This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish, or display any part, in any form, or by any means. Reverse engineering, disassembly, or decompilation of this software, unless required by law for interoperability, is prohibited.

The information contained herein is subject to change without notice and is not warranted to be error-free. If you find any errors, please report them to us in writing.

If this is software, software documentation, data (as defined in the Federal Acquisition Regulation), or related documentation that is delivered to the U.S. Government or anyone licensing it on behalf of the U.S. Government, then the following notice is applicable:

U.S. GOVERNMENT END USERS: Oracle programs (including any operating system, integrated software, any programs embedded, installed, or activated on delivered hardware, and modifications of such programs) and Oracle computer documentation or other Oracle data delivered to or accessed by U.S. Government end users are "commercial computer software," "commercial computer software documentation," or "limited rights data" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, the use, reproduction, duplication, release, display, disclosure, modification, preparation of derivative works, and/or adaptation of i) Oracle programs (including any operating system, integrated software, any programs embedded, installed, or activated on delivered hardware, and modifications of such programs), ii) Oracle computer documentation and/or iii) other Oracle data, is subject to the rights and limitations specified in the license contained in the applicable contract. The terms governing the U.S. Government's use of Oracle cloud services are defined by the applicable contract for such services. No other rights are granted to the U.S. Government.

This software or hardware is developed for general use in a variety of information management applications. It is not developed or intended for use in any inherently dangerous applications, including applications that may create a risk of personal injury. If you use this software or hardware in dangerous applications, then you shall be responsible to take all appropriate fail-safe, backup, redundancy, and other measures to ensure its safe use. Oracle Corporation and its affiliates disclaim any liability for any damages caused by use of this software or hardware in dangerous applications.

Intel and Intel Inside are trademarks or registered trademarks of Intel Corporation. All SPARC trademarks are used under license and are trademarks or registered trademarks of SPARC International, Inc. AMD, Epyc, and the AMD logo are trademarks or registered trademarks of Advanced Micro Devices. UNIX is a registered trademark of The Open Group.

This software or hardware and documentation may provide access to or information about content, products, and services from third parties. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to third-party content, products, and services unless otherwise set forth in an applicable agreement between you and Oracle. Oracle Corporation and its affiliates will not be responsible for any loss, costs, or damages incurred due to your access to or use of third-party content, products, or services, except as set forth in an applicable agreement between you and Oracle.

If this document is in public or private pre-General Availability status:

This documentation is in pre-General Availability status and is intended for demonstration and preliminary use only. It may not be specific to the hardware on which you are using the software. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to this documentation and will not be responsible for any loss, costs, or damages incurred due to the use of this documentation.

If this document is in private pre-General Availability status:

The information contained in this document is for informational sharing purposes only and should be considered in your capacity as a customer advisory board member or pursuant to your pre-General Availability trial agreement only. It is not a commitment to deliver any material, code, or functionality, and should not be relied upon in making purchasing decisions. The development, release, timing, and pricing of any features or functionality described in this document may change and remains at the sole discretion of Oracle.

This document in any form, software or printed matter, contains proprietary information that is the exclusive property of Oracle. Your access to and use of this confidential material is subject to the terms and conditions of your Oracle Master Agreement, Oracle License and Services Agreement, Oracle PartnerNetwork Agreement, Oracle distribution agreement, or other license agreement which has been executed by you and Oracle and with which you agree to comply. This document and information contained herein may not be disclosed, copied, reproduced, or distributed to anyone outside Oracle without prior written consent of Oracle. Documentation Accessibility

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at <https://www.oracle.com/corporate/accessibility>.

Access to Oracle Support

Oracle customers that have purchased support have access to electronic support through My Oracle Support. For information, visit <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info> or visit <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs> if you are hearing impaired.

Sample Code

Oracle may provide sample code in SuiteAnswers, the Help Center, User Guides, or elsewhere through help links. All such sample code is provided "as is" and "as available", for use only with an authorized NetSuite Service account, and is made available as a SuiteCloud Technology subject to the SuiteCloud Terms of Service at www.netsuite.com/tos.

Oracle may modify or remove sample code at any time without notice.

No Excessive Use of the Service

As the Service is a multi-tenant service offering on shared databases, Customer may not use the Service in excess of limits or thresholds that Oracle considers commercially reasonable for the Service. If Oracle reasonably concludes that a Customer's use is excessive and/or will cause immediate or ongoing performance issues for one or more of Oracle's other customers, Oracle may slow down or throttle Customer's excess use until such time that Customer's use stays within reasonable limits. If Customer's particular usage pattern requires a higher limit or threshold, then the Customer should procure a subscription to the Service that accommodates a higher limit and/or threshold that more effectively aligns with the Customer's actual usage pattern.

