This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish, or display any part, in any form, or by any means. Reverse engineering, disassembly, or decompilation of this software, unless required by law for interoperability, is prohibited.

The information contained herein is subject to change without notice and is not warranted to be error-free. If you find any errors, please report them to us in writing.

If this is software, software documentation, data (as defined in the Federal Acquisition Regulation), or related documentation that is delivered to the U.S. Government or anyone licensing it on behalf of the U.S. Government, then the following notice is applicable:

U.S. GOVERNMENT END USERS: Oracle programs (including any operating system, integrated software, any programs embedded, installed, or activated on delivered hardware, and modifications of such programs) and Oracle computer documentation or other Oracle data delivered to or accessed by U.S. Government end users are "commercial computer software," "commercial computer software documentation," or "limited rights data" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, the use, reproduction, duplication, release, display, disclosure, modification, preparation of derivative works, and/or adaptation of i) Oracle programs (including any operating system, integrated software, any programs embedded, installed, or activated on delivered hardware, and modifications of such programs), ii) Oracle computer documentation and/or iii) other Oracle data, is subject to the rights and limitations specified in the license contained in the applicable contract. The terms governing the U.S. Government's use of Oracle cloud services are defined by the applicable contract for such services. No other rights are granted to the U.S. Government.

This software or hardware is developed for general use in a variety of information management applications. It is not developed or intended for use in any inherently dangerous applications, including applications that may create a risk of personal injury. If you use this software or hardware in dangerous applications, then you shall be responsible to take all appropriate fail-safe, backup, redundancy, and other measures to ensure its safe use. Oracle Corporation and its affiliates disclaim any liability for any damages caused by use of this software or hardware in dangerous applications.

Oracle®, Java, and MySQL are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Intel and Intel Inside are trademarks or registered trademarks of Intel Corporation. All SPARC trademarks are used under license and are trademarks or registered trademarks of SPARC International, Inc. AMD, Epyc, and the AMD logo are trademarks or registered trademarks of Advanced Micro Devices. UNIX is a registered trademark of The Open Group.

This software or hardware and documentation may provide access to or information about content, products, and services from third parties. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to third-party content, products, and services unless otherwise set forth in an applicable agreement between you and Oracle. Oracle Corporation and its affiliates will not be responsible for any loss, costs, or damages incurred due to your access to or use of third-party content, products, or services, except as set forth in an applicable agreement between you and Oracle.

If this document is in public or private pre-General Availability status:

This documentation is in pre-General Availability status and is intended for demonstration and preliminary use only. It may not be specific to the hardware on which you are using the software. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to this documentation and will not be responsible for any loss, costs, or damages incurred due to the use of this documentation.

If this document is in private pre-General Availability status:

The information contained in this document is for informational sharing purposes only and should be considered in your capacity as a customer advisory board member or pursuant to your pre-General Availability trial agreement only. It is not a commitment to deliver any material, code, or functionality, and should not be relied upon in making purchasing decisions. The development, release, timing, and pricing of any features or functionality described in this document may change and remains at the sole discretion of Oracle.

This document in any form, software or printed matter, contains proprietary information that is the exclusive property of Oracle. Your access to and use of this confidential material is subject to the terms and conditions of your Oracle Master Agreement, Oracle License and Services Agreement, Oracle PartnerNetwork Agreement, Oracle distribution agreement, or other license agreement which has been executed by you and Oracle and with which you agree to comply. This document and information contained herein may not be disclosed, copied, reproduced, or distributed to anyone outside Oracle without prior written consent of Oracle. This document is not part of your license agreement nor can it be incorporated into any contractual agreement with Oracle or its subsidiaries or affiliates.

Documentation Accessibility

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at <https://www.oracle.com/corporate/accessibility>.

Access to Oracle Support

Oracle customers that have purchased support have access to electronic support through My Oracle Support. For information, visit <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info> or visit <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs> if you are hearing impaired.

Sample Code

Oracle may provide sample code in SuiteAnswers, the Help Center, User Guides, or elsewhere through help links. All such sample code is provided "as is" and "as available", for use only with an authorized NetSuite Service account, and is made available as a SuiteCloud Technology subject to the SuiteCloud Terms of Service at www.netsuite.com/tos.

Oracle may modify or remove sample code at any time without notice.

No Excessive Use of the Service

As the Service is a multi-tenant service offering on shared databases, Customer may not use the Service in excess of limits or thresholds that Oracle considers commercially reasonable for the Service. If Oracle reasonably concludes that a Customer's use is excessive and/or will cause immediate or ongoing performance issues for one or more of Oracle's other customers, Oracle may slow down or throttle Customer's excess use until such time that Customer's use stays within reasonable limits. If Customer's particular usage pattern requires a higher limit or threshold, then the Customer should procure a subscription to the Service that accommodates a higher limit and/or threshold that more effectively aligns with the Customer's actual usage pattern.

Beta Features

This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Marketing Automation Overview

The ability to bring in new leads and to extend offers to existing customers is essential to any business. With NetSuite marketing tools, your marketing department can manage lead generation and campaigns efficiently and effectively.

NetSuite combines all the tools you need to manage your marketing efforts in one integrated system. You can:

- Manage leads generated through custom online lead capture forms and imported lists.
- Create custom templates for marketing emails.
- Schedule and manage campaigns across multiple channels.
- Use the Upsell Manager to find customers with good selling potential.
- Add items to sales orders and estimates based on recommendations calculated using artificial intelligence algorithms.
- Track the keywords that bring customers to your website.
- View reports and key performance indicators (KPIs) for real-time insights to inform your decisions.

Lead Capture

NetSuite can handle a variety of lead generation procedures. You can import lists of leads using CSV or XML files, or add them manually. You can also capture leads using online customer forms.

Online customer forms let you create custom entry forms that generate new leads, prospects, or customers when submitted. You can decide what information to collect from each lead and customize the form's layout.

Additionally, you can determine what NetSuite does with the information you gather. You can choose the type of record created (lead, prospect, customer), and designate which URL the record is taken to after form submission.

You should avoid the creation of duplicate lead records to ensure that NetSuite accurately tracks lead generation. To prevent duplicates, you can update existing records instead of creating new ones. To do this, select a field you want NetSuite to search for. If the info matches an existing record, that record gets updated with the form data.

For example, the Wolfe Electronics marketing manager creates an online lead form that has fields for Company Name, Email Address, and State. The manager sets the Email Address field to search for matching records. If the email address entered matches the email address on an existing record, the existing record is updated. NetSuite does not create a new record.

Each lead is assigned a lead source that indicates which campaign generated the lead. You should keep this lead source information to tie revenue to campaigns. With accurate lead source info, you can see which campaigns generate the most leads.

For more information about lead generation, see [Capturing Leads](#).

Manage Campaigns

You can create and execute campaigns to see how they affect your business. NetSuite reports and KPIs provide a comprehensive look into your marketing campaigns.

You can effectively track return on investment (ROI) for campaigns, as well campaign responses and lead source data for individual campaign events. For information about setting up your campaigns to maximize visibility into key marketing metrics, see [Campaign Overview](#). For tips about when to use different campaign types, see [Managing Campaigns](#).

Email Campaigns

You can create custom email templates for your campaigns. CRMSDK tags enable you to include information that is personalized to each recipient. NetSuite automatically tracks ROI, lead sources, and responses for email campaigns. For more information about email campaigns, see [Email Marketing Campaigns](#).

Keyword Campaigns

If you buy keywords from search engines, you can use keyword campaigns to see how customers find your site. Common internet search engines include Google Ads and Yahoo Partner Ads.

NetSuite tracks revenue from paid keywords using the Lead Source field on sales transactions. This revenue data helps you calculate ROI.

Keyword campaigns track paid keywords, search engines, and target audience. These campaigns also track the URL associated with the keyword search results. For more information about how to manage your paid search keywords, see [Keyword Campaigns](#).

Upselling

The Upsell Manager helps you find customers who are likely to buy more.

The Upsell Manager measures the correlation between the items that customers purchase. It then provides a list of customers, and an item or set of items they might purchase. For more information, see [Upsell Manager](#).

Intelligent Recommendations

Intelligent Recommendations use artificial intelligence algorithms to calculate and display items your customer may be interested in buying. The algorithms use data such as:

- what the customer bought in the past
- what other customers with similar transaction history bought in the past
- what other items were bought by customers who bought a specific item
- items that have similar names, descriptions, and categories

For more information, see [Intelligent Recommendations](#).

Campaign Analysis

NetSuite offers a range of standard marketing reports, including Campaign ROI and Campaign Response. You can customize reports to fit your business needs. For example, you can add columns of data or display a report as a bar graph or pie chart.

Key performance indicators (KPIs) provide immediate updates on your campaigns when you first log in to your NetSuite account. You can view your data in real time as orders are received, or as campaign email is viewed.

In addition to reports, you can use search tools to show the results of searches on your Dashboard or add links to search results.

For more information, see [Marketing Reports](#).

Capturing Leads

NetSuite give you the tools to manage the generation of new leads. In this section, you'll learn how to create online customer forms and manage lead source information.

For information about how you can manage lead generation with the NetSuite Marketing Automation feature, see:

- [Lead Sources](#)
- [Online Customer Forms](#)
- [Passing Parameters Through URLs](#)
- [Tracking Lead Sources for Web Store Visitors](#)
- [Online Form Templates](#)
- [Lead Reports and Analysis](#)

Lead Sources

Lead sources show how new leads find your company. If you use the Marketing Automation feature, the list of possible lead sources matches the titles of your marketing campaigns. For more information, see [Campaign Overview](#).

If you don't use Marketing Automation, you can create new lead sources at Setup > Sales > Setup Tasks > CRM Lists > New.

Lead source is set in the Lead Source field on lead, prospect, customer, and contact records.

If you create a campaign email message with a link to an online lead capture form, pass the lead source in the URL. When you pass the lead source in the URL, the new lead is properly attributed to the lead source. For more information, see [Passing Parameters Through URLs](#).

If you import a list of leads through smbXML or CSV, you can include the lead source in the file. This helps you track where these leads came from.

For letter campaigns and other campaign channels, you can manually track which campaign brought a customer to your company. To manually track the campaign, select the lead source on the customer record.

Online Customer Forms

Online customer forms are used to receive information about customers, leads, and contacts from your website. You can customize the appearance of these forms.

When you save your online customer form, NetSuite creates an external URL for it. This URL appears in the External subtab, under the field label Publishable Form URL. With this URL, you can:

- Link to the online customer form from your website and pass various parameters through the URL. These parameters automatically populate fields on the form. For more information, see [Passing Parameters Through URLs](#).

- Embed the online customer form in your website. Visitors can complete the form without having to click a link to a separate page. In this case, the online lead form displays inside a page on your website. For more information, see the help topic [Embedding an Online Form in your Website Page](#).

Note: You can link to an online customer form from a hosted HTML page on your website. This link preserves incoming URL parameters such as lead source, partner, and promotion. It enables the customer to enter additional information in the fields on the form. To do this, use the website tag, `<%getOnlineFormUrl(ID)%>` in an href to link to the online form. For more information, see the help topic [Web Site Tags](#).

To avoid duplicate records, NetSuite compares information entered in specific fields on the form to similar information in existing records, for example, Email Address or Phone Number. If there is a match, you can determine how NetSuite handles the duplicate information.

Online customer forms can also be used to create contact records. For more information, see [Using Online Customer Forms for Contacts](#).

You can create HTML templates to make your online customer forms match your website's look. For more information, see [Online Form Templates](#).

Note: Before a customer or contact can access online customer forms, they must enable Javascript in their browser.

Creating an Online Customer Form

If you enable both the CRM and Sales Force Automation features, you can create online forms based on the NetSuite default template. You can also use your own HTML template for your forms. HTML templates let you customize your online forms to match your website's look. For more information about creating HTML form templates, read [Online Form Templates](#).

To enable these features go to Setup > Company > Enable Features. On the **CRM** subtab, check the **Customer Relationship Management** and **Sales Force Automation** boxes, and then click **Save**.

To create an online customer form:

1. Go to Setup > Marketing > Setup Tasks > Online Customer Forms > New.
2. On the Select Type page, choose a template option:
 - **Default Form Template:**
 - Enter a title. This title appears at the top of the form.
 - In the **Message** field, enter a message that your customers will see at the top of the form. This message can include up to 500 HTML characters.
 - If you're using NetSuite OneWorld, use the default form template to pass the subsidiary to the online form using a URL.
 - **Custom HTML Template:**
 - Enter a title. This title appears at the top of the form.
 - Select the HTML template you want to use for this form. For more information about creating HTML form templates, read [Online Form Templates](#).
 - If you want NetSuite to insert labels for your form fields, check the **Include Field Labels** box. If this box cleared, you must include field labels in your HTML template file.

3. Check the **Enable Online** box to link to this form from a website.

To select fields:

1. On the **Select Fields** subtab, in the **Field** column, select a field to include on the online customer form. Campaign Event associates an event with an online customer form.

2. In the **Label** column, edit the name of the field as you want it to appear on the form.
3. In the **Section** column, select the subtab for the field to appear on.
You can create new subtabs for your forms at Customization > Forms > Subtabs. Click the **Entity** subtab, enter your new subtab, and then click **Save**.
4. In the **Help** column, enter any text to appear below the field to aid your customers when filling out this form.
5. In the **Width** column, enter the width for the field.
6. If you want to require your customers to enter information in a field, check the box in the **Mandatory** column.
7. To have NetSuite search existing records for information that matches what is entered in a field, check the box in the **Search** column.

If the information closely resembles another record, determine how NetSuite proceeds in the **Handle Duplicate Records** field on the **Set Up Workflow** subtab.

NetSuite requires this option for **First** and **Last Name** fields. You can also search for duplicated information in the following fields:

- company names
- email addresses
- phone numbers
- city
- state
- country
- postal codes
- information entered in custom fields

Note: If you permit updates to address fields, the best practice is to make all of the address fields mandatory. Mandatory address fields ensure that no part of the address is overwritten.

8. If you want a field to not show on the form, check the box in the **Hide** column.
This is useful if you pass information into the form through the URL. For more information, see [Passing Parameters Through URLs](#). **Campaign Event** and **Lead Source** are two of the fields that you may want to mark as hidden. For example, you might want to include the **Lead Source** and **Campaign Event** fields on the form. This inclusion enables you to track the campaign effort that brought the customer to your company. However, you may want to hide this information from the person submitting the form.
9. Check the box in the **Select** column if you want your customer to choose from a list in this field.
10. Click **Add**.
11. Repeat these steps for each field on the form.
12. Use the **Move Up**, **Move Down**, **Move to Top**, and **Move to Bottom** buttons to change the order in which fields appear on your form.
13. On the **Detail Message** subtab, enter a message you would like to appear at the bottom of the form.
This message can include up to 4000 HTML characters.
14. If you want NetSuite to define what information is updated on the Customer records, use the list in the **Update Customer** column.
15. If the customer is a company, use the list in the **Update Contact** column to define what information is updated on the contact record.

To determine submission handling:

1. Click the **Set Up Workflow** subtab.
2. Under Preferences:
 1. Check the **Create Customers as Companies** box if you want the customer record created according to the following:
 - If no company name is entered on the form, create the customer record as an individual.
 - If a company name is entered on the form, create the customer record as a company.
 Clear this box if you want customers to always be created as individuals.

Note: If you create a company customer record, NetSuite creates a contact record and associates it with the customer. NetSuite only uses information that is applicable to contacts to create this contact record.

2. In the **Set Lead Status** field, select the customer status to assign to the person who submits the form.
You can create new customer statuses at Setup > Sales > Setup Tasks > Customer Statuses > New.
3. Check the **Allow Update** box to update existing records with this status if the information entered on this form matches an existing record.
You can only update records if you have checked a box in the **Search** column on the **Select Fields** subtab.

4. In the **Set Lead Source** field, select the lead source to associate with this form.
This lead source appears in the **Lead Source** field on lead, prospect, and customer records.
5. Check the **Allow Update on Customers** and **Allow Update on Contacts** boxes to update existing records to show the lead source. Clear these boxes if you do not want to show the selected lead source on records.

 **Note:** You can update existing records only if you set one or more fields to be searched for when the form is submitted. If the search finds a matching record, NetSuite updates the existing record rather than creating a new record. Common search fields include **Email** and **Company Name**. To choose a search field, click **Select Fields** subtab. In the **Search** column, check the box next to the field you want to search for.

6. If you use NetSuite OneWorld, choose the default subsidiary when NetSuite creates the new record.
For more information about setting the subsidiary on online forms, see the help topic [Subsidiaries on Online Customer Forms in OneWorld](#).
 7. To send your customer to another online customer form after submitting this form, select that form in the **Redirect to Form** field.
 8. Enter the URL to redirect customers to after completing the form. This is a required field.
Your web store home page URL appears by default.
 9. In the **Handle Duplicate Records** field, select how NetSuite should proceed when information submitted on the form matches information in an existing record.
 10. If you use the Duplicate Detection and Merge feature, check the **Use Duplicate Detection Criteria** box. NetSuite detects duplicates on the form using the criteria you set at Setup > Company > Company Management > Duplicate Detection.
3. Under Customer Notification:
 1. If you use the **Marketing Automation** feature, you can send an email message to the person who submits the form. Select an email template in the **Send Auto-Reply E-mail** field.
To create email templates, go to Documents > Email Templates.
 2. Enter a subject for the auto-reply email.
 4. Under Sales Rep Notification:
 1. **Send E-mail Notification** - Check this box if you want the sales rep assigned to this customer to receive notification when the customer submits this form.
 2. **Template for New Leads** - Select the email template you want to use to notify the assigned sales rep when a new lead, prospect, or customer submits this form.
 3. **Template for Existing Customers** - Select the email template you want to use to notify the assigned sales rep when an existing lead, prospect, or customer submits this form.
You can set the default templates for sales rep notification at Setup > Marketing > Preferences > Marketing Preferences. If you do not select a template, NetSuite sends a standard notification message.
 4. If you would like others to receive notification when the form has been submitted, enter the email addresses in the **Cc** field.
You can enter multiple email addresses by separating them with a comma or semicolon.

To set up the form's appearance:

1. Click the **Set Up Appearance** subtab.
2. The options differ based on the template you're using:
 - If you're using the **Default Form Template**:
 - Choose how many columns you want the form to be displayed in.
 - Select a color theme for the form.
 - Select a font for the form.
 - Check the **Unlayered Sections** box if you want your form to appear without tabbed sections.
 - Choose where to place the buttons on the form.
 - Select a logo to place at the top of the form. You can upload new logos at Commerce > Site Builder > Content > Images > New.
 - If you're using a **Custom HTML Template**, select a font for the form.

To add custom code:

1. Click the **Custom Code** subtab.
This subtab appears only if you use the **SuiteScript** feature.
2. Select the JavaScript file that contains the scripts you want to use on this form. Check the **Available Without Login** box to ensure proper functionality.
Note: Client scripts or scripts referenced on the client side can't have the **Hide in SuiteBundle** preference enabled on the script file record.
3. In the **Page Init Function** field, select the script to call when the form loads.
4. In the **Save Record** field, select the script to call when the form is submitted.
5. In the **Validate Field Function** field, select the script to call when a field on the form is changed.
6. In the **Changed Function** field, select the script to call when a change to a field is accepted.
7. Click **Save**.
8. Click **Preview Form** to review your form.

After saving your online customer form, you can publish the form or link to the form. To publish the form, create a customer form information item at Commerce > Site Builder > Content Management > Publish Forms > New. For more information, see the help topic [Case and Customer Forms](#).

To link to the form, click the External subtab on the form record. Use the provided URL to link to this form on your website. When you link to the form, the form pops up in a new window.

NetSuite automatically creates or updates records when customers enter information on your website.

Using Online Customer Forms for Contacts

If you set up your online customer forms to create company records, NetSuite creates two records when the form is submitted: a contact record, and a lead, prospect, or customer record.

Select Fields **Detail Message** **Set Up Workflow** **Set Up Appearance** **Custom Code**

Preferences

☒ Create Customers as Companies

Set Lead Status
 Lead - Unqualified ☒ Allow Update

Set Lead Source
 ☒ Allow Update on Customer Record ☒ Allow Update on Contact Record

Set Campaign Event

Redirect to Form

Redirect to URL
 http://563214.shop.netsuite.com/testncor

Handle duplicate records
 Update the first record created ☐ Use Duplicate Detection Criteria

Customer Notification

Send Auto-Reply Email

To create an online customer form that creates customer records:

1. Add the **Company Name**, **First Name**, and **Last Name** fields to the form.
2. Mark these fields as mandatory.
3. On the **Set Up Workflow** subtab, check the **Create Customers as Companies** box.
4. If you want to set the lead source on the contact record, select it in the **Set Lead Source** field. Lead source is the campaign associated with the customer form. The value you select lets you know which campaign generated the new lead, customer, or updated information.
5. You can track an event in the Online Customer Form. After you select a lead source, select a value in the **Set Campaign Event** field. This value lets you map which event led to the form completion by the customer or lead.
6. You can let the lead source on this form to overwrite the lead source on any contact record updated by this form. Check the **Allow Update on Contact Record** box.
7. Click **Save**.

When a contact submits the form, NetSuite creates a customer record and a contact record. If there are existing records that match what was entered, NetSuite updates those records instead. For more information, see [Using Online Customer Forms for Contacts](#).

Online Form Templates

Online form templates let you to customize the look and layout of your NetSuite online forms. Online form templates are helpful if you don't use a NetSuite website but still use NetSuite online customer and case forms.

Online form templates are HTML documents that you create outside of NetSuite. You either upload them to your NetSuite file cabinet or paste on the template record. Experience with HTML can be helpful when creating an online form template.

Note: To use custom HTML templates, an administrator must enable the Marketing Automation feature.

To create an online form with an HTML online template:

1. Create the HTML file you'll use. For more information, see [HTML Files for Online Form Templates](#).
2. Upload your template to the file cabinet. Click New on the template record, or place it in the Marketing Templates folder in your file cabinet. For more information, see [Uploading an Online Form Template](#).
3. Create a template record at Documents > Templates > Marketing Templates > New > Online Form > Online Form. For more information, see [Creating an Online Form Template Record](#).
4. Create your online customer form at Setup > Marketing > Setup Tasks > Online Customer Forms > New or your online case form at Setup > Support > Case Management > Online Case Forms > New. For more information, see [Online Customer Forms](#).

HTML Files for Online Form Templates

When creating an online form template, you decide which fields to include and how to arrange them. You can also add styling to the page.

The following must be included in the HTML code:

- `<NLFORM>` and `</form>` tags in the code of the page
- `<html>` and `</html>` tags
- tags for each field included on the form
- a button respondents use to submit the form

To place fields on an online customer form, use tags from the table below:

Field	Tag
Company Name	<code><NLCOMPANYNAME></code>
Address Line 1	<code><NLADDRESS1></code>
Address Line 2	<code><NLADDRESS2></code>
City	<code><NLCITY></code>
Comments	<code><NLCOMMENTS></code>
Confirm Password	<code><NLPASSWORD2></code>
Contact First Name	<code><NLFIRSTNAME></code>
Contact Last Name	<code><NLLASTNAME></code>
Contact Middle Initial	<code><NLMIDDLENAME></code>
Country	<code><NLCOUNTRY></code>

Field	Tag
Currency	<NLCURRENCY>
Customer Category	<NLCATEGORY>
E-mail	<NLEMAIL>
E-mail Preference	<NLEMAILPREFERENCE>
Give Access	<NLGIVEACCESS>
Lead Source	<NLLEADSOURCE>
Login Password	<NLPASSWORD>
Partner	<NLPARTNER>
Partner Code	<NLPARTNERCODE>
Phone Number	<NLPHONE>
Promotion	<NLPROMOCODE>
Shipping Item	<NLSHIPPINGITEM>
State / County	<NLSTATE>
Taxable	<NLTAXABLE>
Unsubscribe from Campaigns	<NLUNSUBSCRIBE>
Web Address	<NLURL>
Zip/Postal Code	<NLZIPCODE>

To place fields on an online case form, use tags from the table below:

Field	Tag
Company Name	<NLCOMPANYNAME>
Name	<NLENTITYID>
E-mail	<NLEMAIL>
Message	<NLINCOMINGMESSAGE>
Subject/Title	<NLTITLE>
Case Origin	<NLORIGIN>
Case Type	<NLCATEGORY>
Contact First Name	<NLFIRSTNAME>
Contact Last Name	<NLLASTNAME>
Contact Middle Initial	<NLMIDDLENAME>
Phone Number	<NLPHONE>
Start Date	<NLSTARTDATE>
Start Time	<NLSTARTTIME>

Field	Tag
Support Issue	<NLISSUE>
Support Item	<NLITEM>

When you create your online form, you can have NetSuite add field names for you, or you can label the fields yourself in your template.

Your form should also include a button your customers use to submit the form to your NetSuite account. The HTML code for this button is:

```
1 | <input type="submit" value="Button Text">
```

You can change the button text by editing the value in the code. For example, if you want the button to say Submit Form, the code would be:

```
1 | <input type="submit" value="Submit Form">
```

Below is a sample online form template:

```
1 | <HTML>
2 |   <Head>
3 |     <Title>OnlineLeadForm</Title>
4 |     <link href="/images/styleSheet.css" rel="stylesheet" type="text/css">
5 |     <style type="text/css">
6 |     </style>
7 |   </Head>
8 |   <Body>
9 |     <NLFORM>
10 |       <table width="60%" border="0" align="center">
11 |         <tr>
12 |           <td bgcolor="#FFFFFF" valign="bottom" align="center" height="55">
13 |             <p align="left"> <NSLOGO>
14 |           </td>
15 |         </tr>
16 |         <tr>
17 |           <td bgcolor="#FFFFFF" valign="middle" align="center" height="1">
18 |             <hr color="#CCCCCC" align="left" size="1"></td>
19 |           </tr>
20 |         <tr>
21 |           <td class="text11"><h1>
22 |             <center>
23 |               <span class="mainheader1 style1">Register With Us!</span>
24 |             </center>
25 |           </td>
26 |           <td align="left"> This is a sample online form template.
27 |             <p> New leads would complete the fields below:
28 |             <p><b>Name</b></td> <NLFIRSTNAME> <NLLASTNAME><br>
29 |             Here you might enter special instructions.
30 |             <p><b>Company Name</b></td> <NLCOMPANYNAME>
31 |             <p><b>Email Address</b></td> <NLEMAIL>
32 |             <p><b>Street Address</b></td> <NLADDRESS1>
33 |             <p><b>City</b></td> <NLCITY>
34 |             <p><b>State</b></td> <NLSTATE>
35 |             <p><b>Zip/Postal Code</b></td> <NLZIPCODE>
36 |             <p><input type="submit" value="Button Text"></p>
37 |             <p align="center"><a href="http://www.linkbacktoHomePage.com">Company Home</a>
38 |             <a href="http://www.link1.com">Support</a> | <a href="http://www.link2.com">Help</a>
39 |           </td>
40 |         </tr>
41 |       </table>
42 |     </form>
43 |   </Body>
44 | </HTML>
```

This example uses a stylesheet. You can reference a cascading stylesheet in your online forms if you store the CSS file in the Images folder of your File Cabinet. You should use a relational URL to reference the stylesheet. In the example above, the reference is:

```
<link href="/images/stylesheet.css" rel="stylesheet" type="text/css">
```

Important: You must include all appropriate end tags as well as `<html>` and `<body>` tags for NetSuite to recognize this file as an HTML file.

After you prepare your template file, upload it to your NetSuite file cabinet. For more information, see [Uploading an Online Form Template](#).

Uploading an Online Form Template

NetSuite saves online form templates in the Marketing Templates folder of your file cabinet, by default. An administrator or sales administrator can change the folder you use to store your templates. Go to Setup > Sales > Preferences > Sales Preferences.

To upload an online form template:

1. Click the **Documents** tab.
2. In the Documents Links portlet, click **File Cabinet**.
3. On the Folder Contents page, click **Marketing Templates**.
4. Click **Add File**.
5. In the File Upload window, locate your online form template on your hard drive.
6. Select the file.
7. Click **Open**.
8. On the Folder Contents page, click **Add**.

Now you can create an online form template record to apply to your forms. For more information, see [Creating an Online Form Template Record](#).

Creating an Online Form Template Record

After you upload your template to your file cabinet, create an online form template record.

To create an online form template record:

1. Go to Documents > Templates > Marketing Templates > New > Online Form.
2. On the Select Type page, click **Online Form**.
3. On the Online Form Template page, enter a name for the template.
4. In the **Title** field, enter the text you want to appear at the top of the browser window when someone navigates to your form.
5. Enter any additional information in the **Description** field.
6. If you created this file outside of NetSuite,
 1. Select **File**.
 2. Select the template in the **Template File** field.
 3. Click **Preview** to see your template in a new window.

7. If you're creating the template on the record,
 1. Select Text Editor.
 2. Enter the text in the **Template** field.
8. To insert a field in the template text, choose the type of record you want to insert the field from, and select the field in the **Insert Field** list.
NetSuite places the field tag at your cursor in the text.
9. If you want to be the only one to use this template, check the **Private** box.
10. If you want this template to only be used by members of a group, select that group in the **Restrict to Group** field.
11. Click **Save**.

Now, you can select this template when you create an online form.

For information about creating a customized online form with online form templates, read [Online Customer Forms](#) and [Online Case Forms](#).

Passing Parameters Through URLs

You can use parameters to pass information through the links to your online customer forms. For example, if you link from partner websites, you can include the partner's name or code in the URL. When you do this, you know the source of the new lead or customer. You can also use parameters in links for paid search campaigns.

When a customer clicks a link to an online form and submits it, NetSuite creates a new lead, prospect, or customer record. If you include parameters in the link, NetSuite adds that info to the new record, so you can link it to a campaign or partner.

For example, Wolfe Electronics advertises through banner ads online. Each ad links to an online customer form on their website. The marketing manager wants to track which ad campaign sends each lead to the form.

The campaign ID for each ad is passed through the link to the online form. When the lead submits Wolfe Electronics' lead capture form, the campaign is automatically selected on the lead record that NetSuite creates.

You can find a form's URL in the Publishable Form URL field on the External subtab of the online customer form record.

To pass information through a link, you add the information to the end of the publishable form URL. In the example above, the URL might look like this:

¹ | <https://system.netsuite.com/app/site/crm/externalleadpage.nl?compid=ACCT000000&formid=1&h=1bdc80a058&leadsource=JoinNowAd>

In this sample URL, the first parameter in a URL begins with a question mark (?). Each parameter after the first begins with an ampersand (&). Most URLs include parameters by default. In this example, there are parameters referring to the NetSuite company ID and the online form's ID.

 **Note:** Spaces in parameters should be replaced with %20.

The table below lists the parameters you can use to automatically insert information into an online customer form.

Field	Parameter
Campaign Event***	&campaignevent=187
Company Name	&companyname=Global%20Distributing,%20Inc.
City	&city=New%20York
Country	&country=USA
Custom Form	&customform=New%20Lead%20Form
E-mail	&email=john@example.com
Lead Source	&leadsource=Spring%20Ad%20Campaign
Login Password	&password=password
Partner**	&partner=Universal%20Consulting
Partner Code**	&partner=1111
Phone Number	&phone=555-555-5554
Promotion	&promocode=Feb%20Flyer
State	&state=New%20York
Zip/Postal Code	&zip=54321

* The **&customform** parameter determines which lead, prospect, or customer entry form is used when editing or viewing the record you create.

The **&partner parameter is used to pass both partner names and partner codes.

***The **&campaignevent** parameter determines which event is associated to the customer entry form. The value of this parameter is the internal ID of the campaign event.

If a partner's site links to your online customer form, you might want the Partner field to show their name. To do this, you can create a link in this format:

```
1 | https://sample.online.customer.form.com?partner=Partner%20Name
```

When a lead clicks the link to your online customer form on the partner's web page, they are taken to your online customer form. The Partner field is filled in automatically.

If you link to online customer forms in NetSuite, you can pass information into custom fields about the person filling out the form. For example, you could pass this information when linking to a custom record form from your Customer Center.

The internal form URL from the External subtab of the online form record lets you add any of the parameters in the table below.

Info	Parameter
name	{name}
login email address	{email}
first name	{firstname}

Info	Parameter
last name	{lastname}
internal ID	{user}
internal ID of user's role	{role}

Each parameter must be enclosed in brackets, { and }. If you want to pass the user's name and email address to a form, the link could look like this:

```
1 | /app/crm/common/onlineforms/ internalonlineform.nl?formid=100&custrecord123={name}&custrecord124 ={email}
```

- custrecord123 is the ID of a custom field on the custom record that tracks the name of the person filling out the form.
- custrecord124 is the ID of the custom field that tracks the email address of the person filling out the form.

For more information about online customer forms, see [Creating an Online Customer Form](#).

For information about how to set the Subsidiary field on online customer forms, see the help topic [Subsidiaries on Online Customer Forms in OneWorld](#).

You can also embed the online form in your website so that the customer never leaves your website when they use that form. For more information, see the help topic [Embedding an Online Form in your Website Page](#).

Custom Field Parameters

You can create custom entity fields to track information specific to your business. You can include these fields in online customer forms.

A marketing manager creates a custom box field called Product Trial Candidate to find leads willing to test new products. When a lead clicks the link to "Try New Products – Free!", they're taken to an online lead capture form. The Product Trial Candidate box is checked on the form and on the lead record NetSuite creates when the form is submitted.

If you want to pass custom field information into your online lead capture forms, first determine the custom field ID. It's in the ID field on the custom field record. A URL with custom field parameters should follow this format:

```
1 | https://system.netsuite.com/app/site/crm/externalleadpage.nl?compid=ACCT0000000&formid=1&h=1bdc80a058&custentity1=industryperiodical
```

Custom box fields follow the following format:

```
1 | https://system.netsuite.com/app/site/crm/externalleadpage.nl?compid=ACCT0000000&formid=1&h=1bdc80a058 &custentity2=T
```

If you want the box marked, set the parameter to **T** in the URL. To clear the box, use **F** through the URL.

For more information about creating custom fields, see the **Customization** user guide.

Passing Parameters from Third Party Sites

If NetSuite doesn't host your site, you'll need to add JavaScript to your web pages. This lets you pass parameters to any online customer forms you link to.

