of the transaction that contributed to the total accounts receivable amount calculation.
Due Date	This column displays the due date of the installment amount or due date of the transaction that contributed to the total accounts payable amount calculation.

Item	Description
Terms	This column displays the installment term of the transaction that contributed to the total accounts receivable amount calculation. This column is only available if there is an installment term created for transactions. For more information about creating installments, see the help topic Creating Installments.
Installment Amount (Currency)	This column displays the installment amount that is receivable on the due date specified. This column is only available if there is an installment term created for transactions. For more information about creating installments, see the help topic Creating Installments.
Amount Due (Currency)	This column displays the amount due for a given period for the receivable transaction that contributed to the total accounts receivable calculation. For installment transactions, this column displays the installment amount. If there is no receivable amount due for a given period, this column displays 0.
Transaction Amount (Currency)	This column displays the total receivable transaction amount. The amount is shown in the currency of the selected subsidiary or consolidated subsidiary.
Status	This column displays the status of the transaction that contributed to the total accounts receivable amount calculation. For example: Partially Paid
Close Date	This column displays the close date of the receivable transaction. For example, close date of the invoice.
Foreign Currency Amount	This column displays the transaction amount or installment amount for receivable transactions, in the transaction currency.
Transaction Currency	This column displays the currency of the transaction.

4. (Optional) To view more than 100 transactions, under the Accounts Receivable Details section, click the **Export to** icon and select **CSV** to export the report as a CSV file.

The Accounts Receivable window displays up to 100 recent transactions. Use Export to CSV to view all transactions.

Viewing the Sales Order Details

Click the sales order amount in the Cash Forecast table to open a window that lists all open sales orders included in the amount calculation. You can only click the sales order amount if it is greater than zero.

The row showing amounts from sales orders only appears if the **Include Sales Orders** box is checked on the SuiteApp's Preferences page. For more information, see [Setting Cash 360 Preferences](#).

To view the sales order details:

1. Go to Financial > Cash 360 > Dashboard.
2. On the left pane, click **Cash Forecast** to display the Cash Forecast table.

The default display of the Cash Forecast table is always based on the currently logged-in user's subsidiary. To display the table for another subsidiary, select the subsidiary in the upper right corner of the page.

3. Click the sales order amount.

The Sales Orders window opens and displays the following information:

Item	Description
Account Category	This field displays the account category for the amount. For example, if the amount is from open sales orders, this field displays Sales Orders.
Total Amount	This field displays the total amount from all open sales orders that fall on the date, week, or month specified.
Period	This field displays the period covered for the total sales order amount.
Currency	This field displays the currency of the total sales order amount.
Subsidiary	This column displays the subsidiary of the sales order that contributed to the total sales order amount calculation.
Document Number	This column displays the ID of the sales order that contributed to the total sales order amount calculation. Click the ID to open the sales order record.
Entity	This column displays the entity for the transaction that contributed to the total sales order amount calculation. Entity can be a customer name, vendor name, employee name, or other entities.
Transaction Date	This column displays the transaction date of the sales order that contributed to the total amount calculation.
Forecast Date	This column displays the forecast date for the sales order. The forecast date is calculated as the transaction date plus the order billing lead time for the sales order plus the payment terms if there are any. Forecast date = Transaction date + Order billing lead time + Payment terms The order billing lead time is system-calculated for all sales orders that are fully billed and closed. You can manually enter this value for customers without closed sales orders. For more information, see Viewing the System-Calculated Order Billing Lead Time and Setting Cash 360 Preferences .
Payment Terms	This column displays the payment terms for the sales order. If the payment term is installment, this column displays zero (0). If there is no payment term for the sales order, this column is blank. Only standard payment terms are considered, and not date-driven or installment terms.
Order Billing Lead Time	This column displays the order billing lead time for the sales order. The sales order billing lead time is the time it takes in days for a customer to be billed for goods or services. It can be system-calculated for all fully billed and closed sales orders and displayed in the customer record or manually entered on the Cash 360 Preferences page. For more information, see Viewing the System-Calculated Order Billing Lead Time and Setting Cash 360 Preferences . If the sales order billing lead time is specified in both the customer record and the Cash 360 Preferences page, the value in the customer record takes precedence and is used to calculate forecast dates.
Open Amount (Currency)	This column displays the open amount for the sales order.
Transaction Amount (Currency)	This column displays the transaction amount of the sales order.
Amount Billed (Currency)	This column displays the amount billed for the sales order.
Status	This column displays the status of the sales order. For example: Pending Fulfillment

Item	Description
Open Amount in Foreign Currency	This column displays the open amount for the sales order in foreign currency.
Transaction Currency	This column displays the currency of the sales order transaction.
Transaction Amount in Foreign Currency	This column displays the transaction amount for the sales order in foreign currency.

- (Optional) To view more than 100 transactions, under the Details of Sales Orders section, click the **Export to** icon and select **CSV** to export the report as a CSV file.

The Sales Orders window displays up to 100 recent transactions. Use Export to CSV to view all transactions.

Viewing the Accounts Payable Details

Click the accounts payable amount in the Cash Forecast table to open a window that lists all accounts included in the accounts payable amount calculation. You can only click the accounts payable amount if it is greater than zero.

To view the accounts payable details:

- Go to Financial > Cash 360 > Dashboard.
- On the left pane, click **Cash Forecast** to display the Cash Forecast table.

The default display of the Cash Forecast table is always based on the currently logged-in user's subsidiary. To display the table for another subsidiary, select the subsidiary in the upper right corner of the page.

- Click the accounts payable amount.

The Accounts Payable window opens and displays the following information:

Item	Description
Account Category	This field displays the account category for the amount. For example, if the amount is an accounts payable amount, this field displays Accounts Payable.
Total Amount	This field displays the total accounts payable amount that fall on the date, week, or month specified.
Period	This field displays the period covered for the total accounts payable amount.
Currency	This field displays the currency of the total accounts payable amount.
Subsidiary	This column displays the subsidiary of the transaction that contributed to the total accounts payable amount calculation.
Transaction Number	This column displays the ID of the transaction that contributed to the total accounts payable amount calculation. Click the transaction ID to open the transaction record.
Transaction Type	This column displays the type of transaction that contributed to the total accounts payable amount calculation. For example: Bill Payment
Entity	This column displays the entity for the transaction that contributed to the total accounts payable amount calculation.

Item	Description
	Entity can be a customer name, vendor name, employee name, or other entities.
Transaction Date	This column displays the date of the transaction that contributed to the total accounts payable amount calculation.
Due Date	This column displays the due date of the installment amount or due date of the transaction that contributed to the total accounts payable amount calculation.
Terms	This column displays the installment term of the transaction that contributed to the total accounts payable amount calculation. This column is only available if there is an installment term created for the transaction. For more information about creating installments, see the help topic Creating Installments.
Installment Amount (Currency)	This column displays the installment amount that is payable for a given period. This column is only available if there is an installment term created for the transaction. For more information about creating installments, see the help topic Creating Installments.
Amount Due (Currency)	This column displays the amount due for a given period for the payable transaction that contributed to the total accounts payable calculation. For installment transactions, this column displays the installment amount. If there is no payable amount due for a given period, this column displays 0.
Transaction Amount (Currency)	This column displays the total payable transaction amount. The amount is shown in the currency of the selected subsidiary or consolidated subsidiary.
Status	This column displays the status of the transaction that contributed to the total accounts payable amount calculation. For example: Partially Paid
Close Date	This column displays the close date of the payable transaction. For example, close date of the bill payment.
Foreign Currency Amount	This column displays the transaction amount or installment amount for payable transactions, in the transaction currency.
Transaction Currency	This column displays the currency of the transaction.

4. (Optional) To view more than 100 transactions, under the Accounts Payable Details section, click the **Export to** icon and select **CSV** to export the report as a CSV file.

The Accounts Payable window displays up to 100 recent transactions. Use Export to CSV to view all transactions.

Viewing the Purchase Orders Details

Click the purchase order amount in the Cash Forecast table to open a window that lists all open purchase orders included in the amount calculation. You can only click the purchase order amount if it is greater than zero.

The row showing amounts from purchase orders only appears if the **Include Purchase Orders** box is checked on the SuiteApp's Preferences page. For more information, see [Setting Cash 360 Preferences](#).

To view the purchase order details:

1. Go to Financial > Cash 360 > Dashboard.

2. On the left pane, click **Cash Forecast** to display the Cash Forecast table.

The default display of the Cash Forecast table is always based on the currently logged-in user's subsidiary. To display the table for another subsidiary, select the subsidiary in the upper right corner of the page.

3. Click the purchase order amount.

The Purchase Orders window opens and displays the following information:

Item	Description
Account Category	This field displays the account category for the amount. For example, if the amount is from open purchase orders, this field displays Purchase Orders.
Total Amount	This field displays the total amount from all open purchase orders that fall on the date, week, or month specified.
Period	This field displays the period covered for the total purchase order amount.
Currency	This field displays the currency of the total purchase order amount.
Subsidiary	This column displays the subsidiary of the purchase order that contributed to the total purchase order amount calculation.
Document Number	This column displays the ID of the purchase order that contributed to the total purchase order amount calculation. Click the ID to open the purchase order record.
Entity	This column displays the entity for the transaction that contributed to the total purchase order amount calculation. Entity can be a customer name, vendor name, employee name, or other entities.
Transaction Date	This column displays the transaction date of the purchase order that contributed to the total amount calculation.
Forecast Date	This column displays the forecast date for the purchase order. The forecast date is calculated as the transaction date plus the order billing lead time for the purchase order plus the payment terms if there are any. Forecast date = Transaction date + Order billing lead time + Payment terms The order billing lead time is system-calculated for all purchase orders that are fully billed and closed. You can manually enter this value for vendors without closed purchase orders. For more information, see Viewing the System-Calculated Order Billing Lead Time and Setting Cash 360 Preferences .
Payment Terms	This column displays the payment terms for the purchase order. If the payment term is installment, this column displays zero (0). If there is no payment term for the purchase order, this column is blank. Only standard payment terms are considered, and not date-driven or installment terms.
Order Billing Lead Time	This column displays the order billing lead time for the purchase order. The purchase order billing lead time is the time it takes in days for a vendor to be billed for goods or services. It can be system-calculated for all fully billed and closed purchase orders and displayed in the vendor record or manually entered in the Cash 360 Preferences page. For more information, see Viewing the System-Calculated Order Billing Lead Time and Setting Cash 360 Preferences . If the purchase order billing lead time is specified in both the vendor record and the Cash 360 Preferences page, the value in the vendor record takes precedence and is used to calculate forecast dates.
Open Amount (Currency)	This column displays the open amount for the purchase order.

Item	Description
Transaction Amount (Currency)	This column displays the transaction amount of the purchase order.
Amount Billed (Currency)	This column displays the amount billed for the purchase order.
Status	This column displays the status of the purchase order. For example: Pending Receipt
Open Amount in Foreign Currency	This column displays the open amount for the purchase order in foreign currency.
Transaction Currency	This column displays the currency of the purchase order transaction.
Transaction Amount in Foreign Currency	This column displays the transaction amount for the purchase order in foreign currency.

4. (Optional) To view more than 100 transactions, under the Details of Purchase Order section, click the **Export to** icon and select **CSV** to export the report as a CSV file.

The Purchase Orders window displays up to 100 recent transactions. Use Export to CSV to view all transactions.

Cash 360 Dashboard

Note: An administrator must give access to roles that will use the Cash 360 SuiteApp. When access is not given, the role has no permission to access the Cash 360 dashboard. For more information, see [Giving a Role Access to Cash 360](#).

If you are an Administrator, access the Cash 360 dashboard by going to Customization > Scripting > Single Page Applications. Click the icon next to the Cash 360 name to open the dashboard.

The Cash 360 dashboard lets you quickly view the total receivables, total payables, total bank balance, and cash forecasts for your company. This dashboard also has links where you can access records, transactions, and reports. Aging summary pie charts are also available for accounts receivables and accounts payables.

All posting transactions that affect the accounts receivable and accounts payable, including installment transactions, are considered when displaying values in the Cash 360 tiles and in A/R and A/P aging summary pie charts.

The default display on Cash 360 dashboard is always based on the currently logged-in user's subsidiary. To display data on the dashboard for another subsidiary, select the subsidiary in the upper right corner of the page.

Note: Memorized transactions are not supported.

Read the following topics to know more about the dashboard.

- [Accessing Reports, Records, and Transactions From the Cash 360 Dashboard](#)
- [Viewing the Cash Position](#)
- [Viewing the Cash Forecast From the Cash 360 Dashboard](#)
- [Viewing the A/R and A/P Aging Summary From the Cash 360 Dashboard](#)

Accessing Reports, Records, and Transactions From the Cash 360 Dashboard

Note: An administrator must give access to roles that will use the Cash 360 SuiteApp. When access is not given, the role has no permission to view the Cash 360 dashboard. For more information, see [Giving a Role Access to Cash 360](#).

If you are an Administrator, access the Cash 360 dashboard by going to Customization > Scripting > Single Page Applications. Click the icon next to the Cash 360 name to open the dashboard.

The Actions portlet is available on the Cash 360 dashboard to let you access relevant Cash 360 records, reports, and transactions in one place.

To access reports, records, and transactions from the Cash 360 dashboard:

1. Go to Financial > Cash 360 > Dashboard.
2. In the **Actions** portlet, select from the following actions:

Action	Description
View Invoices	View a list of all invoices in the system or in your subsidiary.
Approve Invoices	View a list of all invoices that need approval. To approve invoices, an administrator must enable features. For more information, see Cash 360 Prerequisites .
View Bills	View a list of all vendor bills in the system or in your subsidiary.
View A/P Aging Summary	View the A/P aging report in the system or for your subsidiary.
View A/R Aging Summary	View the A/R aging report in the system or for your subsidiary.
View Account Categories	View a list of all the account categories in the Cash 360 SuiteApp.

Viewing the Cash Position

The Cash 360 dashboard has a tiles portlet that immediately lets you know your company's cash position. Cash position such as the bank balance for the current posting period, total payables, and total receivables for the selected subsidiary or consolidated subsidiary as of the current date are available as tiles in the Cash 360 dashboard.

To view the cash position:

1. Go to Financial > Cash 360 > Dashboard.

Note: An administrator must give access to roles that will use the Cash 360 SuiteApp. When access is not given, the role has no permission to view the Cash 360 dashboard. For more information, see [Giving a Role Access to Cash 360](#).

If you are an Administrator, access the Cash 360 dashboard by going to Customization > Scripting > Single Page Applications. Click the icon next to the Cash 360 name to open the dashboard.

Go to the upper right corner of the dashboard to view the cash position. The total balance in your bank account (except for excluded bank accounts) up to the current posting period, the total receivable amount, and the total payable amount for your company in the currency of the

selected subsidiary or consolidated subsidiary are displayed as tiles in the dashboard. All posting transactions that affect the accounts receivable and accounts payable, including installment transactions, are considered when displaying values in the tiles. For more information about excluding bank accounts from Cash 360 calculations, see [Excluding Bank Accounts from Cash 360 Calculations](#).

The total payable and receivable amounts are from the A/P and A/R Aging Summary reports.

Note: If an error occurs while retrieving the total bank balance, total receivable amount, or the total payable amount for your company, **Request Timed Out** is displayed in the tiles. Contact NetSuite Customer Support for assistance.

Viewing the Cash Forecast From the Cash 360 Dashboard

The Cash Forecast portlet is available on the Cash 360 dashboard to let you view the cash forecast line graph and table. The values in this portlet are based on the Cash Forecast table and from the preferences set for this SuiteApp. For more information, see [Cash Forecasts in Cash 360](#) and [Setting Cash 360 Preferences](#).

To view the cash forecast from the Cash 360 dashboard:

1. Go to Financial > Cash 360 > Dashboard.

Note: An administrator must give access to roles that will use the Cash 360 SuiteApp. When access is not given, the role has no permission to view the Cash 360 dashboard. For more information, see [Giving a Role Access to Cash 360](#).

If you are an Administrator, access the Cash 360 dashboard by going to Customization > Scripting > Single Page Applications. Click the icon next to the Cash 360 name to open the dashboard.

The Cash Forecast portlet displays a line graph and a cash forecast table with the following information.

Portlet Element	Description
Line graph	Data on the line graph are based on the forecast table in the Cash Forecast portlet. The cash forecast is displayed in the y-axis and is shown in the currency of the selected subsidiary or consolidated subsidiary. The period for the cash forecast is shown on the x-axis. The period varies from days, weeks, or months, depending on the preferences set for the SuiteApp. Points in the line graph show the forecast amount for a given period. The cash forecast is calculated as the opening balance amount, plus the total undeposited/future-period funds, plus the total inflow amount, minus the total outflow amount. Cash Forecast = Opening balance + Undeposited/Future-period funds + Total forecast inflow amount – Total forecast outflow amount
Cash forecast table	Data in this table are condensed and based on the Cash Forecast table. For more information, see Cash Forecasts in Cash 360. This condensed table shows the period as specified in the Preferences page of this SuiteApp. This table displays the total inflow and outflow amounts, as well as the cash forecast for the given period. The cash forecast is calculated as the opening balance amount, plus the undeposited/future-period funds, plus the total inflow amount, minus the total outflow amount.

Portlet Element	Description
	Cash Forecast = Opening balance + Undeposited/Future-period funds + Total forecast inflow amount – Total forecast outflow amount Installment amounts are included in the calculation of forecast inflow or outflow amounts.

Note: If an error occurs while retrieving values in the Cash Forecast portlet, **Request Timed Out** is displayed in the portlet. Contact NetSuite Customer Support for assistance.

Viewing the A/R and A/P Aging Summary From the Cash 360 Dashboard

The A/R Aging Summary and A/P Aging Summary portlets are available on the Cash 360 dashboard. These portlets display A/R and A/P aging reports in a pie chart. All posting transactions that affect the accounts receivable and accounts payable, including installment transactions, are considered when displaying values in the A/R and A/P aging summary pie charts.

To view the A/R and A/P aging summary from the Cash 360 dashboard:

1. Go to Financial > Cash 360 > Dashboard.

Note: An administrator must give access to roles that will use the Cash 360 SuiteApp. When access is not given, the role has no permission to view the Cash 360 dashboard. For more information, see [Giving a Role Access to Cash 360](#).

If you are an Administrator, access the Cash 360 dashboard by going to Customization > Scripting > Single Page Applications. Click the icon next to the Cash 360 name to open the dashboard.

The A/R Aging Summary and A/P Aging Summary portlets on the lower part of the dashboard displays the following information.

Portlet	Item	Description
A/R Aging Summary	Total Amount	This field displays the total amount of receivables in the currency of the selected subsidiary or consolidated subsidiary. The total receivable amount is based on the A/R Aging Summary report.
	# of Transactions	This field displays the total number of receivable transactions with customer information.
	Transactions w/o Customers	This field displays the total number of receivable transactions without customer information.
	Customers	This field displays the total number of customers with receivable transactions.
	Current	This portion of the pie chart represents receivable transactions that are not overdue.
	1–30 Days	This portion of the pie chart represents receivable transactions that are overdue by 1–30 days.
	31–60 Days	This portion of the pie chart represents receivable transactions that are overdue by 31–60 days.