Beta Features

This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish, or display any part, in any form, or by any means. Effective Date Pricing

The Effective Date Pricing SuiteApp enables you to set a schedule for specific price changes in advance. You can select the start date and end date when you expect the price changes to take effect. A scheduled script runs in the background to automatically update item prices at the scheduled period. On the specified end date, the item price goes back to its original price.

You can also set the price as a permanent change. The permanent change in the item price takes effect on the date you selected as the start date for the price update.

For optimal performance, you should run each script daily at midnight in the time zone specified in Company Preferences.

You can apply price updates to an item or a customer. The Effective Date Pricing SuiteApp includes the following update types:

- Item for single item updates
- Item Category for updating a group of items
- Customer for single customer updates
- Customer Group for updating a group of customers

You can apply a price update on these update types by creating a price update record. For more information, see [Creating Price Update Records](#).

Effective Date Pricing Availability

The Effective Date Pricing SuiteApp is a managed and shared SuiteApp that automatically updates whenever enhancements are added.

For instructions on installing this SuiteApp, see [Installing Effective Date Pricing](#).

Effective Date Pricing Process Flow

The following graphic illustrates the Effective Date Pricing SuiteApp process:

To use the Effective Date Pricing SuiteApp, you start by creating a price update record. Select the Update Type and the corresponding item, customer, item category, or customer group for the update type.

You also need to specify the start date when the new item price should take effect. If applicable, specify the end date when the item price goes back to its original price. If you want to set the new item price permanent, check the **Permanent Price Change** box.

Then, you need to create a price detail update containing the following details:

- For item price updates – currency, quantity pricing level, price level, and modified price
- For item category price updates – currency, quantity pricing level, price level, and category price % increase

- For customer and customer group updates – currency and modified price

A script runs in the background to automatically update the item price on your specified start date.

Note: Any price update without a price detail update won't be processed.

When the specified end date arrives, a script runs automatically to change the price back to the original item price.

If the price update or revert fails, check the Error Messages subtab in the price update record for details.

For more information about price update failures, see [Troubleshooting Unprocessed Updates](#).

Required Features for Effective Date Pricing

This topic lists features you need to turn on when using the Effective Date Pricing SuiteApp. If any of these features is turned off, price updates won't be processed.

Feature	Notes
Multiple Currencies	All supported currencies can be updated.
Quantity Pricing	All supported quantity price levels can be updated.
Multiple Prices	All supported price levels can be updated.
Custom Records	-
Client SuiteScript	-
Server SuiteScript	-

Permissions Required for Effective Date Pricing

This topic lists permissions you need for using the Effective Date Pricing SuiteApp.

Permissions

To create, update, or view price updates, you'll need these permissions:

Permission	Subtab	Minimum Permission Level	Maximum Permission Level
Price Update	Custom Record	Edit	Full
Price Detail Update	Custom Record	Edit	Full
Price Update Error Messages	Custom Record	View	View
Price Update Logs	Custom Record	View	View
Item Category	Custom Record	Edit	Full
Items	List	View	View

Permission	Subtab	Minimum Permission Level	Maximum Permission Level
CRM Groups	List	View	View

For scheduling and running the scheduled script, you'll need these permissions:

Permission	Subtab	Minimum Permission Level	Maximum Permission Level
SuiteScript	Setup	Full	Full
Perform Search	List	View	View

Note: Giving a role SuiteScript permission exposes account customizations.

Installing Effective Date Pricing

This topic tells you how to install the Effective Date Pricing SuiteApp.

Note: Only administrators can install this SuiteApp.

To install Effective Date Pricing:

1. Go to Customization > SuiteBundler > Search and Install Bundles.
2. On the Search and Install Bundles page, use the following information to search for the SuiteApp:
 - Bundle Name: **Effective Date Pricing**
 - Bundle ID: **222420**
3. Click the Effective Date Pricing link to display Bundle Details page.
 - To review the documentation for the SuiteApp, click the **Documentation** link.
 - The **Overview** subtab displays the abstract and description of the SuiteApp.
 - The **Components** subtab lists bundle objects, including their custom script IDs, referencing objects, and lock status.

For more information, see the help topic [Bundle Details](#).