The following JavaScript code must be placed at the bottom of each page in your website. It should not be placed inside any HTML tags and should be the last code before the **</body>** tag.

```

1 <script type="text/javascript">
2 <!--
3 function getNS_url_param( name ){
4   name = name.replace(/\[/, "\\[").replace(/\]/, "\\]");
5   var regexS = "[\\?&]" + name + "=[^&#]*";
6   var regex = new RegExp( regexS );
7   var results = regex.exec( window.location.href );
8   if( results == null )
9     return "";
10  else
11    return results[1];
12  }
13  function trackNSParams() {
14    var name = 'leadsource';
15    var value = getNS_url_param(name);
16    if (value != null && value.length > 0)
17      document.cookie = name+"="+value+"; path=/";
18  }
19  function appendNSParams(url) {
20    var nameEQ = "leadsource=";
21    var ca = document.cookie.split(';');
22    for(var i=0;i < ca.length;i++) {
23      var c = ca[i];
24      while (c.charAt(0)==' ') c = c.substring(1,c.length);
25      if (c.indexOf(nameEQ) == 0 )
26        url = url + '&' + nameEQ + c.substring(nameEQ.length,c.length);
27    }
28    return url;
29  }
30  // -->
31  trackNSParams();
32 </script>

```

Then apply the following format to any links to online forms from your site (for example, Contact Us links):

```

1 <a href="#" onclick="document.location.href=appendNSParams(Publishable Form URL)">Contact Us
2 </a>

```

Paste the publishable form URL for the online customer form between the parentheses. For example:

```

1 <a href="#" onclick="document.location.href=appendNSParams(https://forms.netsuite.com/app/site/crm/externallead
2   page.nl?compid=1234567&formid=3&h=ed62a43be13c70de335b)">Contact Us
3 </a>

```

When you copy and paste the form URL, make sure the single and double quotes are correct. If needed, you might have to retype the quotes.

For more information about URL Parameters, see [Tips for Passing Parameters Through URLs](#) and [Website URL Parameters](#)

Tips for Passing Parameters Through URLs

Consider the following tips for using parameters correctly in links:

- The **leadsource** parameter is used to pass the campaign ID into an online customer form. The campaign ID in the URL fills the Lead Source field on the online form.
- To pass a partner code in a URL, use the **partner** parameter. Partner codes help you keep the partner-customer relationship private by not showing the partner's name in the URL.

- For box fields, enter **T** as the value if you want the box checked. Enter **F** if you want the box clear. For example, a link that passes a parameter to a box field would look like this:

```
1 | https://system.netsuite.com/app/site/crm/externalleadpage.nl?compid=ACCT000000&formid=1&h=1bdc80a058&unsubscribe=T
```

- You must spell and capitalize campaign IDs, partner names, and partner codes passed in the parameter exactly as they appear on their record.
- You can add as many parameters as you want to pass through to your online customer form. A link with multiple parameters should follow this format:

```
1 | https://system.netsuite.com/app/site/crm/externalleadpage.nl ?compid=ACCT000000&formid=1&h=1bdc80a058?partner=Wilson%20Computers&leadsource=March%202010%20Flyer
```

Each parameter beyond the first begins with an ampersand (&). The first parameter, **compid**, which is an internal parameter identifying your company, begins with a question mark (?). The partner and lead source parameters each begin with an ampersand.

- Replace any spaces in your URLs with hyphens (-).
- You may want to pass information into hidden fields on your online customer forms. Information in a hidden field saves to the customer record when the online form is submitted. However, the person filling out the form can't see the field.

To hide a field on a form, check the box in the Hide column when selecting fields to include on your form.

Tracking Lead Sources for Web Store Visitors

Typically, with banner ads and paid search results, leads go to landing pages on your site instead of online forms. How you track lead source and other information depends on whether you use a NetSuite hosted site or a third-party site.

If you use the Advanced Web Reports feature, you can pass lead source information in links to any page in your NetSuite website.

If you create a link to your home page with the **leadsource** parameter, NetSuite keeps the lead source for that visitor. When the visitor registers through your website, NetSuite saves the lead source in the customer record created by registration. NetSuite keeps this information even when the visitor leaves your site and returns later. NetSuite passes the lead source to the customer record if the visitor submits an online customer form. NetSuite does this even if the Lead Source field isn't on the form.

Note: In most cases, your website link has only a single parameter. The format should be: **http://www.yourSite.com?leadsource=yourCampaign.**

In addition to lead source, you can also pass partner and promotion parameters in links to your site.

For information about passing parameters to third party-hosted sites, see [Passing Parameters from Third Party Sites](#).

Lead Reports and Analysis

NetSuite provides a full range of tools that you can use to report on lead generation. With online form statistics and lead source reports, you can determine which efforts are the most successful at bringing in new leads.

Online Form Statistics

NetSuite tracks how often your online forms are viewed and filled out.

You can view stats for online lead forms on the External subtab of the form record. Here, you'll see:

- **Number of Requests** – Number of times someone navigates to this form
- **Number of Submits** – Number of times the form is submitted

To view online form statistics, go to Setup > Marketing > Online Customer Forms, and click View next to the online form you want to view. Then, click the External subtab.

Lead Source Reports

There are two standard reports you can use to see how leads are coming into your company.

The [Lead Source Analysis Summary Report](#) list each lead source and the number of leads, prospects, and customers associated with it.

The [Lead Source Analysis Detail Report](#) lists the leads, prospects, and customers associated with each lead source, the customer's status, sales rep and date the customer's record was created.

 **Note:** These reports only include records that were originally entered as leads. Prospects and customers that didn't start as leads aren't included.

For more information about these reports, see [Marketing Reports](#).

Campaign Overview

With the Marketing Automation feature, you can create, manage, and run multi-channel marketing campaigns. Each marketing campaign can track individual campaign events in the form of email, direct mail, telephone marketing, print ads, or any channel you use.

You can also track the revenue and leads your marketing campaigns generate. Revenue is tracked through each campaign's lead source. When you associate a sales transaction with a lead source, it's included in campaign return on investment (ROI), sales by lead source, and sales by keyword reports.

Leads, prospects, and customers generated by a marketing campaign have the campaign selected in the Lead Source field on their records. With this information, you can track the leads generated by campaigns on lead source analysis and leads by keyword reports.

For a list of tasks to complete before creating campaigns, see [Setting Up Marketing](#).

When you are ready to create your campaign, see [Campaign Checklist](#).

Managing Campaigns

You use campaign records to manage your online and offline marketing initiatives. You can create and send email marketing messages, manage paid keywords, send promotions through the mail, and manage your advertising campaigns.

You're also able to use campaigns to track leads from a variety of sources. You can monitor purchased keywords that bring new leads to your site. You can also measure the return on investment for purchased leads.

NetSuite provides the reports and tools necessary to manage and evaluate the marketing data that is important to your business.

Campaign Checklist

There are several steps to creating your marketing campaign. Complete these steps to maximize your campaign reporting ability.

To create a marketing campaign:

1. Read the [Optimizing Email Campaigns](#) for help in optimizing the delivery rate of your marketing emails.
2. For email campaigns, create a template and a template record.
For more information see [Email Marketing Templates](#).
3. Create target group of customers or contacts. For more information, see the help topic [Working with Records, Transactions, and Lists](#).
For tips on creating target groups for email campaigns, see [Choosing Email Recipients](#).
4. Create a campaign record.
For more information, see [Creating a Campaign Record](#).
5. Execute your campaign.
For more information, see [Initiating Campaign Events](#).

After the campaign record is created and executed, you can view reports and statistics on your campaign events.

Campaign Categories

Campaign categories represent the highest level of the campaign data on campaign reports. You group marketing campaigns into categories based on the type of campaigns you're running.

By default, campaign reports are grouped by campaign category. You're also able to filter the campaigns list by category.

The following categories and subcategories are included by default:

■ Purchased Lists

- Direct Mail
- Email

- Phone
- **Print**
 - Magazine
 - Newspaper
- **Online**
 - Paid Keyword
 - Natural Keyword
 - Online
- **Broadcast**
 - Radio
 - TV
 - Webinar

To create a campaign category:

1. Go to Setup > Marketing > Campaign Management > Categories > New.
2. Enter a name for the category.
3. If this is a subcategory, choose a parent category.
4. Select a default lead source for this category.
When a customer selects a campaign category on an online customer form, this lead source appears in the Lead Source field. This field is on the record NetSuite creates if there is no other lead source associated with this customer.
5. Check the **Available Externally** box to make this campaign category available for customers to select on online forms.
6. Click **Save**.

Campaign categories are tracked on the **Marketing** subtab of customer records. Lead sources passed through links on online forms display the campaign's category on the customer record created when the customer submits the form.

Creating a Campaign Record

NetSuite uses campaign records to manage the information important to your marketing efforts. On campaign records, you set the time and date events are sent. You select the recipient groups and enter the overhead cost. You can also add campaign information important to your company's campaign reporting.

You can schedule individual events to cover different campaign parts. You're also able to track a campaign without separate events.

To create a campaign record:

1. Go to Campaigns > Marketing > Campaigns > New.
2. If you use custom forms, you can select a custom campaign form.
3. Under Primary Information:

- a. Enter an ID for this campaign in one of the following ways:
 - If you use auto-generated numbers for campaigns, an ID is generated automatically.
For more information, see the help topic [Set Auto-Generated Numbers](#).
 - If you do not use auto-generated numbers for campaigns, enter an ID.
Campaign IDs can be used to identify campaigns, especially in the event that campaigns share similar names.
 - b. Enter a title for this campaign.
You can enter up to 99 characters in this field.
 - c. Select the category this campaign belongs in.
You can create new campaign categories at Setup > Marketing > Campaign Management > Categories > New.
 - d. Select a campaign manager for this campaign.
The campaign manager receives confirmation that email campaign events have been sent.
 - e. Enter or pick the start date and end date for this campaign.
 - f. In the **Base Cost** field, enter the cost of this campaign apart from the cost of any specific campaign events.
You can enter the cost of specific events on the **Events** subtab.
The **Total Cost** field shows the sum of the cost of any campaign events and the base cost.
 - g. In the **Expected Revenue** field, enter the amount of revenue you expect this campaign to generate.
 - h. Enter the URL for the campaign landing page or online customer form associated with this campaign.
 - i. Enter a description.
4. Under Related Information:
- a. In the **Vertical** field, select a marketing vertical related to this campaign.
For more information, see [Campaign Verticals](#).
 - b. Select a promotion you want to associate with this campaign.
-  **Important:** You should not associate the same promotion with multiple campaigns or campaign events.
- Promotions enable you to offer discounts as part of the campaign. For more info, see the help topic [Promotions](#).
- c. Select the items associated with this marketing campaign.
You can create new items at Lists > Accounting > Items > New.
 - d. If you want to associate an offer with this campaign event, select that offer.
You can create new offers at Setup > Sales > Setup Tasks > CRM Lists > New. Select Marketing Offer.
 - e. In the **Audience Description** field, select an audience for this campaign.
For more information, see [Campaign Audiences](#).
5. Click **Save**.

Now you can schedule campaign events, enter keywords, add notes, and attach files and other related information.

Scheduling Campaign Events

Campaign events represent individual aspects of a campaign.

For example, a campaign could include three events:

- a series of print ads
- an email message sent to existing customers
- a banner ad on partner websites

You can create events for any channel your company uses in its marketing. The following channels are included by default: Direct Mail, Email, Phone, Print Ad, and Misc.

To create new campaign channels, go to Setup > Marketing > Campaign Management > Channels.

Only customers who haven't unsubscribed to your marketing campaigns can receive marketing email. Every email message you send includes an "Unsubscribe" link. Your customers can click this link to automatically unsubscribe from your email marketing campaigns.

With email campaign events, NetSuite automatically deletes duplicate messages to ensure each email address receives only one copy of your campaign mailing.

For more information about email marketing templates, see [Email Marketing Templates](#).

Note: Some of the fields listed below don't appear for all campaign channels.

To schedule a campaign event:

1. On the campaign record, click the **Events** subtab.
2. Click the subtab that corresponds with the type of event you want to schedule.
Use the **Other Events** subtab to track any event that is not an email or direct mail event. For information about Lead Nurturing events, see [Lead Nurturing Campaigns](#).
3. In the **Target Group** column, select the group that receives this campaign event.
You can create new groups at Commerce > Marketing > Personalization > Groups > New.
4. To test this campaign event, select the test cell you want to send it to.
For more information, see [Marketing Test Cells](#).
5. If this event is an email or direct mail campaign event, select the template for the email or direct mail in the **Template** column.
If you use the **CRM Template Categories** feature, you can select a category in the **Template Category** column to filter the list of templates.
Set up marketing templates at Documents > Templates > Marketing Templates > New. Set up letter templates at Documents > Templates > Letter Templates > New.
6. Enter a title for this campaign event.
In the **Subscription** column, the subscription category for the selected template is chosen, by default. Only recipients that have this subscription receive this campaign event. For more information, see [Campaign Subscription Categories](#).
You can select a subscription different from the default for this template.
7. In the **Channel** column, choose the method used to deliver this event.

To create new campaign channels, go to Setup > Marketing > Campaign Management > Channels.

8. Enter the cost incurred by this campaign event.

When you enter a cost, you can track return on investment (ROI) for the campaign. The **Total Cost** field at the top of the page shows the sum of the base cost plus the cost of each campaign event.

9. In the **Status** column, select the status of the campaign event.

If you select **Execute** for an email campaign event, NetSuite send your email on the date and time you set.

10. Select the date and time this campaign event will occur.

Note: You can't change the time of day an email campaign executes on the day it's scheduled to execute.

11. To associate a promotion with this campaign event, select the promotion.

Promotions enable you to track discounts offered through a campaign.

Important: You shouldn't associate a promotion with multiple campaigns or campaign events.

You can create new promotions at Lists > Marketing > Promotions.

12. Leave the field **Internal ID** empty.

When you save the campaign, NetSuite generates a number for this field. This internal ID appears in forms as **Event ID** or **Campaign Event**, so that you can track event responses.

13. Click **Add**.

14. Repeat these steps for other campaign events you want to schedule within this campaign.

Adding Paid Search Keyword Information to Campaigns

If this campaign tracks revenue and leads generated for paid search engine keywords, enter keyword information on the Keyword subtab.

Note: NetSuite provides two other methods to enter keyword campaigns in bulk. For more information, see [Creating Keyword Campaigns in Bulk](#).

To add paid search keyword information to a campaign:

1. On the campaign record, click the **Keyword** subtab.
2. Select the family this keyword belongs to.
Keyword families represent larger groupings of paid keywords. For more information, see [Campaign Families](#).
3. Select the search engine you purchased this keyword from.
For more information, see [Campaign Search Engines](#).
4. In the **Keyword** field, enter the keyword tracked by this campaign.

Campaign Notes and Files

You can enter notes and attach files to marketing campaigns.

To add a note to a campaign:

1. Open a campaign record.
2. Click **Create New > Note**.

The screenshot shows the 'Marketing Campaign' interface. At the top, there's a search bar and a title 'Lead Nurturing Campaign'. Below this are buttons for 'Save', 'Cancel', and 'New Event Field'. The 'Primary Information' section is expanded, showing a 'Custom Form' dropdown set to 'Standard Campaign Form' and an 'ID' field with the value '601'. To the right, an 'Actions' menu is open, displaying options: 'Create New', 'File', 'Note' (which is highlighted with a mouse cursor), and 'Personalize'.

3. In the New Note popup window, enter a title for this note.
4. Select the type of note to attach.
5. In the **Direction** field, select whether the note originates within your company or from outside your company.
6. Change the date and time for this note, if necessary.
The current date and time appear, by default.
7. In the **Memo** field, enter the note.
8. Click **Save**.
9. Repeat these steps for each note you want to document.

To attach a file to a campaign:

1. Open a campaign record.

2. Click **Create New > File**.

The screenshot shows the 'Marketing Campaign' interface. At the top, there's a search bar and a title 'Marketing Campaign'. Below it, 'Lead Nurturing Campaign' is displayed. There are buttons for 'Save', 'Cancel', and 'New Event Field'. On the right, an 'Actions' dropdown menu is open, showing options: 'Create New', 'File' (highlighted with a mouse cursor), 'Note', and 'Personalize'. The 'Primary Information' section is expanded, showing a 'Custom Form' dropdown set to 'Standard Campaign Form', an 'ID' field with the value '601', and an 'Auto' checkbox.

3. In the **Attach From** field, select the source of this file.
4. Select the folder you want to store this file in.
5. If the file source is the web, enter the URL of the file in the **URL** field.
6. If the file source is your computer, click **Browse** next to the **Select File** field.
7. If you want to set file encoding, select the encoding in the **Character Encoding** field.
8. If you want this file accessible to those without login access to your account, check the **Available Without Login** box.
9. Repeat these steps for each file you want to attach.

Note: Files you associate with a campaign aren't sent as attachments with email campaign events.

Campaign Events

You can use campaign events for multichannel or multiphase marketing campaigns. On the Events subtab of campaign records, you'll find the following event types: Email, Lead Nurturing, Direct Mail, and Other Events. If you create a campaign response record using SOAP web services without setting the event field, it defaults to Default Event.

Not all campaigns have individual events. Campaign events are best used for scheduled parts of a campaign, like email blasts. You can also use campaign events when generating campaign messages, like printing letters with Mail Merge. You can schedule the time and date of a campaign event and track its progress on the campaign record.

For example, Wolfe Electronics has an annual spring sale. The Marketing Administrator creates a campaign to manage the sales drive and track revenue:

- a flyer sent through the mail to all customers
- an advertisement in a local newspaper
- an email message sent to customers who purchased during last year's sales event.

Note: Keyword campaigns shouldn't have individual events. Each keyword you purchase should have its own campaign record. For more information, see [Keyword Campaigns](#).

Campaign Channels

There are five default campaign channels: direct mail, email, phone, print ad, and misc.

On the Events subtab of campaign records, you'll find the following event types: Email, Lead Nurturing, Direct Mail, and Other Events.

To create a campaign channel:

1. Go to Setup > Marketing > Campaign Management > Channels.
2. Enter a name for this campaign channel.
3. In the **Type** field, select the type of campaign channel you want to create.

The campaign channel type you select determines the subtab where you create the channel. Email, direct mail, and lead nurturing channels appear on their respective subtabs. You create channels of type Integration and Other type on the **Other** subtab. For example, you can create campaign events that use an email type channel only on the **Email** subtab.

4. Enter a description of the channel.
5. Click **Save**.

For tips on managing other campaign channels, see [Tips for Campaigns](#).

Campaign Event Status

You can track the progress of campaign events in the Status field of the event. You can choose from the following statuses:

- **Not Started** – Use this status to indicate that the event is in the earliest stage.
- **Planning** – Use this status to indicate that the event is in preparation or delivered, but not complete.
- **Execute** – Use this status for email campaign events.

When you set an email campaign event to **Execute**, NetSuite will send the email on the specified date and time.

- **Sent** – Use this status to indicate that a campaign event is complete and was delivered to the recipients.

NetSuite automatically sets email campaign events to **Sent** after the system generates and sends the email.

- **Failed** – Use this status to indicate that a NetSuite could not send the campaign event.

The most common reason for a failed campaign is when you've exceeded your monthly email allotment. Don't use this status for campaign email events that were successfully sent but not delivered due to external issues. For example, in cases that involve invalid email addresses, or problems with the recipient's email server.

Note: If an event fails, you must create a new event and send it again.

Initiating Campaign Events

After you create the campaign record, you should immediately set campaign events to execute. This is especially important for email campaigns. When you set an email campaign event status to **Execute**, NetSuite generates and sends your email messages at the date and time you've specified.

To initiate a campaign event:

1. From the list of campaigns, click **Edit** next to the campaign you want to execute.
2. On the **Events** subtab, click the event you want to execute.
3. In the **Status** column, select **Execute**.
4. Select the date and time you want NetSuite to send the event.

Note: You can't change the time of day NetSuite should send an email campaign event on the day it's scheduled to be sent.

5. Click **Add/Edit**.
6. Click **Save**.

After an email campaign event is executed, you receive an email notification, and the event status is changed to **Sent**.

For direct mail events, you can perform a letter merge operation to prepare the letters and mailing labels. After you mail the letters, change the campaign event status to **Sent**.

Creating Target Groups for Campaigns

Email and direct mail campaign events target segments of customers, prospects, or leads. You can create new customer groups based on items purchased, purchase dates, and amount purchased. You can also create groups based on location, customer category, or lead source.

To create a target group:

1. Go to Campaigns > Marketing > Groups > New.
2. On the Create Group page, choose **Dynamic**, and then select **Customer** in the list.

Create Group

[Continue](#)

What kind of group would you like to create?

☒ **Dynamic**
Automatically update group membership based on saved search criteria. You cannot add or remove individual members, but you can change search criteria.

☐ **Static**
Add specific group members. The membership of static groups does not change automatically, but you can add or remove members at any time.

What kind of members would you like to include?

Customer

3. Click **Continue**.
4. On the Create Dynamic Customer Group page, enter a name for your group.
5. Next to the **Saved Search** field, click **New**.
6. In the New Saved Search popup window, select what you want to base your customer group on.
You can base a customer group on searches for transaction and case criteria in addition to customer criteria.
7. Enter the criteria customers must meet to be included in this group.
8. Click **Save**.
9. On the Create Customer Dynamic Group page, in the **Comments** field, enter a description of the group.
10. Check the **Private** box, if you want to be the only one to use this group.
11. In the **Restrict To** field, select the employee group you want to grant access to this group.
For example, you can select a group of marketing reps to make this group only available to those reps.
12. Click **Save**.

Now you can select this group in the Group field on marketing campaign events.

Marketing to Contacts

Depending on your customer base, you may prefer to send your marketing campaigns to contacts, rather than the customer for whom they work. You can create a target group of contacts based on the characteristics of the customer who employ them.

The Wolfe Electronics marketing manager plans to send email messages to let customers know about a summer sales promotion. Rather than send the email to the customer's company email address, the marketing manager sends it to their primary customer contacts. This email includes a coupon code that they can use when they place an order. The marketing manager creates a new customer search that filters out customers that have not purchased within the last year. Then, they create a group made up of the primary contacts for these customers.

You can track lead sources for contacts in the same way you do for leads, prospects, and customers. There is no transaction or revenue impact of a contact's lead source. Contact lead sources can help you understand which marketing campaigns are most effective at bringing contacts to your company.

You can use online customer forms to capture contact information. See [Using Online Customer Forms for Contacts](#).

Before creating a dynamic contact group based on customer criteria, you must first create the contact saved search the group is based on.

To create a contact group based on customer criteria:

1. Go to Campaigns > Contacts > Search.
2. Check the **Use Advanced Search** box.
3. Click **Create Saved Search**.
4. On the **Criteria** subtab, set criteria based on customer fields.
5. After you set the customer criteria, click **Save**.

6. Go to Campaigns > Marketing > Groups > New.
7. On the Create Group page, choose **Dynamic**, and then select **Contact** in the list.
8. Enter a name for this group.
9. Next to the **Saved Search** field, choose the saved search you created.
10. Click **Save**.

After you have sent a campaign message to contacts, you can track revenue as if the event targeted the customers the contacts work for.

After contacts review the marketing email, they place orders on behalf of their employers. As orders are placed, Wolfe sales reps enter the campaign's coupon code on the order. Later, the Wolfe marketing manager can view the Campaign ROI Analysis and Sales by Promotion reports to determine the success of the campaign.

When contacts submit online customer forms, NetSuite tracks the submissions on the Online Forms subtab on the contact record. NetSuite displays the online form's name, contact's company, and lead source that generated the form submission, for each submission. NetSuite also displays the submission on the Online Forms subtab of the customer record associated with the contact.

Associating a Customer With a Campaign

When you associate a record with a campaign, you can track the revenue generated by that campaign. You can also track the number of leads, prospects, and customers generated.

You can select a lead source manually on a customer record, or you can automate the process through online customer forms.

To use online customer forms to associate customers with campaigns:

1. Include the **Lead Source** field on your online customer form.
To keep this transparent to your customer, make the **Lead Source** field a hidden field on the form.
2. In the link to this online form, append the URL with the lead source parameter.
You can pass the campaign ID or the name of the campaign through this URL. The link should use this format:
`http://youronlineform.com&leadsource=TheCampaignID`
3. Provide the link to customers. You can include this link in campaign email or link to this form from an internet ad.

When a customer submits your online customer form, the created or updated record displays the campaign selected in the **Lead Source** field.

Associating a Transaction With a Campaign

By default, when you create a sales transaction for a customer, the Lead Source field is blank on the transaction. You can manually change the lead source on a per-transaction basis. You can also set the lead source automatically when you use the Default Lead Source on Sales Transactions preference. Go to Setup > Marketing > Preferences > Marketing Preferences.

Choose one of the following if you want a default lead source to appear on sales transactions:

- **First Campaign Sent** – The lead source for the first campaign event sent to the customer is the default.
- **Most Recent Campaign Sent** – The lead source associated with the most recent campaign event sent to the customer is the default.
- **First Campaign Responded To** – The lead source of the campaign event where the customer first responded is the default.
- **Most Recent Campaign Responded To** – The lead source of the campaign event associated with the most recent customer response is the default.
- **Based on Lead Source** – The lead source selected on the customer's record is the default.

Leave this field blank if you do not want a default lead source on sales transactions.

Tracking Campaign Lead Generation

You can track the number of leads, prospects, and customers generated by a campaign. To track this data, select the campaign in the Lead Source field on the customer record.

For more information, see [Associating a Customer With a Campaign](#).

Sales Campaigns

Sales campaigns enable your sales reps to send email campaigns to their customers and track the responses. Sales campaigns enable reps to better assess their customers' interest.

Sales reps can use campaign response reports to view each recipient's response. This helps reps identify interested customers.

When reps use sales campaigns to send offers, they know which recipients opened or clicked a link in the email. Reps can view the Campaign Responses Detail report to see each recipient and their response. Reps can use this information to determine which prospects to follow up with.

Note: NetSuite tracks recipient response data only for links to NetSuite pages. For example, NetSuite tracks a link to a page in your NetSuite website, but not a link to a third-party site.

Reps can send sales campaigns to the customers, contacts, and other records that the sales rep's role gives them permission to view or edit.

Note: You can edit a sales campaign only when you are logged in with the role you used to create the campaign. The role in which you created a sales campaign displays in the Manager Role field on the sales campaign. Only the manager of a sales campaign can edit it.

You can create sales campaigns at Lists > Marketing > Sales Campaigns > New.

To view a list of sales campaigns, go to Lists > Marketing > Sales Campaigns.

By default, sales campaigns do not appear in the list at Lists > Marketing > Marketing Campaigns. However, you can create a custom list view to include sales campaigns. To do this, edit the view of the marketing campaign list, and set the Is Sales Campaign filter to Either. The sales campaign list can't show marketing campaigns.

Note: NetSuite does not send sales campaigns for inactive campaign owners (sales reps no longer with your company).

For information about email marketing campaigns, see [Creating an Email Marketing Campaign](#).

Giving Access to Sales Campaigns

To grant access to sales campaigns, an administrator must enable the Sales Campaigns feature at Setup > Company > Enable Features > CRM. The Sales Campaigns feature grants the standard sales roles (Sales Person, Sales Manager, and Sales Administrator) access to the following:

- the Sales Campaign page and search
- marketing templates
- CRM groups
- marketing reports

Sales reps conduct sales campaigns in a manner similar to marketing user who conducts marketing campaigns.

Target Group Restrictions

Sales reps can send sales campaigns only to customers and contacts that meet the restrictions defined by their assigned role. A sales rep restricted to the customers assigned to themselves and their subordinates can send sales campaigns to only those customers.

Sales Campaign Templates

Marketing templates permit NetSuite to automatically track the response to sales campaign email.

Sales campaigns use the sender's information for the From and Reply To email addresses. The nickname and From address entered in the sales rep's profile (Home > Set Preferences > General subtab) define these email addresses.

Note: NetSuite does not use marketing email addresses in the From Email Address and Reply To Email Address fields (campaign email template) in email sent through sales campaigns. The exception to this is when someone sends a campaign on behalf of a sales rep. For example, if a sales manager sent a campaign on behalf of their subordinates. Sales campaigns created with a marketing template marked to Email as Sales Rep uses the sales rep's email address as the From and Reply To addresses. For more information, see [Email Marketing Templates](#).

If a sales rep hasn't set up a profile, NetSuite uses the rep's login email address as the email's From address. NetSuite uses the name on the sales rep's employee record in the To field on the email.

Sales Campaign Reports and Search

Marketing campaign reports include data on both sales campaigns and marketing campaigns, by default. If you have access to both kinds of campaigns, your campaign reports include both sales and marketing campaign data.

To filter the report results to display only one kind of campaign, customize the report and add the Is Sales Campaign filter. Set this filter to True to view only sales campaigns. Set the filter to False to view only marketing campaigns.

To view campaigns for a specific sales rep, customize the report and add the Campaign Manager filter.

NetSuite returns only sales campaigns when you search at Lists > Marketing > Sales Campaigns > Search. NetSuite returns marketing campaigns and sales campaigns when you search at Lists > Marketing > Marketing Campaigns > Search. To limit the results of this search to display only marketing campaigns, set the Is Sales Campaign filter to False.

Tracking the Success of Your Sales Campaigns

You can track the responses of your sales campaigns on the sales campaign record. The Statistics subtab gives an overview of how your campaigns were received and responded to. For more information about campaign responses, see [Tracking Campaign Responses](#).

For details about how your customers responded to your campaigns, view the [Campaign Response Detail Report](#). Go to Reports > Marketing > Campaign Response > Detail Report. This report lists the campaign recipients and how they responded, which provide understanding into which customers have interest in your offer.

For more information, see [Marketing Reports](#).

Campaign Calendar

You can choose to display campaign events in calendar portlets on your dashboard.

To add campaign events to a calendar portlet:

1. Click **Set Up** on the calendar portlet.
2. Check the **Show Campaign Events** box.
3. Click **Save**.

You can include campaign events in the same calendar as your other events, tasks, and phone calls. You can also add a separate calendar for campaigns.

Campaign Metrics

NetSuite reporting tools offer the following metrics for measuring the effectiveness of marketing campaigns on sales and lead generation. You can access these reports from the menu links in the Marketing section of the Reports page. Go to Reports > Marketing.

Metric	Description	Relevant Reports
Return on Investment (ROI)	Calculating ROI requires that you enter the cost of each campaign or campaign event.	Campaign ROI Analysis Summary & Detail
	Transaction revenue is attributed to a campaign when the campaign is selected on the transaction record.	Sales by Paid Keyword Summary & Detail
		Sales by Lead Source Summary & Detail
Lead Source	Lead sources reference the names of your campaigns. Tracking lead sources lets you determine which campaigns are bringing in new customers and contacts.	Lead Source Analysis Summary & Detail
	NetSuite tracks the Lead source in the Lead Source field on lead, prospect, customer, and contact records.	Gross Lead Source Analysis Summary & Detail
	For information about lead sources, see Lead Sources .	Leads by Paid Keyword Summary & Detail
Campaign Response	You can track campaign responses automatically for email campaigns.	Campaign Response Summary & Detail
	You must manually indicate each recipient's response to campaigns that use non-email channels.	

Tracking Campaign Revenue

When you select a campaign in the Lead Source field on a transaction, the transaction's revenue is associated with the campaign.

Before you send your first campaign, you should set the Default Lead Source on Sales Transactions preference. Go to Setup > Marketing > Preferences > Marketing Preferences. This preference determines which campaign displays by default in the Lead Source field on transactions entered manually or taken through your web store. For more information, see [Marketing Preferences](#).

This preference is set to **Based on Lead Source** by default. You can associate a customer with a campaign in three ways:

- Pass a campaign ID or lead source parameter through a link to an online customer form.
- Pass a campaign ID or lead source parameter through a link to your NetSuite website.
- Manually select the campaign in the Lead Source field on the lead, prospect, or customer record.

For more information, see [Passing Parameters Through URLs](#) and [Tracking Lead Sources for Web Store Visitors](#).

Cost and ROI

You measure return on investment (ROI) when you compare the cost of a campaign with the revenue it generates.

When you initiate a campaign, enter the cost of the campaign in the Base Cost field. If the campaign includes individual campaign events, enter the cost of each campaign event. The sum of the cost of all campaign events and the campaign's base cost displays in the Total Cost field.

When orders include lead sources, the sales revenue is tied to your campaigns. ROI is calculated by dividing the revenue by the cost of the campaign.

For information about ROI reports, see [Campaign ROI Analysis Summary Report](#) and [Campaign ROI Analysis Detail Report](#).

Tracking Campaign Responses

Campaign response information helps you refine how you deliver your campaigns.

You can track the following responses from campaign recipients. You can view these responses in the Response Detail column of the campaign response record:

- **Received** – The recipient received the campaign but hasn't responded or purchased. This status is only applicable to non-email campaigns.
- **Responded** – The recipient did one of the following:
 - Replied to the From address on the campaign email message
 - Submitted an online customer form that included the campaign's lead source or promotion
- **Purchased** – The recipient made a purchase because of the campaign.
- **Sent** – NetSuite sent the campaign.

You can also track the following responses to email campaigns:

- **Queued** – The email is in a queue to be sent but hasn't yet been sent.
- **Opened** – The recipient opened the email message.
- **Clicked Thru** – The recipient opened and clicked a link in the email message.

 **Note:** Recipient response data is only tracked for links to NetSuite pages, not third-party sites.

- **Failed – delivery failure** - NetSuite sent the email, but it could not be delivered.
- **Failed – invalid address** – Email delivery failed due to an invalid email address. This is also known as a hard bounce. For more information about managing hard bounces, see [Managing Bounced Email](#).
- **Failed – miscellaneous delivery failure** - Email delivery failed due to a miscellaneous delivery error.
- **Failed – spam** – The email was marked as spam by the recipient or the recipient's content filter. This is considered a soft bounce.
- **Failed – delivery failure** – Network issues prevented email delivery. This is considered a soft bounce.
- **Failed – other** – The email was not delivered due to unknown reasons. This response can only be set by SOAP web services. This is considered a soft bounce.
- **Subscribed** – The recipient subscribed to your campaigns through the Unsubscribe link in the email message.
- **Unsubscribed** – The recipient unsubscribed to your campaigns through the Unsubscribe link in the email message.

You can find additional information in the Note field of the campaign response. You can include these descriptions in searches or reports. On reports, you can add the Comment field as a column or filter. To include these responses in searches, create a Campaign type saved search. In the Criteria subtab, use the Response Comments field in Campaign Response Fields. For more information, see the help topic [Saved Searches](#).

 **Note:** Email campaign responses are tracked automatically if you check the Track Outgoing Email box on the marketing template record. When a recipient opens and clicks through the email, the response is recorded. If the recipient's email client is configured to not display images or HTML, the tracking pixel does not automatically update the status of the campaign event.

