2025.2

December 17, 2025

Copyright © 2005, 2025, Oracle and/or its affiliates.

This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish, or display any part, in any form, or by any means. Reverse engineering, disassembly, or decompilation of this software, unless required by law for interoperability, is prohibited.

The information contained herein is subject to change without notice and is not warranted to be error-free. If you find any errors, please report them to us in writing.

If this is software, software documentation, data (as defined in the Federal Acquisition Regulation), or related documentation that is delivered to the U.S. Government or anyone licensing it on behalf of the U.S. Government, then the following notice is applicable:

U.S. GOVERNMENT END USERS: Oracle programs (including any operating system, integrated software, any programs embedded, installed, or activated on delivered hardware, and modifications of such programs) and Oracle computer documentation or other Oracle data delivered to or accessed by U.S. Government end users are "commercial computer software," "commercial computer software documentation," or "limited rights data" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, the use, reproduction, duplication, release, display, disclosure, modification, preparation of derivative works, and/or adaptation of i) Oracle programs (including any operating system, integrated software, any programs embedded, installed, or activated on delivered hardware, and modifications of such programs), ii) Oracle computer documentation and/or iii) other Oracle data, is subject to the rights and limitations specified in the license contained in the applicable contract. The terms governing the U.S. Government's use of Oracle cloud services are defined by the applicable contract for such services. No other rights are granted to the U.S. Government.

This software or hardware is developed for general use in a variety of information management applications. It is not developed or intended for use in any inherently dangerous applications, including applications that may create a risk of personal injury. If you use this software or hardware in dangerous applications, then you shall be responsible to take all appropriate fail-safe, backup, redundancy, and other measures to ensure its safe use. Oracle Corporation and its affiliates disclaim any liability for any damages caused by use of this software or hardware in dangerous applications.

Oracle®, Java, and MySQL are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Intel and Intel Inside are trademarks or registered trademarks of Intel Corporation. All SPARC trademarks are used under license and are trademarks or registered trademarks of SPARC International, Inc. AMD, Epyc, and the AMD logo are trademarks or registered trademarks of Advanced Micro Devices. UNIX is a registered trademark of The Open Group.

This software or hardware and documentation may provide access to or information about content, products, and services from third parties. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to third-party content, products, and services unless otherwise set forth in an applicable agreement between you and Oracle. Oracle Corporation and its affiliates will not be responsible for any loss, costs, or damages incurred due to your access to or use of third-party content, products, or services, except as set forth in an applicable agreement between you and Oracle.

If this document is in public or private pre-General Availability status:

This documentation is in pre-General Availability status and is intended for demonstration and preliminary use only. It may not be specific to the hardware on which you are using the software. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to this documentation and will not be responsible for any loss, costs, or damages incurred due to the use of this documentation.

If this document is in private pre-General Availability status:

The information contained in this document is for informational sharing purposes only and should be considered in your capacity as a customer advisory board member or pursuant to your pre-General Availability trial agreement only. It is not a commitment to deliver any material, code, or functionality, and should not be relied upon in making purchasing decisions. The development, release, timing, and pricing of any features or functionality described in this document may change and remains at the sole discretion of Oracle.

This document in any form, software or printed matter, contains proprietary information that is the exclusive property of Oracle. Your access to and use of this confidential material is subject to the terms and conditions of your Oracle Master Agreement, Oracle License and Services Agreement, Oracle PartnerNetwork Agreement, Oracle distribution agreement, or other license agreement which has been executed by you and Oracle and with which you agree to comply. This document and information contained herein may not be disclosed, copied, reproduced, or distributed to anyone outside Oracle without prior written consent of Oracle. This document is not part of your license agreement nor can it be incorporated into any contractual agreement with Oracle or its subsidiaries or affiliates.

Documentation Accessibility

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at <https://www.oracle.com/corporate/accessibility>.

Access to Oracle Support

Oracle customers that have purchased support have access to electronic support through My Oracle Support. For information, visit <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info> or visit <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs> if you are hearing impaired.

Sample Code

Oracle may provide sample code in SuiteAnswers, the Help Center, User Guides, or elsewhere through help links. All such sample code is provided "as is" and "as available", for use only with an authorized NetSuite Service account, and is made available as a SuiteCloud Technology subject to the SuiteCloud Terms of Service at www.netsuite.com/tos.

Oracle may modify or remove sample code at any time without notice.

No Excessive Use of the Service

As the Service is a multi-tenant service offering on shared databases, Customer may not use the Service in excess of limits or thresholds that Oracle considers commercially reasonable for the Service. If Oracle reasonably concludes that a Customer's use is excessive and/or will cause immediate or ongoing performance issues for one or more of Oracle's other customers, Oracle may slow down or throttle Customer's excess use until such time that Customer's use stays within reasonable limits. If Customer's particular usage pattern requires a higher limit or threshold, then the Customer should procure a subscription to the Service that accommodates a higher limit and/or threshold that more effectively aligns with the Customer's actual usage pattern.

Beta Features

This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish, or display any part, in any form, or by any means. Reverse engineering, disassembly, or decompilation of this software, unless required by law for interoperability, is prohibited.