4. Click **Install**.

During the installation, you can click **Refresh** to get the latest status.

Supported Item Types for Effective Date Pricing

The Effective Date Pricing SuiteApp supports the following item types:

- Inventory items
 - Matrix (Lot Numbered, Serialized)
 - Non-Matrix (Lot Numbered, Serialized)
- Non-Inventory items
 - Matrix (Sale, Resale)

- Non-Matrix (Sale, Resale)
- Assembly items
 - Matrix (Lot Numbered, Serialized)
 - Non-Matrix (Lot Numbered, Serialized)

Update Types for Creating Price Update Records

To start using the Effective Date Pricing SuiteApp, you need to create a record for each update type to which the price change applies. You define the update types by creating price update records.

A validation message displays when there is a conflict in any price update. For example, conflicts may occur when the dates overlap with an existing price update record for an item that belongs to the selected item category.

You can create a price update record for the following update types:

- [Item Update Type](#)
- [Item Category Update Type](#)
- [Customer Update Type](#)
- [Customer Group Update Type](#)

Note: For the Customer and Customer Group update types, only custom price levels are supported.

Item Update Type

The Item Update Type enables you to apply price updates on your selected item. The price update for the selected item takes effect on the specified start date and ends if there is a specified end date.

The Effective Date Pricing SuiteApp currently supports the following item types:

- Inventory Item
- Non-inventory Item
 - For Sale
 - For Resale
- Assembly/Bill of Materials

An alert message shows up if you have set up unsupported item types. There are item subtypes that cannot be filtered out of the list such as Non-inventory Items for Purchase.

You can apply price updates to supported item types that you have set up in your account. For more information about items, see the help topic [Item Types](#).

Item Category Update Type

Selecting the Item Category update type enables you to apply price updates on a group of items. Price updates apply to all items that belong to your selected item category. You can also create an item category by selecting - **New** - from the **Item Category** field.

You can create an item category when you have the correct assigned permission.

Items added to an item category after validation:

- are not processed if a price update is already in progress
- are not validated against existing price updates
- can possibly cause an overlap wherein an item can be updated multiple times in a day

Note: Items removed from an item category after running the script are not reverted to their original prices.

Customer Update Type

The Customer Update Type assigns the price update to a specific customer on the scheduled date specified in the price update record. You can select which item needs the price update for the selected customer.

This update type also enables you to create customers by selecting - **New** - from the **Customer** field.

Customer Group Update Type

The Customer Group update type enables you to assign a price update to a specific customer group. Price updates are applied to all customers that belong to the selected customer group.

For more information about creating a customer group, see the help topic [Working with Groups](#).

Customers added to a customer group after validation:

- are not processed if a price update is already in progress
- are not validated against existing price updates
- can possibly cause an overlap wherein a customer can be updated multiple times in a day

Only static customer groups are supported.

Note: To create a customer group, you need to run NetSuite using a role with permission to create customer group records.

Creating a New Item Category

Use the following procedure to create a new item category in the Effective Date Pricing SuiteApp.

To create a new Item Category:

1. Go to Lists > Effective Date Pricing > Item Category > New.
2. Specify a name for the new item category. You can specify a descriptive name to help you identify the items included in the item category.
3. In the **Items** field, select at least one item to include in the item category.

 **Tip:** To select more than one item, press **Ctrl** as you select the items.

 **Note:** You can select a maximum of 1000 items for a given item category.

4. Optionally, check the **Inactive** box to prevent the item category from displaying in the Item Category list.
5. Click **Save**.

 **Note:** If you select items that are not supported by the Effective Date Pricing SuiteApp, you can still create a new Item Category record. However, running the map/reduce script validates the items selected. If the new Item Category contains unsupported item types, the price update will not be processed. An error message saying **Price Update Failed for Invalid Item Type** shows up in the **Error Messages** subtab. For more information, see the following topics:

- [Supported Item Types for Effective Date Pricing](#)
- [Check Update Logs and Error Messages](#)

Creating Price Update Records

This section explains how to create and test price update records in the Effective Date Pricing SuiteApp. Read the following topics to know more:

- [Creating an Item Price Update Record](#)
- [Creating an Item Category Price Update Record](#)
- [Creating a Customer Price Update Record](#)
- [Creating a Customer Group Price Update Record](#)
- [Testing the Effective Date Pricing Solution](#)

Creating an Item Price Update Record

This topic explains how to create an Item price Update record in the Effective Date Pricing SuiteApp.