Portlet	Item	Description
A/P Aging Summary	61–90 Days	This portion of the pie chart represents receivable transactions that are overdue by 61–90 days.
	90+ Days	This portion of the pie chart represents receivable transactions that are overdue by more than 90 days.
	Total Amount	This field displays the total amount of payables in the currency of the selected subsidiary or consolidated subsidiary. The total payable amount is based on the A/P Aging Summary report.
	# of Transactions	This field displays the total number of payable transactions with vendor information.
	Transactions w/o Vendors	This field displays the total number of payable transactions without vendor information.
	Vendors	This field displays the total number of vendors with payable transactions.
	Current	This portion of the pie chart represents payable transactions that are not overdue.
	1–30 Days	This portion of the pie chart represents payable transactions that are overdue by 1–30 days.
	31–60 Days	This portion of the pie chart represents payable transactions that are overdue by 31–60 days.
	61–90 Days	This portion of the pie chart represents payable transactions that are overdue by 61–90 days.
	90+ Days	This portion of the pie chart represents payable transactions that are overdue by more than 90 days.

Note: If an error occurs while retrieving the values in the A/R Aging Summary and A/P Aging Summary portlets, an em dash (—) is displayed. Contact NetSuite Customer Support for assistance.

Cash 360 Limitations

- You can only add a maximum of 1000 chart of accounts for a single category. For more information, see [Adding Cash 360 Account Categories](#).
- The SuiteApp supports up to one million transactions. If your NetSuite account exceeds this limit, forecasts may not display properly in the Cash 360 dashboard.
- Additional values that are included in the cash forecast are shared across users within the same subsidiary. For more information about additional values, see [Setting Cash 360 Preferences](#).
- In the inclusion of sales orders in the cash forecasts, only sales orders without billing schedules, installments, or subscriptions are considered. Also, only standard payment terms are included; date-driven and installment payment terms are excluded.
- In the inclusion of purchase orders in the cash forecasts, only purchase orders without billing schedules, installments, or subscriptions are considered. Also, only standard payment terms are included; date-driven and installment payment terms are excluded.
- The Opening Balance, Undeposited/Future-Period Funds, Accounts Receivable, Sales Orders, Accounts Payable, and Purchase Orders windows can only display the 100 most recent transactions. To view more than 100 transactions, you can use the Export to CSV function.

- When exporting records through CSV for the Opening Balance, Undeposited/Future-Period Funds, Accounts Receivable, Sales Orders, Accounts Payable, Purchase Orders windows, there is a limit of 40,000 rows and a maximum file size of 10MB. It may take a while to export transactions that reach the transaction number limit or file size limit.
- The navigation menus for the Cash 360 dashboard and Account Categories are only available in English.
- You can access the Cash 360 SuiteApp only if your subsidiary is active.

Payment Automation SuiteApp

The Payment Automation SuiteApp lets you automate all your vendor payments from within NetSuite, and pay your suppliers by checks, virtual cards, and ACH.

Benefits of the Payment Automation SuiteApp:

1. **Enjoy one integrated solution**
 - Manage your AP processes in your NetSuite account
 - Better control of outgoing cash flows
 - Easily scale end-to-end AP processes
2. **Save time and money**
 - Cut back on manual processing time
 - Replace manual data entry
 - Streamline AP processes
3. **Improve working capital with Virtual Card payments**
 - Optimize cash flow by making payments through extended credit
 - Earn 1% cash back on all eligible Virtual Card spend
4. **Reduce fraud and human error**
 - Define and apply strict rules and approval workflows
 - Helps you catch fraudulent invoices before they are paid
 - Avoid sharing sensitive financial data with suppliers
5. **Improve visibility and control**
 - Monitor, track, and analyze each stage of the AP process
 - Gain insights to make better decisions
6. **Automate reconciliation processes and reduce errors**
 - Eliminate error-prone manual reconciliation
 - Enable a faster financial close

Read the following topics to learn more about the Payment Automation SuiteApp:

- [Overview](#)
- [Setting Up Payment Automation](#)
- [Making Money Transfers](#)
- [Processing Payments](#)
- [Statements and Reconciliation](#)
- [Frequently Asked Questions about Payment Automation](#)

Overview

Payment Automation is a powerful combination of technology automation provided by NetSuite and banking services provided by HSBC for capturing and paying vendor bills.

Payment Automation is a part of the AP Automation paid module. For information about enabling Payment Automation, contact your account representative.

The Payment Automation SuiteApp is available on the Marketplace, and it's free to download. For more information, see the help topic [Installing from the SuiteApp Marketplace](#).

Note: Provisioning from Bill team is not needed to install the SuiteApp.

For an overview of transaction charges associated with using Payment Automation, see [HSBC Processing Fees](#).

Payment Automation provides the following benefits:

- Time savings – process vendor payments faster. You can stay in NetSuite and don't have to use another application to enter payments details and process payments.
- Increased transparency – track payment status through payment processing stages.
- Early payment discounts – use different payment options to simplify the process of paying suppliers. For financial savings, take advantage of early payment discounts offered by suppliers.
- Increase supplier satisfaction – automate payment results to achieve faster payment processing cycles. Your suppliers get paid promptly, which helps build strong relationships.
- Extended payment terms – with virtual cards, you can extend the credit terms for up to 55 days depending on when payments are processed in the billing cycle. For more information, see [Virtual Card Billing Cycle](#).

Key Features

Payment Automation Dashboard

Get a complete overview of all bank and virtual card activity, and see the real-time account balances. Your company gains unprecedented visibility and control of your bank accounts and Virtual Cards.

Set up and manage account details, monitor the status of vendor payments, review transaction history, and keep track of current balances with daily and real-time updates.

Access the current bank balance, monthly statements, transaction history, payment status, and other account details.

Track the status of your payments. The payment status is continuously updated. For more information about payment statuses, see [Overview of Payment Statuses](#).

For more information, see [Payment Automation Dashboard](#).

Multiple Payment Options

You can pay your vendors with electronic payment (Automated Clearing House (ACH)), virtual card, and check. The vendor must accept these payment methods and the payment methods must be set up on the vendor record.

For information about onboarding vendors to use with Payment Automation, see [Setting Up Vendors](#).

For information about supported modes of payment, see [Payment Options](#).

Automated End-to-End Workflow

Payment Automation saves you time and effort by reconciling HSBC bank and Virtual Card accounts with NetSuite.

Bank and card data are automatically imported and matched daily, which simplifies the traditional tedious task of reconciling bank and Virtual Card statements. Payment Automation handles daily bank downloads, and automatically matches transactions to bank account details. Discrepancies are flagged for further review.

You can download monthly statements for your review within NetSuite. For more information, see the following topics:

- [Statements and Reconciliation](#)
- [Statement and Auto-Debit Payment Schedules](#)
- [Transaction Fees Statement Schedule](#)

Multi-Subsidiary Support

The Payment Automation SuiteApp supports multiple subsidiaries. OneWorld users with multiple US subsidiaries can apply for HSBC accounts in each US subsidiary and can process payments from each US subsidiary.

For more information, see [Multi-Subsidiary Support](#).

Payment Automation Current Limitations

- Only companies located in the United States can use Payment Automation to pay suppliers in the United States.
- Multi-Subsidiary support is limited to US operations.
- The only supported currency is USD.
- You can manage the HSBC Online Account only from the NetSuite platform. Services outside of the NetSuite platform, such as branch services, and deposits of checks and cash, are unauthorized and HSBC is not liable for such transactions.
- You can't import bill payments by CSV.
- You can't edit vendors using Web Services or SuiteScript.
- You can't select more than 400 bills for payment at a time.
- If issued cards are not used, then they are not reflected in the calculation of available balance and outstanding cards. The cards are not displayed in the statements.
- You can't use multiple source accounts to auto-fund the HSBC Online Account at the same time.
- Payment Automation isn't compatible with sandbox accounts. Do not install the Payment Automation SuiteApp on a sandbox account because the SuiteApp is directly integrated with an HSBC production account.
- You can't enter more than 140 characters in the Memo field on the bill payment record.
- Bulk payment processing doesn't support selection of classification fields such as Department, Class and Location.
- Expense reports and customer refunds aren't supported.
- The Auto Place Decimal preference isn't supported. Go to Home > Set Preferences > General. In the **Formatting** subtab, make sure the **Auto Place Decimal** box is cleared. Enabling this preference may cause unwanted updates to transaction amounts calculated during money transfer requests in payment processing.
- Bulk bill payment processing and batch payment approval support up to 5000 bills and are limited to 400 bills per vendor.

Payment Automation Dashboard

You must install the Payment Automation SuiteApp before you can access the Payment Automation dashboard. For instructions, see [Installing the Payment Automation SuiteApp](#).

For more information about accessing a subsidiary account or switching between subsidiaries accounts, see [Switching Dashboards Between Subsidiaries](#).

Overview page

- The HSBC Online Account portlet shows the current account balance, account number, routing number, the daily transaction limit, and the remaining daily transaction limit. For more information, see [HSBC Online Account Portlet](#).
- The HSBC Virtual Card portlet shows the current account balance, account ID, total credit limit, unsettled amount and the scheduled payment date. For more information, see [HSBC Virtual Card Portlet](#).
- The Payments portlet shows the amounts that have been approved and paid to vendors each month through ACH, checks, and by virtual cards.
- The Payables portlet displays the open balance of bills to be paid, and the amount due this week and next week. When applicable, a highlighted overdue amount line is displayed. The Payables portlet displays the payable balance of vendors that were flagged for Payment Automation.
- The Reminder portlet gives you an overview of:
 - Payments pending for approval if vendor payment approval routing is enabled.
 - Canceled payments.
 - Virtual cards expiring in seven days or fewer.

Navigation pane

In the navigation pane on the left side of the dashboard:

- To submit a bulk bill for payment processing, click **Bills**. For instructions, see [Processing Payments](#).
- For an overview of your payments and their current status, click **Payments**.
- To determine the status of your issued virtual cards, click **Cards**.
- For a list of eligible vendors, vendors requiring approval, and SuiteBanking vendors, click **Vendors**.

Note: You can search for payments using the check number on the Payments page of the dashboard.

HSBC Online Account Portlet

The HSBC Online Account portlet shows the current account balance, account number, routing number, the daily transaction limit, and the remaining daily transaction limit.

Click **Account Details** in the portlet or **Bank Accounts** on the navigation pane to:

- Set up auto-funding. For instructions, see [Auto-Funding](#).
- Match bank data. For instructions, see [Statements and Reconciliation](#).
- Download monthly statements and invoices, see [Statements and Reconciliation](#).
- View the account registry, see [Account Registry for HSBC Online Account](#).

Account Registry for HSBC Online Account

The account registry displays all the posted transactions for the bank account. It provides a comprehensive view of account activities, cash flow movement and current status of payments similar to

account registry of GL. The transactions will include adding money, withdrawing money, payments, auto funding, and reversed payments.

The Account Registry is represented as <GL Name> + <Register Number>.

You can use the quick search and date filters to display specific transactions. The following information is available for a transaction:

- Date
- Number
- Type
- Payee
- Memo
- Status
- Payment
- Deposit
- Balance

You can export the payments into CSV from the Dashboard by clicking the **Export CSV** button.

 **Note:** Go to Home > Set Preferences > General. In the **Formatting** subtab, you can change the **Date Format** and the **Time Format**.

HSBC Virtual Card Portlet

The HSBC Virtual Card portlet shows the current account balance, account ID, total credit limit, unsettled amount and the scheduled payment date. Unsettled amount is the sum of issued cards that have not been used yet.

Click **Card Details** in the portlet or **Cards** on the navigation pane to:

- Match bank data. For instructions, see [Statements and Reconciliation](#).
- Access a list of all issued virtual cards and statements. For more information, see [To download a virtual card statement:](#).
- View the account registry. For more information, see [Account Registry for HSBC Virtual Card](#).

Account Registry for HSBC Virtual Card

The account registry displays all the posted transactions for the virtual card. It provides a comprehensive view of account activities, cash flow movement and current status of payments similar to account registry of GL. The transactions will include adding money, withdrawing money, payments, auto funding, and reversed payments.

The Account Registry is represented as <GL Name> + <Register Number>.

You can use the quick search and date filters to display specific transactions. The following information is available for a transaction:

- Date
- Number
- Type

- Payee
- Memo
- Status
- Charge
- Credit
- Balance

You can export the payments into CSV from the Dashboard by clicking the **Export CSV** button.

Note: Go to Home > Set Preferences > General. In the **Formatting** subtab, you can change the **Date Format** and the **Time Format**.

Payment Options

Payment Automation supports the following modes of payments:

- [ACH](#)
- [Virtual Card](#)
- [Check](#)

ACH

Connect your HSBC Online Account to your source bank account, and payment funding will be transferred automatically through ACH direct debit.

ACH payments are deducted from your HSBC Online Account and deposited directly to the vendor's bank account.

Total value of ACH and check payments in a given day may be transacted up to the daily ACH limit. HSBC communicates the daily ACH limit to you after your onboarding is successfully completed. You can see your ACH limit in the HSBC Online Account portlet on the Payment Automation dashboard.

Payments are submitted in batches and typically take three business days to settle.

The ACH batch cut-off time is 8 pm Eastern Time. Payments initiated after 8 pm Eastern Time will be sent at 5 am the next business day.

Virtual Card

After a payment request, a single-use virtual card is generated from the HSBC virtual card account within 15 minutes after being sent for processing. Then, the vendor uses the virtual card number to pay the bills. With the virtual card mode of payment, your HSBC virtual card account is automatically updated and debited to reflect the payment.

The 16-digit virtual card number required to process a payment is communicated to the vendor in the remittance email that is automatically generated. For details, see [Reviewing Remittance Email](#). For more information, see [Setting Up Vendors](#).

A virtual card expires after 30 days. The vendor will receive an automatic email reminder after 7, 14, and 21 days. If a virtual card expires, you'll receive an email notification, a cancellation email, and the payment will be voided.

You can have up to 55 days to repay the virtual card depending on when payments are processed in the billing cycle. For more information, see [Virtual Card Billing Cycle](#).

Annual Virtual Card Statement Credit

On your one-year anniversary, you'll receive back 1% of the amount of eligible virtual card posted transactions from that period.

The annual statement credit has no upper limit. Transactions that were returned or reported as fraudulent are not eligible.

The balance is accumulated for 12 months. On your one-year anniversary, the credit appears on your virtual card statement.

You can:

- use the credit to reduce your virtual card balance for the current month.
- contact virtual card customer support at 1-800-411-9264 to request a transfer of your credit to your HSBC Online Account.

Check

Connect your HSBC Online Account to your source bank account and payment funding will be transferred automatically through ACH direct debit. Total value of ACH and check payments in a given day may be transacted up to the daily ACH limit.

Use this mode of payment to pay your vendors by check. HSBC will print and mail the physical checks from their Jacksonville, FL facility. Checks are sent to your vendors through USPS First Class Mail service.

HSBC check payments are on standard check stock and don't include your logo or digitized signature.

Note: Checks don't include printed remittance information. The remittance notifications are sent using email. For more information, see [Reviewing Remittance Email](#)

Check payments submitted by 8 pm Eastern Time will be printed and mailed on the second business day.

Payment Batch Cut-Off Times Overview

Payments are sent for processing every hour on the hour. A payment has the For Submission status until the payment is sent to the payment processor.

Note: If a timeout error occurs during payment submission to payment processor, the transaction is removed from the current batch and processed in the next batch.

The table in this section provides an overview of the payment batch cut-off times in the Eastern Time Zone (ET) for each mode of payment.

This cut-off time refers to the latest time you can submit and, if applicable, authorize a payment on the Payment Automation dashboard for processing on that same day.

ACH and check payments submitted and authorized after the cut-off time will be processed at 5 am the next business day. A business day is any day except Saturday, Sunday or a US federal holiday observed by the Federal Reserve Banks. A list of Federal Reserve holidays can be accessed on [Federal Reserve Board - Holidays Observed - K.8](#). Payments are deducted from the daily ACH limit for the day in which they are processed.

Transaction Type	NetSuite Last Batch Included (ET)
Check	8:00 pm
ACH	8:00 pm

Virtual card processing is available at all times.

Transaction Settlement

Before you make any payments, you must set up auto-funding. Auto-funding is required to automatically fund the HSBC Online Account and settle your monthly HSBC transaction processing fees statement and virtual card bill.

After you set up your auto-funding account, funds are automatically pulled from your source bank account prior to the date the payments are made to the payees, so funds availability is ensured.

For more information about transaction settlement with auto-funding, see [Funding Cycle](#).

HSBC Processing Fees

For information about ACH processing fees and check processing fees, check the 'HSBC Terms and Charges' section within the Oracle NetSuite Platform HSBC Terms PDF file provided by HSBC [Embedded Banking Useful Documents and Links](#).

No fee is associated with virtual card payments.

For information about what happens in case of insufficient funds in the HSBC Online Account and how funds move after a payment is submitted, see [Auto-Funding](#).

For billing schedules, see [Statement and Auto-Debit Payment Schedules](#).

Virtual Card Billing Cycle

The following figure illustrates how credit terms with virtual cards can be extended for up to 55 days, depending on when payments are processed.

You can't make changes to the billing cycle.

Debit Blocking

Your HSBC Online Account is automatically configured to block ACH debits initiated by parties other than you and HSBC.

An additional security feature to your HSBC Online Account allows certain transactions such as:

- automatic debits for the amount due on your virtual card billing statement. For more information, see [Virtual Card Statement Schedule](#) and [Virtual Card Billing Cycle](#).
- automatic debits for the amount due for processing fees. For more information, see [Transaction Fees Statement Schedule](#).
- any returns of the auto-funding requests to your source bank account.
- any system debits initiated by HSBC to correct processing errors or make other adjustments.

Multi-Subsidiary Support

The Payment Automation SuiteApp supports multiple subsidiaries. OneWorld users with multiple US subsidiaries can apply for HSBC accounts in each US subsidiary and can process payments from each US subsidiary.

In your NetSuite One World Account, go to SuiteBanking > HSBC Application > Apply > New Application and select the subsidiary to apply for HSBC Online Account. For more information, see [Applying for an HSBC Online Account](#).

You'll need to perform the following actions for all subsidiaries at the NetSuite level:

- [Generating Payment Tokens](#)
- [GUID Setup](#)

You'll need to perform the following actions separately for each subsidiary:

- [Auto-Funding](#)
- [Setting Up Vendors](#)
- [Setting Up Vendor Payment Approval Routing](#)
- [Setting Up Batch Approval Routing](#)
- [Setting Up Two-Factor Authentication \(2FA\)](#)
- [Setting Up Roles and Permissions](#)
- [Setting up a Custom Role to Make Money Transfers](#)
- [Setting Default Department, Class, and Location Values](#)
- [Setting Email Preference](#)
- [Setting Default Bank Fees Account](#)

Switching Dashboards Between Subsidiaries

To access a subsidiary account or switch between subsidiaries accounts, go to SuiteBanking > Payment Automation > Dashboard. You can change the subsidiary from the drop-down list in the left navigation panel, if you have the required permissions to view it. For more information, see [Payment Automation Dashboard](#).