Statistics on sent and bounced emails can take longer to update based on the size of your recipient list. Updates are also delayed based on the rate at which the recipient's email servers accept your email. Statistics are updated every two hours on reports and on the Statistics subtab of campaign records.

The following campaign responses are only tracked on older email campaign events. These responses are also available to searches and reports:

- Invalid Sender Address
- Mail Protocol Issues
- Mailbox Disabled
- Mailbox is Full
- Mailbox not Accepting Messages
- Media Error
- Messages Exceeds Size/Limit
- Network/Server Issues
- Security Issues
- Too Many Recipients

Entering Campaign Responses

You can manually mark a recipient's response on the Campaigns subtab of the recipient's record. This is useful for campaigns that do not automatically track response the way email campaigns do.

To enter a new campaign response:

1. Open the recipient's record.
2. Click the **Marketing** subtab.
3. Click the **Campaigns** subtab.
4. Click **Add Response**.
5. In the New Campaign Response popup window, select the campaign the recipient responded to.
6. Select the campaign event the recipient responded to.
7. Enter the date and time of the response.
8. In the **New Response Detail** field, select the response type.
9. Enter any notes related to the response.
10. Click **Save**.

The response history for each campaign is tracked, including the date and time of those responses.

To update the status of an existing campaign response:

1. Open the recipient's record.
2. Click the **Marketing** subtab.
3. Click the **Campaigns** subtab.
4. Click **Update Status** next to the campaign event you want to update.
5. In the Campaign Response popup window, set the date and time for this response.
6. In the **New Response Detail** field, select the new response.
7. Enter a note about the campaign response.
8. Click **Save New Response**.

To delete all responses to a campaign, click Update Status next to the campaign. Click Actions, and then click Delete.

Note: The Response column shows the most recent response for each campaign sent to this recipient. There may be a delay in reporting the response statuses of Sent and Bounced.

You can view how recipients respond to your campaign events with the Campaign Response Summary and Detail reports. For more information, see [Marketing Reports](#).

In addition, you can view data on the Statistics subtab of campaign records. This subtab provides cost analysis such as total revenue, ROI, profit, as well as cost per lead and per purchaser. You can also see the number of leads and website visitors generated by the campaign.

Email with Multiple Links

In a marketing email message, a **Clicked Thru** campaign response is returned when an entity clicks any link in the email message. You can see which specific links entities clicked in the Campaign Clickthrough report. For more information, see [Campaign Clickthrough Detail Report](#).

Bounced Email

There are several reasons why an email message might not be delivered, or bounce. Some are temporary and result in soft bounces. Others can be the result of permanent issues and result in hard bounces. A hard bounce generates the **Failed – invalid address** campaign response.

Note: If an email address generates a **hard bounced** response, NetSuite restricts its inclusion in subsequent campaigns for 30 days or 90 days. The day length depends on whether DKIM and an email domain are set up. Attempts to send to the bounced address before the time elapses results in an unsent message, and the campaign response: **Failed – invalid address**.

You can access all saved searches from Lists > Search > Saved Searches. The following saved searches are available to assist administrators who work with bounced emails:

- You can also access the Sent Email List from Setup > Company > Communication > Sent Email List. See [Using the Sent Email List](#).
- You can also access the Undelivered Emails from Lists > Mailing > Undelivered Emails. See [Managing Bounced Email](#).
- The Bounced Email Addresses list is more inclusive. See [Viewing the Bounced Email Address List](#).

Hard Bounce Reasons

- Unknown User
- Bad Domain
- Address Error
- Account Closed
- Receiver Error
- Hard Bounced - Other (used when unable to determine one of the five preceding reasons)

Soft Bounce Reasons

- Mailbox Full
- Disabled Account

- Greylisted
- Server Too Busy
- Soft Bounce – Other (used when unable to determine one of the four preceding reasons)

For information about excluding email addresses that returned hard bounce responses, see [Choosing Email Recipients](#).

Mail Merge vs. Email Campaigns

Mail Merge and email marketing campaigns both let you create personalized emails in bulk. By using email marketing campaigns, you can track revenue, lead source, and other marketing information for your campaign events. For more information about email marketing campaigns, see [Email Marketing Campaigns](#).

For campaign events that use a channel other than email, use NetSuite Mail Merge tools. NetSuite Mail Merge tools help you create fax, PDF, or letter documents for your marketing events. For more information about merging letters, see [Working with Mail Merge](#).

Tips for Campaigns

Following is information to help you manage two common marketing scenarios: direct mail and imported leads lists.

Direct Mail

To ensure a successful direct mail campaign, the campaign should be recorded on the customer record and on the sales transaction.

When you link a direct mail campaign with revenue, the sales rep must manually select the lead source on the sales transaction. To set a lead source for a lead, prospect, or customer, open the record. In the Lead Source field, select the campaign that brought this customer to your company.

You can use the Mail Merge feature to create personalized mailings and print address labels for the recipients.

Imported Leads Lists

You can import lists of leads using CSV or XML files:

- **For CSV imports** – In the **Lead Source** column, paste the name of the campaign you use to track this list of leads.
- **For XML imports** – Include the **leadSourceRef** element in the import for each record.

For both types of imports, the lead source must **exactly** match the name of the campaign record.

If you use default lead sources on sales transactions, you can link the revenue generated by these leads to the campaign. See [Tracking Campaign Revenue](#)

To track revenue for imported leads, use the Default Lead Source on Sales Transactions preference. Go to Setup > Marketing > Preferences > Marketing Preferences. In the Default Lead Source on Sales Transactions field, select **Based on Lead Source**. When sales reps enter transactions for a customer with

this lead source, NetSuite defaults the campaign event on the transaction. Now you can track campaign revenue and calculate ROI.

Wolfe Electronics purchases a list of leads from a consulting firm. Before the marketing administrator imports the leads into NetSuite, they create a campaign titled Summer 2019 Fleming Consulting Leads.

Email Marketing Campaigns

The integrated marketing tools in NetSuite enable you to create and track all aspects of your email campaigns. You can measure return on investment and see which email campaigns bring in the most leads. You can also view reports of how many recipients get your offers.

Unlike other channels, NetSuite creates and sends your campaign emails at the date and time you set. You can also set up lead nurturing campaigns that go out based on criteria you choose. For information about lead nurturing campaigns, see [Lead Nurturing Campaigns](#).

You can also use email campaigns to send and track email newsletters. Using campaigns enables you to track how readers respond to your newsletters. For more information, see [Sending Newsletters Through Email Campaigns](#).

NetSuite generates campaign email from HTML templates you create. You can personalize these templates to include the name, address, and other information specific to the customer or contact receiving the email.

Before you create your first email campaign, complete the following tasks:

1. Review [Optimizing Email Campaigns](#) for information about how you can ensure the best results from your email campaigns.
2. Set up your campaign email domain. For more information, see [Campaign Email Domains](#).
3. Set up domain key identified mail (DKIM). For more information, see the help topic [DomainKeys Identified Mail \(DKIM\)](#).
4. Set your [Marketing Preferences](#).
5. Send the customers, contacts, and other recipients subscription email to allow them to opt in to your campaigns. For information, see [Subscription Management](#).

After you complete these five tasks, you are ready to create email campaigns.

To create an email marketing campaign:

1. Create an email marketing template. For more information, see [Email Marketing Templates](#).
2. Create a group of recipients. For more information, see the help topic [Working with Records, Transactions, and Lists](#).
3. Create a campaign record. For more information, see [Creating a Campaign Record](#).
4. Run your campaign events. For more information, see [Initiating Campaign Events](#).

Email Best Practices

Best practice includes the use of industry-standard email authentication through DomainKeys Identified Mail (DKIM) and campaign email domains. It also means keeping your recipient lists up to date with people who've chosen to get your emails. Both of these help improve your deliverability and lower the chances of your emails being marked as spam.

The following sections show you how to set up email campaigns in NetSuite and give tips to help you get the best results.

For more information, see the following sections:

- [Five Golden Rules for Outbound Email](#)
- [DomainKeys Identified Mail \(DKIM\) and Email Domains](#)
- [Domain-based Message Authentication, Reporting and Conformance \(DMARC\)](#)
- [Sender Policy Framework \(SPF\)](#)

For an overview of the processes marketing administrators can use to ensure your company's campaigns are reaching their audience effectively, see [Optimizing Email Campaigns](#).

Five Golden Rules for Outbound Email

1. Always send using a FROM domain you control	■ Don't send emails on behalf of customers, and never use their email addresses in the FROM field. ■ Never send from addresses that use a DNS record you don't control. □ For emailed forms, or email messages related to transactions, make sure the Return Email Address field on the Company Information page uses your domain. (A user with an Administrator role can go to Setup > Company > Setup Tasks > Company Information to view the Return Email Address field). For more information, see the entry in the From Address for Emailed Forms row in the Transaction Email Preferences section of Setting Email Preferences. □ For campaign email messages, see Campaign Email Domains.
2. Manage Your Scripts	Regularly check your SuiteScript outbound email scripts and quickly delete any scripts or customizations you're not using anymore.
3. Be Compliant	■ Make sure you've set up the right DNS records for DKIM on the domains you send email from. See the help topics DomainKeys Identified Mail (DKIM) and DomainKeys Identified Mail (DKIM) and Email Domains. ■ Consider setting up a DMARC policy record for your company's entire email infrastructure. See Domain-based Message Authentication, Reporting and Conformance (DMARC). ■ For NetSuite, you don't need to set up DNS records for SPF on your sending domains, but your company might still need an SPF record depending on your needs. See Sender Policy Framework (SPF).
4. Be Aligned	If you have an email relay between NetSuite and your mailbox provider (where the MX points), make sure the MAIL-FROM (ENVELOPE-FROM, RETURN-PATH) passes the SPF check.
5. Be Hygienic	■ Don't send spam or unwanted email. ■ Don't send single email more than a single time. ■ Always honor unsubscribe requests. ■ Don't send or forward email with content (especially attachments) that you don't recognize

DomainKeys Identified Mail (DKIM) and Email Domains

When you create your email template, you can select your company's email domain. This domain replaces each instance of the `netsuite.com` domain that would show in your emails by default.

For emailed forms or transaction-related emails, you can choose your company's email domain when you set up your account. For more information, see the help topic [Setting Email Preferences](#). Best practice is

to make sure the domains you use in **Campaign Email Domains** and **Email Preferences** are ones you control the DNS records for.

You can use this same domain for DKIM email authentication. DKIM is an accepted method of verifying the emails you send. Many Internet Service Providers (ISPs) like Google and Yahoo identify email in their recipients' inboxes that has used DKIM. They also use DKIM to verify their own emails.

For more information about setting up email domains and DKIM, direct your administrator to [Campaign Email Domains](#) and [DomainKeys Identified Mail \(DKIM\)](#).

Domain-based Message Authentication, Reporting and Conformance (DMARC)

A domain administrator can use DMARC to see how emails from their domain will look to receiving systems. DMARC tells the receiver which validations (SPF, or DKIM, or both) will pass. This validation makes sure the email message was sent by the sender identified by the **From** address.

Consider setting up a DMARC policy record with your domain provider. A DMARC policy record is a DNS resource record of the type TXT. The shortest valid DMARC policy record is `v=DMARC1; p=none`. To assist with email deliverability analysis, include an email address (or addresses) to which reports of aggregated feedback can be sent. Use the `rua` tag to list the address (or addresses) for aggregate feedback reports in your policy. For example, `rua=mailto:aggrep@example.com`.

Important: Setting up a DMARC policy affects the entire email infrastructure of your company. The administrator responsible for your company's email infrastructure should be involved in setting up a DMARC policy record with your domain provider. Consider carefully how strong a policy to implement as it may have consequences. For example, if you use the optional `rua` tag, it might consume some of your company's email resources, depending on the volume of received reports.

For more information about DMARC, go to <https://dmarc.org/overview>. You might find the **Anatomy of a DMARC resource record** and **How Senders Deploy DMARC in 5-Easy Steps** sections of that page particularly helpful. See also the DMARC specification, [RFC 7489](#).

Sender Policy Framework (SPF)

SPF is a Simple Mail Transfer Protocol (SMTP) validation system that verifies the sender's IP address. It lets administrators determine which servers can send email messages from a particular domain. You don't need to align SPF with your DMARC policy when you send emails from NetSuite. Only set up an SPF record if a recipient's email system specifically asks for it.

An SPF record is a TXT record using the SPF format with your DNS provider. An SMTP server on the receiving end determines (based on the content of the DNS TXT record) whether the IP address the email message is sent from is approved for that domain.

Important: Email or fax infrastructure or services may require that you to set up a DNS TXT record for SPF.

- **Email Infrastructure and Services:** A DNS TXT record for SPF may be required by the email infrastructure or services (as presented by email domains) that you send email to. If you must include a reference to NetSuite SPF, ensure that the definition `include:sent-via.netsuite.com` is a part of your SPF record.
- **Fax Infrastructure and Services:** A DNS TXT record for SPF may also be required by the fax infrastructure or services that you use to send faxes. For example, eFax validates SPF records. If you are registered with eFax to send faxes from NetSuite, ensure that the definition `include:mailsenders.netsuite.com` is a part of your SPF record.

Note: Don't attempt to manage access to NetSuite by adding a list of NetSuite IP addresses to an access control list. Rather than using a list of allowed IP addresses, there are better, more secure, and less fragile methods to protect your account from unauthorized access. For more information, see the help topic [NetSuite IP Addresses](#).

Optimizing Email Campaigns

NetSuite gives your marketing team the tools they need to boost your email deliverability and build your reputation with ISPs as a legitimate marketer.

The NetSuite Marketing Application Terms of Service specifically prohibit the use of email marketing campaigns for sending spam. **Spam is defined as any email that is sent to recipients who don't want to receive it.**

Spam is not restricted to email with inappropriate or harmful content. Spam is defined only by whether the recipient has agreed to receive it. For example, email sent to a list purchased from a third party is considered spam.

You can make sure people who use campaigns irresponsibly don't hurt your legitimate marketing efforts. NetSuite uses criteria to separate appropriate email campaigns from email that might be spam.

Email campaigns that meet the standards for legitimate marketing get sent at a higher priority than those that don't. Additionally, email that meets these characteristics has a higher delivery rate because it's less likely an ISP would consider it spam.

NetSuite email policies abide by the standards set by the Messaging Anti-Abuse Working Group (MAAWG), of which Oracle is a supporting member. For more information, visit [MAAWG's Web site](#).

These standards apply only to the following types of email in NetSuite:

- campaign email
- bulk merge email
- email initiated by SuiteScript (by the [N/email Module](#) in SuiteScript 2.x or by the `nlapiSendEmail()` or `nlapiSendFax()` API calls in SuiteScript 1.0)

Important: If you use the UK Edition, NetSuite complies with UK law. NetSuite includes the name of your business address and VAT number in the footer of all email you send to those outside of your company.

In accordance with the CAN-SPAM act, NetSuite campaign email is not sent to email addresses with wireless domains. Recipients whose email addresses have domains that are listed on the [Federal Communications Commission \(FCC\) Web site](#) won't receive campaign email.

This section provides an overview of how you can maximize the deliverability of your email campaigns.

Characteristics of Legitimate Campaign Email

Campaign email that abides by our Terms of Service is sent with a higher priority than those that don't meet the criteria below.

Legitimate marketing emails have the following characteristics:

- Your recipients have opted in to your campaigns. **This is the most important indicator in determining whether an email message is spam.**
For information about opting in to campaigns, see [How Customers Opt In to Marketing Campaigns](#).
- Your campaign recipients have purchased or responded to your campaigns in the past.
- The email uses a campaign email domain.
For information about campaign email domains, see [Campaign Email Domains](#).
- The email uses DomainKeys Identified Mail (DKIM).
You can use the same domain for both your campaign email and DKIM. For more information, see the help topic [DomainKeys Identified Mail \(DKIM\)](#).
- You've built a positive sender reputation through your previous campaigns.
For more information, see [Developing a Positive Email Sender Reputation](#).

Characteristics of Possible Spam

Emails that don't meet the standards for legitimate marketing get sent with much lower priority.

Email that might be spam has some or all of the following characteristics:

- The recipients have **not** opted in to the campaign. **This is the strongest indication that a campaign might be spam.**

To make sure your recipients list includes only those who want to receive your email, send campaign subscription invitations. For information about how to have your customers opt in to your campaigns, see [Opt-In Email](#).

Note: Some jurisdictions have regulations regarding whether you can contact entities if you do not have their explicit permission to do so. For example, the European Union (EU). Ensure that you adhere to these regulations when you send both subscription invitations and campaign email.

- You've built a poor sender reputation from past campaigns.
- The recipients haven't bought from you or responded to your past campaigns.

To improve the speed at which your email is sent and the rate at which it's delivered, see [Improving the Deliverability of Your Campaign Email](#).

Campaign Email Limits

If you haven't set up DKIM and an email domain, you're limited to 10,000 messages per campaign.

Your system administrator can set up DKIM and campaign email domains. Your company must first purchase a domain from a domain provider like GoDaddy.com or Network Solutions. DKIM and email domains are required to send more than 10,000 email messages per campaign (email merge), or more than 100,000 bulk email per month.

If you have DKIM set up, there is no limit to the number of email messages you can send in a single merge or campaign. The only limit is the monthly allotment of email messages you have purchased. Email that is sent by NetSuite servers is counted toward your monthly allotment even if it does not reach its target recipient.

Subscription opt-in emails don't count against your monthly email allotment.

Choosing Email Recipients

After you create your email template, it's time to set up a group of recipients for your marketing campaign. For best results, you should only send email campaign messages to:

- Customers who've subscribed to your marketing campaigns with a Confirmed Opt-In status.
- Email addresses that aren't on the bounced email list.

For more information about how to create a group of recipients, see the help topic [Working with Groups](#).

Before you add a customer to a recipient group in NetSuite, make sure you give them a chance to subscribe to your campaigns. Campaigns sent to subscribed customers have a much higher delivery success rate than those who have not explicitly subscribed. NetSuite provides a variety of tools you can use to invite recipients to opt in. For more information about subscriptions, see [Subscription Management](#).

Repeatedly sending email to an invalid email address damages your sender reputation. To help with this, NetSuite automatically logs when email messages return hard bounce responses. NetSuite won't send emails to those addresses for a set period of time. For more information, see [Managing Bounced Email](#).

To make sure you only send emails to valid addresses, set a suitable time period for bounced email addresses. Go to Setup > Marketing > Preferences > Marketing Preferences > Subscription.

Select the right group of recipients is important in to ensure that your email is delivered quickly and successfully. When you create a target group with search criteria, consider adding the following criteria to the other criteria you use to select your recipients:

- **Global Subscription Status** is **Confirmed Opt-In**

Send to recipients who have confirmed that they want to receive your email. This is the most important factor to determine if your email meets the Marketing Automation Terms of Service.

You can send email campaigns to recipients with the status of Soft Opt-In. However, your email might not be delivered as quickly or as successfully as it would be to Confirmed Opt-In customers.

- Bounced is **false**.

If you use the **Remove email addresses from Bounced Email Addresses list** preference, these email addresses are not sent email. However, when you add this criterion you do not incur a charge for these messages.

- **Campaign Response Fields: Campaign Response Filter: Response** is none of **Failed: spam**

This criterion filters recipients who have flagged your email as spam.

Careful management of your recipient lists improves your campaigns' performance, and it also creates trust between you and those with whom you do business. For more information about creating searches, see the help topic [Search Overview](#).

Developing a Positive Email Sender Reputation

NetSuite uses your email history to determine whether your email meets best practice criteria. This includes:

- The percentage of campaign email that is replied to.
- The percentage of email sent to invalid email addresses.
- The percentage of your campaign email that leads to spam complaints from recipients and ISPs.
- The purchase and response history of recipients.

When you maintain a positive sender reputation, your email campaigns receive faster delivery.

Improving the Deliverability of Your Campaign Email

If you want your email sent at the optimal rate of delivery, you should do the following:

- **Invite recipients to opt in to your campaigns.**

You can send campaigns to recipients with the Soft Opt-In status. However, letting recipients subscribe can increase the deliverability of your email.

You can invite your customers to opt in by going to Campaigns > Other > Mass Updates. Under the Marketing heading, select the Send Subscription Message update you want to perform. For more information, see [Opt-In Email](#).

- Only send campaign email to customers who have purchased from you or responded to prior campaigns. For tips on creating recipient groups, see [Choosing Email Recipients](#).
- Set up a campaign email domain.
- Set up domain key identified mail (DKIM).

Subscription Management

NetSuite provides you with the tools you need to manage the email preferences of those with whom you do business.

Every email you send through campaigns or bulk email merges includes a footer with a link and instructions to unsubscribe. For more information, see [How Customers Opt In to Marketing Campaigns](#).

Email recipients can have one of four subscription statuses:

- **Confirmed Opt-In:** When an email recipient subscribes to your marketing campaigns or bulk email merge operation, NetSuite assigns this subscription status. Only a lead or customer can set their

subscription status to **Confirmed Opt-In**. For more information, see [How Customers Opt In to Marketing Campaigns](#).

Getting recipients to opt in leads to better and faster delivery because ISPs are less likely to mark these messages as spam.

- **Soft Opt-In:** Recipients with this status receive all email marketing campaigns or bulk emails received by recipients with the **Confirmed Opt-In** status. They also receive opt-in messages that enable them to confirm whether they want to receive the email campaigns or bulk emails.

Recipients can't set their own status to **Soft Opt-In**. You can set this status in NetSuite manually or with a mass update.

- **Soft Opt-Out:** Soft Opt-Out: Recipients with this status don't get campaign or bulk emails, but they do get opt-in messages.

You can change this subscription status to **Soft Opt-In** manually or through a mass update. If you set a recipient's status to **Soft Opt-Out**, NetSuite unsubscribes them from all subscription categories.

- **Confirmed Opt-Out:** Only the recipient can set their subscription status to **Confirmed Opt-Out**.

Recipients with this status don't receive email campaigns, bulk emails, or opt-in messages. Recipients with this status can opt in again through the Customer Center or by clicking the link in a campaign message they got before opting out.

Status	Receive campaigns?	Receive opt-in message?	Set by
Confirmed Opt-In	yes	yes	recipient only
Soft Opt-In	yes	yes	manual or mass update
Soft Opt-Out	no	yes	manual or mass update
Confirmed Opt-Out	no	no	recipient only

You can set new records to one of the soft statuses when you create them manually or with a CSV import, but you can't set confirmed statuses this way.

Note: Certain jurisdictions have regulations regarding whether you can contact entities if you don't have their explicit permission to do so. For example, the European Union (EU). You should check that your global subscription status adheres to the regulations in the recipient's jurisdiction.

NetSuite tracks subscription status in the **Global Subscription Status** field on each record. This field is located in the Subscriptions subtab of the Marketing subtab. The Subscription Message History subtab contains information about all subscription invitation and confirmation email messages sent to the entity after June 2018.

You can set the default global subscription status at Setup > Marketing > Preferences > Marketing Preferences.

If you use the Duplicate Detection and Merge feature, when you merge two records, NetSuite maintains the subscription statuses from the primary record on the final merged record.

To begin managing campaign subscriptions, see [Setting Up Campaign Subscriptions](#).

Creating Subscriber Lists Using Saved Searches

You can use search filters to track your campaign subscriptions and build mailing lists you can export. NetSuite uses saved searches to build these lists, and lists can apply to both customers or contacts. A list

of the most commonly used filters is as follows. For more information about creating saved searches, see the help topic [Saved Searches](#).

Filter	Options	Comments
Global Subscription Status	Soft Opt-In Soft Opt-Out Confirmed Opt-In Confirmed Opt-Out	Refine your list to target the more receptive (confirmed opt-in) customers.
Inactive	Either, Yes, No	Set to No to only search for active customers or contacts.
Subscription	Select item from Campaign Subscriptions list.	First enable Subscription Categories, at Setup > Company > Enable Features.
Subscription Status	Either, Yes, No	Set to Yes and use with subscription filter to return positive instances of that Campaign Subscription.

When you set up the saved search, you can export the search results in the required format. Supported formats include CSV, Excel, and PDF.

Setting Up Campaign Subscriptions

The first step to manage campaign subscriptions in NetSuite is to set the Unsubscribed to Marketing by Default preference. Go to Setup > Sales & Marketing Automation > Marketing Preferences. This preference determines whether new records are subscribed or unsubscribed, by default. You can set the preference by checking the Unsubscribed to Marketing by Default preference box:

- If you check the preference box, NetSuite automatically assigns new leads, prospects, customers, and other records you create the Soft Opt-Out subscription status by default.
- If you don't check the preference box, NetSuite assigns new records the Soft Opt-In status. Make sure you provide appropriate notice and obtain consent to automatically subscribe new and existing entities to marketing messages.

For more information about global subscription statuses, see [Subscription Management](#).

If you use the Subscription Categories feature, you should next create subscription categories. Categories permit recipients to choose which types of campaign communication they want to receive, rather than being subscribed (or unsubscribed) to all communication. For more information, see [Campaign Subscription Categories](#).

You can also customize the opt-in email message text sent to your email recipients. For more information, see [Opt-In Email](#).

Finally, give your customers the opportunity to subscribe to your marketing campaigns. For more information, see [Sending Subscription Messages](#).

How Customers Opt In to Marketing Campaigns

Customers, vendors, partners, and employees can receive email you generate in bulk through campaigns or email merge operations. The messages they receive depend on their global subscription status. For more information about global subscription statuses, see [Subscription Management](#).

The Campaign Subscription Categories feature permits customers to subscribe to some kinds of communication, and avoid communication they do not want. Your account administrator can enable this feature at Setup > Company > Setup Tasks > Enable Features. For more information, see [Campaign Subscription Categories](#).

Important: When a recipient unsubscribes, no one in your company can resubscribe them. Recipients can't be resubscribed manually on the entity record, or through updates made through CSV import. Only the recipient can choose to resubscribe. NetSuite unsubscribes any entity record in your account with that recipient's email address.

Entities can opt in to your campaign emails in a few ways:

- **Through opt-in email**

You can send email messages to invite entities to change their subscriptions. You can either click the Send Subscription Email link or you can use a mass update. Best practice is not to spam entities with opt-in email messages. You can check how many opt-in messages you've sent to an entity in the Subscription Message History subtab under Marketing. For more information, see [Opt-In Email](#) and [Viewing List of Subscription Messages Sent to a Recipient](#).

- **Opting-in through the Campaign Subscription Center**

Email recipients can change their subscription settings in the Customer Center, Partner Center, Advanced Partner Center, or Vendor Center.

In the Settings portlet, an entity can click the Campaign Subscription Center link. If the Campaign Subscription Categories feature is enabled, entities can choose the subscription categories they want to subscribe to. Entities can also check the box at the bottom of the page to unsubscribe to all bulk email communication.

If the Campaign Subscription Categories feature isn't enabled, an entity can check the box to unsubscribe to all bulk email communication.

- **Clicking the Opt-In link in the footer of an email campaign message**

Every email you send includes a link your customers can click to set their email preferences. When they click it, the Campaign Subscription Center opens.

Important: You can customize the opt-in invitation and opt-in confirmation emails by modifying the default email template or by creating a new email template. See [Customizing Templates for System-Automated Email](#).

You can't change the text of the unsubscribe message, but you can change the formatting of the text to match your template. To format the text, go to Setup > Marketing > Marketing Preferences. Choose the font, font size, and text alignment you want to apply to the footer text.

Opt-In Email

There are two subscription messages you can send to your customers to let them to set their email preferences: **opt-in confirmation email** and **opt-in invitation email**. These email don't count against your monthly email allotment. Best practice is not to spam entities with opt-in email messages. You can check how many opt-in messages have previously been sent to an entity on the Subscription Message

History subtab of the Marketing subtab. For more information, see [Viewing List of Subscription Messages Sent to a Recipient](#).

 **Note:** You can't send opt-in email to recipients who have the Confirmed Opt-Out subscription status.

Opt-In Invitation Email

Opt-in invitation email is used to invite customers to set their subscription preferences, if they haven't done so in the past.

If you use the Multi-Language feature, the default invitation email is available in all languages supported by NetSuite. Customers receive the email in their preferred language.

You can customize the email by modifying the default email template or by creating a new email template. See [Customizing Templates for System-Automated Email](#).

To choose an email template as the invitation email, go to Setup > Marketing > Preferences > Marketing Preferences and select it from the Opt-In Invitation Message list.

Opt-In Confirmation Email

You can send confirmation email to customers to let them confirm their current subscription status. This email specifically provides an opportunity for your customers to reaffirm their interest to receive your email. Opt-in confirmation messages assure your customers that you're committed to sending them only the email they want.

If you use the Multi-Language feature, the default confirmation email is available in all languages supported by NetSuite. Customers receive the email in their preferred language.

You can customize the email by modifying the default email template or by creating a new email template. See [Customizing Templates for System-Automated Email](#).

To use a new email template that you create as the confirmation email, go to Setup > Marketing > Preferences > Marketing Preferences. Select it from the Opt-In Confirmation Message list.

Sending Subscription Messages

You can send subscription messages to a large group or to individual recipients.

You should avoid repeatedly sending subscription email because the recipients may consider it spam.

Certain jurisdictions have regulations regarding whether you can contact entities if you do not have their explicit permission to do so. For example, the European Union (EU). You should check that your global subscription status adheres to the regulations in the recipient's jurisdiction. For information about how to check how many subscription invitation and confirmation email messages have already been sent to an entity, see [Viewing List of Subscription Messages Sent to a Recipient](#).

To send subscription messages to a group of recipients:

1. Go to Lists > Mass Updates > Mass Updates.
2. Under Marketing, click the link for the type of recipient you want to send to.

Mass Updates	
Action	
	General Updates
	Sales Force Automation
	Contact Management
	Activities
	Files
	Group Records
	Customer Support and Service
	Transactions
	Opportunities
	Marketing
	Send Subscription Message to Entities
	Send Subscription Message to Customers
	Send Subscription Message to Contacts
	Send Subscription Message to Vendors
	Send Subscription Message to Partners

- On the Mass Update page, select the type of message.

WARNING
 Avoid sending subscription messages repeatedly as recipients may consider it spam. See details of previously sent messages in the Subscription Message History list on the entity record.

Mass Update

Title of Action *

☒ Opt-In Confirmation: Request customer to confirm their existing email subscriptions.
☐ Opt-In Invitation: Invite customer to subscribe to new email subscriptions.

Criteria Results Audience Schedule Audit Trail Action Title Translation

Use this tab to specify criteria that narrow down your search.

- Set the criteria for the recipients you want to receive your invitations, and then click **Save**. NetSuite sends your messages.

To send subscription messages to an individual:

- Open the recipient's record in edit mode.
- Click the **Marketing** subtab.
- Perform one of the following:
 - If you use the Subscription Categories feature, click the **Send Subscription Email** button on the **Subscriptions** subtab.

- If you do not use using the Subscription Categories feature, click the **Send Subscription Email** link next to the **Global Subscription Status** field.

Note: The recipient must have an email address for you to be able to send subscription email.

4. When you click the link (or button), NetSuite prompts you to choose the type of message you would like to send.

5. Click **Send**.

Viewing List of Subscription Messages Sent to a Recipient

You should avoid sending recipients multiple, repetitive subscription invitation and confirmation messages. You should verify how many of these messages were previously sent before you send another message.

To view all subscription messages sent to a recipient:

1. Open the recipient's record.

2. Click the **Marketing** subtab.
3. The Subscription Message History **subtab** contains a list of all subscription invitation and confirmation email messages previously sent to the recipient. The list is organized by date and time and contains information about the sender, the recipient, and the type of message.

Campaign Subscription Categories

The Campaign Subscription Categories feature enables entities with whom you communicate through bulk email to choose which types of campaign communication they want to receive.

When you enable this feature, you can create unique campaign subscription categories in addition to the following default subscription categories:

- Billing Communication
- Marketing
- Newsletters
- Product Updates
- Surveys

When recipients log in to the Campaign Subscription Center, they can choose which subscriptions they want.

With this feature, the Subscription field on campaign events is required. You can associate subscriptions with marketing and email templates. When you select a template on a campaign or in an email merge, NetSuite sets this subscription category, by default. Email is sent only to the recipient group members with the subscription set on the event.

The Subscription subtab on customer, contact, partner, vendor, and employee records shows the subscription status for each subscription category.

To create a new subscription category:

1. Go to Setup > Sales & Marketing Automation > Campaign Subscriptions > New.
2. Enter the name of this subscription category and a description.
3. Check the **Subscribed by Default** box if you want new and existing records to be subscribed to this campaign subscription.
Entities must manually subscribe to subscriptions that they are unsubscribed to.
4. In the **External Name** field, enter the name of this subscription category as you want it to appear in the Campaign Subscription Center.
5. In the **External Description** field, enter the description of this category that you want to show in the Campaign Subscription Center.
6. Click **Save**.

Campaign Email Domains

To send more than 100,000 email messages through marketing campaigns in a 30 day period, you must set up a campaign domain. Similarly, to send more than 10,000 email messages in any single campaign event (blast), you must also set up a campaign domain.

See the following for more information about domains and your website:

- [Domains](#)
- [Point Your Domain Name at Your Domain \(DNS Settings\)](#)

- [Set Up Domains for Web Stores](#)
- [Campaign Email Limits](#)

When you set up a campaign email domain, all links and other references to **netsuite.com** are instead replaced with your domain.

Important: If you don't host your web store with NetSuite, you shouldn't use your web store or site domain as your email domain.

Note: A campaign email domain is different from a DKIM. For information about DKIM, see the help topic [DomainKeys Identified Mail \(DKIM\)](#).

To make sure the links in your email work properly, your sender domain must match the domain in your links and tracking pixels return responses.

To set up a campaign email domain, configure Domain Name System (DNS) settings to point your email domain name to hosting servers at NetSuite. Your domain provider can redirect your email domain using a CNAME record (Canonical Name record). This makes your email domain an alias of the NetSuite hosting domain assigned to your account. NetSuite uses the CNAME (Alias) domain whenever a secure (HTTPS) connection is **not** required. For example, with website hosting and email campaigns.

To set up your email domain name in NetSuite:

1. Go to Commerce > Hosting > Domains.
2. In the **Domain Name** column, enter the domain name you have registered to send campaign email messages.
3. In the **Hosted As** column, select **Email Campaign**.
4. Click **Add**.
5. Repeat these steps for each email domain you want to add.
6. Click **Save**.

Warning: After you create a new domain or update an existing domain, **you must wait two hours** before you configure DNS settings with your domain provider. See the help topic [Point Your Domain Name at Your Domain \(DNS Settings\)](#).

7. After two hours, return to the Domain Setup page, and then copy the **CNAME (Alias)** NetSuite assigned to you. You will use this CNAME to complete DNS setup with your domain name provider. Go to Commerce > Hosting > Domains.