 **Note:** To complete this procedure, you need to run NetSuite using a role with permission to create an Item Price Update record.

To create an item price update record:

1. Go to Lists > Effective Date Pricing > Price Update > New.
2. In the **Update Type** field, select **Item**.
3. To set the price update permanent, check the **Permanent Price Change** box.
4. In the **Item** field, select the item to which the price update applies.
5. In the **Start Date** field, specify the date you expect the price update to apply. The default value for this field is the current date.

Note: A price update with today's date as the start date and created after the script has been run does not automatically take effect today. You need to manually run the map/reduce script for the price update to take effect today. Otherwise, the price update is not applied to the item unless you change the start date to a future date. For more information, see the help topic [Script Deployment](#).

6. In the **End Date** field, specify the date when the item price reverts to the original price.

Note: If you check the **Permanent Price Change** box, the **End Date** field is cleared and becomes disabled.

7. Click **Save**.

Note: After creating the Item Price Update record, you need to create the corresponding details of the price update. For more information, see [Creating a Price Detail Update for Item Type](#).

Creating an Item Category Price Update Record

This topic explains how to create an Item Category Price Update record in the Effective Date Pricing SuiteApp.

To create an item category price update record:

1. Go to Lists > Effective Date Pricing > Price Update > New.
2. In the **Update Type** field, select **Item Category**.
3. To set the price update permanent, check the **Permanent Price Change** box.
4. Select the item category to which the price update applies.
The price update applies to all items that belong to the selected item category.
To create a new item category, see [Item Category Update Type](#).
5. In the **Start Date** field, specify the date you expect the price update to apply. The default value for this field is the current date.

Note: A price update with today's date as the start date and created after the script has been run does not automatically take effect today. You need to manually run the map/reduce script for the price update to take effect today. Otherwise, the price update is not applied to the item category unless you change the start date to a future date. For more information, see the help topic [Script Deployment](#).

6. In the **End Date** field, specify the date when the price of the items under the item category reverts to the original price.

Note: If you check the **Permanent Price Change** box, the **End Date** field becomes disabled.

7. Click **Save**.

Note: After creating the item category price update record, you need to create the corresponding details of the price update. For more information, see [Creating a Price Detail Update for Item Category Type](#).

Creating a Customer Price Update Record

This topic explains how to create a Customer Price Update record in the Effective Date Pricing SuiteApp.

To create a customer price update record:

1. Go to Lists > Effective Date Pricing > Price Update > New.
2. In the **Update Type** field, select **Customer**.
3. To set the price update permanent, check the **Permanent Price Change** box.
4. In the **Item** field, select the item to which the price update applies.
5. In the **Customer** field, select the customer, or to create a new customer, go to Lists > Relationships > Groups > New.

The price update applies to the selected customer only.

For more information about creating customer records, see the help topic [Customers](#).

6. In the **Start Date** field, specify the date you expect the price update to apply.

The default value for this field is the current date.

Note: A price update with today's date as the start date and created after the script has been run does not automatically take effect today. You need to manually run the map/reduce script for the price update to take effect today. Otherwise, the price update is not applied to the customer unless you change the start date to a future date. For more information, see the help topic [Script Deployment](#).

7. In the **End Date** field, specify the date when the item custom price of the customer reverts to the original price.

Note: If you check the **Permanent Price Change** box, the **End Date** field is cleared and becomes disabled.

8. Click **Save**.

Note: After creating the customer price update record, you need to create the corresponding details of the price update. For more information, see [Creating a Price Detail Update for Customer Type](#).

Creating a Customer Group Price Update Record

This topic explains how to create a Customer Group Price Update record in the Effective Date Pricing SuiteApp.

To create a customer group price update record:

1. Go to Lists > Effective Date Pricing > Price Update > New.
2. In the **Update Type** field, select **Customer Group**.
3. To set the price update permanent, check the **Permanent Price Change** box.
4. In the **Item** field, select the item to which the price update applies.
5. In the **Customer Group** field, select the customer group.

The price update applies to all customers that belong to the selected customer group.

For more information about creating a customer group, see the help topic [Working with Groups](#).

6. In the **Start Date** field, specify the date you expect the price update to apply.

The default value for this field is the current date.

Note: A price update with today's date as the start date and created after the script has been run does not automatically take effect today. You need to manually run the map/reduce script for the price update to take effect today. Otherwise, the price update is not applied to the customer group unless you change the start date to a future date. For more information, see the help topic [Script Deployment](#).