Customer Off-boarding

If your company decides to off-board and close their account at HSBC, you need to submit a request by contacting the NetSuite Support team. Upon receipt of the request, you may be contacted by HSBC by email for additional information, documentation, or both.

If you uninstall the SuiteApp, all saved data will be lost. In a multi-subsidiary account, if one subsidiary wants to off-board, the SuiteApp should not be uninstalled because the other active subsidiaries still need to initiate payments. An administrator has the ability to remove access for roles (such as AP Payment Clerk, AP Payment Manager, Vendor Master Clerk, or Vendor Master Approver) for users who are off-boarding.

Uninstalling the Payment Automation SuiteApp

 **Note:** If you uninstall the SuiteApp, all saved data will be lost.

If you're uninstalling the Payment Automation SuiteApp, take the following information into consideration:

- Format profiles enable you to configure settings necessary for manual or automatic import of financial institution data. You can use the format profiles created from the Payment Automation SuiteApp to import data from HSBC to NetSuite. You can create a format profile record to link your HSBC and NetSuite accounts and trigger the data import for reconciliation. For more information about a format profile, see the help topic [Format Profile](#). Format profiles created from the Payment Automation SuiteApp can access HSBC account data even after you uninstall the Payment Automation SuiteApp. After uninstalling the SuiteApp, the format profile record is stored in your NetSuite account and you cannot import transactions from HSBC to NetSuite.

- Your GL Bank Accounts will still be accessible, but fields related to Payment Automation will be removed.
- Audit trail records will be deleted. The audit trail record is a Payment Automation custom record that is not referenced by any other records.

To uninstall the Payment Automation SuiteApp:

1. Go to Customization > SuiteCloud Development > Installed SuiteApp List.
2. On the line with the com.netsuite.paymentautomation App ID, click **Uninstall** in the **Action** column.

Terms and Conditions

To learn how your personal and other information is treated, and about your rights regarding this information, read the HSBC Embedded Banking Privacy Notice and HSBC terms and conditions.

The NetSuite platform is subject to Oracle NetSuite terms and conditions.

HSBC and NetSuite have agreed to provide HSBC banking services and products on the NetSuite platform. You'll pay fees for banking services directly to HSBC. For more information, see [HSBC Processing Fees](#).

Customer Support

Contact NetSuite Customer Support with any inquiries regarding Payment Automation, with the exception of virtual cards.

If needed, NetSuite Customer Support will pass the inquiry to HSBC for resolution of banking issues.

Contact Virtual Card Customer Support available 24/7 at 1-800-411-9264 with any queries regarding Virtual Card payments.

HSBC offices and HSBC help lines **cannot** provide assistance with Payment Automation issues.

Payment Automation SuiteApp Maintenance Schedule

You can see scheduled and past outages for the Payment Automation SuiteApp from the [Payment Automation SuiteApp Maintenance Schedule](#). Upcoming Payment Automation outages are also included in SuiteAnswers announcements.

Payment Automation SuiteApp Videos

For an overview of the videos available for the Payment Automation SuiteApp, see [Payment Automation Videos](#).

Setting Up Payment Automation

To set up Payment Automation, follow the instructions in the following sections:

- [Installing the Payment Automation SuiteApp](#)

- [License Validation](#)
- [Multi-Subsidiary Support](#)
- [Applying for an HSBC Online Account](#)
- [Generating Payment Tokens](#)
- [Setting Up Auto-Funding](#)
- [Setting Up Vendors](#)
- [Setting Up Vendor Payment Approval Routing](#)
- [Setting Up Batch Approval Routing](#)
- [Setting Up Two-Factor Authentication \(2FA\)](#)
- [Setting Up Roles and Permissions](#)
- [Setting up a Custom Role to Make Money Transfers](#)
- [Setting Default Department, Class, and Location Values](#)
- [Setting Email Preference](#)
- [Setting Default Bank Fees Account](#)

Installing the Payment Automation SuiteApp

The Payment Automation SuiteApp is available on the Marketplace, and it's free to download. For more information, see the help topic [Installing from the SuiteApp Marketplace](#).

Note: Provisioning from Bill team is not needed to install the SuiteApp.

The Payment Automation SuiteApp is a managed SuiteApp and is upgraded automatically.

Before you install the Payment Automation SuiteApp, enable the following features:

- [A/P](#)
- [Accounting Period](#)
- [Custom Records](#)
- [Client SuiteScript](#)
- [SDF](#)
- [Server SuiteScript](#)
- [SuiteFlow](#)
- [Advanced PDF/HTML Templates](#)

After you install the Payment Automation SuiteApp:

1. Assign the respective roles to the users. For more information, see [Setting Up Roles and Permissions](#).
2. Apply for an HSBC Online account. For more information, see [Setting Up Payment Automation](#).
3. Once the account is approved, generate the Payment Tokens. For more information, see [Generating Payment Tokens](#)
4. Set up source bank account. For more information, see [Setting Up Auto-Funding](#).
5. Generate the GUID in step 4.
6. Onboard the vendors. For more information, see [Setting Up Vendors](#).
7. Verify the vendor bank account if the account number is imported correctly or not.

 **Note:** To avoid payment failures, onboard vendors after generating the GUID and the payment tokens. Follow the setup steps in the given sequence.

License Validation

Payment Automation SuiteApp validates your **AP Automation** license and access to payment automation features.

To use the features of the SuiteApp, you need to purchase the AP Automation license and download the **NetSuite SuiteApps License Client**. The License Client will validate the latest AP Automation license information. If no valid license exists for your company, you will need to purchase a license to use the Payment Automation SuiteApp.

 **Note:** Provisioning from Bill team is not needed to install the SuiteApp.

If you have a valid license, you can do the following:

- [Applying for an HSBC Online Account](#)
- [Paying a Single Vendor](#)
- [Processing Bulk Payments](#)
- [Vendor Prepayment](#)
- [Making Money Transfers](#)

 **Important:** You have to install the **NetSuite SuiteApps License Client** to apply for a new HSBC account.

The Payment Automation SuiteApp allowed processing of payments without installing the **NetSuite SuiteApps License Client** until October 31, 2024. From November 01, 2024, payment processing requires installation of the **NetSuite SuiteApps License Client** and a valid AP Automation license.

To install the NetSuite SuiteApps License Client:

1. Go to Customization > SuiteBundler > Search & Install Bundles.
2. In the **Keywords** field, enter NetSuite SuiteApps License Client.
3. Click **Search**.
4. Click the link of the bundle with the following details:
 - Name: NetSuite SuiteApps License Client
 - Bundle ID: 116144
5. On the Bundle Details page, click **Install**.

After installation, the NetSuite SuiteApps License automatically connects with NetSuite to obtain your license information.

Only users with the Administrator role can install SuiteApps in your account. For more information, see the help topic [NetSuite SuiteApps License Client Guide for Administrators](#).

To check the status of the license:

1. Go to SuiteBanking > Setup > Preferences.
2. Click **View** for the preference record.
3. In the Preferences subtab, click **License Details**.
4. View the **License Status** and the **License Expiry Date**. The status could be **Active** or **Expired**.

The license details in the SuiteBanking Preferences are refreshed based on the Time to Live (TTL). If your license is renewed, but you still see the license expired error when trying to process payments from the HSBC Bank Account, you can manually fetch the license from the License server. Go to Setup > License Client > Manual License Request to fetch the license. If an active license is available, the License Dashboard in Setup > License Client > License Dashboard is updated with the **Active** status.

 **Important:** Don't uninstall the License client Bundle.

Applying for an HSBC Online Account

After you install the Payment Automation SuiteApp, apply for an HSBC Online Account. To apply for an HSBC Online Account, go to SuiteBanking > HSBC Application > Apply. If you are applying from NetSuite One World account then list of US subsidiaries are shown, choose the subsidiary you are applying for from the **Which Subsidiary are you applying for?** list.

If you want to apply for another HSBC account from another subsidiary, in your NetSuite One World Account go to SuiteBanking > HSBC Application > Apply > New Application, you can choose the subsidiary to apply for HSBC Online Account. For more information, see [Multi-Subsidiary Support](#).

To learn what permissions are required to access the HSBC application page, go to [Permissions for Role Customization](#).

Oracle NetSuite is a technology service provider and is not an FDIC-insured depository institution. FDIC deposit insurance only protects against failure of an FDIC-insured depository institution. HSBC Bank USA, N.A., Member FDIC, provides banking services on the NetSuite platform.

 **Important:** Before you start the application process, go to Setup > Company > Company Information.

The details in the **Return Email Address** and **Return Address** fields, including the phone, must be the same as the email, phone, and billing address that you will provide when submitting the application. To provide a phone number on the Company Information page, click **Edit** next to the **Return Address** field, and enter the number in the **Phone** field.

These details, along with the company logo set on Company Information page, will also be used in remittance vouchers. For more information, see [Reviewing Remittance Email](#). Use a company logo that is 250 × 150 pixels or smaller. A larger size will cause the logo to be formatted incorrectly on your remittance voucher. For more information, see [Updating Information Included in the Remittance Voucher](#)

The Payment Automation SuiteApp is used in alliance with HSBC. Before you can start using Payment Automation, you must be approved for an HSBC Online Account, and for virtual card payments you will need a provisioned credit limit.

Everywhere a document is requested, you'll need to upload it to complete your application – even if you can proceed to the next step.

HSBC accepts only files that are 10 MB or smaller and have one of the following extensions:

- .bmp
- .doc
- .docx
- .gif
- .jpeg
- .jpg
- .pdf
- .pptx
- .tiff
- .xls
- .xlsx

 **Note:** PNG files aren't accepted.

The HSBC application process consists of the following stages:

- Register
 - Fill out a short form to determine if your company is eligible to sign up for an HSBC Online Account and an HSBC Virtual Card Account. Only companies in certain industries and regions are eligible for Payment Automation. Existing HSBC customers are currently not eligible.
- Account application
 - Provide required information and documents in the account application steps that HSBC will review. If additional information is required, HSBC will contact you.
 - Required documents:
 - W9 Tax form
 - Ownership Chart – if there are trusts or entities in your company's ownership structure.
 - Copy of identification documents, such as passport or driver's license, of owners or controllers may be required.
- Credit application
 - Provide required information that HSBC will use to determine your eligibility for an ACH daily settlement limit and virtual card credit line.
 - HSBC will send you a set of documents for your review and electronic signature using Adobe Acrobat technology. After you sign and return all documents, HSBC will complete the review, and process the application. Adobe and Acrobat are either registered trademarks or trademarks of Adobe in the United States or other countries.
 - HSBC will notify you about the outcome of your application. You may be approved only for an HSBC Online Account for ACH and check payments, and no HSBC Virtual Card account. In this case, you will be able to:
 - pay vendors with ACH and check payments.
 - use the same features without access to the Virtual Card account:
 - Payment Automation dashboard
 - Bulk and single payment processing
 - Bank transfers
 - Approval routing

- Automated reconciliation

The HSBC review process usually takes between five and seven business days to complete. Oracle NetSuite does not influence the result of the application process in any way.

You will receive an email message whenever the application status changes. You can follow the status of your application at any time on the Payment Automation dashboard on the NetSuite platform.

If your application is inactive for 60 days, it will be declined for incompleteness. To return to an unfinished HSBC application, go to SuiteBanking > HSBC Application > Apply.

Important: If your application is declined, you cannot submit another one.

You can access your HSBC Online Account only through NetSuite. For information about getting assistance, see [Customer Support](#).

Status of HSBC Applications

You can track the application status from the Status page. Go to SuiteBanking > HSBC Application > Apply to check the list of applications and their statuses. The sublist displays the **Application ID**, **Subsidiary**, **Submitted By**, **Account Application Status**, **Credit Application Status**, and **Action**.

The status of the application could be:

Status	Description
Submitted	The application has been submitted for review.
Completed	The application has been approved by HSBC.
Pending Review	The application is pending review by HSBC.
Cancelled	The application has been cancelled by HSBC due to improper or incorrect data.
Ineligible	You have not met eligible criteria for opening a HSBC bank account.

In Actions column, click **Resume** to continue working on the application or click **Show Details** to see more information about the application. The Verification page is displayed for a completed application.

Note: You need to have access to the subsidiary for which the application is raised to view the details of the respective subsidiary.

Generating Payment Tokens

Before you can start initiating and processing payments, you must generate payment tokens that the payment processor will use. This is a one-time setup and can be handled by the Administrator.

Payment tokens are generated once for all subsidiaries in a multi-subsidiary setup at the NetSuite account level.

Prerequisites:

- Before you generate payment tokens, enable two-factor authentication (2FA) with one-time password (OTP). For information about setting 2FA, see the help topic [Set up Your Preferences for Two-Factor Authentication \(2FA\)](#)
- Users with [AP Integration Manager](#) role can generate tokens.

Important: The AP Integration Manager role must not be deleted or deactivated. Access to the AP Integration Manager role must not be removed for the user that generated the payment tokens.

To generate payment tokens:

1. Go to SuiteBanking > Setup > Payment Tokens.
2. Enter your NetSuite password in the **Password** field.

Regeneration of Payment Tokens

Tokens don't expire. However, for security reasons, you should regenerate payment tokens every 24 months.

The payment audit trail indicates the user that has generated payment tokens.

If the user that has generated the payment tokens during the initial setup leaves the company, another user must regenerate the tokens.

Note: The user regenerating the tokens must be assigned to the AP Integration Manager role.

To regenerate payment tokens:

1. Go to SuiteBanking > Setup > Tokens.
2. If tokens are already generated, a banner is displayed: **The payment tokens have already been generated. To re-generate tokens please click here.** Click on **here** to regenerate tokens.

Auto-Funding

Auto-funding lets you streamline your accounts payable workflow. You can't make any payments before you set up auto-funding.

Excess balances in the HSBC Online Account can't be used to fund payments directly. When you initiate a payment, auto-funding transfers money from the source account regardless of the current balance of the HSBC Online Account.

In a multi-subsidiary setup, you'll need to create a separate Auto-Funding setup for each onboarded subsidiary.

Auto-Funding Flow

With auto-funding, your source bank account is automatically debited, and the money is deposited in your HSBC Online Account. This process is initiated by the payment processor after NetSuite submits the payment. The payment processor is a third party that NetSuite uses to process payments. The payment processor will then check to confirm that there are sufficient funds in the HSBC Online Account before submitting ACH and check payments to HSBC.

Insufficient Funds in Your HSBC Online Account

Before initiating payments, you should ensure that your source bank account has enough balance, and allocated funds have not been withdrawn from your HSBC Online Account.

If after processing the batch payment your source bank account returns the auto funded direct debit or the funds have been withdrawn from your HSBC Online Account, you will not have sufficient funds in your HSBC Online Account, which will cause your HSBC Online Account to be overdrawn.

HSBC will contact you on the next business day to manually fund your account with a one-time ACH or wire payment sent from your source bank account. For instructions about how to make a one-time payment to fund your HSBC Online Account, see [Making Money Transfers](#).

Funding Cycle

The following diagram illustrates how funds move and when transactions are settled with auto-funding.

Setting Up the Source Bank Account for Auto-Funding

Before you set up auto-funding, set up your source GL account that will be used to fund the HSBC Online Account. You can only have one auto-funding source account at a time. You cannot use multiple source accounts to auto-fund the HSBC Online Account at the same time.

In a multi-subsidiary setup, you need to set up a separate source bank account for auto-funding for each onboarded subsidiary. There can be only be one primary bank for each vendor at the vendor bank level.

Important: The HSBC Bank and Credit Card GL are automatically created upon approval of the bank account. It is important not to modify the account names to prevent any potential errors during payment processing.

For instructions on creating a new account, see the help topic [Creating Accounts](#).

To set up an existing account for Payment Automation:

1. Go to Setup > Accounting > Chart of Accounts.
2. On the line of the bank account you want to set up, click **Edit**.
3. Set the following fields:
 - **Payment Automation Bank Name** – this name will be used on the Payment Automation dashboard.
 - **Payment Automation Bank Routing Number** – you can use only domestic US accounts. The routing number will be validated by the system.
 - **Payment Automation Bank Account Type**
 - **Payment Automation Bank Account**
4. Click **Save**. If this is your first time setting a source account, you will be automatically redirected to the GUID setup page:

- a. Provide a 16-character passphrase, which will be used to set up NACHA encryption rules for the ACH account number. The bank account number will be masked in NetSuite. This is a one-time setup. After the GUID page is set up, it will not be displayed again.
- b. After you submit the GUID, you will be redirected back to GL setup. To save the record, click **Save** again.

To change an auto-funding account for Payment Automation:

1. Go to SuiteBanking > Payment Automation > Dashboard.
2. Click **Bank Accounts**.
3. Click **View Auto-Funding Details**.
4. Click **Remove** to remove the existing auto-funding bank account.

 **Note:** **Remove** will only be enabled if there are no bill payments or vendor prepayments are in pending state.

5. To add a new auto-funding bank account, see [Setting Up the Source Bank Account for Auto-Funding](#).

Allowing Automatic Debit of Your Source Account

For auto-funding to work, you must permit HSBC to automatically debit your source bank account. To allow funds to be transferred, contact your GL source account bank.

If there is a debit block on the source bank account held with your bank, you will be required to provide your HSBC Account Number, which is required to authorize auto debit.

To determine your HSBC Account Number:

1. Go to Setup > Accounting > Chart of Accounts.
2. On the HSBC Bank Account line, click **View**.
3. Write down the number in the **Payment Automation Bank Account** field.

If your source bank requires a HSBC ACH Company ID, refer to your Welcome Letter that was received when your HSBC application was approved. If you do not have access to your Welcome Letter or the ACH Company ID is not available on the Welcome Letter, please contact the NetSuite Support team.

If you set a maximum debit value for this authorization, align the value with your **Daily Transaction Limit** displayed in the Payment Automation dashboard. For more information, see [Daily Transaction ACH Limit](#).

Setting Up Auto-Funding

You must set up your source account for auto-funding before you can start initiating payments.

 **Important:** After you set up auto-funding, wait at least one hour after setup before processing any payments to allow the system configuration to be completed.

If your GL source account changes, you must set up auto-funding again before initiating new payments.

Prerequisites:

- Set up the GL source account, which will be used to fund the HSBC Online Account. For instructions, see [Setting Up the Source Bank Account for Auto-Funding](#).

- Permit HSBC to debit your source account automatically. For instructions, see [Allowing Automatic Debit of Your Source Account](#).

To set up auto-funding:

1. Go to SuiteBanking > Payment Automation > Dashboard.
2. On the left-pane, click **Bank Account**.
3. Click **Set up Auto-Funding**.
4. From the Auto-Fund list, select the auto-funding source account. For more information, see [Setting Up the Source Bank Account for Auto-Funding](#).
5. Check the boxes to certify that this account is exclusively owned for the benefit of your organization, and to authorize HSBC to automatically debit your source bank account.
6. Click **Submit**.