The information contained herein is subject to change without notice and is not warranted to be error-free. If you find any errors, please report them to us in writing.

If this is software or related documentation that is delivered to the U.S. Government or anyone licensing it on behalf of the U.S. Government, then the following notice is applicable:

U.S. GOVERNMENT END USERS: Oracle programs (including any operating system, integrated software, any programs embedded, installed or activated on delivered hardware, and modifications of such programs) and Oracle computer documentation or other Oracle data delivered to or accessed by U.S. Government end users are "commercial computer software" or "commercial computer software documentation" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, the use, reproduction, duplication, release, display, disclosure, modification, preparation of derivative works, and/or adaptation of i) Oracle programs (including any operating system, integrated software, any programs embedded, installed or activated on delivered hardware, and modifications of such programs), ii) Oracle computer documentation and/or iii) other Oracle data, is subject to the rights and limitations specified in the license contained in the applicable contract. The terms governing the U.S. Government's use of Oracle cloud services are defined by the applicable contract for such services. No other rights are granted to the U.S. Government.

This software or hardware is developed for general use in a variety of information management applications. It is not developed or intended for use in any inherently dangerous applications, including applications that may create a risk of personal injury. If you use this software or hardware in dangerous applications, then you shall be responsible to take all appropriate fail-safe, backup, redundancy, and other measures to ensure its safe use. Oracle Corporation and its affiliates disclaim any liability for any damages caused by use of this software or hardware in dangerous applications.

Current Release

2025.2 Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount

Welcome to the 2025.2 release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced (SCA)!

Important: Features and enhancements in this release have dependencies on NetSuite 2025.2. You must implement this release in a **2025.2** NetSuite account.

The 2025.2 release incorporates periodic updates to the application. Refer to the following release notes for updates included in the major release and any subsequent minor releases. How you use these release notes depends on your web store:

- **SuiteCommerce** and **SuiteCommerce MyAccount** – These changes automatically apply to your SuiteCommerce account according to a scheduled update. Use these release notes as an informative guide to understand the changes applied to your account.
- **SuiteCommerce Advanced** – These changes don't automatically apply to your SCA account. To update your site, you must manually migrate your website to the latest SCA release. Use these release notes to determine if migration is necessary for your SCA implementation. This update doesn't alter the existing bundle ID. If you determine an update is necessary, see the help topic [Migrate SuiteCommerce Advanced](#) for instructions.

Note: For more information about updates to this release, see the help topic [Patches and Upgrades](#).

The following SuiteApps are available:

SuiteApp	Bundle ID
SuiteCommerce (Includes SuiteCommerce MyAccount)	572927
SuiteCommerce Advanced 2025.2.10	572916

Other important bundles include:

SuiteApp	Bundle ID
SuiteCommerce Configuration	381166

SuiteApp	Bundle ID
SuiteCommerce Extension Management	521562
SuiteCommerce Base Theme	572857
SuiteCommerce Google Tag Manager Editor	250341
Reference Product Lists Records	53051

Explore the following release notes:

- [2025.2.0 Release SC/SCA/SCMA](#)
- [2025.2.x Minor Releases](#)
- [Other Related Release Notes](#)

2025.2.0 Release SC/SCA/SCMA

Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount

The 2025.2.0 major release includes the following features and enhancements:

- [SuiteCommerce CAPTCHA](#)
- [SuiteCommerce Email Domain Blocklist](#)
- [SuiteCommerce Email Verification](#)
- [Improved Security for Public Display of Pricing](#)
- [Changes to Default Value for SCIS Integration Configuration Setting](#)
- [Configuration Properties Updates](#)
- [Node.js Requirement](#)
- [Third-Party Library Updates](#)
- [Issue Fixes](#)

These enhancements typically apply to SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced; however, some features could apply to a subset of each. The following enhancements explain the implementations to which they apply.

SuiteCommerce CAPTCHA

Applies to: SuiteCommerce, SuiteCommerce Advanced, SuiteCommerce MyAccount

With the 2025.2 release, support for hCaptcha and Google reCAPTCHA is available to help protect your web store from automated abuse and fraudulent activity. CAPTCHA programs are a challenge-response test designed to determine whether the user is a human or a bot.

With SuiteCommerce CAPTCHA, you can add third-party CAPTCHA services to key customer interactions, such as registration, login, and checkout. CAPTCHA services help to block bots, prevent fake accounts, and protect your store's reputation without disrupting the shopping experience for genuine customers.

You can select where CAPTCHA challenges appear on your website in the SuiteCommerce Configuration record.

For more information, see the help topic [SuiteCommerce CAPTCHA](#).

SuiteCommerce Email Domain Blocklist

Applies to: SuiteCommerce, SuiteCommerce Advanced, SuiteCommerce MyAccount

With the 2025.2 release, SuiteCommerce Email Domain Blocklist is available to help protect your web store from registrations from untrusted email providers. This feature blocks user registrations using email addresses from predefined and custom blocklisted domains, reducing spam and enhancing account security.