7. In the **End Date** field, specify the date when the item custom price of the customers under the customer group reverts to the original price.

Note: If you check the **Permanent Price Change** box, the **End Date** field is cleared and becomes disabled.

8. Click **Save**.

Note: After creating the customer group price update record, you need to create the corresponding details of the price update. For more information, see [Creating a Price Detail Update for Customer Group Type](#).

Price Update Statuses in Effective Date Pricing

The table below explains the statuses you'll see in the price update record and Price Detail Update page in the Effective Date Pricing SuiteApp.

Status	Description
Not Started	The initial status when you create a new price update record.
In Progress	The price update has already been applied successfully to all applicable items. When status is In Progress, only the end date can still be updated.
Completed	The price update has ended based on the specified end date. This status is also displayed for price update records with an applied permanent price change.
Price Update Failed	The requested price update was unsuccessful to some or all of the applicable items or customers.
Price Revert Failed	The request to revert the price to what it was before the last unsuccessful price change.

Testing the Effective Date Pricing Solution

When you want to test the Effective Date Pricing solution, check the **Test Mode** box on the price update record. Enter the current date for the price update start and end dates. You can see pricing changes occur immediately when you run the scheduled scripts.

Price Update List Search Customize

When you are running in test mode:

- Normal restrictions for Start Date and End Date do not apply. You can enter a past date or the current date, and date validations are disabled.
- The Status field is enabled so you can change the status.

Handling of Price Update Overlaps

Entering a price update that overlaps with the date range of an existing price update is not permitted. This rule applies to price updates for the same item, item category, customer, or customer group. An error message shows up including links to the affected price update records.

Note: In some cases, instead of an error message, a confirmation message displays stating that there is a possible overlap. You can choose to cancel and proceed with creating the price update record.

The Effective Date Pricing SuiteApp handles overlapping validation differently when saving each of the four item types.

Refer to the following topics for further information about handling of price update overlaps:

- [Item Price Update Type Overlaps](#)
- [Item Category Price Update Type Overlaps](#)
- [Customer Price Update Type Overlaps](#)
- [Customer Group Price Update Type Overlaps](#)

Item Price Update Type Overlaps

When saving an Item Price Update, Effective Date Pricing checks for overlapping dates with:

- An existing Item Price Update that has the same item.
- An existing Item Category Price Update containing an item category that includes the item.

Item Category Price Update Type Overlaps

When saving an Item Category Price Update, Effective Date Pricing checks for overlapping dates with:

- An existing Item Category Price Update that has the same item category.
- An existing Item Price Update containing an item that is part of the item category.
- An existing Item Category Price Update that has an item category related to the items of the given item category. For example, you are saving Item Category 1 (containing Item 1 = Purse and Item 2 = Backpack). Item 2 is also a member of Item Category 2, so the system checks for Item Category 1 and Item Category 2.

Customer Price Update Type Overlaps

When saving a Customer Price Update, Effective Date Pricing checks for overlapping dates with:

- An existing Customer Price Update that has the same customer and item.
- An existing Customer Group Price Update that has the same item.

 **Note:** This type of overlap results in a confirmation message.

Customer Group Price Update Type Overlaps

When saving a Customer Group Price Update, Effective Date Pricing checks for overlapping dates with:

- An existing Customer Group Price Update that has the same customer group and item.
- An existing Customer Price Update that has the same item, and a customer that is a member of the customer group.
- An existing Customer Group Price Update that has the same item. For example, you are saving Customer Group 1 (containing Customer 1 and Customer 2) for Item A. You have an existing Customer Group Price Update with Customer Group 2 for the same item, Item A. Customer 2 may or may not be a member of Customer Group 2. Effective Date Pricing checks for Customer Group 1 and Customer Group 2 and a confirmation message displays.

 **Note:** This type of overlap results in a confirmation message.

Viewing Price Updates

You can view a list of all price updates in the Effective Date Pricing SuiteApp.

To view all price updates:

1. Go to Lists > Effective Date Pricing > Price Update.
2. On the Price Update list, locate the item you want to view and click **View** to display the price update record.
 - You can click **Edit** on the record to make changes to the item, or click **Edit** instead of View on the Price Update page.

- You can also create a new price detail update by clicking **New Price Detail Update** on the Price Update page.

Creating Price Detail Updates

The Price Detail Update page in the Effective Date Pricing SuiteApp lets you specify the new item price for the price update. You can specify the new price for the update type you created in the price update record. The Price Update section displays the information about the price update record along with the status and price update ID. For more information about price update records, see [Update Types for Creating Price Update Records](#).