Vendors

Before you make a first payment, set up the payment methods accepted by your vendors.

Set up vendors for Payment Automation on the vendor record.

To manage vendors, go to SuiteBanking > Payment Automation > Dashboard, and on the left pane click Vendors. The following subtabs are available on the Vendors page:

- **Approved Vendors** – lists vendors that have been already approved for Payment Automation.
- **Vendors Pending Approval** – lists vendors that are waiting for approval for Payment Automation.
- **Eligible Vendors** – lists vendors that can be eligible for Payment Automation.

New vendor records or changes to vendor records and vendor bank records go through approval routing. For more information, see [Setting Up Roles and Permissions](#), [Vendor Approval Routing](#), and [Approving Vendors](#).

To create a new vendor, go to Lists > Relationships > Vendors > New. For more information, see the help topic [Creating a Vendor Record](#).

For information about modifying a vendor, see the help topic [Editing a Vendor Record](#).

For information about modes of payment available in Payment Automation, see [Payment Options](#).

Setting Up Vendors

Vendors with multiple subsidiaries attached can process payments with any subsidiary, provided the primary bank is the same for all subsidiaries. Otherwise, you have to change the primary bank whenever you want to process with a different bank and subsidiary.

To set up a vendor for Payment Automation:

1. Go to Lists > Relationships > Vendors, and then click View on the line with the vendor you want to set up for Payment Automation.
2. On the SuiteBanking subtab:
 - Check the **Automated Payments** box.

Note: Automated payments with HSBC Bank and virtual card are only available to vendors in the United States.

- Select modes of payment in the **Accepted Modes of Payment** list.

- Select a mode of payment in the **Preferred Mode of Payment** list.
- Enter an email address in the **Remittance Email** field. Remittance email messages will be sent to this email address when a payment is made. You can enter two email addresses separated by a semicolon. A carbon copy of all future payment instructions will be sent to the second email address.

 **Note:** The remittance email address on the vendor record is not necessary for check or ACH payment types, but it is required for virtual card payments. However, it is advisable to update the remittance email address to send remittance notification emails to your vendors for ACH and check payments.

3. On the Financial subtab:
 - Select a payment account from the Default Vendor Payment Account list.
 - Select USD from the Primary Currency list. Payment Automation currently supports only USD.
4. Click **Save**.

Vendor Approval Routing

Vendor approval routing ensures that the details required for successful vendor payments are accurate. The approver must be a different user with access to the vendor record.

To learn how to set up vendors for Payment Automation, see [Setting Up Vendors](#).

Vendor approval routing is available by default without any setup. To approve any changes, log in to NetSuite with the Vendor Master Approver role, the Administrator role, or a custom role with access to the vendor record.

A vendor approval is required:

- to create a new vendor for AP Automation.
- to enable an existing vendor for AP Automation.
- to modify the following fields related to payment automation processing:
 - Vendor Bank Details
 - Billing Address
 - Preferred Mode of Payment
 - Remittance Email
 - Accepted Modes of Payment

The status is reflected in the AP Automation Status field on the SuiteBanking subtab of the vendor record:

- Pending Approval – you can't submit payments for processing or edit the vendor record.
- Approved – changes to the vendor record have been approved, and payments can now be submitted for processing.
- Rejected – changes to the vendor have been rejected, will not be reversed, and the vendor will not be paid through Payment Automation. Review the vendor record with the rejected status, and resubmit the record for approval.

You must have the Administrator, Master Approver, or a custom role with access to the vendor record to enter a bank account number in the Bank Account Number field on the Vendor Bank Account page when the vendor is in Pending Approval state.

Changes to standard and custom fields don't trigger vendor approval.

Approving Vendors

 **Note:** Vendors are approved by a different user with access to vendor record. The user who modified the vendor cannot approve the same vendor record.

To approve a vendors or changes to vendor records in bulk:

1. Go to SuiteBanking > Payment Automation > Dashboard.
2. In the Payables section on the left pane, click **Vendors**.
3. Click the **Vendors Pending Approval** subtab.
4. Select the vendors that you want to approve, and click **Approve**. Note that if you bulk-approve a large number of vendors, the action may take some time to take effect.

To approve a single vendor:

1. Go to SuiteBanking > Payment Automation > Dashboard.
2. In the Payables section on the left pane, click **Vendors**.
3. Click the **Vendors Pending Approval** subtab.
4. Click the link in the **Name** column of a particular vendor.
5. On the vendor record page, click **Approve**.

To reject a single vendor:

1. Go to SuiteBanking > Payment Automation > Dashboard.
2. In the Payables section on the left pane, click **Vendors**.
3. Click the **Vendors Pending Approval** subtab.
4. Click the link in the **Name** column of a particular vendor.
5. On the vendor record page, click **Reject**.

Importing CSV with Vendors and Vendor Banks

Prerequisites:

- Prepare a CSV file with to be imported:
 - In a CSV file with vendors, include the following information in the specified order:
 - Inactive, First Name, Last Name, Company Name, Category, Primary Subsidiary, Address 1, Address 2, City, State/Province, Zip Code, Automated Payment, Accepted Modes of Payment, Preferred Mode of Payment, Remittance Email.
 - In a CSV file with vendor banks, include the following information in the specified order:
 - Primary Bank Account, Bank Name, Bank Account Type, Vendor, Bank Account Number, Bank Routing Number

 **Important:** If a CSV file includes the full names of states or provinces rather than short names, the import job may be complete, but state or province values may not be saved correctly. To avoid errors, use short names.

To import a CSV file:

1. Go to Setup > Import/Export > Import CSV Records.
2. Select Relationships from the **Import Type** list.
3. Select Vendors from the **Record Type** list.
4. Set the **CSV Column Delimiter** that you used in your CSV file.
5. Click **Next**.
6. Follow the steps in the Import Assistant.

Important: While importing data, make sure the Run SuiteScript and trigger workflows boxes are enabled, along with required custom fields.

Managing Vendors

On the Vendors page of the Payment Automation Dashboard, you can see a list of all eligible vendors and all SuiteBanking vendors.

Vendor Bank Data

Vendor Bank data is required when the preferred mode of payment is ACH.

To set up the vendor bank account:

1. Go to Lists > Relationships > Vendors, and then click View on the line with the vendor for whom you want to set up the Vendor Bank Account.
2. In the **SuiteBanking** subtab, click **New Vendor Bank Account**.
3. Enter the **Bank Name**, **Bank Account Number**, and **Bank Routing Number** fields.

Note: The account number is stored in an encrypted form and only visible in the Edit mode. It appears masked in the View mode.

4. Select the type of bank account from the **Bank Account Type** list.
5. (Optional) Check the **Primary Bank Account** box to make this bank account primary.

Note: There can be only one primary bank account. All other bank records will be secondary.

6. (Optional) Check the **Inactive** box to mark this bank account as inactive.
7. Click **Save**.

Migrating Vendor Bank Data to Payment Automation

The migration of the vendor bank data from Electronic Bank Payments and Coastal Features to Payment Automation can be automated. This can be done by the administrator.

Details such as bank name, bank account number, and routing number are migrated, and the bank is made the Primary bank.

To automate migration of the vendor bank data to Payment Automation:

1. Go to SuiteBanking > Setup > Vendor Bank Data Migration.

2. From the **Migration Type** list, select **Electronic Bank Payments Vendor Bank Data** or **Coastal Vendor Bank Data**.
3. From the **Subsidiary** list, select the subsidiary.
4. Click **Migrate**.

After the migration process is complete, the user who initiated the process will receive an email. To check the status of the migration, you can refer to the logs for more details. In case of any errors, you can rectify them and re-initiate the migration process. The administrator can perform this process, and if the migration is run multiple times, previously migrated data will be skipped.

Setting Up Vendor Payment Approval Routing

Starting with Payment Automation version 2.0, batch approval routing is required, and setting up your own approval routing is optional. For more information, see [Setting Up Batch Approval Routing](#).

In a typical Payment Automation workflow with approval routing enabled, a Payment Clerk creates payments, and an AP Payment Manager approves them.

If NetSuite approval routing is enabled, payments created after batch approval will be routed for additional approval routing. You can disable the NetSuite approval routing, as it is optional, so batches approved will create payments and be sent for processing immediately.

For information about Payment Automation roles, see [Setting Up Roles and Permissions](#).

Enabling approval routing affects the whole payment processing. You should set up a custom workflow or a script to identify the user who will approve the payments. For instructions, see the help topic [SuiteFlow Overview](#).

For information about the approval routing feature and its setup, see the help topic [Approval Routing](#).

To disable NetSuite approval routing:

1. Go to Setup > Company > Setup Tasks > Enable Features.
2. In the **Employees** subtab, clear the **Approval Routing** box.
3. Click **Save**.

Note: You can only disable approval routing if there are no pending vendor payments for approval.

Setting Up Batch Approval Routing

Starting with Payment Automation 2.0, all payments submitted for processing in batches on the Bulk Payments page require approval. A payment batch is sent for processing only after it is approved. By using batch approval routing, you can help prevent the submission of unauthorized payments.

Important: If you set up a payment approval workflow, payments created after payments are approved through batch approval will still require approval based on the workflow you have set up.

Batch Approval Routing:

- helps accelerate and improve decision making.
- improves spending visibility.

- minimizes the risk of fraudulent payments.

For more information, see [Approving Payment Batches](#).

 **Note:** Batch payment approval supports up to 5000 bills and is limited to 400 bills per vendor.

To set up batch approval routing:

1. Go to SuiteBanking > Payment Automation > Dashboard.
2. On the left pane, expand the Set Up section, and click **Approval Routing**.
3. Click **Setup**.
4. On the Setup page, set values for the following fields:
 - **Approval Type** – choose one of the following options to indicate how approval routing should be triggered:
 - **Bill Payment** – payment amount limit for each bill in a batch.
 - **Vendor Payment** – payment amount limit for each vendor in a batch.
 - **Batch Payment** – total payment amount limit of a batch payment.

The approval type is the basis for determining the value in the **Amount for Approval** field on the Bill Payment Batch page.
 - **Payment Limit** – enter the maximum amount for a bill payment, , or batch payment that can be processed without approval. If the payment exceeds this amount, it is automatically routed for approval.
 - **Level** – set the approval level for each payment approver. Start with the level 1 approver. Note: You can select multiple approvers for one level, but only one approver is required to approve. After an employee is selected as an approver for a level, you cannot select the same employee as an approver for another level higher than the previous one.
 - **Payment Approver** – select the payment approver for each approval level. The selected approver will receive email notification whenever there is a payment batch that requires their approval.
 - **Payment Approval Limit** – Enter the maximum amount that a payment approver can approve for a bill payment, vendor payment, or batch payment. If you leave this field blank, the approver can approve any amount. When you set up an approval hierarchy, the limit of the last approver must be left blank.
5. Click **Save**.

 **Note:** For more information, see [Approving Payment Batches](#).

Setting Up Two-Factor Authentication (2FA)

 **Important:** To reduce the risk of unauthorized access to your NetSuite account, which could result in processing unauthorized transactions, set your Idle Session Timeout to 60 minutes. This means that you will be required to log back in if your NetSuite UI is inactive for over 60 minutes. For more information, please see [User Interface \(UI\) Sessions](#).

When using Payment Automation, use two-factor authentication (2FA) with the device trusted duration set to Per session. The following default roles that are provided with Payment Automation have 2FA enabled Per session by default:

- AP Payment Clerk
- AP Payment Manager
- Vendor Master Clerk
- Vendor Master Approver

If you do not have 2FA enabled with the device trusted duration set to Per session on your NetSuite role, access to the following features and pages is restricted:

- Auto-funding setup
- Money transfer
- Vendor record
- Bill payments
- Creating and editing a vendor bank account
- Generating payment tokens
- Bulk Bill Payments page

In a multi-subsidiary setup, all users need to enable 2FA who want to initiate payments from the newly created subsidiary.

If you are using a custom role, you must enable 2FA for that role, and set the device trusted duration to Per session. For instructions, see the help topic [Set up Your Preferences for Two-Factor Authentication \(2FA\)](#).

You should always log into NetSuite with 2FA when you use Payment Automation.

Setting Up Roles and Permissions

The following roles are added to your account after you install the Payment Automation SuiteApp:

- [AP Payment Clerk](#)
- [AP Payment Manager](#)
- [Vendor Master Clerk](#)
- [Vendor Master Approver](#)
- [AP Integration Manager](#)

Important: These product roles should not be made inactive. SuiteApp updates will fail, and functionality will break when made inactive.

Assign the default roles to users who'll process payments with Payment Automation. Don't edit the default roles because your changes may be overwritten by a future SuiteApp update.

The AP Payment Clerk and AP Payment Manager roles are for the users who processes Payment Automation frequently.

Vendor Master Clerk and Vendor Master Approver roles are used to maintain the Vendor Master File (VMF) which includes the information needed to process the payments.

AP Integration Manager roles are responsible for setting up payment tokens.

The default roles have Two-Factor Authentication (2FA) enabled per session.

AP Payment Clerk

The AP Payment Clerk role lets you pay supplier invoices. This role ensures that payments are authorized, paid correctly, and on time. The AP Payment Clerk keeps track and reconciles payments to ensure they reflect accurately in both NetSuite and in HSBC system. This identifies the irregularities that might be caused by fraud, encoding and accounting errors.

The AP Payment Clerk role has 2FA enabled per session.

When creating payments, you must validate if the 2FA is enabled. If it isn't enabled, then an error message is displayed to prevent you from saving the payment record.

The following table has the AP Payment Clerk role permissions required to use the Payment Automation SuiteApp:

Group	Permission	Level	Group	Permission	Level	Group	Permission	Level
Transactions	Bill	Create	Lists	Accounts	View	Setup	Accounting List	View

AP Payment Manager

The AP Payment Manager is a supervisory role responsible for authorizing supplier payments. To conform with internal control's best practices, this role will not include permissions to create or edit transaction records related to Bill Payments. This role should be assigned to the person who approves payments. This role has 2FA Authentication enabled per session.

The following table has the AP Payment Manager role permissions required to use the Payment Automation SuiteApp:

Group	Permission	Level	Group	Permission	Level	Group	Permission	Level
Transactions	Bills	View	Reports	Accounts Payable	View	List	Accounts	Edit
	Check	Edit		Accounts Payable Graphing	View		Accounts Payable Register	View

	—	—		—	—		Preferences	Edit

Vendor Master Clerk

This role is assigned to an employee who is allowed to create and edit vendor files. Preferably this role must be assigned only to one employee to ensure that all vendors are valid and vetted.

If you check the **For AP Automation** box when creating or editing vendor records, NetSuite validates if the user is using this role and 2FA is enabled. If not, then an error is displayed, and you cannot save the record. This role has 2FA Authentication enabled per session.

The following table has the Vendor Master Clerk role permissions required to use the Payment Automation SuiteApp:

Group	Permission	Level	Group	Permission	Level
List	Accounts	View	Setup	Accounting List	View
	Bank Account Registers	View		Deleted Records	View
	Classes	View		SuiteScript	View
	Currency	View		SuiteScript Scheduling	Full

	Perform Search	View		ACH Limit for Day	View
	Subsidiaries	View		Federal Holidays	View
	Vendors	Edit		License Details	Edit
	—	—		Preferences	View

Vendor Master Approver

This role is assigned to a user to approve the changes in the vendor master file and add new vendors with AP Automation flag. Preferably this user should be different from Vendor Master Clerk.

This role has 2FA Authentication enabled per session.

The following table has the Vendor Master Approver role permissions required to use the Payment Automation SuiteApp:

Group	Permission	Level	Group	Permission	Level
List	Accounts	View	Setup	Accounting List	View
	Bank Account Registers	View		Deleted Records	View
	Classes	View		SuiteScript	View
	Currency	View		SuiteScript Scheduling	Full

Permissions for Role Customization

The following table provides an overview of permissions for customizing your existing roles. You should use the default roles with their default permissions, but customizing an existing role might be necessary, for example to get permission to access the HSBC application.

Screens or Actions	Roles	Permissions Required for Accessing the Screens
Onboarding or application screen	Finance Head - Executive Level ■ Administrators	Custom Record > NSN SuiteBanking – Country Code > Edit

Screens or Actions	Roles	Permissions Required for Accessing the Screens
	■ CFO ■ Controller	Custom Record > NSNSB – Customer Onboarding > Edit List > Subsidiaries > View List > Certificate access > Create Custom Record > Preferences > View Custom Record > License Details > Edit
Editing application	The user who submitted the application or a user who has access to the application	Custom Record > NSN SuiteBanking - Country Code > Edit Custom Record > NSNSB – Customer Onboarding > Edit List > Subsidiaries > View List > Certificate access > Create
Viewing the application	The user who has submitted the application and the following roles: ■ Administrators ■ CFO ■ Controller	Custom Record > NSN SuiteBanking - Country Code > View Custom Record > NSNSB – Customer Onboarding > View List > Subsidiaries > View List > Certificate access > View

Setting up a Custom Role to Make Money Transfers

In addition to the AP Payment Clerk, AP Payment Manager, and the Administrator role, you can set up a custom role to be able to initiate Money transfers. Use the permissions listed in the following table to set up your custom role.

Group	Permission	Level
Transactions	Make Journal Entry	Create
	System Journal	View
	Find Transaction	View
Lists	Accounts	View

Group	Permission	Level
Setup	Custom Lists	View
Custom Record	CSI Credentials	View
	HSBC Customer Information	View
	Payment Audit Trail	View
	Auto-Funding Information	Full

Setting Default Department, Class, and Location Values

In the accounts where preferences for department, class, and location values are required, you need to enter the respective values while creating any bill or journal entry. With this, when an auto funding Journal or money transfer journal is created automatically from Payment Automation, Journal creation will fail as department, class, and location values were not captured.

The preference page includes three fields: **Department**, **Class**, and **Location**. An administrator sets these values and they will be used as default values for creating journals for all payments with auto funding, money transfers, and monthly invoice funding. If any of these values are made inactive, journal creation will fail.

This setup is a one-time process and applies only to the autocreation of journals within Payment Automation.

In a multi-subsidiary setup, you need to setup the preferences for department, class, and location for each subsidiary separately.

To set the default values:

1. Go to SuiteBanking > Setup > Preferences > View.
2. In the **Preferences** subtab, click **New Account Preference**.
3. Select the **Department**, **Class**, and **Location** from their respective lists.
4. Click **Save**.

Setting Email Preference

Set the default email address to receive notifications from the Payment Automation SuiteApp. Multiple email addresses should be separated by a comma.

In a multi-subsidiary setup, for each subsidiary, email preferences needs to be setup.

To set the email preference:

1. Go to SuiteBanking > Setup > Preferences > View.
2. Click **New Account Preference**.
3. In the **Email Notification Recipients** field, enter the email address to which the notifications will be sent.

Note: If this field is not set, email notifications will be sent to the user who submitted the HSBC application.

4. Click **Save**.

Setting Default Bank Fees Account

The recording of transaction fees has been automated. This automation will save more time, allowing you to focus on other important tasks.