With SuiteCommerce Email Domain Blocklist, you can block unwanted or disposable email domains during the registration process, helping ensure only genuine users access your web store. You can manage your custom blocklist in the SuiteCommerce Configuration record.

For more information, see the help topic [SuiteCommerce Email Domains Blocklist](#).

SuiteCommerce Email Verification

Applies to: SuiteCommerce, SuiteCommerce Advanced, SuiteCommerce MyAccount

With the 2025.2 release, email verification is available as an extra layer of security for your Commerce web store. With SuiteCommerce Email Verification, you can require visitors to your website to confirm their email before they create an account or make a purchase. This feature helps prevent fraudulent sign-ups, ensures valid communication, and enhances account security.

You can perform the following actions in the SuiteCommerce Configuration record:

- Enable or disable SuiteCommerce Email Verification
- Select the employee who appears as the sender of the verification email
- Select the email template for verification messages
- Set how many seconds the verification code stays valid before it expires
- Set the minimum number of seconds allowed between verification code requests

For more information, see the help topic [SuiteCommerce Email Verification](#).

Improved Security for Public Display of Pricing

Applies to: SuiteCommerce, SuiteCommerce Advanced

With the 2025.2 release, an issue has been fixed where quantity pricing information appeared in search engine results for some SuiteCommerce web stores, even if the **Require Login for Pricing** setting was enabled on the Website Setup record. With this fix, pricing details are no longer accessible or shown to shoppers who aren't logged in when viewing search engine results.

Changes to Default Value for SCIS Integration Configuration Setting

With the 2025.2 release, the **Is SCIS integration enabled** setting on the SuiteCommerce Configuration record is disabled by default.

The SuiteCommerce Configuration bundle previously enabled the **Is SCIS integration enabled** setting by default, even when SuiteCommerce InStore (SCIS) was not installed. In some cases, this caused search errors and unnecessary logging.

New domains created after installing or upgrading to SuiteCommerce or SuiteCommerce Advanced (SCA) 2025.2 will no longer encounter search errors. If you use an earlier version of SCA and do not use SCIS, follow these steps:

1. Go to Commerce > Websites > Configuration.
2. Select your website and domain and click **Configure**.

3. Go to the **My Account** tab and the **SCIS Integration** subtab.
4. Clear the **Is SCIS integration enabled** box.
5. Click **Save**.

Configuration Properties Updates

Applies to: SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

The following SuiteCommerce configuration properties have been added with the 2025.2.0 release. Refer to the appropriate section for more information.

Property Label (SuiteCommerce Configuration Record)	Property ID	More Information	Property Location (SuiteCommerce Configuration Record Tab > Subtab)
Enable Email Verification	emailVerification.enabled	Email Verification Subtab	Advanced > Email Verification
Sender Employee	emailVerification.senderId	Email Verification Subtab	Advanced > Email Verification
Email Template	emailVerification.templateId	Email Verification Subtab	Advanced > Email Verification
Verification Code TTL (In Seconds)	emailVerification.codeTTL	Email Verification Subtab	Advanced > Email Verification
Code Request Interval (In Seconds)	emailVerification.codeRequestInterval	Email Verification Subtab	Advanced > Email Verification
Enable for Registration	captcha.enableRegister	Captcha Subtab	Integrations > CAPTCHA Settings
Enable for Login	captcha.enableLogin	Captcha Subtab	Integrations > CAPTCHA Settings
Enable for Guest Checkout	captcha.enableGuestCheckout	Captcha Subtab	Integrations > CAPTCHA Settings
Enable for Place Order	captcha.enablePlaceOrder	Captcha Subtab	Integrations > CAPTCHA Settings
CAPTCHA Provider	captcha.type	Captcha Subtab	Integrations > CAPTCHA Settings
Site Key	captcha.siteKey	Captcha Subtab	Integrations > CAPTCHA Settings
Secret Key	captcha.secretKey	Captcha Subtab	Integrations > CAPTCHA Settings
Enable Email Domains Blocklist	blockListEmailDomains.enableEmailBlockList	Blocklist Email Domains Subtab	Advanced > Blocklist Email Domains
Blocklisted Email Domain	blockListEmailDomains.domainList	Blocklist Email Domains Subtab	Advanced > Blocklist Email Domains

Node.js Requirement

Applies to: SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

With the 2025.2.0 release, the developer tools continue to support Node.js version **20.10.0**. To use the Theme, Extension, or core SCA 2025.2 developer tools, you must use this Node.js version.

For more information, see the help topic [Install Node.js](#).

Third-Party Library Updates

Applies to: SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

The following third-party library has been updated with the 2025.2.0 release. Library version information is also shown in the `distro.json` file. Ensure that any themes and extensions using libraries are compatible with the update and make appropriate changes. If you are migrating SCA to this release, ensure that no deprecated method exists in your implementation before migrating.

Library	Old Version	New Version
jquery-bxslider	4.2.15*	4.2.17*

Issue Fixes

Applies to: SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

The 2025.2.0 release includes all minor release fixes, improvements, and security updates of the previous release. See [2025.1.x Minor Releases](#) for details.