Note: Each time you add or edit a domain name in NetSuite, the CNAME (Alias) displayed for that domain changes. You must configure DNS settings with your domain provider to point your domain name to the correct CNAME (Alias).

8. (Required) Visit your domain provider's website to complete the CNAME record setup. See the help topic [Point Your Domain Name at Your Domain \(DNS Settings\)](#).
9. Select the campaign domain on the **Marketing** subtab of your email template or campaign template records.

You can set a default domain for your templates. Go to Setup > Marketing > Preferences > Marketing Preferences (Administrator) > **Default Campaign Domain** field.

After you set up domain names in NetSuite, and configure DNS settings with your domain provider, your domains should begin redirecting. **The time frame for domain redirecting depends on your DNS provider. Generally, this process takes between two to 48 hours.**

In addition to email domains, you can also upload your own email domain keys to increase your delivery rates. For more information, see the help topic [DomainKeys Identified Mail \(DKIM\)](#).

Creating a Campaign Email Address Record

Campaign email addresses can appear in the From field of your marketing email and can receive replies to your marketing email.

Before you send out email campaign events, you need to validate the email address you want to use.

To create a campaign email address record:

1. Go to Setup > Sales & Marketing Automation > Email Addresses > New.
2. On the Campaign Email Address page, enter the email address you want to use.
3. If you check the **Private** box, only the person that entered this campaign email address record can:
 - View this email address record
 - Assign this email address to email templates
4. Click **Save**.

When you save the email record, NetSuite sends an authorization code to that address. You'll need to enter the code in the campaign email address record before you can use it.

To validate an email address:

1. Go to Setup > Sales & Marketing Automation > Email Addresses.
2. Click **Edit** next to the email address you want to validate.
3. In the **Authorization Code** field, enter the code included in the email you received from NetSuite.

Tip: The authorization code is valid for 24 hours. If the code expires, click **Send New Code** to send a new authorization code to the email address.

4. Click **Save**.

You can select a validated email address on campaign email templates to serve as the From address, the Reply to address, or both.

After you create a target group, upload an email template, and validate your marketing email addresses, you can create email marketing campaigns.

For more information about creating email campaign templates, see [Email Marketing Templates](#).

Marketing Templates

You can create marketing templates for:

- **Email campaigns and online form notification** – Customize the email you send in your marketing campaign, or automatically send to people who submit your online forms.
- **Online forms** – Create custom templates that determine the look and arrangement of your online forms.

Email marketing templates are HTML documents that you can select to send marketing campaigns to groups. You can also use marketing templates to automatically send confirmation email to those who

submit your online customer forms. For more information about creating email marketing templates, read [Email Marketing Templates](#).

Online form templates are HTML documents that you can create outside of NetSuite. Then you upload those documents to your NetSuite file cabinet for use with your online forms. For more information about creating online form templates, see [Online Form Templates](#).

You can personalize your templates with information from customer, vendor, partner, employee, or contact records. For example, you might want to have the name of your customers included in the greeting of your monthly newsletter. Email campaign templates can be created as scriptable templates. For more information, see the help topic [Scriptable Templates](#).

Email Marketing Templates

Email marketing templates are HTML files you use to create campaign emails. You can create these templates in an HTML editor outside of NetSuite, or you can use the Rich Text Editor on the template record.

If you create your marketing template outside of NetSuite, you must include the following HTML elements in your template:

- `<html>` and `</html>` tags
- `<body>` and `</body>` tags at the beginning and end of the message
- All end tags, such as `</p>` and `</li>`

You can store images in your template in your NetSuite file cabinet. When you use an image file in a template, ensure the Available Without Login box is checked on the File record.

To insert images from the file cabinet into email templates:

1. Go to Documents > Files > File Cabinet and open the folder containing the required image.
2. Click **Edit** next to the image you want to use in the email template.
3. Copy the URL of the image file. If there is more than one listed, copy the one that begins **https://** **system**.
4. On the Email Template (Scriptable) form, position where you want the image to appear using the WYSIWYG editor.
5. Click the **Picture** icon on the editor.

Insert/Edit Image

Source

Alternative description

Width Height

Cancel Save

6. In the Image Properties window, paste the URL of the image into the **URL** field.
7. Click **OK** to insert the image into the template.
8. When you finish formatting your template, click **Save**.

Scriptable templates enable you to insert personalized information in the body of your email templates through the use of FreeMarker code. For more information, see the help topic [Scriptable Templates](#).

The following is an example of a campaign email template that uses FreeMarker code.

```

1 <b>Dear <#if Customer.companyName != "">${Customer.companyName}</if></b><br><p>Now you have unique opportunity to get
  your favorite items with 20% discount!</p><p>All you need to do is to use the following coupon code when you place an order on
  our site: ${CampaignEvent.couponCode}</p><#assign printedOutItems = 0>
2 <#list Customer.correlatedItems as itemLine> <#if 33 <itemLine.correlation > <br/> </if> <#assign printedOutItems = printed
  OutItems + 1> <#if printedOutItems = 3><#break></if>
3 </#list> <#if 3 <printedOutItems > <#list Customer.relatedItems as itemLine> <br/> <#assign printedOutItems = printedOutItems +
  1> <#if printedOutItems = 3><#break></if> </#list>
4 </#if> <p> Best regards,<br/> <br/> ${preferences.MESSAGE_SIGNATURE}
5 </p>

```

If you compose your email template using NetSuite Rich Text Editor, you can choose fields from the Insert Field list.

Campaign email templates are HTML documents that you attach to email marketing campaign events. On the delivery date for the campaign event, NetSuite uses the campaign email template to generate the email you send to the target group.

With campaign email templates, you can:

- Generate auto-reply email sent to people who submit online forms
- Create campaign email templates outside of NetSuite and then upload them into your NetSuite File Cabinet
- Personalize your email templates with FreeMarker code that uses information from NetSuite records
For example, you might want to include your customers' names in the greeting of your monthly newsletter.

When you create a campaign email template, the fields you use need to match the record type of your target group members. NetSuite does not enter fields in the message that don't refer to a field in the recipient's record. For example, if you create a campaign email template for customers and add a Salutation field, the salutation won't appear because the customer record doesn't have that field.

Records referenced in a campaign email template must match the group you are targeting with your marketing campaign. If not, the group does not appear in the group column of campaign records.

Note: HTML documents uploaded to your file cabinet must include appropriate end tags to be recognized as an HTML files.

If you send more than 10,000 email per marketing campaign or email merge operation, you must set up a campaign domain and DKIM. For more information, see [Campaign Email Domains](#) and [DomainKeys Identified Mail \(DKIM\)](#).

Before you create an email template, you must create campaign email address records. You can use only validated email addresses in your email marketing campaigns. For more information, see [Creating a Campaign Email Address Record](#).

To create a marketing email template:

1. Go to Documents > Templates > Marketing Templates > New.

2. On the Select Type page, click **Campaign**.
3. Select the template layout you want to use for your template.
4. On the New Campaign Email Template page, enter a name for this template.
5. Enter a description of this template.
6. To send a preview of the email template, check the **Send Email Preview** box, and enter the email address to which you want to send a preview.

Template Subtab

On the **Template** subtab, upload a file you prepared outside of NetSuite. You can also create the template with the text editing options in the **Template** field.

1. In the **Subject** field, enter a subject for the email you send with this template.
2. Do one of the following:
 - Choose **File** if you created the template beforehand, and then select the template file in the list. You can also click **New** if you have not already uploaded your template file to your file cabinet.

- Select **Text Editor** if you have not yet created your template, and then compose your template in the rich text field.
- To insert a field in the template, select the record type in the **Field Type** list. Then, select a field in the **Insert Field** list.

Note: If you use the UK Edition, NetSuite complies with UK law. NetSuite includes your business address and VAT number in the footer of all email you send to those outside of your company.

Restrict Access Subtab

1. Check the **Private** box if you do not want others in your company to use this template.
2. If you want you want this template to be used only by members of a specific group, select that group in the **Restrict to Group** field.

Marketing Subtab

Note: The features enabled in your account determine the fields shown on the Marketing subtab.

1. In the **From Name** field, enter the name you want to appear in the **From** field on email messages you send with this template.
2. In the **From Email** address field, select a validated email address to appear in the **From** field of your marketing email.
3. In the **Reply to Email** address field, select a validated email address to receive responses to your marketing email.

You can create and validate email address records at Setup > Campaign Email Addresses > New.

4. Check the **Email as Sales Rep** box if you want replies to the email to be sent to the sales rep assigned to customer recipients.

When checked, each campaign email shows the nickname and From email address entered by the rep. The rep enters this information at Home > Set Preferences > General, under the User Profile heading. If the rep does not have a profile set up, NetSuite uses the marketing email address and From name entered on the template record.

Note: This setting overrides the reply to email address set in the **Reply To Email** Address field.

5. In the **Campaign Domain** field, select the campaign domain you want to use for this template.
For more information, see [Campaign Email Domains](#).
6. In the **Subscription** field, select the category of campaign subscription that this email template is used for.
When you select this template for an email merge or a marketing campaign, NetSuite chooses this campaign subscription, by default. For more information, see [Campaign Subscription Categories](#).
7. To track statistics related to how often this email message is opened or clicked through, check the **Track Outgoing Email** box.

When checked, whenever a recipient of your marketing email opens or clicks through a message, a request is sent to the NetSuite server. Some of your marketing email recipients may have concerns about this process that you may want to address in your company's privacy policy.

Note: Only links to pages in NetSuite are tracked as having been clicked for campaign response reporting. For example, a link to a page in your NetSuite website or an online customer form would be tracked. However, a link to a third-party site would not be tracked.

NetSuite includes these tracking statistics in reports such as the Campaign Statistics Summary and Detail.

Categories Subtab

This subtab appears only if you use the CRM Template Categories feature. Template categories enable you to organize templates. You can create new categories at Documents > Templates > Template Categories > New..

1. Click the **Categories** subtab.

2. In the **Template Category** column, select the category you want to organize this template into.
3. Click **Add**.
4. Repeat these steps for each category you want to organize this template into. A template can be in any number of categories.
5. Click **Save**.

Now, you can select this campaign email template on campaign records. For more information about creating email campaigns, read [Creating an Email Marketing Campaign](#).

Creating an Email Marketing Campaign

Email marketing campaigns are used to generate email messages you send as part of a marketing effort.

To create an email marketing campaign:

1. Go to Campaigns > Marketing > Marketing Campaigns > New.
2. Under Primary Information:
 1. If you use custom forms, you can select a custom campaign form.
 2. Enter an ID for this campaign in one of the following ways:
 - If you use auto-generated numbers for campaigns, NetSuite automatically generates an ID.
For more information, see the help topic [Set Auto-Generated Numbers](#).
 - If you do not use auto-generated numbers for campaigns, enter an ID.
You can use campaign IDs to identify campaigns, especially when campaigns share similar names. In addition, you can use campaign IDs when you pass lead source information into online customer forms.
 3. Enter a title for this campaign.
You can enter up to 99 characters in this field.
 4. Select the category this campaign belongs in.
You can create new campaign categories at Setup > Marketing > Campaign Management > Categories > New.
 5. Select a campaign manager for this campaign.
The campaign manager receives confirmation that email campaign events have been sent.
 6. Enter or pick the start date and end date for this campaign.
 7. In the **Base Cost** field, enter the cost of this campaign apart from the cost of any specific campaign events.
The **Total Cost** field shows the sum of the cost of any campaign events and the base cost.
 8. Enter the URL for the campaign landing page or online customer form associated with this campaign.
You can enter the cost of specific events on the **Events** subtab.
 9. In the **Expected Revenue** field, enter the amount of revenue you expect this campaign to generate.
3. Under the **Events** subtab, click the **Email** subtab.
4. In the **Target Group** column, select the group to receive the campaign email.

You can create new groups at Commerce > Marketing > Personalization > Groups > New.

5. To test this email campaign and send it to only a portion of this group, select the test cell you want to send it to.

For more information, see [Marketing Test Cells](#).

6. Select a template category in the **Template Category** column to filter the list of email templates to that category.

This field is available only if you have use the CRM Template Categories feature.

7. Select the template for the email in the **Email Template** column.

You can set up email templates at Documents > Templates > Marketing Templates > New.

8. Enter a title for this campaign event.
9. The **Subscription** column displays the subscription category for the template in use. Only recipients that have this subscription receive this campaign event. For more information, see [Campaign Subscription Categories](#).
10. Enter the cost incurred by this campaign event.
11. In the **Status** column, select the status of the campaign event.

Note: **Execute** instructs NetSuite to your email on the date and time specified in the **Delivery Date** and **Delivery Time** fields.

12. Select the date and time you want this campaign event to occur.
13. To associate a promotion with this campaign event, select it in the **Promotion** column.
14. Click **Add/Edit**.
15. Repeat these steps for each event for this email campaign.
16. Click **Save**.

NetSuite automatically deletes duplicate messages to ensure that each email address only receives one copy of the campaign email you send.

After you save a campaign record, you can view additional subtabs on that record. Go to Campaigns > Marketing > Marketing Campaigns. Click the name of the campaign you want to view. You can view statistics on what recipients did with email messages, add notes to the campaign record and attach file cabinet documents.

Your Campaign Calendar keeps track of your campaign events. To view your campaign calendar, go to Campaigns > Marketing > Campaign Calendar.

Only customers that haven't unsubscribed to your marketing campaigns can receive marketing email. Every email message you send includes an "Unsubscribe" link your customers can click to automatically unsubscribe to your email marketing campaigns.

Handling of Spam When Notified by Mail Service Providers

NetSuite supports **Complaint Feedback Loop** by which mail service providers notify NetSuite when a campaign email was marked as spam by a recipient. NetSuite automatically unsubscribes the recipient from their marketing subscription preferences and sets their global subscription status to **Confirmed Opt-Out**. The unsubscribed recipient no longer receives email campaigns, which keeps the complaint rate per domain low. A low complaint rate increases the likelihood of ISPs delivering your messages to the inbox of your customers. Customers can also opt-out by clicking the unsubscribe link provided in the email.

For more information about creating email marketing templates, read [Email Marketing Templates](#).

Creating Email Campaigns Using the Campaign Assistant

Important: The Campaign Assistant SuiteApp is not fully compatible with version 2022.2 or future NetSuite releases. There is no guarantee that the SuiteApp will continue to function properly. Be aware of the following:

- The Campaign Assistant SuiteApp is no longer available for new installs.
- If the Campaign Assistant SuiteApp is installed in your account, you can continue to use it.
- Any problems you may encounter with Campaign Assistant SuiteApp won't be investigated by the Engineering team.
- No future updates will be made to code or documentation related to the Campaign Assistant SuiteApp.

You can transition to creating Email Campaigns without using the Campaign Assistant SuiteApp. See [Creating an Email Marketing Campaign](#)

Campaign Assistant is a free SuiteApp that consolidates all the necessary forms you need to create an email campaign. The application lets you go through all the required steps to ensure that you do not omit important information for your campaign event.

To create email campaigns with Campaign Assistant, go to Lists > Marketing > Create Email Campaigns.

Step 1: Entering Campaign Details

To enter campaign details:

1. In the Primary Information section, enter values for the following fields:
 - **Title** – Enter a title for this campaign.
You can enter up to 99 characters in this field.
 - **Category** – Select a category for this campaign.
You can create new campaign categories at Setup > Marketing > Campaign Management > Categories > New. For more information, see [Campaign Categories](#).
 - **Manager** – Select a campaign manager.
The campaign manager receives confirmation when email campaign events have been sent.
 - **Start Date** – Enter or select a start date for this campaign.
 - **End Date** – Enter or select an end date for this campaign.
 - **Base Cost** – Enter the cost of this campaign apart from the cost of any specific campaign events.

 **Note:** You can enter the cost of specific events in the Events subtab.

- **Expected Revenue** – Enter the amount of revenue you expect this campaign to generate.
 - **URL** – Enter the campaign landing page or online customer form associated with this campaign.
 - **Description** – Enter a description for this campaign.
2. In the Related Information section, enter values for the following fields:
- **Vertical** – Select a marketing vertical related to this campaign.
For more information, see [Campaign Verticals](#).
 - **Promotion Code** – Select a promotion to offer with your campaign.
You can enable promotion codes at Setup > Company > Enable Features (Administrator). Click the **Transactions** tab, then check the **Promotion Codes** box under the Sales subfield.
You can create new promotion codes at List > Marketing > Promotions > New. For more information, see the help topic [Promotion Code](#).
 - **Audience Description** – Select your audience for this campaign.
 - **Offer** – Select an offer that you want to associate to this campaign.
You can create new offers at Setup > Sales > Setup Tasks > CRM Lists > New. For more information, see [Campaign Offers](#).
 - **Item** – Select the items associated with this marketing campaign.
You can create new items at Lists > Accounting > Items > New.
3. Click **Next** to define the target group for this campaign event.

Step 2: Selecting the Event Target Group Type

You can use an existing target group or create a new target group.

To create a target group:

1. Choose the type of group you want to create:
 - **Static** – You need to add specific group members for this type of group. The membership of static groups does not automatically change. However, you can add or remove members at any time. You can add members for static groups in the Group Member section.
 - **Dynamic** – This type of group automatically updates group membership based on a saved search criteria. You can't add or remove individual members, but you can change the search criteria.
2. Select the type of members you want to include in this target group from the list.

 **Note:** If you do not use the **Partner Relationship Management** feature, the Partner member type does not appear in the list. Go to Setup > Company > Enable Features (Administrator) and click the **CRM** subtab to enable this feature.

3. For a dynamic group, select an existing saved search from the list, or select **New** to create new search criteria for the target group.
When you select or create a saved search, the criteria used to filter saved search records displays under the **Criteria Details** section.
You can edit an existing saved search's criteria and save the changes. You can also save the modified saved search as a new saved search.

Note: After you save a new saved search, it's automatically available for selection in the existing saved search list.

4. Click **Next** to define the target group for this campaign event.

Step 3: Selecting the Event Target Group

If you used an existing group in the previous step, select a group from the list. The group properties, member type, and group members display when you make your selection.

If you created a target group, the group type and member type you selected displays in the Create Target Group section.

If you created a dynamic target group, the saved search you created or selected displays its results in the Create Target Group section. These results form the members of your dynamic group.

To create a target group:

1. In the Create Target Group section, enter values for the following fields:
 - **Group Name** – Enter a name for this target group. You can enter up to 25 characters in this field.
 - **Owner** – Select the owner of this target group. By default, the person creating the group is the owner.
 - **Email** – If this group shares an email alias, enter the email address in this field.
 - **Comments** – Enter a description for the group in this field.
 - **Private** – Check this box if you want to be the only one to use this group.
 - **Restrict To** – Select the group that you want to have access to this group.
For example, you can select a group of marketing reps in this field to make this group available only to those reps.
2. If you created a static target group, in the Group Member section, select the members you would like to add to the target group.
3. Click **Add** after selecting each member.
To delete a member, click the **x** found on the right side.
4. Click **Next** to select an event template for this campaign.

Note: The target group you created is automatically saved when you click **Next**. This group is then available for selection in the existing target group list.

Step 4: Selecting an Event Template

You can select an existing event template from the list or select **New** to create a new template.

Note: Campaign Assistant uses a different text editor from standard NetSuite templates. However, if you choose to use an existing template in your campaign, you can still view and use them in Campaign Assistant.

To create an event template:

1. Select **New** from the Template list.
 2. In the Create Campaign Email Template section, enter values for the following fields:
 - **Name** – Enter a name for this template
 - **Description** – Enter a description for this template.
 3. In the Template Information section, enter values for the following fields:
 - **Subject** – Enter a subject for the email that you send with this template.
 - **Create Template From** – Select from the following options:
 - **File** – Select this option if you previously created the template. Select the template file in the list or click **New** if you have not uploaded your template to the file cabinet.
 - **Text Editor** – Select this option if you want to compose your template.
 - **Private** – Check this box if you do not want others to use this template.
 - **Restrict To Group** – Select the group that can exclusively use the template.
 - **From Name** – Enter the name that you want to appear in the **From** field on email messages you send with this template.
 - **From Email Address** – Select a validated email address to appear in the **From** field of your marketing email.
 - **Reply To Email Address** – Select a validated email address where you want to receive responses to your marketing email.
 - **Email as Sales Rep** – Check this box if you want replies to emails generated by this template sent to the sales representative assigned to customer recipients
-  **Note:** **Email as Sales Rep** overrides the **Reply To Email Address** setting.
- **Campaign Domain** – Select the campaign domain that you want to use for this template. For more information, see [Campaign Email Domains](#).
 - **Track Outgoing Email** – Check this box to track statistics related to how often this email message is opened or clicked.
 4. Click **Next** to enter the event and schedule details for this campaign.

Step 5: Entering Event and Schedule Details

To enter event and schedule details:

1. In the Event Information section, enter values for the following fields:
 - **Title** – Enter a title for this campaign event.
 - **Cost** – Enter the cost incurred by this campaign event.
If you enter a cost, you can track return on investment (ROI) for the campaign.
 2. In the Schedule Information section, enter values for the following fields:
 - **Status** – Select the status of the campaign event. If you select **Execute** for an email campaign event, NetSuite sends your email on the date and time you set.
-  **Note:** You can't change the time of day an email campaign executes on the day you schedule it for delivery.
- **Date** – Select the date this campaign event will occur.

- **Time** – Select the time this campaign event will occur.
- 3. Click **Next** to review the details for this Campaign Event.

Step 6: Reviewing Email Campaign

When you finish entering information for your campaign event, you can review all the details you entered in the Review Campaign page.

You can add more target groups for the same event under the Campaign Events section. You can select a different template and set a different schedule for additional target groups. However, you can't create a new target group and template from this section.

After you confirm the information, click **Finish** to create your campaign event.

Note: When you complete the Campaign Assistant, you will be redirected to a standard marketing page where the campaign you created displays.

Lead Nurturing Campaigns

Lead nurturing campaigns offer an alternative to traditional email blasts. Sometimes called drip marketing, these campaigns use a series of targeted messages sent based on each lead's response. Lead nurturing campaigns let you focus effort on the leads who express interest in your marketing messages, gradually moving them toward becoming customers.

For example, fictional company Wolfe Electronics sends a webinar invitation to each new lead identified as being in the software industry. One day after the lead record is created, NetSuite uses the marketing template Webinar Invitation: "Trends in Internet Security" to send an email message.

Lead nurturing campaigns can use the NetSuite Workflow Manager. Workflow Manager lets you customize the criteria used to determine who receives each campaign message. You can set the timing of these messages, and the actions or responses that trigger subsequent email.

You can also use SuiteScript to send lead nurturing campaigns. For more information, see the help topic [N/email Module](#).

To see complete steps for creating the lead nurturing campaign example above, see the help topic [Lead Nurturing Workflow](#). Read [Configuring Your Lead Nurturing Workflow](#) for help on applying the sample workflow to your own lead nurturing campaigns.

Before you create a lead nurturing workflow, an administrator must first enable the Workflow feature. Go to Setup > Customization > Scripting > Enable Features > SuiteCloud subtab.

To create a lead nurturing campaign, complete the following steps:

1. Map out how your company's lead nurturing campaigns work. For more information, see [Configuring Your Lead Nurturing Workflow](#).
2. Create the email templates to be used in your lead nurturing campaign. For information, see [Creating an Email Marketing Campaign](#).
3. Create a lead nurturing campaign record. For information, see [Creating a Lead Nurturing Campaign](#).
4. Set up a lead nurturing workflow.
For a detailed sample lead nurturing workflow, see the help topic [Lead Nurturing Workflow](#). Creating workflows requires the Workflow permission.

Configuring Your Lead Nurturing Workflow

Before designing your own workflow, you should read the help topics [SuiteFlow Overview](#) and carefully map out how your lead nurturing campaigns are currently set up.

Be sure to make a note of:

- which leads you send lead nurturing email to
This will help you determine the criteria your workflow uses to select recipients.
- how you determine which templates get sent at each point of the lead nurturing campaign
You use this information to create states and transitions in the workflow.
- how much time should pass before you send each successive email message
You can implement these delays at any point in your workflow in the transitions.

As soon as you have all of this information, you can adapt the procedures for setting up the sample workflow. See the help topic [Lead Nurturing Workflow](#).

You can only set up lead nurturing workflows with criteria that reference the campaign responses for lead nurturing campaigns. You can't set workflow criteria that references the campaign responses for other types of campaigns.

Creating a Lead Nurturing Campaign

Each lead nurturing campaign tracks each message sent as a different campaign event on the Lead Nurturing subtab of the campaign record.

Before you create your lead nurturing campaign record, create the marketing templates to use for each event. For more information, see [Email Marketing Templates](#).

To create a lead nurturing campaign:

1. Go to Campaigns > Marketing > Marketing Campaigns > New.
2. Under Primary Information, enter the title and other information related to the campaign.
3. Under the **Events** subtab, click the **Lead Nurturing** subtab.
4. In the **Template Category** column, select a category to filter the list of templates to this category.
This field is available only if you use the **CRM Template Categories** feature.
5. In the **Template** column, choose one of the email marketing templates you want to use in this campaign.
Update the email subject in the **Title** column, or accept the subject on the template record.
6. If you know the cost of this campaign event, enter it in the **Cost** column. You can update value this later.
7. To offer a discount through this event, or to track this event with a promotion, select it in the **Promotion** column.
8. Click **Add**.
9. Repeat these steps for each different template you will use in your lead nurturing campaign.
10. Click **Save**.

Now, you are ready to set up your lead nurturing workflow. For more information, see the help topic [Lead Nurturing Workflow](#).

Sending Newsletters Through Email Campaigns

You can use email marketing campaigns to send email newsletters to your customers, contacts, and others with whom you do business. Email marketing campaigns track behavior and revenue results from your communication.

You could use the Mail Merge feature, however, email campaigns offer additional functionality. For example, responses that tell you whether recipients opened your newsletters and if they clicked links in the email. You can also track revenue through the lead source of the newsletter campaign.

Best Practices

To maximize the impact of your newsletter:

- Make sure it displays properly and clearly even if the recipient's email application blocks images from showing.
- Only include short summaries in the newsletter, with links to the articles on your NetSuite website.
- Schedule the newsletter to be sent mid-morning on a weekday.

How to Set Up Your Newsletter Campaign

To set up the campaign used to distribute your newsletter:

1. Choose where you want to host your articles. If you host them on your NetSuite website, they can be shared through social media and indexed by search engines.
2. Create your newsletter with an HTML editor and save in NetSuite it as a marketing template. See [Marketing Templates](#).
3. Create the target group for the newsletter. You may want to send it to both customers and their contacts. See [Creating Target Groups for Campaigns](#).
4. Create an email campaign with your template and recipient groups. If you send it to both a contact group and a customer group, you must schedule two separate email events on the campaign. See [Scheduling Campaign Events](#).
5. Set the time and date for delivery, and set the status of the events to Execute. See [Initiating Campaign Events](#).

You can use campaign reports to refine your marketing, based on the results of your campaign. For example, you can remove invalid email addresses (that trigger bounced responses). For more information, see [Bounced Email](#).

You can also use these campaign responses in lead nurturing campaigns and have sales reps follow up with clients for upsell opportunities. See [Lead Nurturing Campaigns](#).

Marketing Test Cells

You can split campaign recipient groups into test cells to help you see how effective your campaign templates are.

You can create a campaign event for each test cell of the recipient group, and choose which template you want that cell to receive. Then, you can view sales and ROI reports to determine which templates are most effective.

To create a marketing test cell:

1. Go to Leads > Relationships > Groups.
2. Click **Edit** next to the group you want to divide into test cells.
3. Click the **Test Cells** subtab.
4. In the **Name** column, enter a name for a test cell of this group.
5. In the **Percentage** column, enter the percentage of group members you want to be a part of this test cell.
6. Click **Add**.
7. Repeat these steps for each test cell.
Ensure that the percentages add up to 100%.
8. Click **Save**.

Now, when you create a campaign record, create an event for each test cell in this group.

If you do not want to use test cells, clear the Campaign Test Cells box at Setup > Sales & Marketing Automation > Marketing Preferences.

Attaching Files to Email Campaigns

You can't attach files to campaign emails, but you can let recipients access files you've saved in your NetSuite file cabinet by including links in your campaign email.

Note: Files you select on the Files subtab of your campaign record are not sent as email attachments.

1. To link to a file, check the Available Without Login box on the file record. This option permits anyone with the file's URL to access it.

The screenshot shows the 'File' record form in NetSuite. The 'File Name' field contains 'AddressList.xlsx'. The 'File Type' is 'HTML File' and the 'File Size (bytes)' is '209'. The 'Folder' field is empty. On the right side, there are several checkboxes: 'Inactive' (unchecked), 'Available for SuiteBundles' (unchecked), 'Hide in SuiteBundle' (unchecked), 'Available Without Login' (checked), 'Company-wide Usage' (unchecked), and 'Generate URL Time Stamp' (unchecked). At the top, there are 'Save' and 'Cancel' buttons, and an 'Actions' button.

2. Link to this file in the email template you use with your campaign. When a recipient receives your email they can view or save the file with this link.

You could also use an email merge operation to provide files through email. With email merges, you can include attachments, but you lose the revenue and lead tracking abilities that are available with campaigns.

Using the Sent Email List

The Sent Email List lets you see all outgoing email sent from your account. You can see which emails were delivered successfully and which ones didn't reach the recipient.

By default, the Sent Email List and search capabilities are only accessible to users with the Administrator role. Administrators can assign the Sent Email permission to other roles, which lets users with those roles use the feature.

The Undelivered Emails feature is also available in your NetSuite account. See [Undelivered Emails Saved Search](#).

You can access all saved searches in your account from Lists > Search > Saved Searches. The Sent Email feature provides similar capabilities as the Undelivered Emails feature. However, Sent Email also provides information about all outbound email sent from an account. The list contains search results from the previous 100 days of activity.

 **Note:** The data in the Sent Email List isn't available to SuiteAnalytics.

The Sent Email List displays the following details for all outbound email:

- **Sent date**
 - **Log date:** Date and time when an email is prepared for sending from the NetSuite application to all recipients.
-  **Note:** For Transactional email messages with multiple recipients (for example, recipients in the To, Cc, or Bcc headers) a single record is created in the Sent Email List. However, if messages to some of the recipients bounced, this would create multiple lines in the Undelivered Emails saved search. The log date on each line in the Undelivered Emails saved search reflects the date and time when the message to a particular recipient bounced.
- **From**
 - **Subject:** Shows the first 300 bytes of the subject line of the message.
 - **Recipients (To/Cc/Bcc)**
 - **Body:** Shows the first 1,000 bytes of the body of the message. HTML tags are removed for readability. Any private or sensitive information is masked.
 - **Message ID**
 - **Status:** **Sent** or **Not Sent**. (Email delivery status per recipient is shown on the Sent Email record.)
 - **Compliance Verified:** Indicates whether messages comply with standards, including DKIM alignment.
 - For more information about DKIM, see the help topic [DomainKeys Identified Mail \(DKIM\)](#)
 - For information about how to optimize email campaign delivery, see the **Five Golden Rules for Outbound Email** in [Email Best Practices](#).

You can schedule Sent Email saved searches the same way that you scheduled Undelivered Emails saved searches.

The following procedure describes how to view the Sent Email List or to incorporate new saved searches in your account.

To use the Sent Email List:

1. You have several options to view the information about the Sent Email List:
 - Go to Setup > Company > Sent Email List.
 - Go to Setup > Company > Sent Email List > Search. On the Sent Email Search page, click **Personalize Search** or **Create Saved Search**.
 - To create a saved search, go to Lists > Search > Saved Searches. Click **New Saved Search**. In the list, click **Sent Email List**. Customize the search as required, and click **Save**.
2. The Sent Email List or Sent Email Saved Search page display the results of email generated from your NetSuite account. The status of email in the list will be either **Sent** or **Not Sent**.

Status	Description
Sent	The message was sent from NetSuite and delivered to all recipients. None of the email addresses were bounced or filtered.
Not Sent	The message wasn't delivered to at least one of the intended recipients. At least one of the email addresses was bounced or was filtered before sending.

3. To view the delivery status, click the corresponding row number with the status of **Not Sent** or **Sent**.

For example, an email may fail to send if a previous attempt resulted in a bounced email.

See the following table for information about the meaning of various recipient statuses and failure reasons.

Delivery Status	Failure Reason	Description
Delivered	Not applicable	Successful delivery of email to recipient.
Skipped	Not sent: Blocked by mail filter	The sending rate is not accurate or is too high (similar email messages are being sent too rapidly).
Skipped	Not sent: Specific address(es) recently bounced	The email wasn't sent because the recipient address appears on the Bounced Email Addresses list.
Skipped	Not sent: No MX or A for domain	The email wasn't sent because there is no DNS record (an MX or an A record) for the domain.
Undelivered	Permanent Failure: Delivery not authorized, message refused	The sender isn't authorized to send to the destination. This can be the result of per-host or per-recipient filtering.
Undelivered	Permanent Failure: No answer from host	The outbound connection attempt was not answered.
Undelivered	Permanent Failure: Bad destination mailbox address	The mailbox specified in the address does not exist.
Undelivered	Permanent Failure: Unable to route	The mail system was unable to determine the next hop for the message because the necessary routing information was unavailable from the directory server.
Undelivered	Permanent Failure: Mailbox disabled, not accepting messages	The mailbox exists, but isn't accepting messages.

Note: Multiple delivery statuses can exist in a single Sent Email record for emails with more than one recipient. For example, the email may be delivered to one recipient, but skip another because their email recently bounced.

Sent Email List Permission and Saved Search

Adding the Sent Email permission to a role gives the role access to the Sent Email page.

To add the Sent Email permission to a role:

1. Go to Setup > Users/Roles > User Management > Manage Roles.
2. Locate the role you want to modify to add the Sent Email permission. Click the **Edit** or **Customize** link.

3. On the **Permissions** subtab, click the **Lists** subtab. Select **Sent Email** under Permissions.
4. Click **Add**.
5. Click **Save**.

Adding the Sent Email List Saved Search to a role gives access to the Sent Email List search page.

To add the Sent Email List Search to a role:

1. Go to Setup > Users/Roles > User Management > Manage Roles.
2. Locate the role you want to modify to add the Sent Email List search. Click the **Edit** or **Customize** link.
3. Click the **Searches** subtab. On the **Standard** subtab, under **Type**, select **Sent Email List**.
4. Click **Add**.
5. Click **Save**.

Managing Bounced Email

Developing a positive sender reputation is important for marketers. You can do this by avoiding sends to invalid email addresses. NetSuite tracks when an email message is returned due to invalid address (hard bounce).