To automate recording of bank fees:

1. Go to SuiteBanking > Setup > Preferences > View Preference record > New Account Preference.
2. In the **Bank Fees Expense Account** list, select a default expense account.
3. Click **Save**.

A journal is auto-created when HSBC confirms posting of the monthly invoice payment, typically every 21st of the month or the next business day.

 **Note:** If Journal Entry Approval Routing is enabled, the journal is routed for approval. The journal is posted only after approval. For more information, see [Auto-Funding and Money Transfers Journal Entry Statuses](#).

Processing Payments

This section provides the following information about how to process payments with Payment Automation:

- [Daily Transaction ACH Limit](#)
- [Paying a Single Vendor](#)
- [Overriding the Preferred Mode of Payment](#)
- [Processing Bulk Payments](#)
- [Vendor Prepayment](#)
- [Approving Payment Batches](#)
- [Tracking Delayed Payments](#)
- [Reviewing Failed and Rejected Payments](#)
- [Reviewing Scheduled Payments](#)
- [Reviewing Outstanding Checks](#)
- [Canceling Virtual Cards](#)
- [Reviewing Remittance Email](#)
- [Overview of Payment Statuses](#)

Daily Transaction ACH Limit

Daily transaction limit is the maximum limit for processing ACH and checks payments on any day set by HSBC Bank. Daily transaction limit validation eliminates the need to reprocess failed payments due to limit-exceeding failures. With this validation:

- You can only process payments that are within the daily transaction limit. The available daily limit can be viewed for processing bill payments from a pay single vendor, bulk bill payments, vendor prepayments, and money transfers.
- You can only submit payments on business days. Payment processing and money transfers cannot be initiated on weekends or bank holidays.

Note: Payment cannot be created or rejected on weekends or holidays. However, they can be approved. When approved on weekends, these approved payments will be sent to HSBC on the next business day.

- You can better plan and prioritize the payments to be processed for any day based on the remaining daily limit available.

In a multi-subsidiary setup, daily ACH and credit card limits are set separately per subsidiary or approved account.

The following fields have been added for [Making Money Transfers](#), [Paying a Single Vendor](#), [Processing Bulk Payments](#), and [Vendor Prepayment](#):

- **Daily Transaction Limit:** It is the maximum limit for processing ACH and checks payments on any given day, set by HSBC Bank
- **Daily Transaction Limit Available:** It is the available limit after processing payments of the present day and the payments initiated post cutoff of the previous day.
- **Payments Pending Approval:** This is the total amount of payments submitted and pending approval.

Incoming and Outgoing Limit Validations

- **Incoming Limit Validation:** The daily limit is validated for payments initiated from pay single vendor, bulk payment processing, and add money requests.

Incoming ACH Available Limit for incoming payments = ACH Daily Limit - Incoming Previously Submitted Payments and Approved

- **Outgoing Limit Validation:** The daily limit is validated during withdraw money requests.
Outgoing ACH available limit for outgoing payments = ACH Daily Limit - Outgoing previously submitted payments (Withdraw requests + ACH payments of previous day)

Pending Approval Batches

ACH daily limit validations will take place during the submission of payments and after approving the payment. Additionally, the validation is performed when the batch is edited, transactions are removed, or the batch is approved. The ACH limit calculation considers the current day's limit for batches with current and past-dated payments.

If you submit or approve a payment after the 8 pm ET cutoff, the next business day's daily limit will be applied. If a transaction is sent after 8 pm, it will be included in the first batch of the next business day, and the daily limits for that day will be applied.

Daily Limit Exceeded

When the daily limit is exceeded, an error message will be displayed. To submit payments, you need to ensure that you stay within your remaining daily transaction limit.

If you're paying a single vendor and processing bulk payments, and exceed the limit, unselect some bills or change the payment date to a future date before submitting the payment.

If you're making money transfers and exceed the limit, initiate the transaction on the next business day.

Paying a Single Vendor

Prerequisites:

- Generate Payment Tokens

- Set up Two-Factor Authentication (2FA)
- Set up Auto-Funding
- Set the Preferred Mode of Payment for the vendor that you want to pay

Note: To restrict users from creating bill payments with a duplicate check number, go to Setup > Accounting > Accounting preferences > Item/Transactions. In the **Other Transaction Preferences** subtab, choose **Warn and Block** in the **Duplicate Number Warnings** list.

Daily transaction ACH limit validations will occur before submitting and approving the payment. For more information, refer to [Daily Transaction ACH Limit](#).

Note: Payments can only be submitted on business days. Payment processing and money transfers can't be initiated on weekends or bank holidays.

To pay a single vendor:

1. Go to the Transactions > Payables > Pay Single Vendor
2. Select a vendor from the **Payee** list.
3. In the **Account** field, select HSBC Bank Account or HSBC Credit Card.
4. On the **Apply** subtab, check the **Apply** box for the bills you want to pay. You can select only bills with a reference number. You can select bill credits to offset the total amount. If a reference number is longer than 35 characters, the excess characters are truncated.
5. On the **Payee Address** subtab, select the vendor address in the **Address to Select** list.

Note: If the default billing address isn't in the United States, then select a United States address of the vendor from the **Address to Select** list or select **-Custom-** to add a new vendor billing address in the United States.

6. Click **Save**.

Note: If you select multiple bills to pay, only one payment is created for the total amount of the bills selected.

The Check Number field is disabled to ensure you can't override the number generated by the system.

For information about the payment approval process, see the help topic [Using the Approval Routing Feature](#).

Overriding the Preferred Mode of Payment

When paying a single vendor, you can override the preferred mode of payment.

To override the preferred mode of payment:

1. On the vendor page, click **Make Payment**.
2. On the Bill Payment page, select the subsidiary. The **Account** field is automatically set to HSBC Bank Account.
3. Click the **SuiteBanking** subtab, and select a **Preferred Mode of Payment**. You can select from vendor's accepted modes of payments.
4. Click **Save**.

Changing the preferred mode of payment on the payment record will not impact the vendor record. Overriding the preferred mode of payment on the Bill Payment page is limited to that particular payment.

Processing Bulk Payments

Prerequisites:

- Set up auto-funding
- Set up Two-Factor Authentication (2FA)
- Set the Preferred Mode of Payment for the vendor that you want to pay
- Generate payment tokens
- Approval routing setup

Note: Bulk bill payment processing supports up to 5000 bills and is limited to 400 bills per vendor.

Daily transaction ACH limit validations will occur before submitting and approving the payment. For more information, refer to [Daily Transaction ACH Limit](#).

Note: Payments can only be submitted on business days. Payment processing and money transfers can't be initiated on weekends or bank holidays.

To process payments in bulk:

1. Go to SuiteBanking > Payments Automation > Dashboard.
2. On the left pane, click **Bills**.
3. In the **GL Account** list, select either the HSBC Bank Account or HSBC Credit Card Account to display all bill payments to vendors with Payments Automation set up.

Note: If you use NetSuite OneWorld and have multiple HSBC accounts, bills associated with subsidiary where the HSBC bank account is opened will be displayed in the list.

4. Select the **A/P Account**.
5. Select the **Vendor**.

Note: Only bills for vendors with a default billing address in the United States will be displayed for payment processing.

6. (Optional) Filter the displayed bills based on the due date or the vendor.
7. Select the bills to process. You can select only bills with a reference number. If a reference number is longer than 35 characters, the transaction will fail.
8. Click **Submit**.

Note: If you select multiple bills to pay, only one payment is created for the total amount of the bills selected per vendor.

Note: After the payments are processed, a batch will be created and routed for approval. When the batch is approved, payment records will be created.

If the Vendor Payments Approval Routing approval is enabled, these payments created from the batch will go for another level of approval. This Vendor Payments Approval Routing is optional, and the user can turn the feature on or off as needed. For information about the payment approval process, see the help topic [Using the Approval Routing Feature](#).

For information about the payment approval process, see [Setting Up Batch Approval Routing](#).

Discount Calculation for Bulk Bill Payments

The Payment Automation SuiteApp supports discount calculations for transactions with standard and date-driven terms. In the Bulk Bill Payment Processing page, the following columns are available in the **Transactions** sublist:

- **Disc. Avail:** It is the discount available and is based on the terms of the purchase order. NetSuite automatically enters the amount discounted on this bill.
- **Disc. Date:** It is the discount date and is calculated based on the terms of the bill, and it automatically shows up in this field. This date is the last day you can pay this bill to receive a discount.

 **Note:** The **Disc. Avail** and **Disc. Date** fields will be blank for a record if a valid discount term is not attached to the bill record.

The **Payment Amount** field for a record is calculated by taking the difference between the **Balance Due** and **Discount** fields. The bill amount cannot exceed the **Payment Amount**.

Adding custom fields in Bulk Payments Page

The Payment Processing page can be customized. You can add up to six standard or custom transaction fields. This enables you to view more transaction details, to help you to prioritize bills for payment. This can be done by the administrator.

To add custom transaction fields:

1. Go to Customization > Lists, Records, & Fields > Record Types.
2. Click **List** link on the line with **Bulk Bill Batch Payment Custom Fields List**.
3. Click **New Bulk Bill Batch Payment Custom Fields List**.
4. Enter the **Field Name** and **Internal Field ID**.
5. Click **Save**.

 **Note:** Adding these fields is optional, and you can choose which values to include based on what you need so that only those can be added.

Only the fields that are available in the view mode of bill records can be added. Fields with special permissions or fields that are displayed in edit mode cannot be added.

Vendor Prepayment

 **Important:** There is a greater fraud risk, for example, through business email compromise when making a payment not linked to an invoice or purchase order. When creating and authorizing a vendor prepayment, make sure you verify both the authenticity of the payment as well as the payment beneficiary account.

You can create and process vendor prepayments to pay vendors. The SuiteBanking subtab in the vendor prepayment record populates the details from the vendor record. Payments processed with HSBC GL are processed with Payment Automation SuiteApp. The **Automated Payment** box will be enabled in the SuiteBanking subtab.

You can process vendor prepayments with ACH, Check and VCard payments. The vendor prepayment will be sent for processing in the next hourly batch during business days. For more information, see [Payment Batch Cut-Off Times Overview](#).

The validations that apply when creating a bill payment: ACH limit, weekend and holiday validation, and role requirement for 2FA per session.

To enter vendor prepayment information, see the help topic [Entering Vendor Prepayments](#).

To enter vendor prepayment details:

1. Go to the Transactions > Payables > Enter Vendor Prepayment.
2. Select a vendor from the **Payee** list.
3. In the **Account** field, select HSBC Bank Account or HSBC Credit Card.
4. On the **Payee Address** subtab, select the vendor address in the **Address to Select** list.

Note: If the default billing address is not in the United States, then select a United States address of the vendor from the **Address to Select** list or select **-Custom-** to add a new vendor billing address in the United States.

5. Click **Save**.

Status tracking can be done through the SuiteBanking tab. For more information see, [Overview of Payment Statuses](#).

Note: Apply vendor prepayment only when payment status is marked **Paid**.

In case of **Failed** payments, if the record status is **Paid**, the vendor prepayment will be automatically voided and the voiding journal will be automatically created. If the record status is **Partially Applied** or **Fully Applied**, the vendor prepayment can't be voided and the user has to manually delete the Vendor Prepayment Application, then void the vendor prepayment.

In case of **Data Error** or **ACH Payment Return** payments, if the record status is **Paid**, the reprocessing payments is allowed. Vendor prepayment will be auto-voided and a new vendor prepayment is created. If the record status is **Partially Applied** or **Fully Applied**, reprocessing payments isn't allowed. The user has to manually delete the Vendor Prepayment Application before reprocessing payment to void the vendor prepayment.

Payment Status	Record Status	Action
Failed	Paid	The vendor prepayment will be automatically voided and the voiding journal will be automatically created.
	Partially Applied or Fully Applied	The vendor prepayment can't be voided and the user has to manually delete the Vendor Prepayment Application, then void the vendor prepayment.
Data Error or ACH Payment Return	Paid	Reprocessing the payments is allowed. Vendor prepayment will be auto-voided and a new vendor prepayment is created.
	Partially Applied or Fully Applied	Reprocessing payments isn't allowed. The user has to manually delete the Vendor Prepayment Application before reprocessing payment to void the vendor prepayment.

For more information about payment statuses, see [Overview of Payment Statuses](#).

Approving Payment Batches

When a payment batch requires your approval, you'll receive a pending batch approval e-mail notification.

A payment batch isn't submitted for processing until it is approved.

For instructions on how to modify the setup of approving payment batches, see [Setting Up Batch Approval Routing](#). For example, add an approver or change the limit for approval.

Important: If you set up a payment approval workflow, payments created after payments are approved through batch approval will still require approval based on the workflow you have set up.

To approve or reject a payment batch:

1. Go to SuiteBanking > Payment Automation > Dashboard.
2. In the Payables section on the left pane, click **Payments**.
3. Click the **Open Batches** subtab.
4. Click on the Batch ID link on a line with the Pending Approval status.
5. (Optional) To change the payment batch information or remove transactions, click **Edit**.
6. On the Bill Payment Batch Page, click **Approve** to approve the payment batch or click **Reject** to reject it. Only people on the approver list will see these buttons. Payments will be created after the batch is approved. If the batch is rejected, the bills will be removed and will be in the open state for processing in a later batch.

Daily transaction ACH limit validations will occur before submitting and approving the batch payment. For more information, refer to [Daily Transaction ACH Limit](#).

Note: Payments can only be submitted on business days. Payment processing and money transfers can't be initiated on weekends or bank holidays.

Tracking Delayed Payments

Delayed payments are the list of payments that require your urgent attention as these payments were not processed successfully due to errors.

You can designate email recipients to receive all notifications from the Payment Automation SuiteApp, such as reminder emails.

An email notification will be sent at 2 PM ET daily to alert users when payments are delayed for processing due to errors in the past 24 hours. This includes payments with **Failed**, **Data Error**, and **ACH Payment Return** statuses.

Reviewing Failed and Rejected Payments

To review failed and rejected payments:

1. Go to SuiteBanking > Payment Automation > Dashboard.
2. On the left pane, click **Payments**.
3. Click the **Canceled** subtab.
4. Click the Reference No. link of the transaction you want to investigate.
5. Click the **SuiteBanking** subtab.
6. On the **Payment Audit Trail** subtab, click the Name link on the transaction line you want to review.

To determine the reason of a payment failure, go to the bill payment record and see the value of the **Failed Reason** field.

Reviewing Scheduled Payments

Scheduled payments help you track future-dated payments that are yet to be submitted to HSBC Bank for processing.

To review scheduled payments:

1. Go to SuiteBanking > Payment Automation > Dashboard.
2. On the left pane, click **Payments**.
3. Click the **Scheduled** subtab.
4. Click the Reference No. link of the transaction you want to investigate.

Reviewing Outstanding Checks

Outstanding checks help you monitor checks that are yet to clear your bank.

To review outstanding checks:

1. Go to SuiteBanking > Payment Automation > Dashboard.
2. On the left pane, click **Payments**.
3. Click the **Outstanding Checks** subtab.
4. Click the Reference No. link of the transaction you want to investigate.

Click **Export to CSV** to export the outstanding check payments in CSV format from the Dashboard. Use the quick search and date filters to display specific transactions. Select the date range from the date fields for the export.

Canceling Virtual Cards

If a vendor is not able to process a virtual card payment, the vendor may request to be paid by other means. In this case, cancel the issued virtual card. You can make the cancellation only if the payment status is VCard Sent or VCard Decline.

To cancel a one-off virtual card:

1. Go to SuiteBanking > Payment Automation > Dashboard.
2. On the left pane, click **Virtual Card**.
3. On the Activity pane, click the Date link on the transaction of the virtual card you want to cancel.
4. Click **Cancel Virtual Card**. The payment will be voided, and you will need to submit another payment.

Reviewing Remittance Email

After a payment is processed, the vendor receives a remittance email message with information about the payment: a list of bills, the payment amount, payment date, reference number, and other payment details.

The Payment Automation SuiteApp uses the **Advanced PDF/HTML Templates** feature to send email remittance notifications to vendors for ACH and check payments. You can resend remittance notifications to your vendors, track when they're sent, and include accurate payment details that contain vendor credits applied to bills.

Remittance notifications for virtual card payments continue to use the earlier process. The payment details are shown in the HTML body of the email remittance. The remittance email sender address is no-reply@payment-automation.netsuite.com.

Enabling the Advanced PDF/HTML Templates Feature

It is required to enable the **Advanced PDF/HTML Templates** feature. If this is not enabled, the Payment Automation SuiteApp upgrade to version 5.0 will fail and no further updates will be received by the account.

To enable the Advanced PDF/HTML Templates Feature:

1. Login using the Administrator role.
2. Go to Setup > Company > Enable Features.
3. Click **SuiteCloud** subtab.
4. In the **SuiteBuilder** subtab, enable **Advanced PDF/HTML Templates**.
5. Click **Save**.

Viewing and Sending the Remittance Voucher

On the Bill Payment page, the **Remittance Voucher** and **Resend Remittance** buttons appear after the payment status changes to **Payment Sent**.

The remittance email will include a PDF copy of the payment voucher. To update the information in the remittance voucher, see [Updating Information Included in the Remittance Voucher](#).

The email notification will use the email address of the user who initiated the payment.

Note: In the case of bulk bill payment processing, if batch approval routing is enabled, the email is sent from the approver's email address.

If an email address is specified in Home > Set preferences > General > User profile > From Email Address, then the email is sent from this address.

To download and resend the remittance voucher:

- To download a PDF copy of the remittance email message for your review, go to the bill payment record, and click **Remittance Voucher**.
- To resend the remittance email, click **Resend Remittance**.

Note: These actions are only available for ACH and Check bill payments, when remittance email is defined in Vendor SuiteBanking subtab.

- On the Bill Payment page, go to the **Communication** subtab to view the details of the remittance notifications that have been sent. You can view and download a PDF copy of the remittance voucher as well.

The pop-up blocker in your browser may prevent you from downloading the remittance email PDF. If you have issues with downloading the file, disable the pop-up blocker in your browser.

Note: By default, only A/P Manager and A/P Clerk are authorized to access remittance vouchers. For information about the required permissions, see [Setting Up Roles and Permissions](#).

Getting the Unmasked Virtual Card Number

If the remittance email is sent using the transport layer security (TLS) protocol, the Virtual Card number is not masked in the remittance email.

TLS encryption increases user security and privacy. Not using TLS makes sensitive information transferred over the internet vulnerable to theft.

If TLS is not used, the Virtual Card number is masked. To get the full card number, follow the instructions in the remittance email.

Updating Information Included in the Remittance Voucher

You should use only one billing information record.

To add information included in the remittance voucher:

1. Go to SuiteBanking > Setup > Account Information > New.
2. Enter the following fields:
 - Company Address
 - Logo
 - Return Email
 - Phone Number
 - Name
3. Click **Save**.

If your address, e-mail, phone, or logo changes in the future, update the remittance voucher information.

Note: The Payment Automation SuiteApp uses the company information and company logo in the remittance email sent to the vendors.