2025.2.x Minor Releases

Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount

Refer to the following minor release notes for the latest updates to SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced:

- [2025.2.10 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced](#)

2025.2.10 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

Enhancements

CAPTCHA Secret Key Moved from SuiteCommerce Configuration Record to API Secret Manager

Applies to: SuiteCommerce, SuiteCommerce Advanced, SuiteCommerce MyAccount

With the 2025.2.10 release, CAPTCHA secret keys are stored in the API Secrets area of NetSuite. Starting 2025.2.10, you must enter the secret key in API Secrets and only its ID in the SuiteCommerce Configuration record.

This change enhances security by removing plaintext secrets from configuration and enabling stricter access control. At runtime, NetSuite retrieves the secret key using its ID, and CAPTCHA verification continues.

To create a CAPTCHA secret key, go to Setup > Company > API Secrets and follow the instructions provided in [Creating Secrets](#). Then, enter the secret key's ID in the SuiteCommerce Configuration record by following the instructions provided in [How to Enable and Configure SuiteCommerce CAPTCHA](#).

Other Related Release Notes

Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount

For release notes on other Commerce offerings associated with this release, see:

- [Commerce Themes Release Notes](#)
- [Commerce Extensions Release Notes](#)
- [Commerce Website Setup](#)
- [SuiteCommerce InStore](#)

Commerce Themes Release Notes

Commerce themes enable you to change the layout and style of your web store. The following release notes describe new or enhanced Commerce themes developed and supported by NetSuite.

Important: Commerce themes are only available if they are **provisioned and set up in your account**. Some Commerce themes may be dependent on the **latest release of NetSuite**. Check that your account has been upgraded to the latest release. For more information, see the help topic [Commerce Themes](#).

Bundle ID	SuiteApp	Documentation	Version
312825	SC Horizon Theme	Horizon V4 Theme	4.0.0
312849	SC Posh Theme	Posh V4 Theme	4.0.0
312859	SC Threads Theme	Threads V4 Theme	4.0.0

Horizon V4 Theme

Horizon V4 is an upgraded version of the Horizon custom theme that continues to provide a framework for your outdoor supply web store, while also taking advantage of the latest SC Base Theme releases. This means that Horizon V4 can receive future updates, including fixes, enhancements, and new features, released through the SC Base Theme just by reactivating Horizon V4 in the Extension Manager.

To activate Horizon V4, go to the Extension Manager (Commerce > Extensions > Extension Manager), check the box for the Horizon V4 theme, and click **Activate**.

Note that if you have made customizations to your existing Horizon (or other) theme, these changes will not be carried over to Horizon V4.

For more information, see the help topic [Horizon Theme](#).

Posh V4 Theme

Posh V4 is an upgraded version of the Posh custom theme that continues to provide a framework for your health and beauty web store, while also taking advantage of the latest SC Base Theme releases. This means that Posh V4 can receive future updates, including fixes, enhancements, and new features, released through the SC Base Theme just by reactivating Posh V4 in the Extension Manager.

To activate Posh V4, go to the Extension Manager (Commerce > Extensions > Extension Manager), check the box for the Posh V4 theme, and click **Activate**.

Note that if you have made customizations to your existing Posh (or other) theme, these changes will not be carried over to Posh V4.

For more information, see the help topic [Posh Theme](#).

Threads V4 Theme

Threads V4 is an upgraded version of the Threads custom theme that continues to provide a framework for your apparel web store, while also taking advantage of the latest SC Base Theme releases. This means that Threads V4 can receive future updates, including fixes, enhancements, and new features, released through the SC Base Theme just by reactivating Threads V4 in the Extension Manager.

To activate Threads V4, go to the Extension Manager (Commerce > Extensions > Extension Manager), check the box for the Threads V4 theme, and click **Activate**.

Note that if you have made customizations to your existing Threads (or other) theme, these changes will not be carried over to Threads V4.

For more information, see the help topic [Threads Theme](#).

January 22, 2025

The following SuiteCommerce Theme SuiteApps have been released:

Bundle ID	SuiteApp	Documentation	Version
312817	SC Manor Theme	Manor V4 Theme	4.0.0
312830	SC Summit Theme	Summit V4 Theme	4.0.0

Manor V4 Theme

Manor V4 is an upgraded version of the Manor custom theme that continues to provide a framework for your interior design-focused web store, while also taking advantage of the latest SC Base Theme releases. This means that Manor V4 can receive future updates, including fixes, enhancements, and new features, released through the SC Base Theme just by reactivating Manor V4 in the Extension Manager.

To activate Manor V4, go to the Extension Manager (Commerce > Extensions > Extension Manager), check the box for the Manor V4 theme, and click **Activate**.

Note that if you have made customizations to your existing Manor (or other) theme, these changes will not be carried over to Manor V4.

For more information, see the help topic [Manor Theme](#).