NetSuite tracks any address that hard bounced from any email sent from NetSuite including marketing campaigns, mail merge, and transactional email.

When a message sent to an email address results in a hard bounce, NetSuite marks that email address as a hard bounce. NetSuite doesn't send email to hard bounced addresses through marketing campaigns for a set time. To choose how long NetSuite maintains the bounce history of an email address, go to Setup > Company > Email > Email Preferences. In the **Remove Email Addresses From Bounced Email Address List After** field, enter the number of days NetSuite should keep copies of bounced email addresses.

You can use the search field Bounced to filter recipients with invalid email addresses from your marketing groups. See [Choosing Email Recipients](#).

You can view and manage the list of hard bounced email addresses at Lists > Relationships > Bounced Email Addresses. See [Viewing the Bounced Email Address List](#). See also [Remove an Email Address from the Bounced Email Addresses List](#).

You can create group of recipients based on the type of system response received for them after sending an email campaign. See [Creating Groups Based On Campaign Response Count](#).

For more information about managing bounced email addresses, see the following topics:

- [Using the Sent Email List](#)
- [Troubleshoot Undelivered Email](#)
- [Undelivered Emails Saved Search](#)
- [Invalid Email Address Notification](#)
- [Mass Unsubscribing Entities with Bounced Email Addresses](#)

Troubleshoot Undelivered Email

This topic includes troubleshooting tips to determine why email messages from NetSuite aren't delivered.

For information about how to optimize email campaign delivery, see the **Five Golden Rules for Outbound Email** in [Email Best Practices](#).

1. If an email message to one person wasn't delivered, go to Lists > Relationships > Bounced Email Addresses. Determine if the recipient is on the bounced email list. For more information, see [Viewing the Bounced Email Address List](#).
2. Determine whether the email was blocked by NetSuite or whether it was rejected on the destination mail system. For more information, see [Using the Sent Email List](#) or [Undelivered Emails Saved Search](#).
3. Go to Setup > Company > Email Preferences, click the Email Domains (DKIM) subtab and check the status of your Domain record. The status of your domain should always be **Ready**. For more information, see, [Setting Email Preferences](#).

Undelivered Emails Saved Search

The Undelivered Emails saved search helps you analyze email deliverability problems. Go to Lists > Mailing > Undelivered Emails. The search results provide information logged for undelivered email messages. Fields in each log record include:

- **Sent Date**
- **Log Date:** Date and time when the message to a recipient bounced. The Undelivered Emails search results show one line per recipient. The log is created when the bounce occurs, so could be created almost immediately after sending, or at some time after the email was sent.
- **From**
- **Recipients:** A comma-separated list of the original recipients to whom a specific email message was not delivered.
- **Subject**
- **Message-ID**
- **Reason:** See the following table for descriptions.

For information about how to optimize email campaign delivery, see the **Five Golden Rules for Outbound Email** in [Email Best Practices](#).

The Reason, or root cause, of a specific error might indicate the following deliverability problems:

Reason (Errors)	Description
Not sent: Blocked by mail filter	The sending rate is not accurate or is too high (similar email messages are being sent too rapidly).
Not sent: Specific address(es) recently bounced	The email was not sent because the recipient address appears on the Bounced Email Addresses list.
Permanent Failure: Delivery not authorized, message refused	The sender is not authorized to send to the destination. This can be the result of per-host or per-recipient filtering.
Permanent Failure: No answer from host	The outbound connection attempt was not answered.
Permanent Failure: Bad destination mailbox address	The mailbox specified in the address does not exist.
Permanent Failure: Unable to route	The mail system was unable to determine the next hop for the message because the necessary routing information was unavailable from the directory server.

Reason (Errors)	Description
Permanent Failure: Mailbox disabled, not accepting messages	The mailbox exists, but is not accepting messages.

A specific email message can have more than one error log record. The destination domains in the original To header determine whether a new error log record is created. Search results can be filtered by Reason, Recipients, and Log Date.

Invalid Email Address Notification

When an email message returns an invalid address (hard bounce), records associated with that email address display a warning about the invalid email address. This includes:

- email campaigns
- customer, contact, vendor, employee, and other name records
- email messages

 **Note:** NetSuite won't send messages (for a specified number of days) to addresses that trigger a hard bounce. You set the number of days in the **Remove Email Addresses From Bounced Email Address List After** preference. Go to Setup > Company > Email > Email Preferences.

Mass Unsubscribing Entities with Bounced Email Addresses

You can use a mass update to unsubscribe anyone with an invalid email address from email campaigns. You can base the mass update on the Hard Bounced field on a record whenever email sent from NetSuite triggers a hard bounce.

To unsubscribe entities with bounced email addresses:

1. Go to Lists > Mass Update > Mass Updates.
2. Expand **General Updates**.
3. Click the type of record you want to unsubscribe.
4. On the Mass Update page, on the **Criteria** subtab, select **Bounced** in the **Filter** column.
5. In the popup window, select **Yes** and click **Set**.
6. In the **Filter** column, select **Global Subscription Status**.
7. In the popup window, select **Soft Opt-Out** and click **Set**.
8. Click **Preview** to review the records that will be affected by this update.
9. On the preview page, click **Perform Update**.

For information about saving mass updates so they can be reused, see the help topic [Mass Updates](#).

Viewing the Bounced Email Address List

Email campaign administrators can view the reason for a delivery failure to a particular email address to better manage their email campaign lists. The reason code shows whether the failure to deliver is

temporary (soft bounce) or permanent (hard bounce). Go to Lists > Relationships > Bounced Email Addresses.

The following are some of the system-generated errors, both soft and hard bounces:

■ **Soft Bounce**

- Mailbox Full
- Disabled Account
- Greylisted
- Server Too Busy
- Soft Bounce – Other

■ **Hard Bounce**

- Unknown User
- Bad Domain
- Address Error
- Account Closed
- Hard Bounce

Note: The lists above do not show all possible error messages. If you encounter the **Excess Traffic** error, and you are using Mimecast, the following SuiteAnswers article may be of help. See [Configuring a Mimecast Policy for NetSuite Outbound Email](#), SuiteAnswers ID 95602.

Be aware of the following:

- NetSuite evaluates transactional email message addresses against hard bounce records in the list. If a transactional message matches a hard bounce record, NetSuite won't send it.
- NetSuite evaluates bulk email message addresses against soft bounce records in the list. If a bulk message matches a soft bounce record, NetSuite won't send it.
- Soft bounces for both bulk and transitional email recipient addresses are included in the list. NetSuite applies a fixed-length Time-To-Live (TTL) to these soft bounces. The TTL assigned could be minutes or hours, depending on the specific reason code.

Each email address that triggers a hard bounce response is automatically excluded from any email traffic for a defined period of time. You can view a list of bounced email addresses at Lists > Relationships > Bounced Email Addresses.

Remove an Email Address from the Bounced Email Addresses List

On the Bounced Email Addresses page, you can also remove email addresses from the list to include them in email campaigns. When you clear the bounce history for an email address, you can send messages to it.

To remove an email address from the Bounced Email Addresses list:

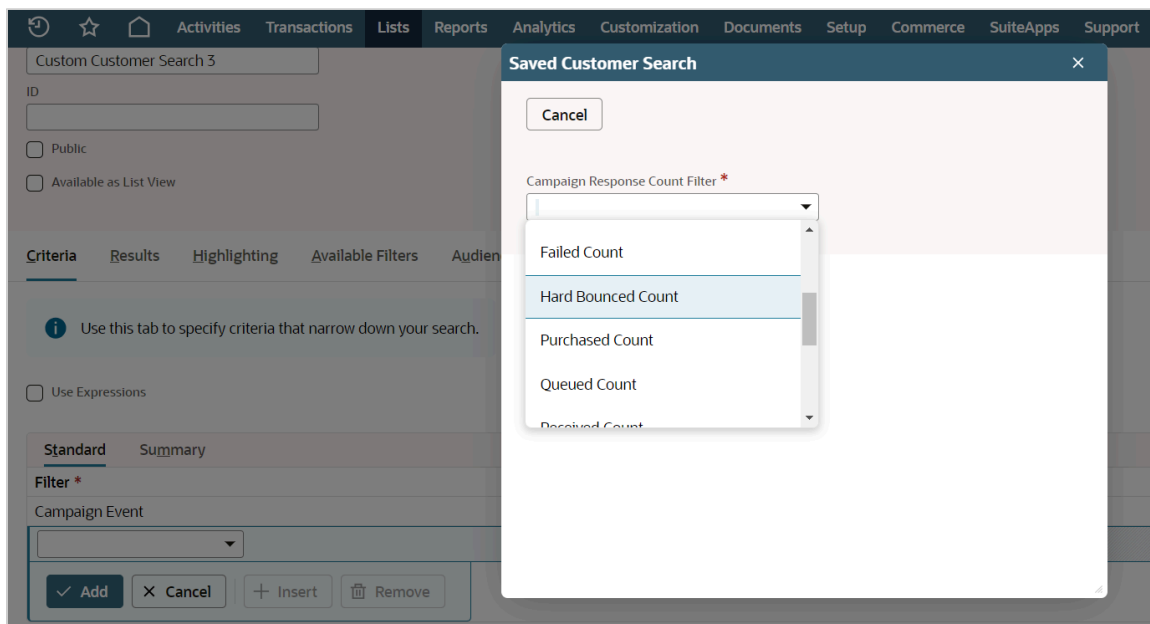

1. Go to Lists > Relationships > Bounced Email Addresses.
2. Check the box in the **Delete** column for each email address you want to clear the bounce history for. You can also click **Mark All** to select all email addresses in the list.
3. Click **Delete**.

Creating Groups Based On Campaign Response Count

You can create customer, contact, vendor, employee, and partner saved searches, filtering results based on **Campaign Response Count**. This search shows how many responses of each type you get for each recipient and campaign event. A customer record is an entity record. There are many response count types to choose from. For example, Soft or Hard Bounced Count, Sent Count, Queued Count, or Clicked Through Count. This capability can have multiple uses.

To create a group of recipients who triggered a bounce response to a campaign email event:

1. In the search form, under the **Criteria** subtab choose the **Campaign Response Count** filter.
2. Choose a field to filter on, in this example, choose **Campaign Event**. Choose from the list of available **Campaign Events** and click **Set**.
3. Add an additional line of criteria by choosing again the **Campaign Response Count Fields** field.
4. In the popup window, choose **Hard Bounced Count**. Then, set the value of the count to be any value greater than zero.
5. Save or preview.

Working with Email Templates

- Creating a New Email Template:
- Modifying a System Email Template:
- Composing Email Templates
- Adding File Attachments to Email Templates
- Assigning an Email Template to a Transaction Type
- Inactivating and Deleting Email Templates

Note: The email templates in this topic do not support email marketing campaigns. For information about email templates for campaigns, see [Email Marketing Templates](#).

Email templates are HTML or text documents that you create to:

- Send email from records
- Send email from transactions
- Send automatic notifications to those who submit online forms
- Send notification email to sales reps when a lead, prospect, or customer submits an online form
- Send bulk email with the mail merge feature
- Perform mail merge operations
- Send notification to customers who submit cases
- Send notification to employees who have been assigned a case

Creating a New Email Template:

You can use an email template to generate personalized email messages to send to your business contacts.

Before you use an email template, you need to create a template record. You can prepare your template file outside of NetSuite using an HTML editor. You can also create it directly on the template record. These templates are available at Documents > Templates > Email Templates. For information, see [Creating New Email Templates](#).

Modifying a System Email Template:

Users with the Set Up Company permission can modify the standard email templates for system-automated email used in case management and user notifications. These templates are available at Setup > Company > System Email Templates. For information, see [Customizing Templates for System-Automated Email](#).

Composing Email Templates

Email templates can be scriptable templates that use FreeMarker language. Scriptable templates merge information from records in your NetSuite account into your template. You can then customize the messages you send for each recipient.

For example, you can list the company's name and address in the heading of a letter. To do this, insert the IDs (for scriptable templates) that correspond with each line in the address above the greeting. You can also include FreeMarker code in the subject of the email you send.

Adding a Signature and Logo file to Email Templates

If you set up an email signature in your user preferences, you can include this in your template. Insert the following FreeMarker text in the template markup: `${preferences.message_signature}`. Go to Home > Set preferences to set up an email signature.

To add your company logo to your signature file, insert this markup: `<img src=${companyinformation.logoUrl}>`. This markup references the image in the Company Logo (pages) field on the Company Information page. Go to Setup > Company > Company Information. Best practice is to save your image file as either a GIF or JPEG.

Your request is currently being processed. We will contact you shortly.

`$(preferences.message_signature)`
`<img src=${companyinformation.logoUrl}>`

Adding File Attachments to Email Templates

To add a file attachment to your email template, create a link to the document contained in the File Cabinet. Don't embed the file directly into the template. For example, you might create a template which contains links to a PDF instruction manual, terms and conditions, or even an instructional video. The procedure below refers specifically to email templates, but applies equally to all template types using the HTML editor.

To attach a download file link to a template:

1. Locate the file you want to link to in the File Cabinet.
2. Click **Edit** on the file.
3. Check the **Available Without Login** box.
4. Copy the file URL. If there are more than one, copy the URL beginning `https://<accountID>.app.netsuite.com`.
5. Go to Documents > Templates > Email Templates.
6. Edit an existing template or click **New Template**.
7. In the HTML editor highlight the text you want to make a link.
8. Click the chain icon in the UI.
9. Paste the URL into the link box.
10. Click **OK**.

Assigning an Email Template to a Transaction Type

You can select which transaction email template to use for each transaction type when NetSuite sends transaction emails with a PDF attachment.

Note: You must have the Email Templates and Custom Transaction Forms permissions.

You can select transaction email templates for the following types of transactions:

- Sales Orders

- Invoices
- Cash Sales
- Purchase Orders
- Estimates
- Credit Memos
- Return Authorizations
- Cash Refunds
- Opportunities
- Purchase Contracts
- Blanket Purchase Orders
- Request for Quotes

To use a custom email template, you must first customize a transaction form. This feature doesn't support standard transaction forms, and all email sent from standard transaction forms use the NetSuite default email template. The standard email template can be defined at Setup > Company > Email > Email Preferences (Administrator). To use a custom template in your transaction emails, select Transaction in the Record Type field. You can also clear the Record Type field in the template form. Go to Documents > Templates > Email Templates > [select a template].

You can control access to email templates with permissions that control access to transaction types. Use the Email Template and Custom Transaction Forms permissions.

You can use SuiteScript to select which email templates to use with all supported transaction types, except GL Impact.

There are two ways to assign an email template to a transaction type.

To assign an email template from a transaction form:

1. Go to a transaction form for the transaction type for which you would like to select a template.
2. Go to Customize > Customize Form and select the template from the **Email Message Template** list.
3. Click **Save**.

To assign an email template from the Custom Transaction Forms page:

1. Go to Customization > Forms > Transaction Forms and then click the **Customize** link for the transaction type to add a template to.
2. Select the template from the **Email Message Template** list.
3. Click **Save**.

You can use the Custom Transaction form to email transactions that use the customized email template.

Inactivating and Deleting Email Templates

To remove an email template from template lists, but preserve it for the future, check the Inactivate box on the relevant template record page. Go to Documents > Templates > Email Templates. Click Edit next to the required template.

Alternatively, you can permanently delete a template. Select **Delete** from the **Actions** menu on the relevant template page.

For more information about scriptable templates, see the help topic [Scriptable Templates](#).

Creating New Email Templates

Note: The email templates in this topic don't support email marketing campaigns. For information about email templates for campaigns, see [Email Marketing Templates](#).

You can create email templates outside of NetSuite in a basic word processing application, or directly on the Template subtab of email template records. If you create an email template outside of NetSuite, save your template as a plain text (.txt) or an HTML (.html or .htm) file.

Email templates can use FreeMarker code to personalize and customize the messages you send. For more information, see the help topic [Scriptable Templates](#).

When you select an email template in the Send Email popup on a record, the text from your template appears in the Message field. You can modify the template message before you send the email message.

If you don't prepare your template file beforehand, you can compose the message in the Template field of the email template record.

To create an email template record:

1. Go to Documents > Templates > Email Templates > New.
2. Enter a name for this template.
3. From the **Record Type** list, select the required type of template.
If you select a record type, NetSuite restricts the template's availability to send email from only those record types. Leave this field blank if you want the template to be available across all record types.
4. In the **Description** field, enter a short summary of what the template is used for. The description appears on the template list page.
5. On the **Template** subtab, in the **Subject** field, enter the subject of the email.
6. Do one of the following:
 - Select **File** if you created the email template beforehand. Then select the template file.
Select **New** if you have not uploaded your template file to your file cabinet.
 - Select **Text Editor** if you have not created your email template. Compose your template in the text field.
To insert a field, select the type of record you want to insert a field from. Then select a field in the **Insert Field** list.
As you type the message, misspelled words appear underlined in red. To correct a word, press and hold CTRL and then right-click the correct spelling.
7. On the **Restrict Access** subtab, check the **Private** box if you do not want others to use this template.
8. If you want members of a specific group to use this template, select that group in the **Restrict to Group** field.
9. Click the **Marketing** subtab.
10. Check the **Add Unsubscribe Link to Message Footer in Bulk Merges** box.
This option adds a link to the **Campaign Subscription Center** to the footer of email messages sent with this template.
11. Check the **Add Company Address to Message Footer in Bulk Messages** box.
This option displays your company's address in the footer of email sent with this template.
12. Select the campaign email domain to use for this email template.

Campaign domains replace any reference to netsuite.com in the email message you send with templates. Campaign domains are required if you send more than 10,000 email messages each month through campaigns or email merge operations.

13. Select the campaign subscription associated with this email template.
You can create new campaign subscription categories at Setup > Marketing > Campaign Subscriptions > New.
14. Click the **Categories** subtab.
15. In the **Template Category** column, select the category you want to organize this template into.
For more information see, [Creating Email Template Categories](#).
16. Click **Add**.
17. Repeat these steps for each category you want to organize this template into. A template can be in multiple categories.
18. Click **Save**.

 **Note:** You can use SuiteCloud Development Framework (SDF) to manage custom email templates as part of file-based customization projects. For information about SDF, see .

You can use the Copy to Account feature to copy an individual custom email template to another of your accounts. When you edit a custom email template, a clickable **Copy to Account** option is available in the upper right corner. For information about Copy to Account, see the help topic [Copy to Account](#).

Creating Email Template Categories

 **Note:** The email templates in this topic do not support email marketing campaigns. For information about email templates for campaigns, see [Email Marketing Templates](#).

Template categories let you group individual templates into logical categories. They're especially helpful when you work with multiple campaigns or client communication that may contain multiple templates.

For example, you could set up a template category called "After Sales Follow-up" that contains three templates:

- "How did we do?" – a customer response template.
- "What would your friends say?" – suggest a friend request
- "Have a month's free support on us." – courtesy upgrade and cross sell offer

NetSuite makes template categories available to all roles. You can create as many categories as you require, and you can assign individual templates to more than one category. In addition, you can mark a template category Public, which permits NetSuite to share the category with other users.

 **Note:** Template categories are not enabled by default. An administrator must first enable this feature.

To create a template category:

1. Go to Setup > Company > Enable Features (Administrator). In the Marketing section, check **CRM Template Categories**.
2. Click **Save**.

3. Go to Documents > Templates > Template Categories > New.
4. Select either a **Campaign** or **Email** template version. The selection determines whether the category relates to marketing campaigns or general transactional email.
5. Enter a name for this category.
6. Optional. Enter a description for the category. The description appears on the individual **Campaign Template Category** record.
7. Check the **Inactive** box to inactivate the category. This option is useful when you prepare campaign categories in advance.
8. On the **Restrict Access** subtab, check the **Public** box to make the category visible to all users.
9. On the same subtab, select a subsidiary to which you want to restrict the category.
10. In the **Template** column, select a template you want to add to this category.
11. Click **Add**.
12. Repeat these steps for each template you want in this category.
13. Click **Save**.

To assign a template category to an existing template:

1. Edit the template you want to assign to a category.
2. Click on the **Categories** subtab.
3. Select the required template from the **Template Category** list.
4. Click **Attach**.
5. Click **Save**.

System-Automated Template Categories

Note: The following information relates only to template categories used by system-automated email templates. For information about template categories used in email templates, see [Creating Email Template Categories](#)

Categories help contextualize and limit the list of available templates in template selection lists. For example, on the Case Alerts record, only case alert templates display in the template selection list. NetSuite automatically assigns default system email templates to one of the categories shown in the table below. You must assign all new templates to at least one of these categories. Administrators can create exceptions and assign individual templates to more than one category, if required.

Category Name	Areas Used (examples)
Access	■ Setup > Company > Email Preferences > Templates ■ Setup > Company > Subsidiary > Edit Subsidiary > Preferences
Case Alerts	Setup > Support > Escalation Management > Case Alerts
Case Notifications	Setup > Support > Case Management > Case Profiles > Notifications
Issue Notifications	Setup > Issues > Preferences > Issue Preferences
Online Forms	■ Setup > Support > Online Case Forms > New > Set Up Workflow ■ Setup > Marketing > Marketing Preferences > General ■ Setup > Marketing > Online Customer Forms > Set Up Workflow

Sales Order Notifications	Used as part of the Advanced Order Management module. Setup > Order Management > Advanced Order Management > Notifications
Marketing Subscriptions	Setup > Marketing > Marketing Preferences
Web Site Digital Delivery Notifications	Commerce > Websites > Website List > Email tab > Digital Delivery Emails subtab
Web Site Order Notifications	Commerce > Websites > Website List > Email tab > Order Emails subtab
Web Site Other Notifications	Commerce > Websites > Website List > Email tab > Other Emails subtab

To assign a category to a system-automated template:

1. Go to Setup > Company > Email > System Email Templates
2. Click **Edit** next to the required template.
3. Click the **Categories** subtab.
4. From the **Template Category** list, select the required category and click **Attach**.
5. Click **Save**.

Customizing Templates for System-Automated Email

 **Note:** The email templates in this topic don't support email marketing campaigns. For information about email templates for campaigns, see [Email Marketing Templates](#).

Users with the Set Up Company permission can modify the following system email templates for automated email notifications. See [To modify a system email template](#). The task paths in the table below show where each template is applied in NetSuite.

System Email Template	Where Do I Apply This Template?
Automatic Case Closure Notification	If you are setting up a new case profile, go to Setup > Support > Case Profiles > New, then go to the Notifications tab. To edit an existing case profile, go to Setup > Support > Case Profiles, and click Edit next to the profile you want to modify, then go to the Notifications tab.
Case Assignment Support Notifications	
Case Escalation Notifications	
Case Update Support Notifications	
New Case Customer Notifications	
Messages to Customers	
Messages to Employees	
Customer Center Access Email	Setup > Company > Enable Features > Web Presence See the help topic Giving Customers Access
Partner Center Access Email	Lists > Relationships > Customers > Edit See the help topic The Partner Center Role
User Access Email	Lists > Employees > Employees

	See the help topic Giving an Employee Access to NetSuite
Subscription Opt-In Invitation Email	Setup > Marketing > Marketing Preferences
Subscription Opt-In Confirmation Email	See Sending Subscription Messages
Web Site Order Received Email	Commerce > Websites > Website List > Email tab > Order Emails subtab
Web Site Order Canceled Email	See the help topic Order Emails
Web Site Order Approved Email	
Web Site Order Fulfilled Email	
Web Site Gift Certificate Email	Commerce > Websites > Website List > Email tab > Digital Delivery Emails subtab
Web Site Gift Certificate Confirmation Email	See the help topic Digital Delivery Email
Web Site Download Available Email	
Web Site License Code Email	
Web Site Checkout Errors Email	Commerce > Websites > Website List > Email tab > Other Emails subtab
Web Site Password Recovery Email	See the help topic Other Emails
Web Site Registration Confirmation Email	

System email can use scriptable templates that refer to specific information in your NetSuite data. When NetSuite generates an email message that uses a template, it replaces the field IDs with information sourced from the recipient's record. For more information about scriptable templates, see the help topic [Scriptable Templates](#).

To modify a system email template:

1. Go to Setup > Company > Company Management > System Email Templates.
2. Click **Edit** next to the type of email you want to change.
3. If you need to modify a non-default system email template, click **Edit** next to that template.
4. If you need to modify a default system email template, you can follow one of these methods:
 - In the System Email Templates page, click **Customize** next to that template.
 - In the System Email Templates page, click the name of the template you want to edit. When you are in the default System Email Template record, click **Customize**.
5. Optional. Enter a description of this template.
6. If you use the **Multi-Language** feature, multiple language subtabs appear on the **Templates** subtab. Click the subtab for the language of the template you want to edit.
7. Edit the subject text, as required.
8. In the **Create Template From** field, choose whether to modify template text and tags in the text editor, or to substitute an uploaded file.

- To use a file, choose the **File** option button. Then, click **Add New** to upload a file to the file cabinet. You can also click **Open** to open an existing file in the cabinet file.
- To modify the existing template in the text editor, choose the **Text Editor** button. Then, edit text and tags in the field below.

Use the following fields to display tags for inclusion on the template:

- Select a record type in the **Field Type** list. This selection determines options in **Select Field** list.
 - Select a field in the **Select Field** list. This selection determines the tag that displays in the **Tag** field.
 - You can replace the tag displayed in the **Tag** field with information from each recipient's record. Place the tag between angle brackets in your template.
9. If you do not want the customized template available to all users, click the **Restrict Access** subtab.
 - To be the only user for this template, check the **Private** box.
 - To restrict the use of this template to a group of employees, select the group in the **Restrict To Group** field. (You can create a new group record at Lists > Groups > New.)
 10. Click the **Categories** subtab to assign this template to other template categories.
 - Select the required category from the **Template Category** list.
 - Click **Attach** to associate the template with the selected category.
 11. Click **Save**.

You can optionally set the default email template for the following email template types:

- Customer Center Access
- Partner Center Access
- User Access

Select the default template to use on the Templates subtab in Setup > Company > Email > Email Preferences. For more information about email preferences, see the help topic [Setting Email Preferences](#).

Including URLs in Email Templates

You can include URLs in email templates that link to pages in NetSuite. For example, you might include a link to a specific issue or case record in communication you send to a customer. In emails, these are sometimes referred to as **deep links**. The ability to access a record from a deep link depends on the role and permissions of the recipient.

In most cases, an email template should include a FreeMarker tag for a record's URL. This tag is most useful for system email templates. These templates are only used in situations where the intended record (and its URL) can be determined.

The deep link must contain the NetSuite account ID to work properly for the recipient. You have several options for including URLs in email templates:

- You should include the FreeMarker tag for a record's URL. You could use the `${record.url}` or `${companyInformation.appDomain}` tag. The `${companyInformation.appDomain}` tag returns your account-specific domain in the URL. As a generic example: `https://${companyInformation.appDomain}/path/to/my/page.nl`. See the help topics [Sample Scriptable Templates](#) and the Apache FreeMarker Manual at <https://freemarker.apache.org/docs/index.html>.
- If you can't use a FreeMarker tag for a NetSuite page, use your account-specific domain URL. Go to the record in your account, and copy the page's URL from your browser. Paste the URL into the email template. For more information, see the help topic [URLs for Account-Specific Domains](#).

If you don't include a FreeMarker tag or use your account-specific domain, when you save the email template you receive the following error:

Links to NetSuite record pages must include your account ID for them to work correctly.

The error message contains instructions for correcting the problem. You must edit the URL for the deep link to include your account ID using FreeMarker tags or using your account-specific domain.

Adding a link to the File Cabinet

You can also use URLs in email templates to create a link for a document contained in the File Cabinet. For more information, see: [Creating a New Email Template](#):

Note: If you want to restrict file access to internal company use only, leave the **Available Without Login** box unchecked.

Using CRMSDK Tags

You use CRMSDK tags to customize PDF and letter templates. When a template generates a document, NetSuite replaces the CRMSDK tags with the information in the corresponding fields on the recipient's record.

The following table includes the CRMSDK tags recognized by NetSuite.

The entries in the Field column refer to fields on CRM records you can reference in your templates. An "x" marks the records that include each field.

Field	Cust:Project	Vendor	Partner	Employee	Contact	Tag
Auto Name	x	x	x	x	x	NLAUTONAME
Company Name	x	x	x	x		NLCOMPANYNAME
Name	x	x	x	x	x	NLENTITYID
Sales Rep	x				†	NLSALESREP
Phone	x	x	x	x	x	NLPHONE
Alt. Phone	x	x				NLALTPHONE
Fax	x	x	x		x	NLFAX
Email	x	x	x	x	x	NLEMAIL
Contact First Name	x	x			x	NLFIRSTNAME
Contact Last Name	x	x			x	NLLASTNAME
Contact Middle Initial				x	x	NLMIDDLENAME
Promotion Code	x				†	NLREFERRALCODE
Partner	x				†	NLPARTNER
Child Of, Subpartner Of, Company	x		x		x	NLCOMPANY

Field	Cust:Project	Vendor	Partner	Employee	Contact	Tag
Child Of	x					NLPARENT
Address Line 1	x	x	x	x	x	NLADDRESS1
Address Line 2	x	x	x	x	x	NLADDRESS2
City	x	x	x	x	x	NLCITY
State/County	x	x	x	x	x	NLSTATE
Zip/Postal Code	x	x	x	x	x	NLZIPCODE
Country	x	x	x	x	x	NLCOUNTRY
Account Number	x	x		x	†	NLACCOUNTNUMBER
Terms	x	x			†	NLTERMS
Balance	x					NLBALANCE
Days Overdue	x					NLDAYSOVERDUE
Overdue Balance	x					NLOVERDUEBALANCE
Sales Rep Nickname	x					NLSALESREPNICKNAME
Signature	x					NLSIGNATURE
Salutation				x	x	NLSALUTATION
Department				x		NLDEPARTMENT
Class				x		NLCLASS
Location				x		NLLOCATION
Supervisor				x	x	NLSUPERVISOR
Alt. Email					x	NLALTEMAIL
Office Phone					x	NLOFFICEPHONE
Home Phone					x	NLHOMEPHONE
Mobile Phone					x	NLMOBILEPHONE
Title/Subject					x	NLTITLE
Partner Code			x			NLPARTNERCODE

Note: The preceding table lists the most commonly used CRMSDK tags and the corresponding fields. To see a complete list of supported tags, open a letter template file in NetSuite. Go to Documents > Templates > Letter Templates > New. From the Templates subtab, click the Download link to open an Excel file containing all tags.

CRMSDK tags have different formats depending on where they are used. CRMSDK tags should always be capitalized. Use the following formats:

- **PDF templates** – enter without brackets
- **Letter templates** – automatically formatted by Microsoft Word

In general, the tags you apply to a template must match the record for the document you create. For example, you can't use a template to create a partner letter if the template includes a tag for the Sales Rep field.

However, if you create a template to communicate with contacts, you can refer to fields on the parent record associated with the contact. For example, you can include the name of the sales rep assigned to a customer in a message sent to that customer's contact person.

In addition, you can use fields in contact templates that do not appear on the contact record. In the preceding table, these fields appear with a "†".

When you include the **NLFIRSTNAME** and **NLLASTNAME** tags in a template, NetSuite replaces these tags based on these rules:

- If the recipient is a customer of the type Individual, NetSuite uses the first and last name on the customer record.
- If the recipient is a customer of the type Company, NetSuite uses the primary contact's first and last name.

Inserting Tags for Names

When you create an email template for customers, you can use the following tags:

- **NLENTITYID** – This tag inserts the information entered in the Customer ID field.
To add this field to a template, select Name in the Insert Field.
- **NLCOMPANYNAME** – This is the information entered in the Company Name field on the customer record.
To add this field to a template, select Company Name in the Insert Field.
- **NLFIRSTNAME** – This is the information entered in the first name field. This applies only to customers who are individuals.
To add this field to a template, select First Name in the Insert Field.
- **NLLASTNAME** – This is the information entered in the last name field. This applies only to customers who are individuals.
To add this field to a template, select Last Name in the Insert Field.
- **NLCONTACT** – This is the name of the customer's primary contact.
Select Contact (Primary) in the Insert Field

When you create a template for contacts, you can use the following:

- **NLENTITYID** – This tag inserts the information entered in the Contact ID field.
To add this field to a template, select Name in the Insert Field.
- **NLCOMPANY** – This is the information in the Customer ID field on the customer record for which this contact is the primary.
To add this field, select Parent Entity in the Insert Field.
- **NLFIRSTNAME** – This is the information entered in the first name field on the contact record.
To add this field to a template, select First Name in the Insert Field.
- **NLLASTNAME** – This is the information entered in the last name field on the contact record.
To add this field to a template, select Last Name in the Insert Field.

CRMSDK Tags for Cases

You can use the following tags to add case information to a document. You can use these tags in addition to the CRMSDK tags that refer to the customer who entered the case.

Field	Tag
Subject	NLTITLE
Case Number	NLCASENUMBER
Company Name	NLCOMPANYNAME
Support Rep Assigned	NLASSIGNED
Priority	NLPRIORITY
Contact Name	NLCONTACT
Status	NLSTATUS
Origin	NLORIGIN
Message History (Non-Internal)	NLCASEHISTORY
Message History (Internal or External)	NLCASEHISTORYEMP
Most Recent (Non-Internal) Message	NLCASELASTMESSAGE
Most Recent Message (Internal or External)	NLCASELASTMESSAGEEMP
Creation Time	NLSTARTTIME
Creation Date	NLSTARTDATE
Type	NLCATEGORY
Recent Escalation Message	NLESCALATIONMESSAGE
Link to Customer Center	NLCASEURL
Name of User who Logged In	NLUSERNAME
Company Logo	NLCOMPANYLOGO
Signature	NLSIGNATURE

Note: The following tags are not supported for use in PDF or letter templates:

- NLCASEHISTORY
- NLCASEHISTORYEMP
- NLCASELASTMESSAGE
- NLCASELASTMESSAGEEMP

CRMSDK Tags for Issues

You can use the following tags to add issue information to documents. You can use these tags in addition to the CRMSDK tags that refer to cases associated with an issue.