To remove the logo from the remittance email, edit the **Logo** field for ACH and Check payments. However, for virtual cards, you will need to submit a support case to the NetSuite Customer Support team. Please note that it may take up to five business days to complete this request.

To change information included in the remittance voucher:

1. Go to SuiteBanking > Setup > Account Information.
2. On the account information record line, click **Edit**.
3. Update the fields as needed.
4. Click **Save**.

Overview of Payment Statuses

The following table provides an overview of payment statuses used in Payment Automation.

ACH and Check Statuses

Status	Description
For Submission	The payment is created in NetSuite but hasn't been sent to the payment processor yet, and a transaction is not yet created at the payment processor. Waiting to be sent to the payment processor. With approval routing enabled, only approved payments are sent for processing.

Status	Description
Pending	The payment processor confirms the payment is created in their system and is waiting for funds from the source bank to be credited into the HSBC Online Account.
Processing	ACH Funding from source bank is credited to HSBC Online Account. Payment is sent to HSBC for processing and is waiting now for HSBC confirmation.
Payment Sent	The payment is in queue for HSBC processing. Checks are printed and mailed at this stage.
Paid	Received confirmation from the payment processor that payment initiation was successful. The ACH or check payment has been settled and cleared in your HSBC Online Account.
Data Error	Payment information contains erroneous data like incorrect address formatting or special characters in payment details. You can see the reason for failure in the Failed Reason field on the SuiteBanking subtab of the bill payment record. For more information, see Addressing the Data Error Status .
Failed	Payment processing failed, and payment was voided. A new payment transaction needs to be initiated. You can see the reason for failure in the Failed Reason field on the SuiteBanking subtab of the bill payment record.
ACH Payment Return	The payment was returned by the vendor's bank due to incorrect bank details or another error. For more information, see Addressing the ACH Payment Return Status .
For Resubmission	ACH funding from the source bank is credited to the HSBC Online Account. However, initial attempts in sending the payment to HSBC failed. The system will automatically queue the payment for next day execution.

Important: if the payments to vendors end up with an **ACH Payment Return** or **Data Error** status, you will be able to reprocess those payments. There is no need to void the payment and then re-initiate it manually. In addition, no new funding request will be created for reprocessed payments. Existing funds at the HSBC Online Account will be used for the reprocessed payments. With one click, payments are reprocessed and sent to HSBC for processing.

Addressing the Data Error Status

Payments with incorrect or missing data are updated with the Data Error status along with an error code and description. When this happens, you can:

- **Reprocess the payment** – Choose this option after correcting the error; this option will resubmit the payment for processing without new funding. If reprocessing is performed without correcting the error, the reprocessed payment will result in the same data error again. If approval routing is enabled in the account, the reprocessed payment will be submitted to HSBC for processing once approved.
- **Void the payment** – Choose this option if you prefer to submit another payment instead. The payment status will change to Failed and the record will be voided. You will be asked if you want to withdraw the funding money from HSBC. If so, you'll be redirected to the Withdrawal page.

You can see the reason for failure in the Failed Reason field on the SuiteBanking subtab of the bill payment record.

Addressing the ACH Payment Return Status

The return payment is updated with information from the reconciliation report when the money is credited back to HSBC Online Account. The Failure Reason will be empty because this information is not available in the reconciliation report. You will receive an e-mail notification from HSBC about why the payment was returned.

The following table includes few of the common errors and how they can be resolved:

Note: The return reason is listed on the report that is sent to you by HSBC listing the items returned. If the amount returned is listed as **Total Credit Amount**, this return was related to a payment to a vendor. If the amount returned is listed as **Total Debit Amount**, this return was related to funding request.

Reason Code	Title	Description	Next Steps
R01	Insufficient Funds	Insufficient funds in the customer account to process this debit request.	Your source bank account doesn't have enough balance to cover the auto-funding request for your payments. Please add money to your HSBC account. For more information, see Making Money Transfers . Ensure that you have enough balance before submitting payments or making money transfers.
R02	Account Closed	The beneficiary's account is closed.	Contact your vendor to confirm their bank account details. Then, update the vendor's primary bank account before reprocessing the payment. For more information, see Addressing the ACH Payment Return Status .
R03	No Account/ Unable to Locate Account	Unable to locate beneficiary account.	Contact your vendor to confirm their bank account details. Then, update the vendor's primary bank account before reprocessing the payment. For more information, see Addressing the ACH Payment Return Status .
R04	Invalid Account Number Structure	The account number structure is not valid. (Example: Not enough digits).	Contact your vendor to confirm their bank account details. Then, update the vendor's primary bank account before reprocessing the payment. For more information, see Addressing the ACH Payment Return Status .
R08	Payment Stopped	The receiver has placed a stop payment order on this debit entry.	Auto-funding request from your source bank was rejected. Contact your source bank to remove the stop payment order and allow auto-funding requests from HSBC before submitting payments or bank transfers.
R09	Uncollected Funds	Insufficient funds in the customer account.	Your source bank account does not have enough balance to cover the auto-funding request for your payments. Please add money to you HSBC account. For more information, see Making Money Transfers . Ensure that you have enough balance before submitting payments or making money transfers.
R13	Invalid ACH Routing Number	Invalid ACH Routing Number.	Contact your vendor to confirm their bank account details. Then, update the vendor's primary bank account before reprocessing the payment. For more information, see Addressing the ACH Payment Return Status .
R20	Non-Transaction Account	The beneficiary's account is a Non-Transaction Account for ACH.	Contact your vendor to confirm their bank account details. Then, update the vendor's primary bank account before reprocessing the payment. For more information, see Addressing the ACH Payment Return Status .

Reason Code	Title	Description	Next Steps
R23	Credit Entry Refused by Receiver	Any credit entry that is refused by the receiver.	Contact your vendor to discuss the return reason. You have the option to void or reprocess the payment. For more information, see Addressing the ACH Payment Return Status .
R29	Corporate Customer Advises Not Authorized	Corporate Customer Advises not authorized.	Auto-funding request from your source bank was rejected. Contact your source bank to remove the stop payment order and allow auto-funding requests from HSBC before submitting payments or bank transfers.
R32	RDFI Non-Settlement	The Receiving Financial Institution is not able to settle the Entry.	Contact your vendor to discuss the return reason. You have the option to void or reprocess the payment. For more information, see Addressing the ACH Payment Return Status .

For information about other return codes and reasons, contact the NetSuite Support team.

When a payment is returned, you can void it in NetSuite. The payment status will change to Failed and the record will be voided. You will be asked if you want to withdraw the funding money from HSBC. If so, you'll be redirected to the Withdrawal page. After you void the payment, make changes to prevent the error from occurring, and submit another payment.

You can choose to reprocess the payment. Reprocessing ACH returned payment will not initiate new funding and existing funds will be used. Resubmit the payment for processing only after correcting the error.

Auto-Funding and Money Transfers Journal Entry Statuses

Status	Description
Sent to Bank	Status for auto-funding request Journal Entries. ACH funding request is sent to the HSBC for processing.
Completed	Bank transfer request is complete, and that money has settled and cleared in your HSBC Online Account. This is for Add Money, Withdrawal and Funding journal entries.
Failed	Error in transferring money to your HSBC Online Account – the transfer request has failed. You can see the reason for failure in the Failed Reason field on the SuiteBanking subtab of the bill payment record.

Virtual Card Statuses

Status	Description
For Submission	Payment is created in NetSuite but hasn't been sent to the payment processor yet and a transaction is not yet created at the payment processor. Waiting to be sent to the payment processor. With approval routing enabled, only approved payments are sent for processing.
Pending	The payment processor confirms the payment is created in their system and is waiting for funds from the source bank to be credited into the HSBC Online Account.
Processing	Transaction belongs to a batch that was published successfully. Waiting for the payment processor and HSBC to confirm successful payment initiation.

Status	Description
Failed	Payment processing failed, and payment was voided. A new payment transaction needs to be initiated. You can see the reason for failure in the Failed Reason field on the SuiteBanking subtab of the bill payment record.
Rejected	Occurs when: ■ payment initiation or individual transaction included in the payment initiation has been rejected. ■ ACH Funding is not successful, for example due to a wrong account number or insufficient funds. ■ When a virtual card limit is exceeded.
Virtual Card Sent	The virtual card is created.
Virtual Card Authorized	The virtual card is authorized.
Virtual Card Declined	The virtual card is declined.
Paid	Received confirmation from the payment processor that payment initiation was successful.
Virtual Card Expired	The virtual card is expired.
Virtual Card Canceled	The virtual card is canceled or blocked and payments cannot be made by the card.

 **Note:** Expired virtual cards cannot be canceled from UI. The payment status will be **Payment Sent**. You need to void the payment and initiate it again.

Payment Status Tracking

The Payment Automation SuiteApp tracks and updates funding requests and payments to provide almost real-time status as transactions are processed by HSBC. The users will have full visibility of the status of the payment and funding, providing you with positive confirmation if the transaction was posted successfully in HSBC, such as a funding request or payment execution. You will also receive information about whether the payment was returned to HSBC from the beneficiary bank.

In addition, the Bill Payment and Vendor Prepayment records now include a visual status tracker, which is handy for checking the status of the payment quickly.

Making Money Transfers

Payment Automation lets you make transfers to add money to your HSBC Online Account from your source account, or withdraw money from your HSBC Online Account.

Daily transaction ACH limit validations will occur before submitting and approving the payment. For more information, refer to [Daily Transaction ACH Limit](#).

 **Note:** Payments can only be submitted on business days. Payment processing, money transfers, and payment can't be initiated on weekends or bank holidays.

Users with the AP Payment Clerk, AP Payment Manager, and the Administrator roles that have logged in to NetSuite with two-factor authentication can make money transfers. In addition, you can set up a

custom role to be able to initiate Money transfers. For instructions, see [Setting up a Custom Role to Make Money Transfers](#).

When a bank transfer is initiated, a journal entry is created in NetSuite to record the transaction. To access the journal entry after you submit a money transfer, click the link in the Reference column on the Bank Account Transfers page.

Enable journal entry approval routing for money transfers to be authorized before they are sent for processing. For more information, see the help topic [Use Journal Entry Approval Routing](#).

If you enable journal entry approvals, money transfer requests are sent to HSBC according to the schedule after a journal entry is approved. The daily scheduler runs at 8 pm Eastern Time, and sends all unsent money transfer requests to HSBC for processing.

If journal entry approval routing is disabled on your account, money transfer requests are sent to HSBC for processing immediately after you create an Add money or Withdraw money request.

Bulk approval of journals for money transfers isn't supported. Each journal created has to be manually approved by the approver.

The Payment Automation SuiteApp prevents excess withdrawal request submission if the total number of withdrawal requests for the day exceeds the current HSBC balance or if there are any pending withdrawals that have yet to be processed at HSBC. You cannot withdraw from your HSBC Online Account more than what is your current available balance.

Bank Transfer Statuses

- For Submission – the Payment is created in NetSuite and will be forwarded to HSBC Online Account for processing.
- Completed – the transfer request has been successful.
- Failed – the transfer request failed. Receiving this status will auto-void the original transfer request.

To make a money transfer:

1. Go to SuiteBanking > Payment Automation > Dashboard.
2. On the left pane, click **Transfers**.
3. On the Bank Account Transfers page, choose one of the following options:
 - To transfer money from your source account to the HSBC Online Account, click **Add Money**.
 - To withdraw money from your HSBC Online Account and transfer it to your source account, click **Withdraw Money**.

Note: For withdrawal requests, the journal entries with statuses **For Submission**, **Pending**, and **Sent to Bank** will be considered when calculating the amount allowed for withdrawal.

4. Enter the amount you want to transfer in the **Amount** field.
5. (Optional) Enter details about the transfer in the **Memo** field. The upper limit is 16 characters.
6. Check the obligatory consent and authorization boxes.
7. Click **Submit**.

Transfers and withdrawal requests are sent for processing with the batch at 8 pm Eastern Time. Any money transfer request submitted after the 8 pm Eastern Time cut-off time will be sent for processing on the next business day. It takes one to two business days for your HSBC Online Account to be credited or debited.

Statements and Reconciliation

Use daily and monthly statements for HSBC Online Account and HSBC Virtual Card reconciliation. Bank account monthly statements, virtual card statements, and invoices become automatically available for download as PDF files on the second day of every month.

To access the statements, go to SuiteBanking > Payment Automation > Dashboard, and click **Account Details** in the HSBC Online Account portlet. You can also access the statements by clicking **Card Details** in the HSBC Virtual Card portlet. Click **Refresh** in the Statements portlet to get available new invoices or statements.

 **Note:** Invoices are generally available by the 15th of a month at 5: 30 p.m. Eastern Time (UTC – 5). If no new invoices are available by the next working day at 5: 30 p.m. Eastern Time (UTC – 5), click **Refresh**. All available invoices will be updated in the Invoices tab of the Statements portlet.

For an overview of dates relevant to bank and virtual card data reconciliation, see [Statement and Auto-Debit Payment Schedules](#).

A format profile is created automatically for your account. For information about format profiles, see the help topic [Format Profile](#).

Journal entries for transaction fees are automatically created based on the monthly statement on the 15th day of every month. The transfer status of the journal entry is "Sent to the Bank" and the Memo is "Monthly Invoice Fee". The journal entry is created to record the bank transfer from the source bank to HSBC to pay the fees.

On the second day of every month, statement files of posted transactions are automatically retrieved from HSBC. NetSuite existing auto matching rules match the transactions from the files with bill payments in NetSuite. For more information, see [Matching Bank Data](#).

The HSBC ACH Reconciliation format profile lets you see individually all the ACH transactions that are posted in each batch.

Billing fees and virtual card payments are automatically debited from HSBC when due:

- Billing fees – debited five days after the statement is generated, which is typically every 20th day of the month.
- Virtual card payments – due every 25th day of the month. Virtual card payments are included in the ACH CSV report. The CSV reconciliation report does not include any Memo information. However, the report includes the payee.

Billing fees and virtual card payments are posted in the HSBC Online Account and are included in the daily reconciliation report.

The daily reconciliation file of the HSBC Virtual Card will include the statement credit as well as any other charges like late fees and penalties imposed by HSBC Bank. These transactions will appear on the Match Bank Data page.

Watch the following help video for information about Reconciliation:

 [Payment Automation SuiteApp - Reconciliation](#)

To download a bank account monthly statement or an invoice:

1. On the left navigation pane, click **Bank Accounts**.
2. In the **Statements** portlet, click the **Statements** subtab or the **Invoices** subtab.
3. Click **Refresh** to get all available statements or invoices.

4. Locate the statement or invoice that you want to download.
5. Click **Download**.

To download a virtual card statement:

1. On the left navigation pane, click **Cards**.
2. In the **Statements** portlet, click **Refresh** to get all available statements.
3. Locate the statement you want to download.
4. Click **Download**.

Manually Refresh Monthly Statements or Invoices

To manually refresh monthly statements or invoices:

1. Go to SuiteBanking > Payment Automation > Dashboard.
2. Click **Account Details** in the HSBC Bank Account portlet. Click **Card Details** in the HSBC Virtual Card portlet.
3. To switch between viewing the statements or invoices, click the Statements or Invoices tab in the Statements portal of your bank account.
4. Click **Refresh** to get the statements or invoices.
5. If you still do not see statements or invoices, contact NetSuite Customer Support.

Statement and Auto-Debit Payment Schedules

Virtual Card Statement Schedule

- **Billing period** – covers previous month from second to the last day. All posted transactions during this period are included.
- **Billing cut-off** – the first day of the following month – end of day. If the first of the month is a non-business day, the statement will be generated on the next business day.
- **ACH auto-funding** – automatically initiated from the NetSuite platform every 20th day of the following month to pay the amount due on the Virtual Card statement. The ACH request will follow the T+1 settlement date, meaning next day following payment initiation. If the settlement date is a non-business day, funding will become available on the next business day.
- **Payment due date** – 25th day of the following month. If the due date is a non-business day, the payment will be debited on the next business day. HSBC will debit your HSBC Online Account on the payment due date.

Transaction Fees Statement Schedule

Transaction fees are charges for payments processed through the HSBC bank account. These fees are assessed on a monthly basis.

- **Billing period** – covers previous month from the first to the last day.

- **Billing statement** – the 15th day of the following month.

HSBC Bank generates monthly invoices that are fetched on the 15th day of every month. In case the 15th day is not a business day, the invoice will be fetched on the next business day. An automatic email notification is sent to the user who initiated the HSBC application when the billing invoice is available. The invoice will be accessible in the dashboard without the need for manual refreshing. If manual refreshing is necessary, please see [Manually Refresh Monthly Statements or Invoices](#).

 **Note:** The Billing Statement will become available the same day the ACH Auto-funding for the monthly invoice is initiated. For any questions regarding fees and charges on the statement, contact NetSuite Customer Support.

To add or change the email preference, see [Setting Email Preference](#).

- **ACH auto-funding for monthly invoice** – automatically initiated from the NetSuite platform after the invoice becomes available on the 15th. In case the 15th is not a business day, the auto-funding will be initiated on the next business day. The ACH request will settle within your account on T+1 settlement day, meaning next day following payment initiation. If the settlement date is a non-business day, funding will become available on the next business day.
- **Payment due date** – the fifth day after the invoice receipt or generation. If the due date is a non-business day, the payment will be due on the next business day. HSBC will debit your HSBC Online Account on the payment due date. For information about autorecording of bank fees, see [Setting Default Bank Fees Account](#).

To access the statements, go to SuiteBanking > Payment Automation > Dashboard, and click Account Details in the HSBC Online Account portlet. Transaction fees are included as separate invoices that you can access from the Invoices tab of the Statements portlet on the HSBC Online Account page.

For more information about HSBC Processing Fees, refer to [HSBC Processing Fees](#).

Reviewing Automatically Matched Transactions

Transactions posted in HSBC bank accounts are imported daily from 4 AM to 7 AM PST.

To review automatically matched transactions:

1. Go to SuiteBanking > Payment Automation > Dashboard.
2. On the left pane, click **Bank Account**.
3. Click **Match Bank Data**.
4. In the **Account** list, select HSBC Bank Account or HSBC Virtual Card.
5. Click the **Review** subtab.

For more information, see [Bank Data Matching and Reconciliation](#).

Matching Bank Data Manually

In cases where the system is unable to automatically match the imported transaction with the recorded NetSuite transaction, you can manually match the transaction. To do this, you need to select the transactions based on imported bank data versus account transactions.

To reconcile HSBC Bank Account and HSBC Credit Card transactions:

1. Go to SuiteBanking > Payment Automation > Dashboard.
2. On the left pane, click **Bank Account**.
3. Click **Match Bank Data**.
4. In the **Account** list, select HSBC Bank Account or HSBC Credit Card.
5. On the **To Be Matched** subtab, select the **Imported Bank Data** transactions on the left, and then select the corresponding GL account entries on the right.
6. Click **Submit**.

Automatic Journal Entry Creation for Auto-Funding Transactions

When a payment batch is sent to the payment processor, a funding request from the source bank is initiated to obtain funding before the payment is processed.

A corresponding journal entry for the funding amount request is created automatically. A journal entry is created for any batch that includes an ACH or check payment. The amount is calculated based on total payments.