Summit V4 Theme

Summit V4 is an upgraded version of the Summit custom theme that continues to provide a framework for your industry supply web store, while also taking advantage of the latest SC Base Theme releases. This means that Summit V4 can receive future updates, including fixes, enhancements, and new features, released through the SC Base Theme just by reactivating Summit V4 in the Extension Manager.

To activate Summit V4, go to the Extension Manager (Commerce > Extensions > Extension Manager), check the box for the Summit V4 theme, and click **Activate**.

Note that if you have made customizations to your existing Summit (or other) theme, these changes will not be carried over to Summit V4.

For more information, see the help topic [Summit Theme](#).

March 19, 2024

Bundle ID	SuiteApp	Documentation	Version
312849	SC Posh Theme	Posh Theme	3.5.1

Posh Theme

Version 3.5.1 of the Posh theme includes minor fixes regarding shopping cart behavior.

For more information, see the help topic [Posh Theme](#).

March 5, 2024

The following SuiteCommerce Theme SuiteApps have been released:

Bundle ID	SuiteApp	Documentation	Version
312814	SC Bridge Theme	Bridge Theme	3.1.1

312825	SC Horizon Theme	Horizon Theme	3.2.1

September 8, 2020

The following SuiteCommerce Theme SuiteApps have been released:

Bundle ID	SuiteApp	Documentation	Version
312849	SC Posh Theme	Posh Theme	3.0.2
312830	SC Summit Theme	Summit Theme	3.0.3

Posh Theme

The Posh Theme has been updated to include minor fixes and performance improvements. For more information, see the help topic [Posh Theme](#).

Summit Theme

The Summit Theme has been updated to include minor fixes and performance improvements. For more information, see the help topic [Summit Theme](#).

August 4, 2020

The following SuiteCommerce Theme SuiteApps have been released:

Bundle ID	SuiteApp	Documentation	Version
312814	SC Bridge Theme	Bridge Theme	3.0.1
312825	SC Horizon Theme	Horizon Theme	3.0.2

Bridge Theme

Note: The Bridge Theme requires SuiteCommerce or the Aconcagua release of SuiteCommerce Advanced or later.

The Bridge Theme is a custom theme that balances clean white space with edgy graphics to create a tech-oriented web store. You can use high-quality, dark images overlaid with clean, white text to highlight the different areas of your site. For more information, see the help topic [Bridge Theme](#).

When you activate the Bridge Theme, you must also activate the companion Bridge Theme extension that comes with the SuiteApp. For details, see the help topic [Activating Themes and Extensions](#).

Horizon Theme

The Horizon Theme has been updated to include minor fixes and performance improvements. For more information, see the help topic [Horizon Theme](#).

July 15, 2020

The following SuiteCommerce Theme SuiteApps have been released:

Bundle ID	SuiteApp	Documentation	Version
312830	SC Summit Theme	Summit Theme	3.0.2
312859	SC Threads Theme	Threads Theme	3.0.1

Summit Theme

Version 3.0.2 of the Summit Theme has been released. This version includes the following enhancements:

- The JSON-LD Structured Data Format feature is now available. For details, see the help topic [Structured Data Markup](#)
- Newsletter sign up is now available on the Configuration record, under the Footer settings subtab. For details, see the help topic [Configuring the Footer](#).

For more information, see the help topic [Summit Theme](#).

Threads Theme

Note: The Threads Theme requires SuiteCommerce or the Aconcagua release of SuiteCommerce Advanced or later.

The Threads Theme is a custom theme that allows your apparel web store to showcase products with a fresh, structured layout. You can create a seamless user experience while displaying photographs on a clean white background. For more information, see the help topic [Threads Theme](#).

When you activate the Threads Theme, you must also activate the companion Threads Theme extension that comes with the SuiteApp. For details, see the help topic [Activating Themes and Extensions](#).

July 1, 2020

The following SuiteCommerce Theme SuiteApp has been released:

Bundle ID	SuiteApp	Documentation	Version
312817	SC Manor Theme	Manor Theme	3.0.1

Manor Theme

Note: The Manor Theme requires SuiteCommerce or the Aconcagua release of SuiteCommerce Advanced or later.

The Manor Theme is a custom theme that allows you to create a product-focused furniture web store, utilizing blocks of images on a clean, white background. You can display suggested looks for rooms and

highlight different furniture types to create an effortless shopping experience. For more information, see the help topic [Manor Theme](#).

When you activate the Manor Theme, you must also activate the companion Manor Theme extension that comes with the SuiteApp. For details, see the help topic [Activating Themes and Extensions](#).

June 19, 2020

The following SuiteCommerce Theme SuiteApp has been released:

Bundle ID	SuiteApp	Documentation	Version
312849	SC Posh Theme	Posh Theme	3.0.1

Posh Theme

Note: The Posh Theme requires SuiteCommerce or the Aconcagua release of SuiteCommerce Advanced or later.

The Posh Theme is a custom theme that uses an elegant layout of images and text to showcase your health and beauty web store's assorted products. You can utilize the refined, understated color palette alongside bold images to create a high-end landing page that entices shoppers. For more information, see the help topic [Posh Theme](#).