Field	Tag
Abstract	NLISSUEABSTRACT

Field	Tag
Assigned To	NLASSIGNEDTO
Broken In Build	NLBUILDBROKEN
Broken In Version	NLVERSIONBROKEN
Creation Date	NLISSUECREATEDDATE
Creation Time	NLISSUECREATEDTIME
Duplicate Number	NLISSUEDUPLICATEOF
External Abstract	NLEXTERNALABSTRACT
External Details	NLEXTERNALDETAILS
External Status	NLEXTERNALSTATUS
External Target	NLEXTERNALTARGET
Fixed In Build	NLBUILDFIXED
Fixed In Version	NLVERSIONFIXED
Number	NLISSUENUMBER
Priority	NLISSUEPRIORITY
Product	NLPRODUCT
Product Team	NLPRODUCTTEAM
Reviewer	NLREVIEWER
Severity	NLSEVERITY
Showstopper	NLISSHOWSTOPPER
Status	NLISSUESTATUS
Target Build	NLBUILDTARGET
Target Version	NLVERSIONTARGET
Type	NLISSUETYPE

CRMSDK Tags for Transactions

You can use the following tags to include transaction information in messages you send.

Field	Tag
Bill To	NLBILLADDRESS
Class	NLCLASS
Consolidated Balance	NLCONSOLBALANCE
(Consolidated) Overdue	NLCONSOLOVERDUEBALANCE
(Consolidated) Days	NLCONSOLDAYSOVERDUE

Field	Tag
Currency	NLCURRENCYNAME
Date	NLTRANDATE
Date Created	NLDATECREATED
Days Open	NLDAYSOPEN
Department	NLDEPARTMENT
Exchange Rate	NLEXCHANGERATE
Expected Close Date	NLEXPECTEDCLOSEDATE
Forecast Type	NLFORECASTTYPE
ID	NLID
Include in Forecast	NLINCLUDEINFORECAST
Include in Forecast: High	NLINCLUDEINFORECASTHIGH
Include in Forecast: Low	NLINCLUDEINFORECASTLOW
Project	NLJOB
Last Modified Date	NLLASTMODIFIEDDATE
Lead Source	NLLEADSOURCE
Location	NLLOCATION
Main Entity	NLENTITY
Memo	NLMEMO
Open Status	NLOPENSTATUS
Partner	NLPARTNER
Probability	NLPROBABILITY
Sales Group	NLSALESGROUP
Sales Rep/Employee	NLSALESREP
Ship To	NLSHIPADDRESS
Status	NLDOCUMENTSTATUS
Total	NLTOTAL
Transaction #	NLTRANID
Type	NLTYPE

Custom Field Tags

To determine the tags to use for custom fields, enable the Show Internal IDs preference at Home > Set Preferences > General. Then, click the field name to open the field-level help popup. NetSuite displays the field ID in the bottom right corner of the popup. You create a CRMSDK tag when you prepend this ID with **NL**.

A custom field CRMSDK tag might look like this:

NLCUSTENTITY5

Note: If you include tags for rich text custom fields in templates, NetSuite does not preserve font formats in tag replacements in the final message. Font formatting includes color, bold, size, and so on.

Working with Mail Merge

Note: This topic is unrelated to marketing campaigns. For information about campaigns, see [Email Marketing Campaigns](#).

In NetSuite, the mail merge feature lets you create personalized letters, bulk email messages, faxes, and mailing labels from your NetSuite data.

Click one of the links below for information about specific mail merge processes.

- [Merging Email](#)
- [Merging Letters](#)
- [Merging Faxes](#)
- [Merging PDFs](#)

The Mail Merge feature is best used for communication that does not need to be reported on. If you need to view reports on recipient response or revenue generation, you should use the Marketing Automation feature. For more information, see [Marketing Automation Overview](#).

Setting Up Mail Merge

To use the mail merge feature, an administrator must go to Setup > Company > Enable Features, and click the CRM subtab. In the Marketing section, click the Terms of Service link under Mail Merge. Read the NetSuite Inc. Terms of Service for Campaign Marketing Services, and click I Agree. Check the Mail Merge box, and click Save. If this feature is not available in your account, please contact your account manager.

To perform a mail merge, ensure you have fulfilled the prerequisites for performing a merge such as a group record. Some mail merge processes require a template and a template record. You can create a template file outside of NetSuite or fill in the message field. Upload the template created outside of NetSuite to your NetSuite file cabinet. Next, create a template record in NetSuite to correspond with the template file you created. For more information, see [Using Letter Templates](#).

For example, a sales rep might use mail merge to print personalized thank you letters to their customers after they close deals. The sales rep might include their first name in the greeting. In this case you would use a scriptable template that inserts personalized information for each recipient. For more information about scriptable templates, see the help topic [Scriptable Templates](#).

PDF and letter templates use CRMSDK tags. For more information, see [Using CRMSDK Tags](#).

After you upload your template and create a template record, you create a group that includes the recipients of your mail merge document. For more information, see the help topic [Working with Records, Transactions, and Lists](#).

After you create a template and a target group, go to Documents > Mail Merge > Bulk Merge to process your mail merge.

The following table shows the different kinds of mail merge templates and the file format for each kind of template.

Template type	File format	Used in
Fax	plain text (.txt) or FreeMarker (.ftl)	fax merge operations
E-mail	plain text (.txt), HTML, or FreeMarker (.ftl)	email to contacts, email merge operations, online form auto-replies
Letter	Word file (.doc)	letter merge operations
PDF	PDF file (.pdf)	PDF merge operation

Merging Email

Note: All bulk email communications sent through NetSuite must meet the requirements defined in the Mass Email Messaging Terms of Service. You will see a link to the Terms of Service when you set up a bulk email merge in NetSuite.

The Email Merge feature in NetSuite lets you send personalized email messages in bulk. When you use this feature, the following actions take place:

- NetSuite generates and sends your merged email message.
- NetSuite automatically deletes duplicate messages to ensure that each email address only receives one copy of the email message.
- Your login email address appears in the **From** field.
- NetSuite records all messages sent by an email merge operation in Documents > Mail Merge > Merge History.

Note: This topic does not relate to marketing campaigns. For information about campaigns, see [Email Marketing Campaigns](#).

Complete the following tasks before you perform an email merge:

- Understand the terms of service for Mass Email Messaging and email best practices.
You will see a link to the Terms of Service when you set up a bulk email merge in NetSuite.
See [Email Best Practices](#) for information about email best practices.
- Create a group that can be selected as the recipient group for bulk email messages. See the help topic [Working with Groups](#).
- Create an email template record. See [Email Marketing Templates](#).

To perform an email merge:

1. Go to Documents > Mail Merge > Bulk Merge.
2. On the Select Output page, click **Email**.
3. Click **Terms of Service** to read the terms of service for bulk email communications sent through NetSuite.
4. Go to the **Recipients** tab to select your email recipients.

5. Select the type of group you want to email from the **Group Type** list. See the help topic [Working with Groups](#) for more information.
6. Select the group you are emailing from the **Group** list.

Note: For groups of over 100 members, NetSuite schedules and sends the email merge operations within an hour after you submit the merge request. For groups of fewer than 100 members, NetSuite sends the email merge operations after you submit the merge request.

Note: You must set up a campaign domain to perform either of the following actions:

- Send over 100,000 email messages in a 30-day period
- Send over 10,000 email messages in any single campaign event (email blast)

See [Campaign Email Domains](#) for more information.

A list of recipients appears in the **Recipients** area. NetSuite lists only those recipients who have not opted out of your marketing campaigns.

7. Check **Opt-Out Override** to ignore opt-outs to send critical updates or non-marketing emails. Enter the justification for the opt-out override in the **Opt-Out Override Reason** textbox.

Note: Your justification must be compliant with General Data Protection Regulations (GDPR) and spam policies/regulations.

8. Go to the **Message** tab to create your email message.
9. From the **Template** list, select the email template you want to use to generate your email.
Select **-New-** to create a new email template.
10. Check the **Update** box if you want changes you make to the selected template to be saved to the template file in your file cabinet.
11. The subject text from the email template record appears in the **Subject** field by default. Edit this field as required.
12. The message text from the email template record appears in the **Message** textbox by default. Edit this textbox as required.
13. Go to the **Attachments** tab to send attachments with your email.
14. Check **Zip Attachments** box if you want attachments to be compressed in a ZIP file.
15. To attach a Microsoft Word document to the email message, select the letter template you want to use from the **Attach Document Template** list.
Select **-New-** to create a new letter template.
16. Check the **Include Statement** box if you want to send a customer statement as an attachment with your email. Complete the following actions:
 - In the **Statement Date** field, enter the date you want to appear on the attached statement.
 - In the **Start Date** field, enter the date of the oldest transaction you want to appear on the attached statement. If you do not enter a start date, all transactions in the customer's history appear on the statement.
 - Select one of the following types of statements to attach from the **Type** list:
 - **Default From Customer** - uses the email preference from each customer's record.

- **Default** - uses HTML if you checked the **Email Using HTML** box at Home > Set Preferences > Transactions or, PDF if you didn't check the **Email Using HTML** box.
- Check the **Show Only Open Transactions** box if you only want to include open transactions on the statement. If you entered a start date, open transactions from that start date onward appear. If you didn't enter a start date, all open transactions appear.
- Check the **Consolidated Statement** box to apply payments, deposits, and credits to the top-level customers in a customer-subcustomer hierarchy. Clear this box to apply payments, deposits, and credits to any open invoice entered for any customer or subcustomer in a customer hierarchy.

 **Note:** This box is only available if you use the **Consolidated Payments** feature.

17. Select a file to attach to the email in the **Attach File** column.

 **Note:** Attachments can't exceed 5 MB in size.

18. Click **Add**.
19. Repeat Steps 17 and 18 for each file you want to attach.
20. Click **Merge & Send**.

Merging Letters

 **Note:** This topic is unrelated to marketing campaigns. For information about campaigns, see [Email Marketing Campaigns](#).

In NetSuite, the Mail Merge feature provides the following two merging capabilities:

- **Merging Individual Letters:** creates a single letter to send to an individual.
- **Merging Letters in Bulk:** creates letters to send to a group of customers or contacts.

Merging Individual Letters

Before you can do a letter merge to an individual, you'll need to:

- Create a letter template file in Microsoft Word. For information, see [Using Letter Templates](#).
- Create a letter template record in NetSuite.

To merge a single letter:

1. Go to Lists > Relationships to find the recipient for your letter merge.

 **Note:** You can merge any type of relationship record except Groups and Competitors.

2. Select the type of relationship.
3. Enable **Edit** on the **List Page**.
4. In the **New** column next to the recipient's name, select **Letter**.
5. The Letter Merge popup window shows the recipient selected, by default.
6. Click the **Template** tab.
7. Select the template you want to use.

 **Note:** You must have an existing letter template. See [Using Letter Templates in Microsoft Word](#)

8. In the **Subject** field, update the subject of this template, if required.
9. Optional. Enter a memo for internal information. This recipient won't see this memo.
10. Check the **Record Merge** box to have a record of this merge appear on the recipient's record at Communications > Messages.
11. Click **Merge**.

After you click **Merge**, NetSuite downloads the merged letter to your computer. You can print or save the merged letter.

Merging Letters in Bulk

Before you can do a bulk mail merge operation with your NetSuite data, you'll need to:

- Create a letter template file in Microsoft Word. For information, see [Using Letter Templates](#).
- Create a letter template record.
- Create a group record for the recipients of the letter. For more information, see the help topic [Working with Groups](#).

To perform a bulk letter merge:

1. Go to Documents > Mail Merge > Bulk Merge.
2. On the Select Output page, click **Letter**.
3. On the **Recipients** subtab, in the **Group Type** field, select the type of group to send the letters to.
4. In the **Group** field, select a group.

 **Note:** For groups with more than 100 members, NetSuite schedules and sends the bulk letter merge operations within an hour of submission. For groups with fewer than 100 members, NetSuite sends the bulk letter merge operations at submission. You can't send bulk letter merge operations to groups with more than 4000 members.

5. Click the **Template** subtab.
6. In the **Template** field, select the template you want to use for this merge.
7. In the **Subject** field, enter the subject of the letters.
8. Click **Actions** > **Merge**.

The Mail Merge Confirmation page opens. To view Bulk Merge History, go to Documents > Mail Merge > Merge History.

After you complete a bulk letter merge, NetSuite sends an email message to your account with a link to download the file. You can also download the file from the Merge History Page. For more information see, [Viewing Bulk Merge History](#).

Viewing Bulk Merge History

 **Note:** This topic is unrelated to marketing campaigns. For information about campaigns, see [Email Marketing Campaigns](#).

You can view the status of your bulk merge operations at Documents > Mail Merge > Merge History.

To view bulk merge history:

1. Choose Documents > Mail Merge > Merge History.
2. Optional. To narrow or expand your search of merge history files, apply filters on the **Filters** subtab.

To view bulk merge information about each recipient's record, you must customize the entry form to include the Bulk Merge subtab.

To show the Bulk Merge subtab on relationship records:

1. Go to Customization > Forms > Entry Forms.
2. Click **Customize** next to the type of form you want to include the **Bulk Merge** subtab.
3. On the custom entry form page, check the **Form is Preferred** box.
4. Under **Lists, Communication** subtab, check the **Show** box next to **Bulk Merge**.
5. Click **Save**.

A record of each type of merge is now accessible from the **Communication** subtab.

Note: The file attached to this subtab is not the merged PDF that contains customer data. It's the bulk merge template. To view the populated mail merge, use **Merge History**.

Using Letter Templates

Note: This topic is unrelated to marketing campaigns. For information about campaigns, see [Email Marketing Campaigns](#).

Letter templates are Microsoft Word documents you create to use in mail merge operations. You then upload the templates to the Letter Templates folder of your file cabinet.

Letter templates generate personalized letters that you can print using Word, and then mail to those with whom you do business.

Letter templates can contain CRMSDK tags that refer to specific information in your NetSuite data. When Microsoft Word merges your data with your template, information that corresponds with the recipients record in NetSuite replaces the CRMSDK tags. For example, you might list the company's name and address in the heading of a letter. You insert the CRMSDK tags that correspond with each line in the address above the greeting. When Word merges your document, the company name, address, city, and state replace the CRMSDK tags.

The first step to create a letter template is to download the sample data source file. For more information, see [Downloading the Sample Data Source File For Letter Templates](#).

The method you use to create a letter template for mail merge depends on the version of Microsoft Word you use. For more information, see [Using Letter Templates in Microsoft Word](#).

For steps to create a new letter template, see [Creating a Letter Template Record](#).

Downloading the Sample Data Source File For Letter Templates

Note: This topic is unrelated to marketing campaigns. For information about campaigns, see [Email Marketing Campaigns](#).

To create a letter template, you must first download the sample data source file from NetSuite. This data file contains all of the tags you can include in your template.

Download this sample data source file one time, and then use the file for each letter template you create.

To download the sample source file:

1. Go to Documents > Templates > Letter Templates > New..
2. On the Letter Template page, click the sample source file link at the top of the page.
3. Save this file to your hard drive.

After you download the sample data source file, you can use Microsoft Word to create the template.

Using Letter Templates in Microsoft Word

Note: This topic is unrelated to marketing campaigns. For information about campaigns, see [Email Marketing Campaigns](#).

You must use Microsoft Word to create letter templates. Before you create a letter template, you must first download the sample data source file.

To create a letter template in Microsoft Word:

1. Open an existing Microsoft Word document.
2. Click **Mailings > Start Mail Merge > Letters** to begin your mail merge.
3. To select the recipients of this mail merge, click **Select Recipients > Use an Existing List**.
4. Find the sample data source file on your computer. The file name looks like NetLedgerSampleHeaderFile1.
If you do not see this file, ensure the files of type list displays **All Files (*.*)**.
5. Click **Open**.
6. If a notice appears that Word finds no merge fields in your document, click **Edit Main Document**. Next click **Edit** to edit the template document.
7. Enter the text of your template.
8. Click the **Insert Merge Field** list to place tags in your template.
Your data replaces these tags when you perform the letter merge. For a complete list of these tags and their corresponding fields, see [Using CRMSDK Tags](#).
9. Save your letter template as a Word document (.doc file).

Upload your letter template to your file cabinet, and then create a letter template record. For more information, see [Creating a Letter Template Record](#).

Creating a Letter Template Record

Note: This topic is unrelated to marketing campaigns. For information about campaigns, see [Email Marketing Campaigns](#).

Letter templates are Microsoft Word files that you merge with your NetSuite data to create personalized correspondence. You store letter templates in the Letter Template folder in your file cabinet.

To upload your template to your file cabinet:

1. Go to Documents > Templates > Letter Templates.

2. On the Letter Template page, click **New Template**.

Create a letter template record.

To create a letter template record:

1. Go to Documents > Templates > Letter Templates > New.
2. Enter a name for this template.
The Mail Merge page displays this name on the **Template** subtab.
3. In the **Subject** field, enter the subject of the letter.
4. In the **Description** field, enter information about this letter template.
5. In the **File** field, select the template file.
 1. Select **New**, and then choose your template file.
 2. Click **Save**.
6. Optional. On the **Restrict Access** subtab, check the **Private** box.
7. Optional. To restrict access by group, select this group in the **Restrict to Group** field.

 **Note:** You can't assign private templates to groups.

8. Click **Save**.

Now you can select this template when you perform a letter merge. For more information, see [Merging Letters](#).

Merging Faxes

 **Note:** This topic is unrelated to marketing campaigns. For information about campaigns, see [Email Marketing Campaigns](#).

Fax merge lets you send personalized faxes in bulk to those with whom you do business.

Before you perform a fax merge you must have:

- Created a group record for the recipients of your faxes.
- Prepared a fax template. See [Using Fax Templates](#).
- Created a fax template record. See [Creating a Fax Template](#) and [Creating a Fax Template Record](#).

NetSuite merges and sends your faxes. NetSuite automatically deletes duplicate messages to ensure that each fax number receives only one copy.

You must have an account with eFax to perform a fax merge in NetSuite. For more information about this service, see the help topic [Fax Preferences](#).

To perform a fax merge:

1. Go to Documents > Mail Merge > Bulk Merge.
2. On the Select Output page, click **Fax**.
3. On the **Recipients** subtab, in the **Group Type** field, select the type of group to receive the fax.
4. In the **Group** field, select the group to receive the fax.

Note: For groups with more than 100 members, NetSuite schedules and sends the fax merge operations within an hour of submission. For groups with fewer than 100 members, NetSuite sends the fax merge operations at submission. You can't send fax merge operations to groups with more than 4000 members.

You can create new groups at Commerce > Marketing > Personalization > Groups > New.

A list of recipients appears on the **Recipients** subtab.

5. Click the **Message** subtab.
6. In the **Template** field, select the fax template you want to use to generate the faxed documents. Select **New** to create a new fax template record.
7. Check the **Update** box to save changes you make to the message in the template file.
The subject entered on the fax template record appears in the **Subject** field, by default. You can edit this subject for the merge.
The message text from the template appears in the **Message** field.
8. You can edit this message for this merge.
If you checked the **Update** box, NetSuite saves the changes you make to the template file in your file cabinet.
9. To attach files to your faxes, click the **Attachments** subtab.
10. To compress attachments in a ZIP file, check the **Zip Attachments** box.
11. Select a file to attach to the fax in the **Attach File** column.
Attached files print as additional pages with your fax.
Attachments can't exceed 5MB in size. You may incur additional charges from your fax service when you send attachments.
12. Click **Add**.
13. Repeat these steps for each file you want to attach.
14. Click **Merge & Send**.

NetSuite records all messages sent in mail merge operations at Documents > Mail Merge > Merge History.

Using Fax Templates

Note: This topic is unrelated to marketing campaigns. For information about campaigns, see [Email Marketing Campaigns](#).

Fax templates are text documents you create for use in mail merge operations. Fax templates generate personalized fax documents that you can send to those with whom you do business.

Before you can send faxes from NetSuite, you must register with [eFax®](#). For more information about this service, see the help topic [Fax Preferences](#).

Creating a Fax Template

You can create fax templates as scriptable templates. Scriptable templates let you customize the output to include information specific to the recipient. For more information, see the help topic [Scriptable Templates](#).

Below is a sample fax template that incorporates FreeMarker code. This example is a fax sent to new leads by the sales rep they are assigned to.

```

1 <#if Customer.companyName = "">${Customer.firstName} ${Customer.lastName}<#else>${Customer.companyName}</#if><br />
2 ${customer.billAddr1}<br />
3 ${customer.billAddr2}<br />
4 ${customer.billCity}<br />
5 ${customer.billState} ${customer.billZip}<br />
6 ${customer.billCountry}
7
8 <p>Dear <#if Customer.companyName = "">${Customer.firstName}<#else>Customer</#if>,</p>
9
10 <p>My name is ${Customer.salesRep.firstName}, a sales representative for Wolfe Electronics in the ${Customer.billCity} area.</p>
11
12 <p>Thank you for your interest in Wolfe Electronics. If you need any assistance in placing an order, or if you need information
13 about any of our products, please call me on ${Customer.salesrep.phone}.</p>
14
15 <p>Sincerely,</p>
16 <br />
17 ${preferences.MESSAGE_SIGNATURE}

```

When NetSuite merges the fax, information from the lead record replaces the tags.

Tom Wetteland
 TRS Van Lines, Ltd.
 Suite 12
 3810 Castleberry Rd.
 San Diego, CA 92110
 Dear Tom,
 My name is Krista Barton, a sales representative for Wolfe Electronics in the San Diego area.
 Thank you for your interest in Wolfe Electronics. If you need any assistance in placing an order or if you need information about any of our products, please call me on 408-555-3652.
 Sincerely,
 Krista Barton
 Wolfe Electronics

After you create your fax template, you can create a fax template record.

Creating a Fax Template Record

If you create a fax template file outside of NetSuite, upload the file to the Fax Templates folder of your NetSuite file cabinet. You can also create a template directly on the template record.

To create a fax template record:

1. Go to Documents > Templates > Fax Templates > New.
2. Enter a name for this template.
3. In the **Description** field, enter information about this template.
4. On the **Template** subtab, in the **Subject** field, enter the subject of the fax.

5. Do one of the following:
 - Select **File** if you uploaded the template file to your file cabinet, and then select the file. Select **New** if you have not uploaded your template file to your file cabinet.

- Select **Text Editor** if you have not created your fax template. Compose your template in the rich text field.
If your template file contains HTML and you want to paste the template text, click the **HTML Source Code** button. This option ensures that your code is properly included.
Select a field in the **Insert Field** list to have NetSuite place the corresponding fields in your template.
6. **On the Restrict Access** subtab, check the **Private** box if you do not want others in your company to use this template.
 7. If you want this template to be used by members of a specific group, select that group in the **Restrict to Group** field.
 8. Click **Save**.

Merging PDFs

Note: This topic is unrelated to marketing campaigns. For information about campaigns, see [Email Marketing Campaigns](#).

PDF merge lets you create personalized PDF documents for those with whom you do business.

Before you perform a PDF merge, ensure you have:

- Created a group record for the recipients of the PDF documents.
- Prepared a PDF template. See [Using PDF Templates](#).
- Created a PDF template record. See [Creating a PDF Template](#) and [Creating a PDF Template Record](#).

NetSuite performs PDF merges. After you complete the merge operation, you download a ZIP file that contains all the PDF documents generated by the merge.

To perform a PDF merge:

1. Go to Documents > Mail Merge > Bulk Merge.
2. Under the **Select Output** column, click **PDF**.
3. On the **Recipients** subtab, in the **Group Type** field, select the type of group to receive the PDF documents.
4. In the **Group** field, select the group to receive the PDF documents.

Note: For groups with more than 100 members, NetSuite schedules and sends the PDF merge operations within an hour of submission. For groups with fewer than 100 members, NetSuite sends the PDF merge operations at submission. You can't send PDF merge operations to groups with more than 4000 members. The maximum permitted file size for the merge is 1GB.

You can create new groups at Commerce > Marketing > Personalization > Groups > New.

A list of recipients appears on the **Recipients** subtab.

5. Click the **Template** subtab.
6. In the **Template** field, select the PDF template you want to use to generate the PDFs.
Select **New** to create a new PDF template record.
7. Enter the subject of the document.
8. Enter a memo about the document.
9. Click **Actions > Merge**.
10. To download the ZIP file that contains your PDF documents, go to Documents > Mail Merge > Merge History.

If you merge PDFs for a group with more than 100 members, NetSuite sends you email notification when it completes the PDF merge. This confirmation includes a link to download the documents.

You can print these PDF documents or attach them to email you send.

Using PDF Templates

Note: This topic is unrelated to marketing campaigns. For information about campaigns, see [Email Marketing Campaigns](#).

PDF templates are PDF documents you create for use in mail merge operations. NetSuite uses PDF templates to generate personalized documents that you can send to those with whom you do business.

You create PDF templates outside of NetSuite, and then upload them to your file cabinet. NetSuite then merges your template with the data contained in each recipient's record. When the merge is complete, you can download a ZIP file that contains each of your personalized PDF documents.

PDF templates can include CRMSDK tags that refer to specific information in your NetSuite data. When NetSuite merges your data with your template, information that corresponds with the recipient's record replaces the CRMSDK tags. For a list of CRMSDK tags, see [Using CRMSDK Tags](#).

Creating a PDF Template

PDF templates are especially useful when you create documents that should not be edited. For example, contracts, user licenses, and proposals.

To prepare a PDF template, first create a document in a format that you can convert to PDF. Then, use Adobe Acrobat to convert your document to PDF format.

To insert CRM SDK tags in your PDF template:

1. Open the PDF template file in Adobe Acrobat.
2. Click the **Form Tool** button.
3. Place a tag in the document with the **Form Tool**.
4. In the Field Properties popup window, enter the CRM SDK tag in the **Name** field.
This tag should be all capital letters and have no angle brackets.
5. Click **OK**.
6. Repeat these steps for each tag you want to place in the document.
7. Save your template file.

Creating a PDF Template Record

After you upload your PDF template file to your file cabinet, you can create a PDF template record.

To create a PDF template record:

1. Go to Documents > Templates > PDF Templates > New.
2. Enter a name for this template.
The Mail Merge page displays this name on the **Template** subtab.
3. In the **Subject** field, enter the subject of the PDF file.
4. In the **Description** field, enter information about this template.
5. Do one of the following:
 - In the **Template File** field, select the template file.
 - Select **-New-** if you have not uploaded your template file to your file cabinet.
6. Optional. Check the **Private** box if you do not want others in your company to use this template.
7. Optional. If you want this template to be used by members of a specific group, select this group in the **Restrict to Group** field.
Private templates can't be restricted to a group.
8. Click **Save**.

Merge your PDF documents with your NetSuite data. For more information, see [Merging PDFs](#).

Keyword Campaigns

You can use keyword campaigns to track revenue and leads generated by paid search keywords. Keywords can be purchased through such services as Google Ads and Yahoo Partner Ads.

Before you create a keyword campaign:

- Enable auto-generated numbers for campaigns. For more information, see [Enabling Auto-Generated Numbers for Campaigns](#).
- Set up your keyword campaign naming format. For more information, see [Naming Keyword Campaigns](#).

There are three ways of creating keyword campaigns:

- [Creating Keyword Campaigns in Bulk](#)
- [Importing Keyword Campaigns](#)
- Creating keyword campaigns individually
For information about creating individual keyword campaigns, see [Adding Paid Search Keyword Information to Campaigns](#).

After creating your keyword campaign, you can create a saved search to export the information you need to provide to search engines. For more information, see [Exporting Keywords](#).

You can also run reports on revenue and lead generation for the tracked link you provided to the advertising service.

For more information, see [Passing Parameters Through URLs](#).

Enabling Auto-Generated Numbers for Campaigns

If you enable auto-generated numbers for campaigns, the system automatically assigns a campaign ID when you create a campaign record. Make sure auto-generated numbers are enabled before you create keyword campaigns. In your keyword campaign, only enter the URL of the destination page in the URL field. When the record is saved, the campaign ID parameter is added to the URL.

For example, many of Wolfe Electronics paid keywords direct customers to Wolfe's home page. The URL for a keyword campaign might look like:

1 | `http://www.wolfeelectronics.com/home?leadsource=420`

In this example, **420** is the campaign ID for this search keyword.

To enable auto-generated numbers for campaigns:

1. Go to Setup > Company > Setup Tasks > Auto-Generated Numbers.
2. On the **CRM** subtab, check the Enable box for Campaign.
3. Click **Save**.

After auto-generated numbers are enabled, you can create your keyword campaign.

Creating Keyword Campaigns in Bulk

On the Create Keyword Campaigns page, you can create multiple campaigns for paid keywords on different search engines from one page.

To create keyword campaigns in bulk:

1. As an administrator, go to Lists > Marketing > Create Keyword Campaigns.
2. Under Primary Information:
 1. Select the category for these keyword campaigns.
 2. Select the manager of these keyword campaigns.
 3. Enter start and end dates for these campaigns.
3. Under Related Information, select a campaign vertical, audience description, and items you want to associate with this campaign.
4. In the **ID** column, enter a campaign ID for a keyword campaign.
5. Select a search engine and a campaign family.
6. Enter a paid keyword in the **Keyword** column.
7. Enter the cost paid for the keyword.
8. Enter the URL of the landing page or online customer form for this keyword.
9. Select an offer to associate with this campaign.
10. Click **Add**.
11. Repeat these steps for each keyword campaign you want to create.
12. Click **Save**.

When you save this page, NetSuite creates a campaign record for each keyword you added on the Keyword subtab. NetSuite applies the vertical, audience, and items selected to each campaign record.

NetSuite names the keyword campaigns based on the Bulk Keyword Campaign Naming Template preference. Go to Setup > Sales & Marketing > Marketing Preferences.

Importing Keyword Campaigns

You can import keyword campaigns using CSV files. NetSuite provides a sample file that you can use to ensure that you include all of the keyword campaign information. The search engines, families, and offers in the CSV file need to match the records exactly.

NetSuite names the created keyword campaigns based on the Bulk Keyword Campaign Naming Template preference. Go to Setup > Sales & Marketing > Marketing Preferences.

To import keyword campaigns:

1. If you logged in with a marketing role, go to Campaigns > Marketing > Create Keyword Campaigns > Import.
If you logged in as administrator, go to Lists > Marketing > Create Keyword Campaigns > Import.
2. On the Import Assistant page in Step 1: Scan and Upload CSV File, select the type of character encoding for imported data.

For information about available options, see the help topic [Choose Import Character Encoding](#).

3. Click the **Campaign Keywords Template File** link to download a template file.
4. Save the file to your system, and then populate the saved file with your keyword data.
5. Click **Select** to choose the keyword campaign CSV file you prepared.
6. Click **Next**.
7. In Step 2: View Mapping / Start Import page, compare the fields mapping (columns) in your CSV file to fields on the campaign record.

Make any necessary changes or additions.

For information about Import Assistant field mappings, see the help topic [Guidelines for CSV Import Files](#).

8. Click **Run** to start the import.

For information about the Import Assistant's error handling, see the help topic [CSV Import Error Reporting](#).

For information about checking import status, see the help topic [Checking CSV Import Status](#).

When you save this page, NetSuite creates campaign records for each keyword you import. NetSuite displays the vertical, audience, and items selected on the Related Info subtab on each of the created campaigns.

Naming Keyword Campaigns

NetSuite names keyword campaigns that you create in bulk, or that you import based on the Bulk Keyword Campaign Naming Template preference. Go to Setup > Marketing > Preferences > Marketing Preferences.

By default, this naming template uses the following format:

Keyword-{searchengine}-{keyword}

Therefore, a keyword campaign title might be:

Keyword-Google-electronics

You can replace the delimiters with underscores or other characters, but don't remove the **{searchengine}** and **{keyword}** tags. If you do, this information does not appear in the title of the keyword campaigns you create.

If you enter individual keyword campaign records manually, you should maintain this format to ensure your keyword campaign names are recognizable.

Exporting Keywords

After you create your keyword campaigns, you can create a saved search to export the information you need for search engines.

To create a saved search, go to Campaigns > Marketing > Campaigns > Search. Enter criteria for the keyword campaigns you want to export. For example, you may want to export the campaigns for one search engine at a time.

Then, choose which information you want to show on the Results subtab. For example, you might include the keyword, the keyword family, and the destination URL in your results.

Finally, click Create Saved Search, enter a title, and then click Save. When you view the results, click Export to save the information as a CSV or Excel file.

Submitting Your Paid Search Proposal

With the Advanced Web Reports feature, when a customer finds your site through a search engine, NetSuite captures that customer's keyword campaign information. This lets you track revenue and lead generation for your paid keywords.

To make this information available on the lead or customer record, you should do the following:

- Have an administrator enable the Advanced Web Reports feature at Setup > Company > Setup Tasks > Enable Features. Create campaign records for each keyword you purchase.
- Provide a URL with the proper lead source parameter when you register a keyword with a paid keyword service.

Formatting Destination URLs

When you register keywords with a paid search service, give the landing page URL that customers see when they click your site in search results.

You should format the landing page URL as follows so that NetSuite associates the correct keyword campaign with the customer record:

```
1 | http://yourlandingpage.com?leadsource=yourcampaignID
```

When you enter a keyword campaign record in NetSuite, you only enter the URL for the landing page. When you save it, NetSuite adds the lead source parameter and campaign ID to the URL.

You can copy and paste this URL from the record when you register the keyword with the search engine. You can also export this URL into a spreadsheet. For more information, see [Exporting Keywords](#).

When a lead clicks the link to your site, NetSuite saves the lead source in the cookie from your website. NetSuite keeps this information no matter how many times the lead leaves your site and returns. When the lead registers with your website, or submits an online customer form, NetSuite saves the lead source to the record.

Managing Cost-Per-Click

Many paid search services don't charge up front, but get paid each time someone clicks your search result. You can calculate ROI anytime by updating a campaign's total cost with the cost you incurred for a certain time period.

Campaign Families

Campaign families are groups of keywords used in marketing campaigns. If you buy keywords in groups, you can use a keyword family to represent the group.

For example, Wolfe Electronics purchases a group of keywords that refer to specific brands of computer systems. These keywords are grouped in the keyword family Computers.

 **Note:** When you group keyword campaigns by family, it's simpler to view keyword reports, especially if you have many keyword campaigns.

You can track keyword families on the Keyword subtab of campaign records. You can customize campaign reports to show information about keyword families. NetSuite includes the Family Name field in the Lead Source component. For more information, see the help topic [Report Customization](#).

To create a campaign family, go to Setup > Marketing > Campaign Management > Campaign Families > New.

Upsell Manager

The Upsell Manager feature helps you maximize your sales and marketing efforts. It determines which items present a good upsell opportunity, and which customers you should target. This is also called **product affinity analysis**.

To enable the Upsell Manager feature, an administrator can go to Setup > Enable Features > CRM subtab. Check the Upsell Manager box, and then click Save.

Upsell Manager searches your customer transaction histories to suggest possible upsell items and categories of items. It chooses these upsell items and categories based on their correlation, which means how often a customer buys two items together.