Refer to the following topics for information about how to set a price detail update on each update type:

- [Creating a Price Detail Update for Item Type](#)
- [Creating a Price Detail Update for Item Category Type](#)
- [Creating a Price Detail Update for Customer Type](#)
- [Creating a Price Detail Update for Customer Group Type](#)

You can access the Price Detail Update page after saving the price update record. The **New Price Detail Update** button becomes available in the **Prices** subtab.

 **Note:** You can edit or delete a price detail update only if the Price Update status is Not Started.

Creating a Price Detail Update for Item Type

This topic explains how to create a Price Detail Update for the Item type in the Effective Date Pricing SuiteApp.

To create the price detail for item type:

1. From the price update record, on the **Prices** subtab click **New Price Detail Update**.

 **Note:** The Price Update ID is a system-generated identifier that is unique to the price update record that you created.

2. In the **Currency** field, select the currency to be used in the price.
3. In the **Price Level** field, select the price level.
4. In the **Quantity Pricing Level** field, enter the quantity price level to which the update applies.

 **Important:** Make sure you enter the index (for example, 0, 1, 2, and so on) of the quantity-based price level in the item record. The index is the order in which the Quantity Pricing is placed in the item record, with the leftmost pricing level being 0.
For more information about quantity-based pricing, see the help topic [Using Quantity Pricing](#).

5. In the **Modified Price** field, specify the new price for the selected item.
6. Click **Save**.

The new price is applied to the item record effectively when the start date occurs.

Creating a Price Detail Update for Item Category Type

This topic explains how to create a price detail update for the Item Category type in the Effective Date Pricing SuiteApp.

To create the price detail for an Item Category:

1. From the price update record, on the **Prices** subtab, click **New Price Detail Update**.

The Price Update field group displays the information about the price update record.

Note: The Price Update ID is a system-generated identifier that is unique to the price update record that you created.

2. In the **Currency** field, select the currency to be used in the price.
3. In the **Price Level** field, select the price level.
4. In the **Quantity Pricing Level** field, enter the quantity price level to which the update applies.

Important: Make sure you enter the index (for example, 0, 1, 2, and so on) of the quantity-based price level in the item record. The index is the order in which the Quantity Pricing is placed in the item record, with the leftmost pricing level being 0.

For more information about quantity-based pricing, see the help topic [Using Quantity Pricing](#).

5. In the **Category Price % Increase** field, specify the percentage increase of the price update. You can enter values from -100 to 1000.
6. Check one of the boxes according to your round-off preference:
 - **Round to .99** – Check this box to round off the updated price to the nearest .99 value.
 - **Round to .00** – Check this box to round off the updated price to the nearest .00 value.
7. Click **Save**.

The new price for the item category is applied to the item record when the start date occurs.

Rounding

For item category update types only, Effective Date Pricing includes an option to round off prices to the nearest .00 or .99. If you choose a rounding option when you apply a percentage discount or surcharge to an item, the price is automatically adjusted.

Note: The rounding process adjusts the price to the nearest .99 or .00, by either increasing or decreasing the price. In some cases, this process leads to a price that is lower than the original price.

Example Price Adjustments

The examples in this topic show how rounding options effect the final price of an item with a price increase.

Example 1

The following table shows the results of a 5% price increase on two different base prices, with and without the rounding options selected.

Base Price	Adjusted Price (No Rounding Options Checked)	Adjusted Price with Round to .99 Option Checked	Adjusted Price with Round to .00 Option Checked
10.00	10.50	10.99	11.00
9.80	10.29	9.99	10.00

Example 2

The following table shows the results of a 4% price increase with and without rounding options selected.

Base Price	Adjusted Price (No Rounding Options Checked)	Adjusted Price with Round to .99 Option Checked	Adjusted Price with Round to .00 Option Checked
12.00	12.48	11.99	12.00

Creating a Price Detail Update for Customer Type

This topic explains how to create a Price Detail Update for the Customer type in the Effective Date Pricing SuiteApp.

To create the price detail for a customer:

1. From the price update record, on the **Prices** subtab, click **New Price Detail Update**.

The Price Update field group displays the information about the price update record.

 **Note:** The Price Update ID is a system-generated identifier that is unique to the price update record that you created.

2. In the **Currency** field, select the currency to be used in the price.
3. In the **Modified Price** field, specify the new price for the selected item.
4. Click **Save**.