When you activate the Posh Theme, you must also activate the companion Posh Theme extension that comes with the SuiteApp. For details, see the help topic [Activating Themes and Extensions](#).

June 5, 2020

The following SuiteCommerce Theme SuiteApp has been released:

Bundle ID	SuiteApp	Documentation	Version
312825	SC Horizon Theme	Horizon Theme	3.0.1

Horizon Theme

Note: The Horizon Theme requires SuiteCommerce or the Aconcagua release of SuiteCommerce Advanced or later.

The Horizon Theme is a custom theme that allows your outdoors web store to showcase your products with a striking black background and prominent images. You can grab the user's attention with eye-catching photographs and bold lettering. For more information, see the help topic [Horizon Theme](#).

When you activate the Horizon Theme, you must also activate the companion Horizon Theme extension that comes with the SuiteApp. For details, see the help topic [Activating Themes and Extensions](#).

May 22, 2020

The following SuiteCommerce Theme SuiteApp has been released:

Bundle ID	SuiteApp	Documentation	Version
-----------	----------	---------------	---------

312830	SC Summit Theme	Summit Theme	3.0.1
--------	-----------------	------------------------------	-------

Summit Theme

 **Note:** The Summit Theme requires SuiteCommerce or the Aconcagua release of SuiteCommerce Advanced or later.

The Summit Theme is a custom theme that allows your industry supply web store to showcase products on a sleek, simple background. You can create a seamless user experience while displaying clear headings, professional images, and explanatory texts. For more information, see the help topic [Summit Theme](#).

When you activate the Summit Theme, you must also activate the companion Summit Theme extension that comes with the SuiteApp. For details, see the help topic [Activating Themes and Extensions](#).

Commerce Extensions Release Notes

Commerce extensions provide additional functionalities to your Commerce web store. The following release notes describe new or enhanced Commerce extensions developed and supported by NetSuite.

 **Important:** Commerce extensions are only available if they are **provisioned and set up in your account**. Some extensions may dependent on the latest release of NetSuite. For more information, see the help topic [Commerce Extensions](#).

October 6, 2021

Bundle ID	SuiteApp	Documentation	Version
402703	SC Cookie Consent	Cookie Consent	1.0.0

Cookie Consent

The Cookie Consent extension lets you set up a banner and menu that shoppers can utilize to accept or reject cookies on a web store site.

It gives shoppers the ability to give informed consent to the collection of data that might include personally identifiable information (PII). The extension provides areas for you to enter information about the cookies used, identify whether some cookies are strictly necessary for functioning of the site, and

include links that direct shoppers to a web store's unique privacy policy page. For more information, see the help topic [Configure the SC Cookie Consent Extension](#).

The extension is required if the SuiteCommerce Analytics Data feature is enabled. It is also available for other SuiteCommerce web store setups. For more information, see the help topic [SuiteCommerce Analytics Data Overview](#).

250341	SC Google Tag Manager Editor	Google Tag Manager Editor	1.3.1
251769	SC Infinite Scroll	Infinite Scroll	1.1.2
251558	SC Product Comparison	Product Comparison	1.1.0

Google Tag Manager Editor

The Google Tag Manager Editor extension has been updated to include the following improvements:

- You can use the **Restore Defaults** feature to:
 - Update default variable values.
 - Add missing default variables.
 - Add missing default triggers.
 - Update valid service tag values.
 - Updates have been made to the ZenDesk service tag. If you are currently using the ZenDesk service, you must perform one of the following options using the Google Tag Manager Editor:
 - Use the **Restore Defaults** feature to update the ZenDesk service tag.
 - Remove the ZenDesk service. Then, add the ZenDesk service back to your container.

For more information on restoring, removing, and adding supported services, see the help topic [Modify Google Tag Manager Services](#).
 - Updates have been made to the Google Analytics service tag. If you are currently using the Google Analytics service, the service will be considered invalid when you update the extension. To continue using Google Analytics, you must remove the Google Analytics service, then add it back to your container.
- For more information on removing and adding supported services, see the help topic [Modify Google Tag Manager Services](#).
- For default variables, if no currency is set, the currency defaults to US dollars.

For more information on Google Tag Manager Editor, see the help topic [Google Tag Manager](#).

Infinite Scroll

The Infinite Scroll extension has been updated to include minor fixes and performance improvements.

For more information, see the help topic [Infinite Scroll](#).

Product Comparison

The Product Comparison extension has been updated to include minor fixes and performance improvements.

250891	SC Stock Notifications	Stock Notifications	1.1.3

Stock Notifications

The Stock Notifications extension has been updated to include minor fixes and performance improvements involving the item image that appears in the stock notifications email.

For more information, see the help topic [Stock Notifications](#).

July 21, 2020

Bundle ID	SuiteApp	Documentation	Version
249263	SC Columns	Columns	1.0.3
247488	SC Custom Fields	Custom Fields	1.1.3
243341	SC Gift Certificate Management	Gift Certificate Management	1.2.3

Columns

The Columns extension has been updated to include the **Image Size ID** field. This field gives you more control over image resizing and can be accessed through Site Management Tools.

For more information, see the help topic [Columns](#).