For example, Wolfe Electronics used Upsell Manager to determine that 30% of customers that bought laptops also purchased store warranties on those machines. Wolfe decided to create a list of customers that purchased laptops but not warranties in an effort to upsell store warranties to those customers.

Another value Upsell Manager uses is **lift**. Lift is the difference between an item's correlation and its purchase rate (percentage of customers who purchased it).

When you have identified the upsell items and target customers, you can create:

- a target audience for marketing campaigns
- tasks for each customer's sales representative to upsell the selected items
- scheduled phone calls for each customer
- opportunities for each customer that include the upsell items

You can also determine upsell items on customer records or sales transactions. When you use the Upsell Manager:

- an Upsell subtab appears on customer records that lists potential upsell items for the customer. For more information, see [Upselling From Customer Records](#).
- an Upsell Items button appears on sales transactions. After you select items on the transaction, click Upsell Items to see a list of items that correlate with the items you have chosen. For more information, see [Upselling on Transactions](#).

 **Note:** Upsell preferences let you limit the number of items that display on the Upsell subtab and the Upsell Items popup window on transactions. To maintain performance, you should set upsell preferences. Go to Setup > Sales > Upsell Preferences.

Using the Upsell Manager Wizard

The Upsell Manager Wizard walks you through the creation of lists of upsell customers. To upsell with the Upsell Manager, go to Lists > Marketing > Upsell Manager.

Step 1 of 5: Select Upsell Type

There are two ways to use the Upsell Manager to determine upsell items and target customers. You can base your upsell on:

- **Items to Upsell** – Select this option to upsell specific items or categories of items.
- **Items Purchased** – Select this option if you do not know which items or item categories you want to upsell. This option lets you search for upsell items based on past purchases.

Click **Next**.

Step 2 of 5: Selecting Upsell Items

You can either select the items you want to upsell or search for items that provide strong upsell opportunities.

Upselling Based on Items to Upsell

To base your upsell on items to upsell, select your upsell items or item categories. You'll see a list of items and categories that have sold well with the upsell items you chose.

Correlation is the percentage of customers who bought both the upsell item and the related item.

Use the selected upsell items to create a list of customers that purchased the correlated item but not the upsell item.

For example, a Wolfe Electronics sales rep wants to upsell service plans. They use Upsell Manager to determine that there is a strong correlation between service plans and laptops. They create a group of customers that purchased laptops but not service plans.

To select specific upsell items:

1. Select the items or item categories you want to upsell in the **Items to Upsell** field.
Hold **CTRL** to select more than one item.
2. Set the following upsell search criteria to filter your upsell item search results:
 - **Correlation Greater Than** – NetSuite returns only those items with a correlation greater than what you set in your upsell item search.
Correlation is the percentage of customers that purchased both the upsell items and each item in your upsell search results.
 - **Count Greater Than** – NetSuite returns only those items with a greater count than what you set in your upsell item search.
Count represents the number of customers that purchased both the upsell items and each item in your upsell search results.
3. Click **Search**.
A list of items and categories that have correlation with the upsell items you selected appears.
4. If you need to change your search criteria, make your changes, and click **Refresh**.
5. Check the boxes in the **Apply** column to select the item pairs on which you want to base your upsell.
6. Click **Next**.

NetSuite automatically creates a customer search based on items purchased.

You can now set additional criteria for your upsell customer search.

Upselling Based on Items Purchased

To base your upsell on items purchased, you first select items customers purchased in the past. Then, NetSuite presents a list of upsell items that sold well with the purchased items.

Correlation is the percentage of customers who bought both the upsell item and the related item.

For example, a Wolfe Electronics sales rep uses Upsell Manager to decide which items they can upsell to their customers. They use Upsell Manager to determine that there is a strong correlation between desktop computers and wireless routers. They create a group of customers that purchased desktop computers but not wireless routers.

To select upsell items based on items purchased:

1. Select the purchased items in the **Items to Upsell** field.
Hold **CTRL** to select more than one item.
2. Set the following upsell search criteria to filter your upsell item search results:
 - **Correlation Greater Than** – NetSuite returns only those items with a correlation greater than what you set in your upsell item search.
Correlation is the percentage of customers that purchased both the upsell items and each item in your upsell search results.
 - **Lift Greater Than** – NetSuite returns only those items with a greater lift than what you set in your upsell item search.
Lift is the degree to which the item's correlation exceeds its overall purchase frequency (**correlation - purchase frequency**). Purchase frequency is the percentage of customers who purchased an item.
A high lift implies a more reliable correlation.
For example, Wolfe Electronics sold Dell XPS 13 Developer Edition laptops to 100 customers. Forty of the customers also purchased a premium warranty. The correlation between the laptop and the warranty is 40%. Wolfe has 1000 customers, so the purchase frequency is 10%. The lift is 30%.
Wolfe sold its less expensive Dell Inspiron 15 3000 laptops to 300 customers. 150 of these customers purchased the premium warranty. A correlation of 50% and a purchase frequency of 30%. The lift is 20%.
 - **Count Greater Than** – NetSuite returns only those items with a greater count than what you set in your upsell item search.
Count represents the number of customers that purchased both the upsell items and each item in your upsell search results.
3. Click **Search**.
A list of potential upsell items appears.
4. If you need to change your search criteria, make your changes, and click **Refresh**.
5. Check the boxes in the **Apply** column to select the item pairs on which you want to base your upsell.
6. Click **Next**.

You can now set additional criteria for your upsell customer search.

Step 3 of 5: Additional Customer Criteria

After you choose your upsell items or item categories, define the list of target customers with the upsell.

By default, the customer search finds customers that purchased the upsell items but not purchased other correlated items. You can set additional criteria if you want to filter the results further.

If you do not want to set additional criteria, click **Next**.

To add criteria to the customer search:

1. On the **Criteria** subtab, select a filter.
2. Enter the filter criteria.
3. Click **Add**.
4. Repeat these steps for each additional filter.

You can also change the way your customer search results appear.

To change how your results display:

1. Click the **Results** subtab.
2. At the top of the subtab, choose which columns determine the order of the list of results.
3. In the **Field** column, select a field to add a column to the results.
4. Click **Add**.
5. Repeat these steps for each new column.

After you set additional criteria, click **Next**. NetSuite searches for customers that match your criteria and returns a list of results.

Now, you can preview your list of upsell customers.

Step 4 of 5: Previewing Your Upsell Customer List

To exclude customers from the upsell effort, clear the box in the **Apply** column next to the customer's name.

To return to the search criteria page, click **Back**. To accept the customer list, click **Next**.

 **Note:** When you click **Next** NetSuite does not contact customers.

After you choose the customers you want to include, you can choose upsell actions.

Step 5 of 5: Choosing Upsell Actions

The Choose Upsell Action page provides four actions for how NetSuite should proceed with this upsell effort. You can choose any of these actions.

For each upsell action, enter information in the fields provided. NetSuite uses this information when it creates records.

For example, a Wolfe Electronics sales rep chooses to create opportunities from upsell customer search results. In the Title field, they enter **Store Warranty Upsell**. For the expected close date, they

enter the last day of the month. NetSuite creates an opportunity for each customer in the upsell customer results list with the same title and expected close date.

- **Create a group of customers to upsell to**

If you choose this action, NetSuite creates a group record from this list of upsell customers. You can then create a marketing campaign targeting this group or perform a bulk merge that offers the upsell items to these customers.

- **Create tasks for the sales reps assigned to the upsell customers**

If you choose this action, NetSuite creates task records for the sales rep assigned to each customer.

- **Schedule phone calls for each upsell customer**

If you choose this action, NetSuite creates phone call records for the sales rep assigned to each customer.

- **Create opportunities for each upsell customer**

If you choose this action, NetSuite creates opportunity records for each customer. These opportunities have the upsell items selected, by default.

Note: You can create opportunities only for upsell items. You can't add item categories to opportunities.

After you choose your upsell actions, click **Finish**.

Upselling From Customer Records

When you view customer records, you'll see a list of potential upsell items and categories.

The Upsell subtab presents suggested upsell items that sold well with items that customers purchased.

The list of upsell items also displays a correlation and count for each set of items. Correlation is the percentage of customers that purchased the upsell item and the items the customer purchased. The Count value indicates the number of customers that purchased both items, which provides the relative reliability of the correlation.

For example, Wolfe Electronics considers two items for upsell. The first item has a correlation of 50% and a count of six. The second item has a correlation of 20% and a transaction count of 150. The higher count value for the second upsell item indicates that its correlation is less likely to be coincidence. Wolfe decides that the second item is a better item for upsell.

To upsell from a customer record:

1. Go to Leads > Relationships > Customers.
2. Click **View** next to the name of the customer to whom you want to upsell.
3. Click the **Sales** subtab.
4. Click the **Upsell** subtab.

This subtab shows a list of items, their correlation, and a count of transactions in which the two items appear together.

5. Click the **Create Opportunity** button.

A new opportunity opens with the customer automatically selected.

6. Click the **Items** subtab.
7. Click **Upsell Items**.
8. In the Upsell Items popup window, check the boxes next to the items you want to upsell to the customer.
9. Click **Submit**.
NetSuite adds these items to the opportunity.
10. Add more items and enter other information about the opportunity.
11. Click **Save**.

Now you can provide this opportunity to your sales team so that they can negotiate the offer with the customer.

 **Note:** To maintain optimal NetSuite performance, you should set upsell preferences to limit the number items that display. Go to Setup > Marketing > Upsell Preferences. These limited items appear on the Upsell subtab of the customer record and the Upsell Items popup window on transactions.

Upselling on Transactions

When you enter an estimate, sales order, cash sale, invoice, or opportunity, you can view a list of upsell items.

This Upsell Items popup window lists items and item categories that historically sold well with the items on the transaction.

Each upsell item displays with correlation and count values to help you determine the best upsell candidate. An upsell item's correlation is the percentage of customers that purchased both the upsell item and the items you selected on the transaction. The count displays the number of transactions in which the items are purchased together.

For example, a sales rep creates a sales order for a new laptop. After they select the laptop on the Items subtab, they click the Upsell Items button. At the top of the Upsell Items list, they see that 13% of transactions that include this model of laptop also include wireless routers. They ask the customer if they are interested in a router, and if so, they add it to the order.

 **Note:** NetSuite searches for correlation on each item separately when you search for potential upsell items.

To choose an upsell item on a transaction:

1. Create a new sales transaction.
2. On the **Items** subtab, add at least one item to the transaction.
3. Click **Upsell Items**.
4. In the Upsell Items popup window, check the boxes next to the items you want to upsell to the customer.
5. Click **Submit**.
NetSuite adds the item to the transaction.

Note: To maintain optimal NetSuite performance, you should set upsell preferences to limit the number items that display. Go to Setup > Marketing > Upsell Preferences. These limited items appear on the Upsell subtab of the customer record and the Upsell Items popup window on transactions.

Upsell Preferences

Set up upsell preferences prior to using the Upsell Manager feature. Go to Setup > Sales > Upsell Preferences.

- **Items to Upsell** – When you upsell from transactions or from the customer record, NetSuite provides a list of possible upsell items. NetSuite generates this item list based on item correlation, or from related items. Upsell items are items that have positive correlation with previously purchased items. Related items are items that were manually selected on the Related Items subtab of item records.

Choose from the following:

- **Show Upsell Items and Related Items** – Both related items and items with correlation display on the Upsell subtab and in the Upsell Items popup window.
- **Show Upsell Items If There Are No Related Items** – Related items display on the Upsell subtab and in the Upsell Items popup window. If there are no related items, items that correlate with past purchases display.
- **Show Only Related Items** – Only related items display on the Upsell subtab and in the Upsell Items popup window.

- **Minimum Correlation** – When you suggest upsell items, NetSuite presents a correlation value for each pair of items.

Correlation is the percentage of customers that purchased the upsell items and each item in your upsell search results. Enter a minimum correlation to:

- Filter the suggested upsell items on the Upsell subtab of customer records and on the Upsell Items popup window on transactions
- Appears by default in the Correlation Greater Than field on the Select Upsell Items page when you use Upsell Manager

- **Minimum Lift** – Lift is the degree to which the item's correlation exceeds its overall purchase frequency. Lift helps you filter out basic items sold in a large percentage of transactions. A high lift implies a more reliable correlation. For example, an electronics dealer might notice that CD-Rs have low lift because they are sold in many transactions with unassociated items.

Enter the degree of lift that:

- Is used to filter items on the Upsell subtab of customer records and on the Upsell Items popup window on transactions
- Appears by default in the Lift Greater Than field on the Select Upsell Items page when you use Upsell Manager

- **Minimum Count** – Count represents the number of customers that purchased the upsell items and each item in your upsell search results. Enter the count that:

- Is used to filter items on the Upsell subtab of customer records and on the Upsell Items popup window on transactions
- Appears by default in the Lift Greater Than field on the Select Upsell Items page when you use Upsell Manager

After you set these preferences, click Save.

Limits on Upsell Manager Data

The amount of upsell data that NetSuite stores on your account depends on how many items or customers you have. NetSuite uses the larger of these two values to determine your allocation. The following table provides allocation examples.

Number of customers / items	Number of correlations / recommendations allowed
<2000	100
5000	40
10000	20
25000	8
50000	4
100000	2

For accounts with more than 2000 items or customers, NetSuite calculates the maximum number of correlated items and customer recommendations by the following method:

1. Determine the number of items or customers in your account and use the larger of these two values (for example, 4500 customers).
2. Divide this number by 2000* ($4500 / 2000 = 2.25$).
3. Divide 100** by the figure above ($100 / 2.25 = 44$).
4. This value is the number of correlated items and customer recommendations NetSuite allocates to your account. For example, NetSuite allows an account with 4500 customers 44 recommendations per customer and 44 correlations per item.

* the customer/items threshold.

** the correlations/recommendations threshold.

Product Affinity Analysis in Search

You can use upsell data in item search results. This enables you to create reports and saved searches that give information about customer purchasing patterns.

The following fields are available as criteria or as result columns:

- **Correlated Item** – This includes all of the items purchased by the same customer as a certain item. (Correlation is the percentage of customers who purchased both the correlated item and the upsell item.)
- **Correlated Item Count** – This is the number of customers who purchased both the upsell item and the correlated item.
- **Correlated Item Lift** – This is the lift between the upsell item and the correlated item. (Lift is the difference between the correlation and purchase rate of the correlated item, or the percentage of customers who purchased a certain item.)
- **Correlated Item Purchase Rate** – This is the percentage of customers who purchased the correlated item.

- **Correlated Item Fields** – This field group includes all of the fields on the item record of the correlated item.

Note: NetSuite provides weekly updates to the upsell data for accounts that exceed 2000 customers and items. See [Limits on Upsell Manager Data](#).

Intelligent Recommendations

Intelligent Recommendations use artificial intelligence algorithms to calculate and display items your customer might want to buy. The algorithms use data such as:

- what the customer bought in the past
- what other customers with similar transaction history bought in the past
- what other items were bought by customers who bought a specific item
- items that have similar names, descriptions, and categories

Intelligent item recommendations are useful to two different audiences. Sales representatives can use them to identify and add relevant items to sales orders, estimates, and opportunity records. You can also add recommendations to your SuiteCommerce website to show shoppers items they may want to buy.

Intelligent item recommendations are generated based on their context:

- **Item context** – the recommendations are based on data related to items. There are four types:
 - **Order or Cart Items** – these are related to the items already selected in the sales order, estimate form, or opportunity record.

When used on a SuiteCommerce website, these recommendations are specific to the items in the shopper's cart.

Recommended items are the top 10 recommended items for the *entire* order or cart, based on items that are frequently bought together with items in the entire order or cart. To determine the top 10 recommended items:

1. The system generates a list of recommended items for *each* item in the customer's order or cart.
2. If an item is recommended for multiple items in the order or cart, its scores are combined, making that item more likely to appear in the top recommendations.
3. The system then sorts all the recommended items by their score and selects the top 10 items.

- **Customers Who Bought This Also Bought** – these are specific to an item selected in the sales order, estimate form, or opportunity record, and are based on the purchase history of other customers who bought the selected item.

These recommendations can also be shown on Product Details Pages (PDP) on SuiteCommerce websites.

- **Recently Viewed Items** – these are related to the items the SuiteCommerce website shopper has viewed recently while browsing the website.

Note: This applies only to SuiteCommerce websites.

- **Alternative Items** – these are specific to an item selected in the sales order, estimate form, or opportunity record and show recommendations of alternatives to the item based on similarity of item name, description, and category.

These recommendations can also be shown on Product Details Pages (PDP) on SuiteCommerce websites. For example, if a website shopper adds small green shirts to an order, and then realizes there aren't enough shirts in stock, the Alternative Items recommendation might show large green shirts or small red shirts.

- **Customer/ Shopper context** – the recommendations are based on data related to customers. There are two types:

- **Customer Purchase History** – often called ‘You might like’ recommendations, these are specific to each customer and are based on the customer's purchase history and items bought by customers with a similar purchase history.

These recommended items can be shown on sales orders, estimate forms, and opportunity records as well as SuiteCommerce websites.

- **Buy Again** – these are specific to each customer and are based on whether items are regularly bought by the customer. If a customer bought an item only one time, recommendations are based on whether the item is bought regularly by other customers.

These recommended items can be shown on sales orders, estimates, and opportunity records, as well as SuiteCommerce websites.

If Customer Relationship Management, SuiteCommerce, or SuiteCommerce Advanced is enabled in your account, you'll see an Intelligent Recommendations button on sales orders, estimates, and opportunity records. The number of available item recommendations is displayed on the top-right of the button. Clicking **Intelligent Recommendations** displays a list of recommended items that apply to the specific combination of customer and items at that point of time. If you change the customer or items, you'll get different recommendations. You can use the dropdown to change the basis on which items are recommended, by adding or removing options from the Recommendations Based On list.

The exception to this are Alternative Items and Customers Who Bought Also Bought recommendations, which can be seen by selecting an item in a sales order, estimate, or opportunity, and clicking **Intelligent Recommendations**.

Note: The recommendations you see depend on the transaction data in your account. For example, if only a few transactions include the selected item, you might not get any ‘Order or cart items’ recommendations.

The machine learning algorithms process and learn from your transaction data every 24 hours, so the recommendations change and improve over time. As the number of customers, products, and transactions increase in your account, the quality of the intelligent recommendations also improves.

If you want to use intelligent item recommendations on your website, see the help topic [Intelligent Item Recommendations for Commerce Websites](#).

To check which types of recommendations are currently available for a subsidiary or a site, go to Commerce > Marketing > Intelligent Recommendations > Recommendation Availability.

Account Requirements for Intelligent Item Recommendations

Intelligent item recommendations are available on any account that has Customer Relationship Management, SuiteCommerce, or SuiteCommerce Advanced enabled. Whether a particular type of recommendation is available in a specific site or subsidiary, depends upon the following:

Type of Recommendation	Subsidiary/Site Requirements
- Order or cart items - Customers who bought this also bought - Recently viewed items - Customer purchase history	- At least 50 items in the catalog - A minimum number of transactions in the past 12 months

Type of Recommendation	Subsidiary/Site Requirements
Buy Again	A minimum number of repeat purchases in the past 12 months
Alternative Items	- At least 50 items in the catalog - A system-supported language, excluding Vietnamese

Your account must meet further criteria if you want to use intelligent recommendations on a SuiteCommerce or SuiteCommerce Advanced website. For more information about additional requirements, see the help topic [Account Requirements for Intelligent Item Recommendations for Websites](#). For more information about system-supported languages, see the help topic [Configuring Multiple Languages](#).

To check which types of recommendations are available for a subsidiary or a site, go to Commerce > Marketing > Intelligent Recommendations > Recommendation Availability.

Recommendation Scenarios and Blocklists

Recommendation scenarios are a set of configuration guidelines that the machine learning algorithm follows while calculating which items to recommend. The guidelines included in a recommendation scenario are:

- **Recommendations based on** – whether the recommendations should be based on:
 - Customer purchase history
 - Order or cart items
 - Recently viewed items
 - Customers who bought this also bought
 - Buy again
 - Alternative items
- **Freshness** – this defines the degree to which the recommendations should prioritize items recently added to the catalog.
- **Novelty** – this defines the degree to which the recommendations should prioritize items that customers rarely see.
- **Diversity** – this defines the degree to which the recommendations should prioritize items that are different from each other.

NetSuite creates default recommendation scenarios based on the following and automatically sets them to provide recommendations for sales orders, estimates, and opportunities:

- Customer purchase history
- Order or cart items
- Customers who bought this also bought
- Buy again
- Alternative items to the selected item

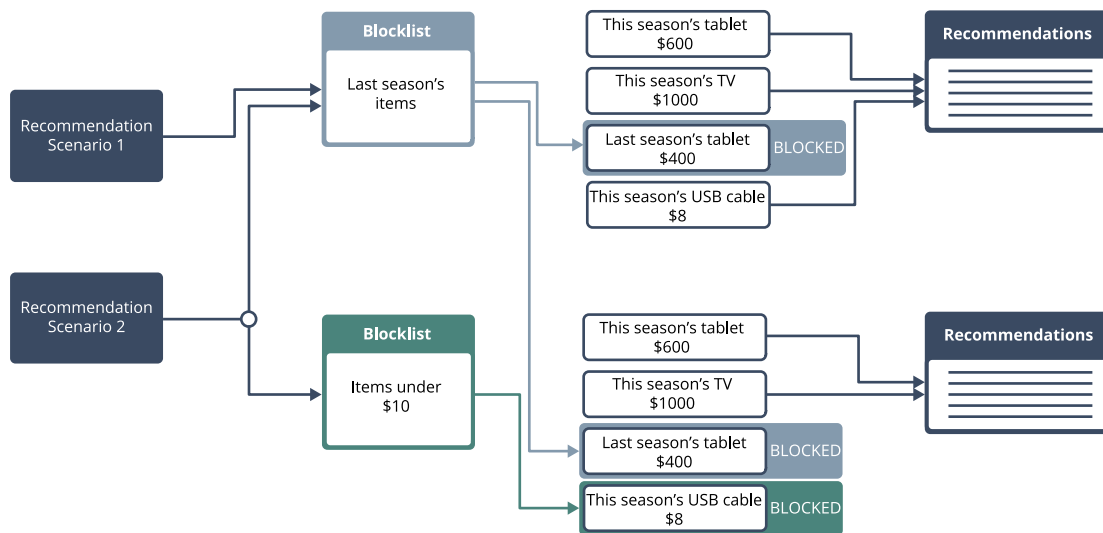

NetSuite creates up to six default scenarios based on "Recently viewed items". These scenarios are available for use on SuiteCommerce websites. The default scenarios are suited to most businesses but you can change these scenarios or create additional scenarios with custom intelligent recommendations

settings for each website. For more information about using intelligent item recommendations on your website, see the help topic [Intelligent Item Recommendations for Commerce Websites](#).

Blocklists

Blocklists are lists of items or item collections that you don't want to include in intelligent item recommendations. If you link a blocklist to a recommendation scenario, the items in the blocklist won't show up in that scenario.

You can link one blocklist to several recommendation scenarios, or link multiple blocklists to one scenario.

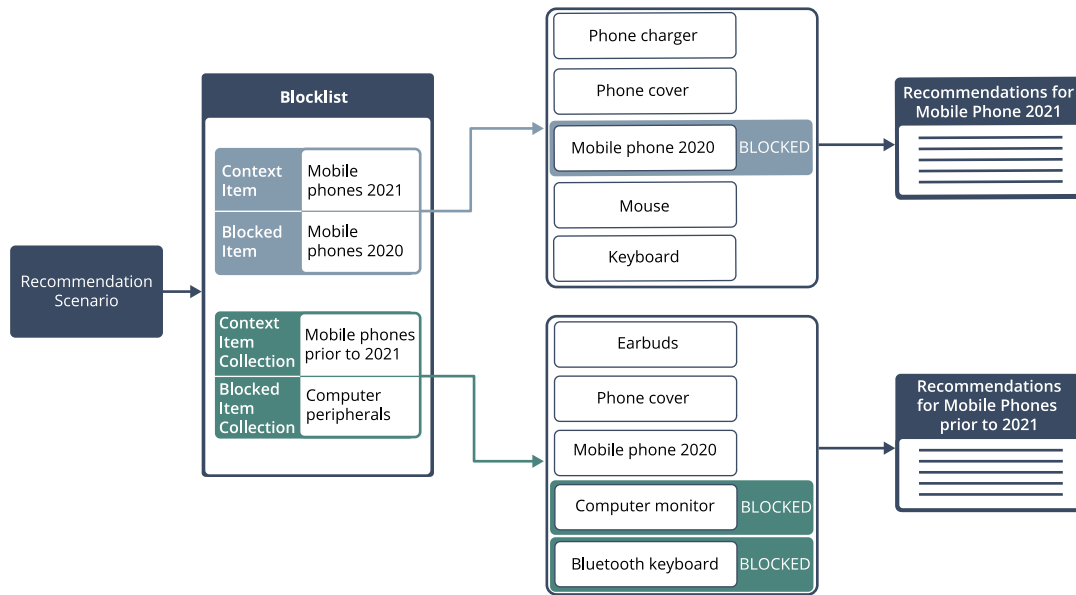

Always Block vs. Block for Item

There are two ways to block items in blocklists:

- **Always Block** – items and item collections marked as Always Block never appear as intelligent recommendations.
- **Block for Item** – these items are blocked from appearing in intelligent recommendations only when a specific item has been added to the sales order, estimate, or opportunity record. When the blocklist is used in a website, these items are blocked from recommendations only when the shopper is looking at the specific item. In both cases, the specific item is called a context item.

For example, you may not want an older model of equipment to be recommended when the sales order or estimate already contains a newer model, or when the website shopper is looking at a newer model. You can choose the newer model as the context item and the older model as the blocked item.

Block for Item also applies to item collections. For example, if you sell books and music, you may want to block all music recommendations when the sales order, estimate, or opportunity record contains only books. On your website, you might want to stop showing music recommendations when someone is looking at books. In these cases, you can select the Books item collection as the context item collection and the Music item collection as the Blocked item collection.

For information about creating blocklists and recommendation scenarios, see [Create a Blocklist](#) and [Recommendation Scenarios and Blocklists](#).

Create a Blocklist

A blocklist is a list of items or item collections that shouldn't be included in intelligent item recommendations.

To create a blocklist:

1. Go to Commerce > Marketing > Intelligent Recommendations > Recommendation Blocklists.
2. Click **New**.
3. Enter the **Name** of the blocklist.
4. Enter a description of the blocklist.

Optionally, you can get writing help for the **Description** field from our generative AI service, NetSuite Text Enhance. Click the Enhance Text button to use the available options. For more information about using this capability, see the help topic [Text Enhance](#).

5. If you know the recommendation scenario with which you want to link this blocklist, select it from the **Recommendation Scenarios** list. You can select one or more scenarios from the list.
6. If you want to prevent one or more items from being recommended in all circumstances, select the item or item collection on the **Always Block** tab.

For example, if you are having supply issues for a particular item, you can prevent it from being recommended by adding it to a block always list.

7. If you want to prevent one or more items from being recommended only for a specific context item or item collection, select the item or item collection on the **Block For Item** tab, and then select the item or item collection that should not be displayed in the Blocked Item or Blocked Item Collection field.

For example, you might not want to recommend an older model when the order or estimate already has a newer one, or when a shopper is looking at a newer model. You can set the newer model as the context item and the older one as the blocked item.

For more information, see [Always Block vs. Block for Item](#).

8. After you have added all the items and item collections you want to block to the blocklist, click **Save**.

Create a Recommendation Scenario

Recommendation scenarios are a set of configuration guidelines that the machine learning algorithm follows while calculating which items to recommend.

 **Note:** You don't need to create recommendation scenarios to use intelligent item recommendations. The default recommendation scenarios work for most businesses.

To create a recommendation scenario:

1. Go to Commerce > Marketing > Intelligent Recommendations > Recommendation Scenarios.
2. Click **New**.
3. Enter a name and description for the scenario.

Optionally, you can get writing help for the **Description** field from our generative AI service, NetSuite Text Enhance. Click the Enhance Text button to use the available options. For more information about using this capability, see the help topic [Text Enhance](#).

4. Select an option from the **Recommendations Based On** list. For more information about these options, see [Intelligent Recommendations](#).

For more information about using recommendation scenarios on SuiteCommerce websites, see the help topic [Intelligent Item Recommendations for Commerce Websites](#).

5. Though you can create multiple recommendation scenarios based on each of the options in **Recommendations Based On**, sales orders, estimates, and opportunity records can only have five scenarios associated with them, one based on each of the following:

- Customer purchase history
- Order or cart items
- Buy again
- Customers who bought this also bought
- Alternative items

For example, you could create two recommendation scenarios based on customer purchase history, one with a blocklist attached and one without. You could use both recommendation scenarios on your website but you could only use one for sales orders, estimates, and opportunity records.

To use a recommendation scenario for sales orders, estimates, and opportunity records, check **Select as Default Scenario for Sales Transactions**. When you save the scenario, it will automatically replace the recommendation scenario currently in use for sales orders, estimate forms, and opportunity records.

6. From the **Recommendation Blocklists** list on the **Advanced Settings** tab, select the blocklist (if any) applicable to the recommendation scenario.

For more information, see [Blocklists](#).

7. Set the **Diversity**, **Popularity**, and **Freshness** sliders to the required level:
 - **Diversity** – to increase the chance of recommending items that are different from each other, choose a higher Diversity level.

- **Freshness** – to increase the chance of recommending items recently added to the catalog, choose a higher Freshness level.
 - **Novelty** – to increase the chance of recommending items that are rarely seen by a customer, choose a higher Novelty level.
8. You can see a live preview of recommendations and blocked items when you create the recommendation scenario and at any time afterwards. For more information, see [View Recommendations Live Preview](#).
 9. Click **Save**.

If you selected **Select as Default Scenario for Sales Transactions**, you are asked to confirm that you want the scenario you have created to automatically replace the scenario currently in use for sales orders, estimates, and opportunity records. Click **OK** to confirm or **Cancel** to go back to the recommendation scenario form.

Note: Sales orders and estimates must have a recommendation scenario associated with them for each option listed in **Recommendations Based On**. If you want to save the new scenario you have created but you don't want it to be the default scenario for sales orders and estimates, clear the **Select as Default Scenario for Sales Transactions**, and then save again. If, in the future, you want to set the recommendation scenario you created as default for sales orders and estimates, you can edit the recommendation scenario record, check the **Select as Default Scenario for Sales Transactions** and save.

View Recommendations Live Preview

You can preview the intelligent recommendations calculated by the algorithm for each scenario. The recommendations use the latest transaction data available to the algorithms. This data updates every 24 hours.

To view a live preview of recommendations:

1. Go to Commerce > Marketing > Intelligent Recommendations > Recommendation Scenarios.
2. In the Live Preview section of a recommendation scenario, select the subsidiary or website for which you want to see the intelligent recommendations.

Note: The **Website** list is available only if there is a suitable website in your account. For more information, see the help topic [Account Requirements for Intelligent Item Recommendations for Websites](#).

3. If the recommendation scenario is based on:
 - **Order or cart items, Customers who bought this also bought, Alternative items, or Recently viewed items** – select the item whose recommendations you want to see. If the recommendation scenario is based on Order or cart items or Recently viewed items, you can select more than one item.
The Recommended Items and Blocked Items for those items appear in the Live Preview section.
 - **Customer purchase history or Buy again** – select the customer or website shopper whose recommendations you want to see.
The Recommended Items and Blocked Items for that customer or shopper appear in the Live Preview section.

Note: Select **Guest Shopper** to see recommendations for website shoppers who have no transaction history.

4. When you view Live Preview for a website, if the algorithm can't calculate intelligent recommendations for the selected shopper or item, recommendations are not displayed. The **Fallback Recommendations** list becomes available instead. From the options in the **Fallback Recommendations** list, select what items you want to see when no intelligent recommendations are available. The options are:

- **None** – no recommendations are shown
- **Popular items** – displays the bestselling items in the website catalog
- **New items** – displays the items most recently added to the website catalog

If you choose either **Popular** or **New items**, these items are shown in the **Fallback Items** list.

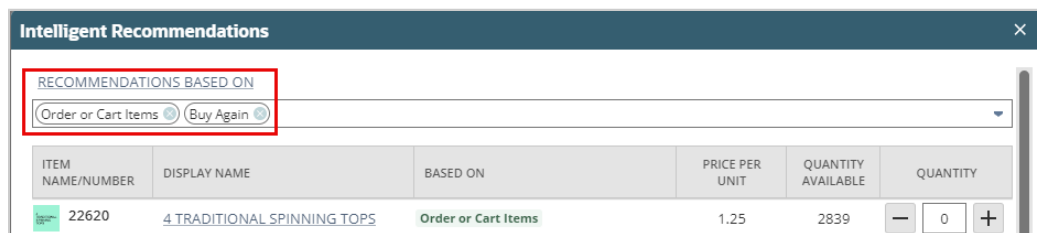

Note: The fallback items you choose here are applicable only to the live preview. For information about choosing which fallback items are shown on your website, see the help topic [Add and Remove Intelligent Item Recommendations from your Website](#).

Add Recommended Items to Sales Orders, Estimates, and Opportunities

When you enter a sales order, estimate, or opportunity, you'll see a list of intelligent recommendations based on the customer and items you've already picked.

To add a recommended item to a sales order, estimate, or opportunity record:

1. Create a new sales order, estimate, or opportunity record.
2. Choose a customer or add items to the transaction on the **Items** subtab.
3. Click the **Intelligent Recommendations** button at the top of the Items list to view the recommendations available for the selected combination of customer and items.
4. From the Intelligent Recommendations popup window, choose the quantity of each item you want to add to the sales order, estimate, or opportunity record.
 - If you want to change the basis on which items are recommended, you can add or remove options from the **Recommendations Based On** list.

Note: The recommendations shown depend upon the transaction data available in the account. For example, if only a few transactions include the selected item, you might not get any 'Order or cart items' recommendations.

5. If any of the recommended items are matrix items, click **Subitems >** and choose the quantity of each subitem you want to add to the sales order, estimate, or opportunity record.

Intelligent Recommendations					
RECOMMENDATIONS BASED ON					
Order or Cart Items Buy Again					
ITEM NAME/NUMBER	DISPLAY NAME	BASED ON	PRICE PER UNIT	QUANTITY AVAILABLE	QUANTITY
22620	4 TRADITIONAL SPINNING TOPS	Order or Cart Items	1.25	2839	- 0 +
22610	PENS ASSORTED FUNNY FACE	Order or Cart Items	0.85	2695	- 0 +
22621	TRADITIONAL KNITTING NANCY	Order or Cart Items	1.45	3054	- 0 +
82494	WOODEN FRAME ANTIQUE WHITE	Buy Again	--	--	Subitems >

Click **Add Subitems** when you have finished to return to the list of intelligent recommendations.