The new price for the Customer Type is applied to the customer record when the start date occurs.

Creating a Price Detail Update for Customer Group Type

This topic explains how to create a Price Detail Update for the Customer Group type in the Effective Date Pricing SuiteApp.

To create the price detail for a customer group:

1. From the price update record, on the **Prices** subtab click **New Price Detail Update**.

The Price Update field group displays the information about the price update record.

 **Note:** The price update ID is a system-generated identifier that is unique to the price update record that you created.

2. In the **Currency** field, select the currency to be used in the price.
3. In the **Modified Price** field, specify the new price for the selected item.

4. Click **Save**.

The new price for the Customer Group Type is applied to the customer record when the start date occurs.

Scheduling Automatic Price Updates

To automatically update prices in the Effective Date Pricing SuiteApp, schedule the following script deployments:

- EDP MR Item Price Update
- EDP MR Customer Price Update
- EDP MR Item Category Price Update
- EDP MR Customer Group Price Update

 **Note:** Do not create new script deployments.

For more information about scheduling script deployments, see the following topics:

- [Map/Reduce Script Deployment Record](#)
- [Scheduling a Map/Reduce Script Submission](#)

You should use the **Price Detail Update Search** saved search in map/reduce script deployments. This is the saved search provided by the Effective Date Pricing SuiteApp to make sure that the correct price update records are processed.

 **Important:** Using a different saved search may result to the SuiteApp processing different price update records.

If you want to create a new saved search, see the help topic [Defining a Saved Search](#). You can refer to the existing **Price Detail Update Search** for the preferred values.

 **Note:** When you run map/reduce script deployments, your role is automatically set to Administrator. This value cannot be edited.

The scheduled script processes only the records that start or end on the day the script runs. Any unprocessed records from previous days remain unprocessed.

You should run each script daily at midnight in the timezone set up in Company Preferences.

 **Important:** Never schedule or run the EDP MR Item Price Update Starts Today script deployment. Also, never schedule the following script deployments:

- EDP MR Customer Price Update Starts Today
- EDP MR Item Category Price Update Starts Today
- EDP MR Customer Group Price Update Starts Today

For more information about scheduling automatic price updates, see [Time Zones](#).

Time Zones

When creating price updates, the system validates the dates based on the time zone set in the user preference. When applying these updates by running the scheduled script, the system follows the time zone set up in Company Preference.

Import Price Updates Using CSV Files

You can import price update data into NetSuite using CSV import.

The CSV import process saves time and prevents errors by submitting data in a CSV file. This data can add or update many records at the same time, avoiding the need for manual data entry. For more information and guidelines on importing CSV files, refer to the following help topics:

- [CSV Imports Overview](#)
- [Importing CSV Files with the Import Assistant](#)
- [Guidelines for CSV Import Files](#)

Important: To ensure all added and updated data using the CSV import are valid, check the **Run Server SuiteScript and Trigger WorkFlows** box. This box shows up when you complete [Step Two Import Options](#).

Limitations and Best Practices of Effective Date Pricing

The following limitations and best practices apply to the Effective Date Pricing SuiteApp:

- On a single run, Effective Date Pricing can process up to:
 - 10,000 customers per customer group. Additional customers are not validated and processed. After this limit is exceeded, the status may still show as In Progress, even though there are unprocessed customers.
 - 1,000 items per item category. After this limit is exceeded, the status may still show as In Progress, even though there are unprocessed items.
 - 4,998 Item Category Update Type price updates or Customer Group Update Type price updates whose start date is today. Additional price updates are not processed.
 - 4,988 Item Category Update Type price updates or Customer Group Update Type price updates whose end date is today. Additional price updates are not processed.
- For optimal performance, process no more than 10,000 items and 10,000 customers per day.
- Default discounts are not taken into account. If a scheduled update changes an item's base price and that item has default discounts on other price levels, those price levels also change. Changes due to default discounts are not recorded in the Price Update logs.
- Effective Date Pricing does not support:
 - accounts with multiqueue
 - negative prices
 - reactivation of an inactive price update or price detail update