Custom Fields

The Custom Fields extension has been updated to include the following improvements:

- You can add custom fields to the **matrixchilditems** field set to display the fields on the Product Detail Pages (PDP) of matrix subitems.
- The **Label and Field ID** field now supports the use of basic HTML formatting tags.
- The extension can now implement JSON-LD structured data markup in conjunction with the **Schema.org Property** field for custom fields for the PDP. SuiteCommerce Advanced customers must be implementing the 2020.1 release or later to take advantage of this feature. For more information, see the help topic [Structured Data Markup](#).

For more information, see the help topic [Create Custom Fields Using an Extension](#).

Gift Certificate Management

The Gift Certificate Management extension has been updated to include minor fixes and performance improvements.

In addition, the Gift Certificate Management topic now includes help videos on how to do each of the following:

- [Group Gift Certificates in Your Web Store](#)
- [Add Gift Certificate Value Check](#)
- [Display Gift Certificates in My Account](#)

For more information, see the help topic [Gift Certificate Management](#).

Map & Contact

The Map & Contact extension has been updated to include changes to the script deployment. If you are using a custom deployment for this extension, you need to contact Technical Support to make the required changes.

For more information, see the help topic [Map & Contact](#).

September 10, 2019

Bundle ID	SuiteApp	Documentation	Version
251246	SC Item Badges	Item Badges	1.1.2
249788	SC Map & Contact	Map & Contact	1.1.1

Item Badges

The SuiteCommerce Item Badges extension has been updated to include fixes involving search engine optimization.

For more information, see the help topic [Item Badges](#).

Map & Contact

The SuiteCommerce Map & Contact extension has been updated to fix an error that occurs when saving a contact form.

For more information, see the help topic [Map & Contact](#).

August 27, 2019

Bundle ID	SuiteApp	Documentation	Version
250407	SC Product Feeds	Product Feeds	1.02.8

Product Feeds

The SuiteCommerce Product Feeds extension has been updated to include the following improvements:

- The currency can be changed for Facebook product feeds.
- Feed generation failure results in the previous, successful feed being retained.

In addition, a list of required features for product feeds has been added to the topic.

For more information, see the help topic [Product Feeds](#).

August 20, 2019

Bundle ID	SuiteApp	Documentation	Version
251769	SC Infinite Scroll	Infinite Scroll	1.0.2
251783	SC Inventory Display	Inventory Display	1.1.0

Infinite Scroll

The SuiteCommerce Infinite Scroll extension has been updated to include minor improvements. Update to the newest version to take advantage of display enhancements.

For more information, see the help topic [Infinite Scroll](#).

Inventory Display

The SuiteCommerce Inventory Display extension has been updated to include the following improvements:

- Font, color, and icon options in the Theme Customizer.
- Configuration at the item level, in addition to the existing site-wide configuration.
- Specialized behavior for items that are low on inventory.

For more information, see the help topic [Inventory Display](#).

August 13, 2019

Bundle ID	SuiteApp	Documentation	Version
247488	SC Custom Fields	Custom Fields	1.1.1

Custom Fields

The SuiteCommerce Custom Fields extension has been updated to make critical improvements to version 1.1.0. Update to the newest version to take advantage of custom product detail page fields and search engine optimization.

For more information, see the help topic [Create Custom Fields Using an Extension](#).

August 6, 2019

Bundle ID	SuiteApp	Documentation	Version
243341	SC Gift Certificate Management	Gift Certificate Management	1.1.0
251558	SC Product Comparison	Product Comparison	1.0.2

Gift Certificate Management

The SuiteCommerce Gift Certificate Management extension has been updated to let you group existing gift certificates to display them as item options on your site. You can also set up gift certificate storage on the My Account page and include a gift certificate value check feature for users on your site.

For more information, see the help topic [Gift Certificate Management](#).

Product Comparison

The SuiteCommerce Product Comparison extension has been updated to include the following improvements:

- Optional placeholder to automatically include the number of selected items on the **Compare Button – Product Listing Page** on your site.
- Additional color and font options in the Theme Customizer.

For more information, see the help topic [Product Comparison](#).

July 9, 2019

Bundle ID	SuiteApp	Documentation	Version
247488	SC Custom Fields	Custom Fields	1.01.0

Custom Fields

The SuiteCommerce Custom Fields extension has been updated to let you display additional item fields from NetSuite on the Product Detail Pages of your web store. These improvements allow you to share more information with users, such as the UPC Code, Manufacturer, and Item Weight. You can still use this extension to add custom fields to the checkout application of your site as well.

For more information, see the help topic [Create Custom Fields Using an Extension](#).

June 18, 2019

Bundle ID	SuiteApp	Documentation	Version
251246	SC Item Badges	Item Badges	1.1.1
249422	SC Photo Gallery	Photo Gallery	1.1.0
249983	SC Shipping Bar	Shipping Bar	1.1.0

Item Badges

The SuiteCommerce Item Badges extension has been updated to include the following new field and record names:

- The previously named Item Badges record is now named Item Badges and Shapes record.
- The previously named **Badges** field, found in the **Item Badges** subtab of the Item record, is now named the **Badges to Display** field and located in the **Item Badges and Shapes** subtab.