- Click **Add & Close** to add the selected quantity of the items and subitems to the sales order, estimate, or opportunity record.

To add an alternative item recommendation to a sales order, estimate, or opportunity:

- In the **Items** tab of a sales order, estimate, or opportunity record, select the item for which you want to see alternative item recommendations.
- Click **Intelligent Recommendations** in the toolbar that appears below the item to view the recommendations.

Item *	Quantity	Description
10080 + [icon]	1	GROOVY CACTUS INFLATABLE
OK Cancel Make Copy + Insert Remove Intelligent Recommendations		

- From the Intelligent Recommendations popup window, choose the quantity of each item you want to add to the sales order, estimate, or opportunity record.
- If any of the recommended items are matrix items, click **Subitems >** to choose the quantity of each subitem you want to add to the sales order, estimate, or opportunity record.
- Click **Add & Close**.

The selected quantity of the selected items are added to the sales order, estimate, or opportunity record.

Manage Intelligent Item Recommendations Preferences

If you do not want to see intelligent item recommendations on sales orders, estimates or opportunity records, you can remove the Intelligent Recommendations button from these records.

Note: Removing the button doesn't affect your use of intelligent recommendations on websites.

To enable or disable Intelligent Item Recommendations:

1. In NetSuite, go to Setup > Sales > Preferences > Sales Preferences.
2. Locate the **Show Intelligent Recommendations Button for Item Recommendations** box:
 - Check the **Show Intelligent Recommendations Button for Item Recommendations** box to enable the Intelligent Recommendations button in your account.
 - Clear the **Show Intelligent Recommendations Button for Item Recommendations** box to disable the Intelligent Recommendations button in your account.
3. Click **Save**.

Customize Display Columns

To customize your display columns:

1. Go to Setup > Company > AI > AI Preferences.
2. From the AI Preferences page, click the **Intelligent Recommendations** subtab.
3. On the **Intelligent Recommendations** subtab, check the boxes for the columns you want visible in the Intelligent Item Recommendations popup window: Display Name, Unit Price, and Quantity Available.
4. Click **Save**.

Promotional URLs

Promotional URLs are short, descriptive links that take users to online forms, categories, or items in your website.

For example, the URL NetSuite assigns to the Information tab of the Wolfe Electronics website is `http://www.wolfeelectronics.com/app/site/site.nl/site.ACCT000000/mode.items/sc.5/.f`. By creating a promotional URL, Wolfe can promote this page to customers as `http://www.wolfeelectronics.com/information`. When customers enter the promotional URL, they are taken to the Information tab of Wolfe's site.

If you include a promotional code in the URL, NetSuite applies discounts associated with the promotion to any order placed during that site visit.

Before you set up promotional URLs, you must set up your own domain through a domain registrar. For more information, see the help topic [Domain Setup Checklist](#).

To create a promotional URL:

1. Go to Setup > Marketing > Setup Tasks > Promotional URLs.
The URL you create appears in the **Composite URL** field.
2. In the **Name** field, enter the word or phrase you want customers to enter as the URL.
This word or phrase appends the URL in the **Base URL** field.
3. In the **Description** field, enter a short message describing this promotional URL.
4. In the **Page Type** list, select a type of page to link to from the following list:
 - File Cabinet Item
 - Hosted Web Page
 - Knowledge Base Topic
 - Online Case Form
 - Online Customer Form
 - Web Site Category
 - Web Site Information Item
 - Web Site Item
 - Web Site Tab
5. In the **Page** list, select the page you want to link to.
6. In the **Additional Parameters** field, enter the descriptive information you want to pass through the URL.
 - Enter up to 40 characters in this field.
 - Enter parameters in the following format: ID=value.
 - In place of ID, enter the ID listed in the table below for the field you want to enter information into.
 - In place of value, enter the value you want to automatically appear in this field.
 - String parameters together with ? and & symbols. The first parameter in a URL should begin with a ?. Subsequent parameters should begin with &. For example, `category=individual&partner=Hill's Fine Jewelry`.
7. Click **Save**.

Field	ID
Company Name	companyname

Web Address	url

Customers can now access your web pages with this promotional URL. If customers use a promotional URL that's different from your site's domain name, the URL might change to the default display URL.

NetSuite determines the domain in the URL using the following rules:

1. The first domain hosted as a Promotional URL at Commerce > Hosting > Domains.
2. The domain used in the web store primary site URL.
3. The first domain name that begins with www and is hosted as a hosted web page.
4. If there is no hosted web page domain that begins with www, NetSuite uses the first domain hosted as a hosted web page.
5. If 1 - 4 do not apply, NetSuite uses the first domain name in the list on the Set Up Domains page that begins with www.

Customer Surveys

NetSuite has the tools you need to create a customer survey from creation to results analysis.

You can use custom records to create an online survey form and link it in the email you send to customers. When a customer completes the survey, NetSuite creates a new survey record and links it to the customer's record.

You can create a standard online form for the survey. You can also upload your own HTML template for a fully customized form. You can add custom code validation to online forms for more control over what customers enter.

With NetSuite Mail Merge or Marketing Campaigns, you can send emails to your customers with a link to the survey form. When you add a parameter for the customer's name in the URL, NetSuite associates the completed survey with the correct customer record.

Following are the four tasks you must complete to send out a survey:

- [Creating a Custom Record Type for a Customer Survey](#)
- [Building an Online Form for a Customer Survey](#)
- [Creating the Link to a Customer Survey](#)
- [Sending Out a Customer Survey](#)

Creating a Custom Record Type for a Customer Survey

The first step is to create a custom record type and link it to the customer record.

Note: This task requires permission to create custom record types. By default, marketing roles do not have this permission. Therefore, this step requires an administrator or a customized role to complete.

To create a custom record type for a customer survey:

1. Go to Customization > Lists, Records, & Fields > Record Types > New.
2. Enter a name for the record type, such as Customer Survey.
3. Clear the **Include Name Field** box.
4. Click **Save**.

Next, create a field to link the customer survey record to the customer record. Customer records are the parent records for customer surveys.

To create a custom field to link a survey to the customer record:

1. On the **Fields** subtab, click the **New Field** button. A new field page opens.
2. In the **Label** field, type **Customer**.
3. In the **Type** field, select **List/Record**.
4. In the **List/Record** field, select **Customer**.
5. Check the **Record is Parent** box.

6. Click **Save**.

The custom record page appears with the Customer field listed on the **Fields** subtab.

Next, create other fields for the questions you want to include in your survey.

To create fields for the questions in the survey:

1. Click the **New Field** button.
2. In the **Label** field, enter a name for the custom record field.
3. In the **Type** field, select the type of field this will be. For example, select Free-form text to create a basic text field.
4. Click **Save**.

The custom record page appears with your new field added to the **Fields** subtab.

5. Repeat these steps for each question you want to add to the record.

Now you can create a new record of this type. Go to Customization > Lists, Records, & Fields > Record Types > New. Click the New Record link next to your Customer Survey record.

NetSuite provides a list of completed surveys (those completed by you and those completed by customers). To view the list, click the List link on the Record Types page.

Building an Online Form for a Customer Survey

You can create an online form for customers to fill out and create a survey record.

Note: You'll need permissions to create custom record types, which marketing roles don't have by default. An administrator or a custom role has to do this.

To create an online form for a customer survey:

1. Go to Customization > Lists, Records, & Fields > Record Types.
2. Click the **Customer Survey** link in the **Edit** column.
3. On the Customer Survey record page, click the **Online Forms** subtab.
4. On the **Online Forms** subtab, do one of the following:
 - Click **New Online Form** to create the form customers will use to complete the survey. Select the record fields that will appear on the form and define the order of those fields. Set other parts of the form's appearance such as the way fields display, color theme, and a form logo.
 - Click **New Online HTML Form** to use a custom HTML template and fully control your form's layout and appearance. For more information, see [Online Form Templates](#).
5. On the **Select Fields** subtab, select the **Customer** field in the **Field** column. NetSuite uses this field to link the survey to the customer record.
6. Clear the box in the **Select** column.
You can hide this field on the form. If you pass the customer name through the URL, it can help avoid confusion for the respondent. For more information, see [Creating the Link to a Customer Survey](#).
7. Click **Add**.
8. Repeat these steps for each question you want on the survey.

9. Set up the online form as you want it to appear for customers. For more information, see the help topic [Online Custom Record Forms](#).
10. Click **Save**.

For a custom HTML form, you must supply tags in the body of your document to show how fields are arranged.

Each field tag should look like <NLTAG>. You make a tag by adding NL to a field ID. You'll find the ID for custom fields on the Fields subtab in the ID column. Each tag should be formatted like this: <NLCUSTRECORD1>.

Creating the Link to a Customer Survey

The next step is to build the URL you'll use to link customers to your survey.

To build the URL, first find the online form's publishable URL, then add a parameter to the end.

 **Note:** You'll need permissions to create custom record types, which marketing roles don't have by default. An administrator or a custom role has to do this.

To find the form's URL:

1. Go to Customization > Lists, Records, & Fields > Record Types > New.
2. Click the link for your Customer Survey record type under the **Edit** column.
3. On the **Online Forms** subtab, click the name of your online form.
The online form record opens in a new window.
4. Click the **External** subtab, and find the **Publishable Form URL**.
The URL is in the following format: `https://system.netsuite.com/app/site/crm/externalcustrecordpage.nl?compid=1a2b3c4d&formid=xx&h=1a2b3c4d`

The next steps add a parameter to the URL that passes the customer's name into the form. This way, customers can't enter their own name, so you don't have to worry about mismatches that would keep the survey from linking to the correct record.

To add a parameter to the form's URL:

1. On the Customer Survey record, click the **Fields** subtab.
2. Copy the ID for the **Customer** field.
3. Create a parameter to add to the end of the publishable form URL. The parameter sets the **Customer** field on the Survey form to the ID of the customer you send the survey email to. There are two parts to this parameter:
 - The field's ID – for example, `custrecord1`.
 - The FreeMarker Syntax – `${record.field}`
This FreeMarker Syntax dynamically pulls the name from the customer's record when you send the email.
(The field ID must be changed to lowercase when you build the parameter.)

The parameter in this example would look like `&custrecord1=${record.field}` and should follow the capitalization in this example.

4. Add this parameter to the end of the publishable form URL located in the previous set of steps.

Your final URL should look like:

```
https://system.netsuite.com/app/site/crm/externalcustrecordpage.nl?
compid=1a2b3c4d&formid=xx&h=1a2b3c4d&custrecord1=${record.field}
```

To verify that you correctly created the form URL, you should test the link before you send it to customers.

To test the link to your survey:

1. Go to Lists > Relationships > Clients > New and create a test customer.
2. Enter an email address you have access to in the **Email** field.
3. Click **Save**.
4. After you save the customer record, click the **Communication** subtab, and then click **Email**.
5. On the **Message** subtab of the email message, enter a subject.
6. Enter text for your link, select the text, and click the **Link** button.
7. Enter the URL for the custom record form.

In the URL, replace the **&custrecord1** parameter with the ID of the customer field you created above.

The URL should be in this format: `https://system.netsuite.com/app/site/crm/externalcustrecordpage.nl?compid=1a2b3c4d&formid=xx&h=1a2b3c4d&custrecord1=${record.field}`

8. Click **Merge and Send**.
NetSuite replaces the tags with the customer's name in the email it sends.
9. Check your email and click the link to the survey form.
10. Confirm that the name of the test customer is showing in the URL.

Sending Out a Customer Survey

To send out your survey, you can do an email merge or send it through a marketing campaign. If you use a campaign, you can track how many messages were received, opened, responded to, and clicked.

First, create a customer group to use as the recipient group for the merge or campaign. To create a group, go to Commerce > Marketing > Personalization > Groups > New.

Finally, send the survey email through an email merge or marketing campaign. For more information, see [Merging Email](#) and [Creating a Campaign Record](#).

Marketing Reports

The following standard marketing reports are available in NetSuite:

- [Campaign ROI Analysis Summary Report](#)
- [Campaign ROI Analysis Detail Report](#)
- [Campaign Response Summary Report](#)
- [Campaign Response Detail Report](#)
- [Campaign Clickthrough Summary Report](#)
- [Campaign Clickthrough Detail Report](#)
- [Lead Source Analysis Summary Report](#)
- [Lead Source Analysis Detail Report](#)
- [Gross Lead Source Analysis Summary Report](#)
- [Gross Lead Source Analysis Detail Report](#)
- [Sales by Lead Source Summary Report](#)
- [Sales by Lead Source Detail Report](#)
- [Leads by Paid Keyword Summary Report](#)
- [Leads by Paid Keyword Detail Report](#)
- [Sales by Paid Keyword Summary Report](#)
- [Sales by Paid Keyword Detail Report](#)

For information about customizing your reports, see the help topic [Report Customization](#).

Campaign ROI Analysis Summary Report

The Campaign ROI Analysis Summary report shows the profit and return on investment (ROI) for each marketing campaign. It also shows the number of leads, prospects, and customers generated. Campaigns are grouped by campaign category.

Profit is calculated by deducting the cost of the campaign from the amount generated by sales transactions with the campaign's lead source. ROI is calculated by dividing the profit by the cost of the campaign.

To view the Campaign ROI Analysis Summary report:

Go to Reports > Marketing > Campaign ROI Analysis.

You'll see a message that your report is loading. The status bar at the bottom shows the progress as your report loads. You can click Cancel Report next to the status bar if you want to stop the report from loading.

Note: This report does not support reporting by period even when the Report by Period preference is set to All Reports. You can set the Report by Period preference at Home > Set Preferences > the Analytics subtab.

Campaign ROI Analysis Detail Report

The Campaign ROI Analysis Detail report shows the profit for each scheduled event of your marketing campaigns. It also shows the number of leads and prospects generated. Campaign events are grouped by campaign.

Profit is calculated by deducting the cost of the campaign event from the amount generated by sales transactions with the campaign's lead source. Return on investment (ROI) is calculated per campaign, by dividing the profit by the cost of the campaign.

To view the Campaign ROI Analysis Detail report:

Go to Reports > Marketing > Campaign ROI Analysis > Detail.

You'll see a message that your report is loading. The status bar at the bottom shows the progress as your report loads. You can click Cancel Report next to the status bar if you want to stop the report from loading.

Note: This report does not support reporting by period even when the Report by Period preference is set to All Reports. You can set the Report by Period preference at Home > Set Preferences > the Analytics subtab.

Campaign Response Summary Report

The Campaign Response Summary report shows when each campaign and campaign event was delivered and gives information about the responses of recipients. Campaigns are grouped by campaign category.

This report shows the following information about each marketing campaign event:

- date scheduled
- number of messages sent
- number and percentage of messages opened (email only)
- number and percentage of recipients who clicked any link in the message (email only)
- number and percentage of messages that the recipient responded to
- number and percentage of recipients that purchased because of the campaign
- number and percentage of failed messages that were not delivered

For more information about types of campaign responses, see [Tracking Campaign Responses](#).

Purchases are tracked as Default Events. To view additional information about purchaser count, use the [Campaign Response Detail Report](#).

To view the Campaign Response Summary report:

Go to Reports > Marketing > Campaign Response.

You'll see a message that your report is loading. The status bar at the bottom shows the progress as your report loads. You can click Cancel Report next to the status bar if you want to stop the report from loading.

Note: This report does not support reporting by period even when the Report by Period preference is set to All Reports. You can set the Report by Period preference at Home > Set Preferences > the Analytics subtab.

Campaign Response Detail Report

The Campaign Response Detail report lists the recipients of each marketing campaign event in the date or period range you select. The report shows when the event was delivered and the action taken by each recipient. Campaigns are grouped by campaign category.

This report shows the following information about each marketing campaign event:

- title of the campaign events
- the campaign response for each recipient
- details on each response
- the date and time the event was queued to be sent

For more information about types of campaign responses, see [Tracking Campaign Responses](#).

To view the Campaign Response Detail report:

Go to Reports > Marketing > Campaign Response > Detail.

You'll see a message that your report is loading. The status bar at the bottom shows the progress as your report loads. You can click Cancel Report next to the status bar if you want to stop the report from loading.

Note: This report does not support reporting by period even when the Report by Period preference is set to All Reports. You can set the Report by Period preference at Home > Set Preferences > the Analytics subtab.

Campaign Clickthrough Summary Report

The Campaign Clickthrough Summary report shows the specific links clicked by recipients in a marketing email message. In a message with multiple links, the report shows all links recipients clicked. The report displays base URL's and subgroups for each one of them based on the GET parameters appended to them.

For information about how to tie a transaction to a campaign, see [Associating a Transaction With a Campaign](#).

To view the Campaign Clickthrough Summary report:

Go to Reports > Marketing > Campaign Clickthrough Summary.

You'll see a message that your report is loading. The status bar at the bottom shows the progress as your report loads. You can click Cancel Report next to the status bar if you want to stop the report from loading.

Note: This report does not support reporting by period even when the Report by Period preference is set to All Reports. You can set the Report by Period preference at Home > Set Preferences > the Analytics subtab.

Campaign Clickthrough Detail Report

The Campaign Clickthrough Detail report lists specific links recipients clicked in a marketing email message. It also provides the name of the recipient who clicked on the link in the Recipient ID column. In a message with multiple links, the report shows all links that recipients clicked. The report displays base URL's and subgroups for each one of them based on the GET parameters appended to them.

For information about how to tie a transaction to a campaign, see [Associating a Transaction With a Campaign](#).

To view the Campaign Clickthrough Detail report:

Go to Reports > Marketing > Campaign Clickthrough Summary > Detail.

You'll see a message that your report is loading. The status bar at the bottom shows the progress as your report loads. You can click Cancel Report next to the status bar if you want to stop the report from loading.

Note: This report does not support reporting by period even when the Report by Period preference is set to All Reports. You can set the Report by Period preference at Home > Set Preferences > the Analytics subtab.

Lead Source Analysis Summary Report

The Lead Source Analysis Summary report shows the number of lead, prospect, and customer records entered during the time period set for each lead source. It also shows campaign events.

The leads included in this report represent:

- Records that were originally entered as leads during the time period selected
- Records that have had a lead status that is set to be included in reports

Records entered as prospect or customer records during this time period are not included in this report.

A lead source is also attached to a customer if:

- a lead source is manually selected on the record
- a record is created when the customer fills out an online customer form and selects a lead source
- there are parameters in the online customer form link

If you use the Marketing Automation feature, the lead source list contains created campaigns. The Lead Source Analysis Summary report then lists the campaigns you have available, and the number of leads, prospects, or customers added for each.

If you do not use Marketing Automation, you can create a new lead source at Setup > Sales > Setup Tasks > CRM Lists > New.

To view the Lead Source Analysis Summary report:

Go to Reports > Marketing > Lead Source Analysis.

You'll see a message that your report is loading. The status bar at the bottom shows the progress as your report loads. You can click Cancel Report next to the status bar if you want to stop the report from loading.

Note: This report does not support reporting by period even when the Report by Period preference is set to All Reports. You can set the Report by Period preference at Home > Set Preferences > the Analytics subtab.

Lead Source Analysis Detail Report

The Lead Source Analysis Detail report shows the number of lead, prospect, and customer records entered during the time period selected for each lead source.

The leads included in this report include:

- Records that were originally entered as leads during the time period selected.
- Records that have had a lead status that is set to be included in reports.

A lead source is also attached to a customer if:

- a lead source is manually selected on the record
- a record is created when the customer fills out an online customer form and selects a lead source
- there are parameters in the online customer form link

If you use the Marketing Automation feature, the lead source list contains created campaigns. The Lead Source Analysis Detail report then lists the campaigns you have available, and the number of leads, prospects, or customers generated by each campaign.

If you do not use Marketing Automation, you can create a new lead source at Setup > Sales > Setup Tasks > CRM Lists > New.

To view the Lead Source Analysis Detail report:

Go to Reports > Marketing > Lead Source Analysis.

You'll see a message that your report is loading. The status bar at the bottom shows the progress as your report loads. You can click Cancel Report next to the status bar if you want to stop the report from loading.

Note: This report does not support reporting by period even when the Report by Period preference is set to All Reports. You can set the Report by Period preference at Home > Set Preferences > the Analytics subtab.

Gross Lead Source Analysis Summary Report

The Gross Lead Source Analysis Summary report shows the number of leads, campaign events, prospects, and customers entered during the time period set for each lead source.

The leads included in this report are records that were originally entered as leads during the time period selected. This report also includes leads that at one time had a lead source that was **not** set to be included in reports.

A lead source is also attached to a customer if:

- a lead source is manually selected on the record
- a record is created when the customer fills out an online customer form and selects a lead source
- there are parameters in the online customer form link

If you use the Marketing Automation feature, the lead source list contains created campaigns. The Gross Lead Source Analysis Summary report then lists the campaigns you have available, and the number of leads, prospects, or customers generated by each campaign.

If you do not use Marketing Automation, you can create a new lead source at Setup > Sales > Setup Tasks > CRM Lists > New.

To view the Gross Lead Source Analysis Summary report:

Go to Reports > Marketing > Gross Lead Source Analysis.

You'll see a message that your report is loading. The status bar at the bottom shows the progress as your report loads. You can click Cancel Report next to the status bar if you want to stop the report from loading.

Note: This report does not support reporting by period even when the Report by Period preference is set to All Reports. You can set the Report by Period preference at Home > Set Preferences > the Analytics subtab.

Gross Lead Source Analysis Detail Report

The Gross Lead Source Analysis Detail report lists the lead, prospect, and customer records entered during the time period you select for each lead source.

The leads included in this report are records that were originally entered as leads during the time period selected. This report also includes leads that at one time had a lead source that was **not** set to be included in reports.

A lead source is also attached to a customer if:

- a lead source is manually selected on the record
- a record is created when the customer fills out an online customer form and selects a lead source
- there are parameters in the online customer form link

If you use the Marketing Automation feature, the lead source list contains created campaigns. The Gross Lead Source Analysis Detail report then lists the campaigns you have available, and the number of leads, prospects, or customers generated by each campaign.

If you do not use Marketing Automation, you can create a new lead source at Setup > Sales > Setup Tasks > CRM Lists > New.

To view the Gross Lead Source Analysis Detail report:

Go to Reports > Marketing > Gross Lead Source Analysis > Detail.

You'll see a message that your report is loading. The status bar at the bottom shows the progress as your report loads. You can click Cancel Report next to the status bar if you want to stop the report from loading.

Note: This report does not support reporting by period even when the Report by Period preference is set to All Reports. You can set the Report by Period preference at Home > Set Preferences > the Analytics subtab.

Sales by Lead Source Summary Report

The Sales by Lead Source Summary report shows the total sales by lead source for the date range you select. Campaigns are grouped by campaign category.

For information about how to tie a transaction to a campaign, see [Associating a Transaction With a Campaign](#).

To view the Sales by Lead Source Summary report:

Go to Reports > Marketing > Sales by Lead Source.

You'll see a message that your report is loading. The status bar at the bottom shows the progress as your report loads. You can click Cancel Report next to the status bar if you want to stop the report from loading.

Sales by Lead Source Detail Report

The Sales by Lead Source Detail report lists and totals the sales transactions for each lead source in the date range you select. Campaigns are grouped by campaign category.

For information about how to tie a transaction to a campaign, see [Associating a Transaction With a Campaign](#).

To view the Sales by Lead Source Detail report:

Go to Reports > Marketing > Sales by Lead Source > Detail.

You'll see a message that your report is loading. The status bar at the bottom shows the progress as your report loads. You can click Cancel Report next to the status bar if you want to stop the report from loading.

Leads by Paid Keyword Summary Report

The Leads by Paid Keyword Summary report shows the number of leads, prospects, and customers entered during the time period set for each paid keyword campaign.

The leads included in this report are records that were originally entered as leads during the time period selected.

To view the Leads by Paid Keyword Summary report:

Go to Reports > Marketing > Leads by Paid Keyword.

You'll see a message that your report is loading. The status bar at the bottom shows the progress as your report loads. You can click Cancel Report next to the status bar if you want to stop the report from loading.

Note: This report does not support reporting by period even when the Report by Period preference is set to All Reports. You can set the Report by Period preference at Home > Set Preferences > the Analytics subtab.

Leads by Paid Keyword Detail Report

The Leads by Paid Keyword Detail report lists the lead, prospect, and customer records entered during the time period set for each paid keyword campaign.

The leads included in this report include:

- Records that were originally entered as leads during the time period selected.
- Records that have had a lead status that is set to be included in reports.

To view the Leads by Paid Keyword Detail report:

Go to Reports > Marketing > Leads by Paid Keyword > Detail.

You'll see a message that your report is loading. The status bar at the bottom shows the progress as your report loads. You can click Cancel Report next to the status bar if you want to stop the report from loading.

Note: This report does not support reporting by period even when the Report by Period preference is set to All Reports. You can set the Report by Period preference at Home > Set Preferences > the Analytics subtab.

Sales by Paid Keyword Summary Report

The Sales by Paid Keyword Summary report shows the total sales by keyword campaign for the date range you select. Campaigns are grouped by campaign category.

For information about how to tie a transaction to a campaign, see [Associating a Transaction With a Campaign](#).

To view the Sales by Paid Keyword Summary report:

Go to Reports > Marketing > Sales by Paid Keyword.

You'll see a message that your report is loading. The status bar at the bottom shows the progress as your report loads. You can click Cancel Report next to the status bar if you want to stop the report from loading.

Sales by Paid Keyword Detail Report

The Sales by Paid Keyword Detail report lists and totals the sales transactions for each keyword campaign in the date range you select. Campaigns are grouped by campaign category.

For information about how to tie a transaction to a campaign, see [Associating a Transaction With a Campaign](#).

To view the Sales by Paid Keyword Detail report:

Go to Reports > Marketing > Sales by Paid Keyword > Detail.

You'll see a message that your report is loading. The status bar at the bottom shows the progress as your report loads. You can click Cancel Report next to the status bar if you want to stop the report from loading.

Setting Up Marketing

Before you create a marketing campaign, you should do the following:

1. Set your [Marketing Preferences](#).
2. Create [Campaign Email Domains](#).
This is a required step if you send more than 10,000 bulk email per month.
3. Set up an email domain key.
See the help topic [DomainKeys Identified Mail \(DKIM\)](#).
4. Create [Campaign Categories](#).
5. Authorize the email addresses you want to use to receive replies to your campaign email.
See [Creating a Campaign Email Address Record](#).
6. Create [Campaign Subscription Categories](#) to allow customers to choose the kinds of email they receive from your company.
7. Create any of the following information to help evaluate and analyze your campaigns:
 - [Campaign Audiences](#)
 - [Campaign Verticals](#)
 - [Campaign Families](#)
 - [Campaign Search Engines](#)
 - [Campaign Channels](#)
 - [Campaign Offers](#)
 - [Promotional URLs](#)

Marketing Preferences

You can set company marketing preferences at Setup > Marketing > Preferences > Marketing Preferences. The following preferences affect how your company works with marketing campaigns:

- **Marketing Template Folder** – Choose a file cabinet folder to store your marketing templates.
When you're setting up Marketing Automation, NetSuite creates the Marketing Templates folder in your File Cabinet.
To create a new folder, go to Documents > File Cabinet.
- **Default Reply Email Address** – Select an email address that appears as the default reply address on email template records.
- **Default From Email Address** – Select an email address that appears as the default from address on email templates.

 **Note:** You can authorize the use of an email address with your marketing campaigns. Go to Setup > Marketing > Setup Tasks > Email Addresses > New.

- **Default Campaign Domain** – Select the campaign domain you want to be selected by default on email and marketing templates. You can create new domains at Commerce > Hosting > Domains. See [Campaign Email Domains](#).

- **Default Promotion Code on Sales Transactions** – Choose one of the following if you want a default promotion code to appear on sales transactions. Leave this field blank if you do not want to default a coupon code on transactions.
 - **First Promotion Code Sent** – The promotion associated with the first campaign event sent is the default.
 - **Most Recent Promotion Code Sent** – The promotion associated with the most recently sent campaign event is the default.
 - **First Promotion Code Responded To** – The promotion associated with the first campaign event to which the customer responded is the default.
 - **Most Recent Promotion Code Responded To** – The promotion associated with the most recently send campaign event to which the customer responded is the default.
 - **Based on Lead Source** – The promotion associated with the campaign event where the customer's record has a defined lead source is the default.
- **Default Lead Source on Sales Transactions** - Choose one of the following if you want a default lead source to appear on sales transactions. Leave this field blank if you do not want to default a lead source on transactions.
 - **First Campaign Sent** – The lead source for the first campaign event sent is the default.
 - **Most Recent Campaign Sent** – The lead source associated with the most recently sent campaign event is the default.
 - **First Campaign Responded To** – The lead source of the campaign event to which the customer first responded is the default.
 - **Most Recent Campaign Responded To** – The lead source of the most recently sent campaign event to which the customer responded is the default.
 - **Based on Lead Source** – The lead source associated with the campaign event where the customer's record has a defined lead source is the default.
- **Unsubscribed to Marketing by Default** – Check this box if you want new records assigned the global subscription status Soft Opt-Out, by default.

Clear this box if you want new records assigned the global subscription status Soft Opt-In, by default.

 **Note:** Keep this box checked until you provide appropriate notice and obtain sufficient consent to automatically subscribe new and existing entities for marketing messages.

For more information about subscriptions, see [Subscription Management](#).

- **Bulk Keyword Campaign Naming Template** - Enter the format you want to use for naming keywords you import into your account.

 **Note:** Use {searchengine} and {keyword} tags if you want this information to show in the title of the keyword campaigns you create.

- **Campaign Test Cells** – Check this box if you want to divide recipient groups into test cells to help you evaluate the effectiveness of your campaign templates. For more information, see [Marketing Test Cells](#).
- **Opt-In Invitation Message** – Choose the email template you want to send to customers to invite them to set their subscription preferences.
- **Opt-In Confirmation Message** – Choose the email template you want to send to customers to let them to confirm their current subscription status. This email provides an opportunity for your customers to reaffirm their interest to receive your email. When you send opt-in confirmation messages, it assures your customers that you are committed to sending only the email they want to receive.

For more information, see [Sending Subscription Messages](#).

- **Default Sales Rep Notification Template for New Lead** – Choose the default marketing template for the Notification Template for New Leads field on online customer forms. This template notifies reps when NetSuite creates a new lead, prospect, or customer through an online form.
 - **Default Sales Rep Notification Template for Existing Customer** – Choose the default marketing template for the Notification Template for Existing Customers field on online customer forms. This template notifies reps when one of their existing leads, prospects, or customers updates their information through an online customer form.
- You can create new marketing templates at Documents > Templates > Marketing Templates > New.
- For more information, see [Creating an Online Customer Form](#).
- **Unsubscribe Footer Text** – Select the font, font size, and text alignment you want applied to the unsubscribe message on your email campaigns and bulk email merge operations.

Campaign Audiences

Campaign audiences describe the target audience of a marketing campaign.

You can track audiences on the Related Info subtab of campaign records. You can customize campaign reports to include information about your audience. The Audience Name field is a part of the Lead Source component. For more information, see the help topic [Report Customization](#).

To create a campaign audience, go to Setup > Marketing > Campaign Management > Audiences.

Campaign Verticals

NetSuite uses campaign verticals to show which market categories you're targeting in a marketing campaign. For example, if you're running a campaign for the automotive sector, you might include verticals like main dealers, fleet owners, and car hire businesses.

You can track verticals on the Related Info subtab of campaign records. You can customize campaign reports to include information about verticals. The Vertical Name field is a part of the Lead Source component. For more information, see the help topic [Report Customization](#).

To create a target vertical, go to Setup > Marketing > Campaign Management > Verticals.

Campaign Search Engines

You can create campaign search engine records for the search engines from which you buy keywords.

When you create a campaign record for a keyword, you can select the search engine on the Keyword subtab. You can also customize campaign reports to include information about search engines. The Search Engine Name field is a part of the Lead Source component. For more information, see the help topic [Report Customization](#).

To create a record of a search engine, go to Setup > Marketing > Campaign Management > Search Engines > New.

Campaign Channels

Campaign channels describe the medium NetSuite uses to deliver a marketing campaign or campaign event. NetSuite includes the following campaign channels by default: Direct Mail, Email, Phone, Print Ad, and Misc.

To create a campaign channel:

1. Go to Setup > Marketing > Campaign Management > Channels.
2. Enter a name for this campaign channel.
3. In the **Type** field, select the category you want this channel to be included in.
Your selection determines the type of campaign event that can use this channel. For example, you create campaign events that use an email type channel on the **Email** subtab of the campaign record.
4. Enter a description of the channel.
5. Click **Save**.

Now you can create campaign events that use this campaign channel.

Campaign Offers

Use campaign offers to group marketing campaigns by assigning each one to a specific offer. Campaign offers let you create reports that provide the combined revenue or activity of a group, rather than individual campaign performance. Only users with the Marketing Administrator or Administrator role can create campaign offers. You can assign only one campaign offer to a marketing campaign.

To create a Campaign Offer:

1. Go to Setup > Sales & Marketing Automation > Campaign Offers > New
2. Enter a name for the offer.
3. Enter a short description. This appears on the list page of campaign offers.
4. Click **Save**.

To assign an offer to a particular marketing campaign, go to Lists > Marketing > Marketing Campaigns. Open the campaign record in edit mode and select the offer from the Offer list in the Related Information section.

Example 1. Using Campaign Offers to Track Multiple Campaign Revenues

Wolfe Electronics run several marketing campaigns throughout the year that qualify for financial support from the manufacturers they promote. Wolfe uses campaign offers to track the results of these campaigns so they can claim a rebate from the manufacturer. They create a transaction saved search that groups together campaign revenues that are associated with a particular campaign offer.

To create a grouped campaign offer transaction search:

1. Go to Reports > New Search > Transaction.
2. Click the **Results** subtab.
3. From the **Field** list, select **Lead Source Fields...**
4. From the **Lead Source Field** list, select **Offer**.
5. In the **Summary Type** column, select **Group**, and click **Add**.
6. In the **Summary Type** column, select **Amount (Gross)** and summary type, **Sum**. Click **Add**.
These selections give you a consolidated revenue for each campaign offer.
7. Click the **Create Saved Search** button.
8. Enter **Campaign Offer Consolidated Revenue** in the **Search Title** field.
9. Click **Preview** to test the results of your newly created search.
10. Click **Return to Criteria**.
11. Set any search visibility options, for example **Public**.
12. Click **Save**.

The newly created search generates a report similar to the following:

Campaign Offer Consolidated Revenue: Results