- Effective Date Pricing does not work unless the following features are enabled:
 - Multiple Currencies
 - Pricing Level
 - Multiple Prices
- Item and customer price updates are applied regardless of subsidiary, class, department, and location to which you have access.
- Specifying a parent item matrix only updates the parent matrix item and not its children.
- The scheduled script processes only the records that start or end on the day the script runs. Any unprocessed records from previous days are not picked up and updated by the script.
- There are no restrictions on:
 - adding customers to customer groups
 - removing customers from customer groups
 - adding items to item categories
 - removing items from item categories
- Items removed from an item category or customers removed from a customer group after running the script are not reverted to their original prices.
- Items added to an item category or customers added to a customer group when the script is run are not validated against existing price updates. There is a possibility of an overlap, which means an item or customer can be updated multiple times in a day. Overlaps between price updates can occur even if there is a price update overlap validation. You should not add items to an item category or customers to a customer group when updates are ongoing.
- You are not restricted from manually changing an item or customer's price while a price update is in progress.
- Customers of one customer group are not validated against customers of another customer group.
- Only static customer groups are supported.
- Effective Date Pricing supports two decimal places. If the original price of an item has more than two decimal places, on the reversal date, the reverted price rounds to two decimal places. For example, the item price 1.29876 is rounded to 1.30 on the reversal date.
- For processing price updates, you can only use the supplied map/reduce script deployments. Do not create new map/reduce script deployments.
- You should use the **Price Detail Update Search** saved search in map/reduce script deployments. This is the saved search provided by the Effective Date Pricing SuiteApp to make sure that the correct price update records are processed.
- The Effective Date Pricing SuiteApp supports the following languages:

□ Chinese (Traditional)	□ Italian
□ Chinese (Simplified)	□ Japanese
□ Czech	□ Korean
□ Danish	□ Norwegian
□ Dutch	□ Portuguese
□ English	□ Russian
□ Finnish	□ Spanish
□ French	□ Swedish
□ German	□ Thai
□ Indonesian	□ Turkish

Troubleshooting Unprocessed Updates

Use this topic to find out why requested updates of customers, items, and prices did not complete successfully in the Effective Date Pricing SuiteApp.

View the Price Update Error Messages Summary

You can view a list of error messages generated by failed price updates and price reverts. Go to Lists > Effective Date Pricing > Price Update Error Messages Summary.

Check Update Logs and Error Messages

Note the following on the Update Logs subtab of the item record and for price update records. A message is recorded corresponding to every successful update of a price. For example, if there are two price detail updates, there are two update log records.

For Item Category update type, if the Quantity Pricing Level specified in the detail does not exist for that item, no error message is recorded. An update log is created with the original price and the modified price listed as blank.

If a price update fails, you can check the Error Messages subtab for details on what went wrong.

Unprocessed Price Updates

If a price update was not processed, check the following:

- All of the following features are enabled:
 - Multiple Currencies
 - Quantity Pricing
 - Multiple Prices
- Price details for the item are specified.
- The selected item category or customer group has members (is not empty).
- Price updates ending today are processed prior to price updates starting today. For example, you create Price Update 1 for item A, starting on 2018/7/23. Then, you create Price Update 2 for item A, ending on 2018/7/23. Price Update 2 is processed before Price Update 1. If Price Update 2 does not complete due to an error, Price Update 1 is not processed.

- The limit of 4,988 Item Category Update Type Price Updates or Customer Group Update Type Price Updates whose end date is today has been exceeded.
- The limit of 4,998 Item Category Update Type Price Updates or Customer Group Update Type Price Updates whose start date is today has been exceeded.

Unprocessed Item or Customer Records

The number of unprocessed records as shown in the Number of Unprocessed Items or Customers field indicates items and customers that failed to update. This number is also incremented when:

- The number of items per item category queued for processing exceeds the limit of 1000.
- The number of customers per customer group queued for processing exceeds the limit of 10,000.
- After Price Update creation, you add an item to the item category or you add a customer to the customer group. For example, Price Update 1 has 5 items. You run the script on the start date. Price update 1 has a status of In Progress. You add Item CAT1 to Item Category A. Price update 1 now has 6 items. On the end date, the script runs. The number of unprocessed items is 1 because the CAT1 item is not processed (since it was not processed during the 1st run).
- The Price Update is In Progress, you remove an item from the item category.
- The Price Update is In Progress, you remove a customer from the customer group.

Item Updated Two Times or Not Reverted

An item was updated two times for the specified date range, or not reverted to the original price.

This problem typically occurs when two item category price updates or two customer group price updates for the same date range are in progress. Their status is Not Started or Price Update Failed. You add an item to one of the item categories, but that item already belongs to a different category, which is why it's not validated.

Handling of Script Re-runs

Effective Date Pricing updates prices only one time, even when a script is re-run due to errors.