A journal entry is created when a payment status changes to Pending. You can use this journal entry to reconcile the credit entry received in the daily bank statement. If a funding request fails, the payment transactions and funding journal will be auto-voided.

When an Auto-Funding request is raised for monthly transaction fees and credit card due, journal entry will be created in NetSuite automatically for the funding amount.

For more information about journal entries, see the help topic [Journal Entries](#).

For more information about classification fields such as Department, Class and Location for journal entries, see [Setting Default Department, Class, and Location Values](#).

For more information about transaction settlement, see [Transaction Settlement](#).

For more information about virtual card statement, see [Virtual Card Statement Schedule](#).

Making Adjustments for Virtual Cards Not Paid In Full

Sometimes, a vendor might charge less than the full amount when using a virtual card, for example if the vendor incorrectly calculates charges like taxes or other fees. This causes an imbalance between Payment Automation and HSBC. The current balance displayed on the Payment Automation dashboard won't match the total amount on the Activity pane of the HSBC Virtual Card page.

To correct this discrepancy, create an adjustment journal entry. The vendor will need to provide a credit note or another document to correct the original bill. You should correct the information in the system by creating a journal entry. Then, the amounts will match on the Match Bank Data page too.

Electronic Signature Attestation and Agreement

- **What is an electronic signature?**
 - The electronic signature process (Esign), powered by Adobe Acrobat technology, is a cloud-based service that replaces the paper and ink signature process with a fully automated electronic signature workflow. Adobe and Acrobat are either registered trademarks or trademarks of Adobe in the United States and/or other countries
 - With Esign, you can easily sign documents anywhere, anytime, and on any device within minutes.
 - After the signing process is complete, you will receive an email message with the signed document, and an audit trail for its records.
- **Is electronic signature secure?**
 - Yes, electronic signature employs industry standard security practices to protect your documents, data, and personal information. Whether related to identity management, data confidentiality, or document integrity, the industry standard security practices are deeply ingrained in the technology and our service operation processes.
- **How does an electronic signature work?**
 - An electronic signature, or e-signature, is a way of signing documents digitally. The advantages of using electronic signatures include:
 - **Signer authentication** – e-signature document requests are emailed to the signers' company email address and for additional security, a One-Time Password (OTP) must be entered. You must obtain an OTP through a cell phone or a land line without an extension.
 - **Final proof** – electronic signature provides an audit trail with clear evidence for each transaction, showing what document was signed and who signed it. Copies of executed documents are automatically sent to all parties.

- **Is electronic signature required or can I use the traditional paper version?**
 - To execute documentation, electronic signature is not required. The sender will ask you during the process if you are able to receive and sign the document electronically. If you are, the document link will be sent to you to start the signing process. However, if you want to opt out of signing electronically at any stage in the process, let the sender know. HSBC will send you a PDF version of the documents in an email message if you are TLS-enabled, or a traditional paper version by mail.
- **Will the email message asking to sign the documents be sent from an HSBC email address?**
 - The email message will be sent from adobesign@adobesign.com and will include the name of the Onboarding Case Manager and an email address that you can use if you have any questions.
- **How long is my One-Time Password (OTP) valid?**
 - The OTP is valid for ten minutes after receipt. If your OTP expires, you will have to request a new OTP by following the link in your email message.
- **How many times can I request a One-Time Password (OTP)?**
 - You can request an OTP up to five times after which you will be required to contact your HSBC Onboarding Case Manager whose contact information will be in your email message received from adobesign@adobesign.com.
- **Which browsers are supported for electronic signature?**
 - You should use Google Chrome, but other browsers such as Edge, Firefox, and Safari are compatible. Internet Explorer 11 and below are not supported.
- **What should I do if I did not receive an email message containing a link to electronic signature?**
 - If you believe you should have received an email message requesting your signature, check your spam and promotions folders, and if you cannot locate the email message, contact your HSBC Onboarding Case Manager.
- **What should I do if the sign function does not work for me?**
 - Try a different browser. If you are using a mobile device, try using a desktop browser.
- **What should I do if I have provided incorrect details?**
 - Contact your HSBC Onboarding Case Manager whose details will be provided in the Esign email message sent to you.
- **How can I change the phone number provided for electronic signature?**
 - To request a change to the phone number provided on the electronic signature request, contact your HSBC Onboarding Case Manager and provide them with the new phone number you want to use. The HSBC Onboarding Case Manager will contact you to confirm the change has been applied, and you can continue with your application.
- **How can I get copies of the signed documents?**
 - You will receive a copy of the signed documents through email. If you misplace a copy of the document, contact NetSuite Customer Support.

SuiteBanking Account Information Change

How can I update my mailing address, registered address, name, entity, ownership structure, and request these changes to be reflected on my HSBC Online Account?

You can submit a request to change your company's account information such as address, name or entity by contacting your NetSuite Support team.

Note that upon receipt of your request, you may be contacted by HSBC by email for additional information, documentation, or both.

After you have submitted all required information, you will receive a confirmation email from HSBC to advise on the status of your request.

Changes to Certificate of Banking Authority

How can I update the names provided on Certificate of Banking Authority?

Request to change the Certificate of Banking Authority must be submitted by an Authorized Person only. Please submit the request by contacting your NetSuite Support Team.

The request needs to come from those authorized in the manner stated in the Certificate of Banking Authority. Please consult your internal company records for this information.

Reapplying for a HSBC Virtual Card

How can I re-apply for a HSBC Virtual Card if I now only have the HSBC Online Account?

It is currently not possible to re-apply for a HSBC Virtual Card.

Request for Audit Confirmation from HSBC

How can I request an audit confirmation to verify my HSBC Online Account for credit reviews, quality control audits, loan applications, and so on?

HSBC uses confirmation.com as the mechanism to receive all audit confirmation requests sent by auditors.

Confirmation.com is an online confirmation solution from US-based Capital Confirmation Inc., which lets banks respond to auditors directly for requests raised on behalf of customers.

Auditors must register with confirmation.com to use this service. After registration, confirmation.com will validate both the audit firm and the individual auditor. There is no registration fee, it is a "pay-as-you-go" service.

After the registration, the auditor sets up a company account. The account requires the name of an individual listed on the Certificate of Banking Authority. The individual will receive an email message from systems.administrator@confirmation.com, seeking permission for the auditor to request the information through confirmation.com. After this individual has provided authority, the auditor is notified through an email message and can initiate a request to HSBC.

After the confirmation is completed by HSBC, the auditor receives an email message notifying them that the confirmation is available on confirmation.com.

Request Bank Reference Letter Confirming Accounts with HSBC

How can I request a bank reference letter that would confirm that our company holds an account with HSBC Bank USA, N.A., as requested by a supplier we will be paying from this account?

You can submit a request for a bank reference letter by contacting NetSuite Customer Support. You will be asked to provide the following information:

- Account name

- Account number
- Account address

Your request will be reviewed by HSBC and a bank reference letter will be sent to the email address HSBC holds on your account.

Handling an Unprocessed Returned Check

What should I do if I have made a check payment and have received a returned check in the mail? What action is required to complete or void the payment?

If your check payment is returned to you unprocessed, and you still want to send it to the recipient, verify the recipient's address is correct, affix proper postage, and mail the check to the recipient.

To void a check if necessary:

1. Write "VOID" in large letters across the front of the check. After the check is voided, it can no longer be used to make payments.
2. Manually void the payment on your Payment Automation dashboard. For more information, see [Tracking Delayed Payments](#).
3. Transfer the funds from your HSBC Online Account back to the funding financial institution. For instructions, see [Making Money Transfers](#).

Handling a Returned Check Due to Insufficient Funds

What should I do if I have been notified that there were insufficient funds in my account when the recipient tried to deposit the check?

You will receive an email notification from HSBC that will include the check payment details being held because of insufficient funds in your HSBC Online Account, including a deadline of when the account must be funded to support settlement.

For instructions about how to make a one-time payment to fund your HSBC Online Account, see [Making Money Transfers](#).

For rejected payments, you'll need to manually void the payment on your Payment Automation dashboard and submit a new payment. To void a payment, click the Payments tab on the left navigation pane, select a payment, and click **Void**.

Retrieving a Check Image

What should I do if I want to request a copy of an issued or paid check to provide proof of payment to the beneficiary who is claiming non-receipt?

Contact NetSuite Customer Support to request a copy of a check from HSBC that has been issued or paid.

To process your request, you will have to provide the following information:

- Account number
- Check number
- Date when the check has been posted

HSBC will send you an email message with a copy of the check image requested.

Stopping a Check Request

What should I do if I want to request a stop check because the payment is incorrect, I made an error, or I received a returned check in the mail and want to stop the payment?

A stop check can be applied only on a check payment that hasn't cleared. Contact NetSuite Customer Support to request a stop payment on your check.

To process the request, you will have to provide the following details:

- HSBC Online Account number
- Payee name
- Date on the check
- Amount on the check
- Check number

HSBC needs a reasonable amount of time to verify that the check has not already been paid and apply the stop on the payment.

Your stop payment request takes effect when confirmed by HSBC.

A stop payment is valid for 6 months as per Uniform Commercial Code guidelines, after which you will be required to re-apply the stop for each additional 6-month period.

If your request is successful, you will be required to manually void the payment on your payment automation dashboard and withdraw the funds from your HSBC Online Account. To void a payment, click the Payments tab on the left navigation pane, select a payment, and click **Void**. For instructions about withdrawing funds, see [Making Money Transfers](#).

Handling an ACH Payment Failure or a Beneficiary Claiming Non-Receipt

What should I do if I have made an ACH payment, but I do not see this payment deducted from my account and would like to confirm that the payment was successful?

HSBC will assist you with investigating payments made from your HSBC Online Account. Contact NetSuite Customer Support, and provide the following information:

- The date of the payment
- Transaction amount
- Customer account number
- Any associated message on the payment

HSBC will investigate and contact you with a response to your query.

Handling an ACH Payment Returns

What should I do if an ACH payment I authorized has been returned.

HSBC will assist with investigations on payments made from your HSBC Online Account. HSBC sends PEPCAR report through email with details of the ACH Return. Contact NetSuite Customer Support, and provide the following information:

- The date of the incoming returned payment
- Transaction amount
- Customer account number
- Any associate message on payment return

HSBC will investigate and contact you with a response to your query.

For more information see, [Addressing the ACH Payment Return Status](#).

Handling Suspected Fraudulent ACH or Check Transactions

What should I do if I want to report suspected fraud on my account because funds have left my account and my intended recipient is claiming non-receipt, or I did not authorize this payment?

If you suspect fraud on your HSBC Online Account, contact NetSuite Customer Support immediately.

Requesting an ACH Payment Amendment, Reversal, or Deletion

What should I do if I want to amend, reverse, or delete a payment?

The Payment Automation SuiteApp doesn't support payment amendments.

You can request a payment reversal with HSBC within 5 days post settlement. Contact NetSuite Customer Support and someone from HSBC Platforms Service Support will contact you regarding your request.

HSBC will contact the beneficiary bank to request they return the funds to your HSBC Online Account. Wait for 3 days following a credit for an ACH reversal before manually voiding the payment and requesting a transfer of the funds. For details, see [Making Money Transfers](#).

The 3-day period allows for a possible return of the reversal by the beneficiary bank. If a reversal is returned to the beneficiary bank, you will have to contact the payee directly to arrange for the return of funds.

If the payment is more than 5 days post settlement, you should contact the payee and request they return the funds to your HSBC Online Account. Then, manually void the payment and request and transfer the funds. For details, see [Making Money Transfers](#).

Making a One-Time Payment to Top up the HSBC Online Account

What should I do if I want to make a one-time payment to fund my HSBC Online Account?

If you have a pending outgoing payment that is unable to be processed due to funding that has been canceled or returned after the payment was executed on your HSBC Online account, you should transfer funds to the account. For instructions, see [Making Money Transfers](#).

Transferring Funds to and from the HSBC Online Account

What should I do if I want to request funds be moved from my HSBC Online Account into another account because the funds are no longer required?

For information about topping up the HSBC Online Account or moving funds to another account, see [Making Money Transfers](#).

Why can't I withdraw funds from my HSBC Online Account?

The Payment Automation SuiteApp prevents excess withdrawal request submission if the total number of withdrawal requests for the day exceeds the current HSBC balance or if there are any pending withdrawals that have yet to be processed at HSBC.

Payment Status

What do I do if my payment status shows Data Error?

Payments with incorrect or missing data are updated with the Data Error status along with an error code and description. When this happens, you can:

- **Reprocess the payment** – Choose this option after correcting the error; this option will resubmit the payment for processing without new funding. If reprocessing is performed without correcting the error, the reprocessed payment will result in the same data error again. If approval routing is enabled in the account, the reprocessed payment will be submitted to HSBC for processing once approved.
- **Void the payment** – Choose this option if you prefer to submit another payment instead. The payment status will change to Failed and the record will be voided. You will be asked if you want to withdraw the funding money from HSBC. If so, you'll be redirected to the Withdrawal page.

You can see why a payment failed in the Failed Reason field on the SuiteBanking subtab of the bill payment record.

What do I do if my payment status shows ACH Payment Return?

The return payment is updated with information from the reconciliation report when the money is credited back to HSBC Online Account. The Failure Reason will be empty because this information is not available in the reconciliation report. You will receive an e-mail notification from HSBC about why the payment was returned.

When a payment is returned, you can void the payment in NetSuite. The payment status will change to Failed and the record will be voided. You will be asked if you want to withdraw the funding money from HSBC. If so, you'll be redirected to the Withdrawal page. After you void the payment, make changes to prevent the error from occurring, and submit another payment.

You can choose to reprocess the payment. Reprocessing ACH returned payment will not initiate new funding and existing funds will be used. Resubmit the payment for processing only after correcting the error.

Vendor Prepayment

How do I make a Vendor Prepayment?

Go to Transactions > Payables > Enter Vendor Prepayment. Enter the information and click Save and click Submit for Approval. For more information, see [Vendor Prepayment](#).

How do I apply my Vendor Prepayment to the existing bill for my vendor?

When the vendor prepayment status is **Paid** in the SuiteBanking subtab of the record, you should apply the funds to the existing bill for your vendor.

Go to SuiteBanking > Vendor Prepayments > Apply. Choose from list of bills available for the vendor and enter the amount you want to apply.

Daily Limit Validation

What is Daily limit validation, and who will set this limit?

Daily transaction limit is the maximum limit for processing ACH and checks payments on any day set by HSBC Bank. Daily transaction limit validation eliminates the need to reprocess failed payments due to limit-exceeding failures.

Determining the Available Balance

What should I do if I want to determine the available balance within my HSBC daily ACH settlement limit to avoid initiating payments that would exceed my daily limit?

The following fields have been added for [Making Money Transfers](#), [Paying a Single Vendor](#) and [Processing Bulk Payments](#):

- **Daily Transaction Limit:** It is the maximum limit for processing ACH and checks payments on any given day, set by HSBC Bank
- **Daily Transaction Limit Available:** It is the available limit after processing payments of the present day and the payments initiated post cutoff of the previous day.
- **Payments Pending Approval:** This is the total amount of payments submitted and pending approval.

You can only process payments that are within the daily transaction limit. The SuiteApp will give an alert while processing the payments that exceed the daily transaction limit.

You can better plan and prioritize the payments to be processed for any day based on the remaining daily limit available.

For more information, see [Daily Transaction ACH Limit](#).

Where to see the remaining daily limit of the day?

You can refer to the **Remaining Daily Transaction Limit** field on the HSBC Bank Account portlet under the overview page of SuiteBanking Dashboard. Alternatively, the Pay Single Vendor and Bulk Bills pages will display the limit values, which are visible when HSBC Bank GL is selected.

Increasing or Decreasing Daily Limit

How can the Daily Transaction Limit and Virtual Card limit be increased or decreased?

You need to reach out to the NetSuite Support Team for queries related to the Daily Transaction Limit and Virtual Card Limit.

Daily Limit Exceeded

What to do in case of an urgent payment and the daily limit is exceeded?

If no payments are pending approval and the daily limit is exceeded, then no payments can be processed for that day. You can pay the vendor using a virtual card, provided the vendor accepts payments in virtual cards. Otherwise, create the payment for the next business day.

How to approve a payment when it is pending approval and the daily limit is exceeded?

Edit the payment and change the payment date to the next business day.

What to do in case the outgoing limit is exceeded and a money request withdrawal request cannot be initiated?

Wait until the next business day to initiate the withdrawal request.

What to do in case you are unable to approve the payment batch created from bulk bills with limit exceeded error?

Edit the payment batch and change the payment date to a future date, or remove some bills, or reject the batch.

Payment on Bank Holiday

Is it possible to create a payment on a bank holiday?

You can only submit payments on business days. Payment processing and money transfers can't be initiated on weekends or bank holidays. Change the payment date to a future date and create the payment.

Processing Virtual Card Remittances

What do my vendors do with the remittances they receive?

Your vendors will process the virtual card payment. They must only process the payment for the total amount displayed on the remittance.

Processing Payments for Different Amounts Than On The Remittance

Can my vendor process the payment for a different amount than indicated on the remittance?

No, single-use virtual cards can only be used for the total authorized amount. If your vendor processes the virtual card for a different amount, it will be declined. If your vendor needs to open the card for additional transactions (for example, per invoice or account), they should contact your accounts payable department.

Why do vendors have to run the virtual card for the exact amount?

This is a security feature associated with the service. Vendors can only process the payment for the total authorized amount.

Lost Card Information

What should my vendor do if they lose the card information provided in the remittance?

You can email a copy of the remittance email to the vendor. You can also cancel the virtual card and issue a new one. See [Canceling Virtual Cards](#) for more information.

In addition, your vendor can contact your accounts payable department if they've lost the virtual card's information. For more information, see [Reviewing Remittance Email](#).

Virtual Card Decline

What can my vendor do if the virtual card number does not work?

Your vendor should confirm that they have entered the correct card number, expiration date, CVC, and dollar amount. Then, they should try to process the payment again. If they continue to receive a decline code, they should contact your accounts payable department.

Notifications When Virtual Cards Are Assigned To Invoices

How will my vendors be notified when a virtual card has been assigned to an invoice?

Your vendors will receive a remittance email when a virtual card is assigned to an invoice.

Due to industry requirements, we can only send detailed card data (the 16-digit card number, CVC, and expiration date) if your vendor's email system uses the TLS (transport layer security) protocol. The TLS protocol uses a higher level of cryptography to encrypt data in emails and prevent the undetected loss or alteration of data.

If your vendor's email does not have TLS security, they'll receive a less detailed remittance email. This email contains basic payment information (for example, payment date, amount, check number, and invoice number), but it does not include the full card details. Instead, the email directs your vendor to access a Vendor Portal. For more information, see [Reviewing Remittance Email](#).

Handling Multiple Invoices For a Payment

If my vendor has multiple invoices for a payment, will a virtual card account number be assigned to each invoice?

No, each time payments are submitted, the system aggregates all records by vendor code. This results in the creation of a single virtual card account number that is issued for the total amount listed on the remittance.

Virtual Card Refunds or Credit Chargebacks

Can my vendor refund the virtual card, or can they charge back a credit?

Your vendor should contact your accounts payable department for assistance in these situations.

Overdue Balances

My vendor is claiming a balance that is overdue. When will the payment be sent?

Your vendor should contact your accounts payable department to discuss the status of the payment. For more information, see [Virtual Card Statuses](#).

Virtual cards are usually sent to vendors within 15 minutes after the payment has been sent for processing. Vendors should check their spam or junk email folders to ensure they didn't receive the remittance emails.

Remittance emails may arrive from this email address:

- no-reply@payment-automation.netsuite.com

Retaining Virtual Cards on File

Are vendors required to keep card accounts on file?

Vendors are not required to keep a card on file. Every new remittance generates a new virtual card number.

Adding, Removing, or Modifying the Virtual Card Program Administrator

What should I do if I want to change the Program Administrator for my Virtual Card program so that the new appointed person can contact Customer Support?

The Program Administrators are the primary contacts for the administration of your Virtual Card Program with HSBC.

A Program Administrator requesting that a new Program Administrator or Administrators be added to the account must provide all the necessary information to the newly appointed Program Administrator. This includes the Virtual Card account number and the verification ID that is required when calling to speak with a Virtual Card support specialist. The verification ID is listed under the HSBC Virtual Card account details in the Welcome Letter that was received when your HSBC application was approved.

Existing Program Administrators can call 1-800-411-9264 to reach a Virtual Card support specialist. They'll need to provide their Virtual Card Account ID and Verification ID. After the Program Administrator is verified and the request has been submitted, changes will be made and reflected on the account within 5-10 business days.

If you're not an existing Program Administrator or are requesting a change on behalf of yourself, call 1-800-411-9264 to reach a Virtual Card support specialist. You'll need to provide the name of an Authorized Person on the Certificate of Banking Authority, which should be included in your company records. This person will be contacted by HSBC and required to complete, sign, and return a program administrator change request form.

Resetting the Four-Digit Program Administrator Verification ID

What should I do if I want to request a reset of my four digit verification ID as the one I currently have is difficult for me to remember and I would like to change this to a more memorable code?

Any existing Program Administrator can change their own Verification ID by calling 1-800-411-9264, where they will be directed to a Virtual Card support specialist. The cards support specialist will complete identification and verification and process the change on the account profile. This change will be reflected within three to five business days.

Note: The verification ID was previously referred to as the unique identifier code.

Amending, Canceling, Recalling, or Blocking Virtual Card Payments

What should I do if I authorized a Virtual Card payment that needs to be amended because the amount, supplier, or payment details are incorrect?

Virtual Card payments that have been submitted and authorized cannot be amended, canceled, or recalled. If the payment has not yet posted, that is the recipient has not yet redeemed the payment, you can apply a block or stop to the payment. For details, see [Canceling Virtual Cards](#).

After the block or stop has been successfully applied, the invoice will be auto voided.

Setting Up Recurring Virtual Card Payments

What should I do if I want to schedule a recurring Virtual Card payment that can be sent to a supplier because I send the same amount each month to this supplier?

HSBC Virtual Card payments allow you to pay invoices using a secure payment method. Each Virtual Card contains the exact payment amount, for a given supplier in reference to a unique invoice for a specified time period, after which the Virtual Card expires. So, you can't set up recurring payments.

Setting Up Auto-Debit

What should I do if I want to request Virtual Card monthly statement payments be debited from a bank account through auto-debit?

As part of your HSBC Online Account relationship, you have been provided with an HSBC Online Account. Only this account can be used to pay your Virtual Card monthly statement amount.

You do have the ability to submit one-off payments. If you need help, call 1-800-411-9264 to reach a Virtual Card support specialist.

Multiple accounts with HSBC Bank

How can I open additional accounts and or services with HSBC Bank?

You can request for additional accounts or services with HSBC Bank by contacting the NetSuite Support team. Upon receipt of your request, HSBC will contact you by email for additional information.

Multiple Subsidiaries

How can I apply for the other US subsidiaries?

In your NetSuite One World Account, go to SuiteBanking > HSBC Application > Apply > New Application, and select the subsidiary you want to apply for HSBC Online Account. For more information, see [Applying for an HSBC Online Account](#).

How do I see the accounts for the other subsidiaries or switch between subsidiaries?

To access or switch between subsidiaries accounts, go to SuiteBanking > Payment Automation > Dashboard. You can change the subsidiary from the drop-down list in the left navigation panel, if you have role permissions.

Note: The Company Name for the entity will be at the top of your screen. Each entity will have its own Dashboard, Transaction and credit limit, and its own bank transfer history, account activity and Virtual Card activity history.

How do I make payments using the other subsidiaries?

While making a payment, you can choose the respective subsidiary GL account. To access the Payment Automation dashboard, go to SuiteBanking > Payment Automation > Dashboard. You can change the subsidiary from the drop-down list in the left navigation panel, if you have role permissions.

Note: The Company Name for the entity will be at the top of your screen. Each entity will have its own Dashboard and Transaction and credit limit displayed. You will have a bank transfer history, account activity and Virtual Card activity history on an entity level.

I previously applied for an HSBC Payment Automation account but canceled or failed to complete the application. I want to re-apply for Payment Automation through one or many subsidiaries.

You can go to SuiteBanking > HSBC Application > Apply and Resume application from the status page. If you are not able to complete the application within 90 days from the application initiation or a subsidiary is not listed, contact NetSuite Support team.

Status of HSBC Applications

How do I see the status for the subsidiaries for the HSBC Application I applied for?

Go to SuiteBanking > HSBC Application > Apply to check the list of applications and their statuses. The sublist displays the **Application ID, Subsidiary, Submitted By, Account Application Status, Credit Application Status, and Action**. To see more information about an application, click **Show Details** in the **Actions** column for the required application. The Verification page is displayed for a completed application.

Note: You need to have access to the subsidiary for which the application is raised to view the details of the respective subsidiary.

NetSuite SuiteApps License Client not installed

What will happen if I don't install the NetSuite SuiteApps License Client before July 24, 2024?

Existing customers could process payments and initiate Add Money or Withdrawal until October 31, 2024. However, they won't be able to apply for new HSBC accounts without installing the NetSuite SuiteApps License Client.

What will happen if I don't install the NetSuite SuiteApps License Client by October 31, 2024?

You won't be able to submit payments for processing with HSBC from November 1, 2024.

License Expired

My license expired, can I process payments with HSBC Bank?

No, you need a valid AP Automation license to process payments with HSBC Account. Please contact your account manager.

My license is renewed, still I am facing license expired error when trying to process payments from HSBC Bank Account.

Go to Setup > License Client > License Dashboard and check the **Status** of the **AP Automation** license in the License Dashboard.

If the status is **Expired** or **Stale**, manually fetch the license from License server. Go to Setup > License Client > Manual License Request to fetch the license. After the manual license request, renewed license details are shown in NetSuite SuiteApp Licenses. If the **AP Automation license** is active, the License

Dashboard is updated with the **Active** status. Now you shall be able to process the payments. Please contact Customer Support if your license status is not updated.

License Validation Failed

What will happen if license validation fails?

If the license validation fails, you won't be able to process payments from your HSBC bank account and you cannot apply for a new HSBC bank account.

Ad Hoc Mid-Cycle Payment to Pay off the Virtual Card Balance

What should I do if I submitted a mid-cycle payment that I do not see on my HSBC Virtual Card account, and I would like to understand if this payment has been credited to my account?

Payments can take up to five business days to post to your account. If the payment is not reflected in your account after five business days, call 1-800-411-9264 to reach a Virtual Card support specialist for assistance.

Making an Ad Hoc Mid-Cycle Payment to Clear the Virtual Card Balance

What should I do if I want to submit a mid-cycle payment to free up part or all of my Virtual Card credit line?

A Program Administrator can call 1-800-411-9264 to reach a Virtual Card support specialist and request to make a one-time payment from a preferred bank account. Support will request details of the debiting account.

Initiating a Non-Fraud Virtual Card Payment Dispute

What should I do if I want to initiate a Virtual Card non-fraud dispute because I have a disagreement on the goods, services, or both, received with the recipient of the payment?

Contact your supplier to review the items in dispute. If you are unable to resolve the issue, call 1-800-411-9264 to reach a Virtual Card support specialist who can conduct a formal investigation on your behalf.

Accessing an Older Virtual Card Statement Not Available on the Payment Automation Dashboard

What should I do if I want to access an older Virtual Card billing statement that is not available on the Payment Automation dashboard?

You can view, download, and print your Virtual Card statements from your Payment Automation dashboard for the last six months. The Program Administrator can request a paper copy of the statement

older than six months to be mailed to the company's billing address. To raise the request for a paper copy of the statement, call 1-800-411-9264 to reach a Virtual Card support specialist.

Disagreeing with the Annual Statement Credit Amount

What should I do if I have received an annual statement credit to my Virtual Card account, and I disagree with the amount received?

You will receive an Annual Statement Credit of 1% on all eligible purchases, as detailed in the Pricing Addendum to your Virtual Corporate Cards Services Schedule. This will show up on your Virtual Card statement following your annual account opening anniversary.

For example, if your HSBC Online Account was opened in September 2022, you will see the credit on your October 2023 statement. If you have any further questions, call 1-800-411-9264 to reach a Virtual Card support specialist.

Requesting an Investigation Non-Receipt of Annual Credit

What should I do if I have not received an annual statement credit to my Virtual Card account and would like further information?

You will receive an Annual Statement Credit of 1% on all eligible purchases, as detailed in the Pricing Addendum to your Virtual Corporate Cards Services Schedule. This information will be displayed on your Virtual Card statement following your annual account opening anniversary date.

For example, if your account was opened in September 2022, you will see this reflected on your October 2023 statement. If you have any questions, call 1-800-411-9264, where you will be directed to a Virtual Card support specialist.

Clearing Virtual Card Account Delinquency and Reactivating the Account

What should I do if I am unable to make a Virtual Card payment because the account appears to be deactivated?

If your account is delinquent by more than 60 days, you will no longer be able to create Virtual Cards to pay your suppliers. Your Virtual Card has been set up with auto pay to automatically deduct your last statement balance in full from your HSBC Online Account.

Ensure there are sufficient funds in the account to pay off the outstanding balance on your Virtual Card statement. You can also make a one-time payment over the phone by calling 1-800-411-9264 to reach a Virtual Card support specialist.

After the account has been paid in full, the Virtual Card support specialist will reactivate your account so that you can resume using your Virtual Card account.

Submitting a Notice of Suspected Virtual Card Fraudulent Activity

What should I do if I have identified activity on my Virtual Card account that I do not recognize and would like to report this as potential fraud on my Virtual Card account?

If you suspect fraud on your Virtual Card account, immediately call 1-800-411-9264 to reach a Virtual Card support specialist who are available 24/7.

Acting Upon a Remittance Email

What should I do with a remittance email I have received?

Process the Virtual Card in the same way you process all payment cards transactions, but only for the **Total** amount displayed on the remittance.

Processing a Different Virtual Card Amount

Can I process a virtual card payment for a different amount than the Total amount on the remittance email that I have received?

For security reasons, single-use Virtual Cards can only be used for the total authorized amount. Trying to process a virtual card for a different amount will result in a failure.

Dealing with Lost Virtual Card Information

What should I do if I lose virtual card information?

If you lose the Virtual Card information provided in the remittance email, view the Remittance Voucher to see the Virtual Card details. For more information, see [Reviewing Remittance Email](#).

You can contact the Virtual Card Customer Support available 24/7 at 1-800-411-9264 to obtain the account information for that specific invoice.

Dealing with Virtual Card Number Not Working

What should I do if the Virtual Card number I enter does not work?

Confirm that you have entered the correct 16- digit Virtual Card number, card verification code (CVC) expiration date, and the amount. Then, try to process the payment again. If the payment still cannot be processed, contact Virtual Card Customer Support available 24/7 at 1-800-411-9264.

Virtual Card Remittance Email

How will I be notified when a Virtual Card is assigned to an invoice?

If your server is secure, each email remittance will include all the information needed to process the virtual card payment: the expiration date, card verification code (CVC), invoice details, and the 16-digit virtual card number.

If your server is NOT secure because the transport layer security (TLS) protocol is not used, the virtual card number will be masked in the email remittance.

You will be asked to register at <https://www.csipaysystems.com/payee/auth>. You must register using the email address that the remittance was sent to. This is a one-time registration process, and you will use your login credentials to receive all future payments.

After you log in to the website, you will have access the information needed to process your virtual card payment, including invoice details, the 16-digit virtual card number, expiration date, and card verification code (CVC).

Paying Multiple Invoices from a Single Vendor

If I have multiple invoices for a payment, will a Virtual Card be assigned to each invoice?

No, each time payments are submitted, the system aggregates all records by vendor. A single Virtual Card is issued for the **Total** amount listed on your remittance.

Refunding a Virtual Card

Can I refund a Virtual Card?

Contact Virtual Card Customer Support available 24/7 at 1-800-411-9264 for assistance.

Handling an Overdue Payment

I have a payment that is overdue. When will the payment be sent?

Contact Virtual Card Customer Support available 24/7 at 1-800-411-9264 for assistance.

To understand the Virtual Card processing time-line, see [Virtual Card Billing Cycle](#)

Keeping Virtual Cards on File

Am I required to keep a received Virtual Card on file?

You don't have to keep a card on file. A new unique Virtual Card number is generated for each remittance.

Closing Virtual Card Before Anniversary Date

If I close my virtual card before my anniversary date, will I still get credit for the annual statement credit?

You won't be eligible to receive credits for the annual statement credit if you decide to close your HSBC Virtual Card Account before the card's anniversary date. To ensure you understand the conditions for receiving your annual statement credit, refer to section 3 of the Pricing Addendum for HSBC Virtual Cards offered through Oracle NetSuite AP Automation, which is a part of your HSBC Terms. For more information, see [HSBC Embedded Banking Useful Documents and Links](#).

Submitting a Query Regarding Changes to Fees and Charges on the Statement

What should I do if I disagree with the charges on my monthly billing statement?

For any questions regarding changes to fees and charges on the statement, contact NetSuite Customer Support.

Submitting a Query Regarding Billing Transactions or Charges

What should I do if I disagree with the charges on my monthly billing statement?

For any questions regarding billing transactions or charges, contact NetSuite Customer Support.

Understanding the Billing Statement Calculation

What should I do if I want to learn how the billing statement invoice that I received for my account was calculated?

You can access your invoice and transaction level details from the Payment Automation dashboard. The invoice displays the total of all service charges and includes a detailed summary with unit pricing.

Understanding the Two Billing Statements

Why did I receive two billing statements – one invoice for my Virtual Card account and one for my accounts payable?

Payments made through your Virtual Card account generate a monthly billing statement that is specific to this product. All other charges will be reflected on a separate billing statement.

Requesting a Billing Statement Copy

What should I do if I want to request a copy of a billing statement that is not available for me to access from the Payment Automation dashboard?

You can view and download e-statements from your Payment Automation dashboard for the last six months for Virtual Cards and 12 months for all charges not related to Virtual Cards.

If you want to view an earlier statement, contact NetSuite Customer Support, providing the dates of the statement required and the type of statement: Virtual Card or all other charges. A copy of the statement will be sent to you.

Requesting a Change to the Auto-Debit Account Setup

Is it possible to change the setup of my auto-debit account? I have another bank account that is used to manage other payments on behalf of my business, and I would like all debits to be sent from one account.

As part of the SuiteBanking proposition, you have been provided with an HSBC Online Account. This account can't be changed.

Changing the Allocation of the Credit Limit between ACH and Virtual Cards after Onboarding

What should I do if I want to request a change to the allocation of credit between my ACH and Virtual Card products because I expect to initiate more payments through ACH or Virtual Cards?

Credit allocation between ACH and Virtual Card products can't be interchanged. You may request to decrease either ACH or Virtual Card credit limit by contacting NetSuite Customer Support.

Requesting a Virtual Card Credit Balance Refund

What should I do if I want to request a credit balance refund because a mid-cycle payment to my Virtual Card account was not reflected in my monthly billing statement?

Call 1-800-411-9264 to reach a Virtual Card support specialist for assistance.

Disagreeing the Billing Amount because of Additional Fees

What should I do if I disagree the monthly billing statement that I received for my Virtual Card account because of additional fees?

Late fees are calculated at the rate of 3% of the outstanding balance. You can view your Virtual Card invoice and late fee details through the Payment Automation dashboard. For further assistance, call 1-800-411-9264 to reach a Virtual Card support specialist.

Requesting a Large Print Statement

What should I do if I want to request my statements in large print as the current font size is difficult to view?

To request an ADA-compliant copy of your statement in a larger font size call 1-800-411-9264 to reach a Virtual Card support specialist.

Setting Up Debit Blocks on the HSBC Online Account

Will there be a debit block on my HSBC Online Account to block any attempted ACH Debits?

You can't set up debit blocking on the HSBC Online Account, but the account is automatically configured to allow certain limited debits. For more information, see [Debit Blocking](#).

Remittance Notifications Using Advanced PDF/HTML Templates

What are the functionalities of remittance notifications using Advanced PDF/HTML templates?

Starting version 5.0, the Payment Automation SuiteApp will send email remittance notifications to vendors for ACH and check payments. You can resend notifications, track sent notifications, and include accurate payment details with vendor credits applied to bills.

Customization Capabilities Supported by Advanced PDF/HTML Templates

What are the customization capabilities supported by the Advanced PDF/HTML Template feature?

The Payment Automation SuiteApp currently doesn't support the customization capabilities that Advanced PDF/HTML offers.

Enabling Advanced PDF/HTML Templates Before Upgrade

What happens if the Advanced PDF/HTML Template feature is not enabled before the upgrade?

The Payment Automation SuiteApp upgrade to the version 5.0 will fail and no further updates will be received by the account if the feature is not enabled. You will still be able to use the SuiteApp and process payments.

What happens if I enable the Advanced PDF/HTML Templates feature before the upgrade?

If you enable the feature before the upgrade, the Payment Automation SuiteApp will be upgraded to version 5.0.

Remittance Emails Layout

What do the remittance emails look like?

The remittance emails include a PDF copy of the payment voucher, which contains accurate payment details, including vendor credits applied to bills.

Download Remittance Notifications

Can I download copies of earlier remittance notifications?

You will still be able to download copies of remittance notifications for payments processed before your account is upgraded to the version 5.0.

Email Address for Remittance Notifications

What email address will the vendors receive the remittance notifications from?

For ACH and check payments, your vendors will receive remittance emails from the email address of the user who initiated the payment.

- In the case of bulk bill payment processing, if batch approval routing is enabled, the email is sent from the approver's email address.
- If an email address is specified in Home > Set preferences > General > User profile > From Email Address, then the email is sent from this address.

For virtual card payments, the remittance email is sent from noreply@payment-automation.netsuite.com.

Changing Company Information in Payment Voucher

Can I change my company information that is shown in the payment voucher?

Yes, you can. For more information, see [Updating Information Included in the Remittance Voucher](#).