Note: The **Badges (Legacy)** field on the Item record and the Item Badges (Legacy) record are included in this version for backwards compatibility.

For more information, see the help topic [Item Badges](#).

Photo Gallery

The SuiteCommerce Photo Gallery extension has been updated to include the following improvements:

- Color and font options in the Theme Customizer.
- Animation effects when hovering over an image.
- Description field to add more information about each photo.

For more information, see the help topic [Photo Gallery](#).

Shipping Bar

The SuiteCommerce Shipping Bar extension has been updated to include the following improvements:

- Color and font options in the Theme Customizer.
- Multi-currency support.
- URL fields to link from the shipping bar to related pages.

For more information, see the help topic [Shipping Bar](#).

May 21, 2019

Bundle ID	SuiteApp	Documentation	Version
250732	SC Featured Category	Featured Category	1.1.0

Featured Category

The SuiteCommerce Featured Category extension has been updated to replace the **Number of Rows** configuration field with the **Number of Items** and **Number of Columns** fields. This change offers you more control over your customers' experience and over the number of products you want to display. This version also includes general design and performance improvements to help you further customize the featured category to fit your needs.

For more information, see the help topic [Featured Category](#).

May 7, 2019

Bundle ID	SuiteApp	Documentation	Version
249425	SC McAfee Secure	McAfee Secure	1.0.1

McAfee Secure

The SuiteCommerce McAfee Secure extension has been updated to allow you to display the McAfee SECURE trustmark on your site. After signing up for a McAfee SECURE plan, you can display the trustmark to show visitors that your online store is tested and certified to be safe.

For more information, see the help topic [McAfee Secure](#).

April 23, 2019

Bundle ID	SuiteApp	Documentation	Version
251806	SC Grid Order	Grid Order	1.0.1
251769	SC Infinite Scroll	Infinite Scroll	1.0.1
251246	SC Item Badges	Item Badges	1.1.0

Grid Order

SuiteCommerce Grid Order lets users buy multiple variations of a product more easily by displaying purchasing options in a grid on the product details page. Users can quickly add quantities for multiple buying options in an easy-to-use table.

For more information, see the help topic [Grid Order](#).

Infinite Scroll

SuiteCommerce Infinite Scroll loads content continuously as users scroll down the page, eliminating the need for pagination. This feature encourages users to view more items, while letting you choose whether users need to click a button to show more content or continue to scroll as new products are automatically loaded on to the page.

For more information, see the help topic [Infinite Scroll](#).

Item Badges

The SuiteCommerce Item Badges extension has been updated to include the following improvements:

- A shortcut to accessing the Item Badges record in NetSuite.
- A configuration setting to employ consistent badge placement on product images across your site.
- Mass Update options to update badges for a category of items at the same time.

For more information, see the help topic [Item Badges](#).

April 9, 2019

Bundle ID	SuiteApp	Documentation	Version
251246	SC Item Badges	Item Badges	1.0.2
251572	SC Look Book	Look Book	1.0.1

Item Badges

The SuiteCommerce Item Badges extension has been updated to allow backwards compatibility with Item Badges version 1.0.0. To use the most recent version of Item Badges that corresponds to the documentation in the Help Center, you must activate the latest update. See the help topic [Updating Themes and Extensions](#) for assistance.

This update includes records from the previous and latest versions. When choosing a badge on the Item Configuration record, you must do one of the following:

- Customers implementing version 1.0.0 can find the **Badges** field in the **Custom** subtab.
- Customers implementing a later version can find the **Badges** field in the **SuiteCommerce Extensions** subtab.

Note: The **Badges** field could be labeled **Badges (2)**, depending on which version you are implementing.

For more information, see the help topic [Item Badges](#).

Look Book

SuiteCommerce Look Book allows you to create a visual portfolio on your site by displaying a slider of Looks that are each linked to a collection of Look Items. Look Book lets you showcase new items, engage customers through images to convey a theme, highlight corresponding items within a collection, and drive additional sales. Additionally, users can see a **Looks Good With** section on the product detail page that links to other Look Items in a Look.

For more information, see the help topic [Look Book](#).

March 26, 2019

Bundle ID	SuiteApp	Documentation	Version
251558	SC Product Comparison	Product Comparison	1.0.1

Product Comparison

SuiteCommerce Product Comparison lets users see a side-by-side comparison of web store items. Users can select up to four products to compare at one time and can use the information to make an educated purchasing decision. You can configure the comparison page and select the item fields to include in the comparison table.

For more information, see the help topic [Product Comparison](#).

March 12, 2019

Bundle ID	SuiteApp	Documentation	Version
251783	SC Inventory Display	Inventory Display	1.0.1
251246	SC Item Badges	Item Badges	1.0.1
250891	SC Stock Notifications	Stock Notifications	1.0.1

Inventory Display

SuiteCommerce Inventory Display lets you show stock status and quantity on an item's Product Details Page. You can customize the behavior for different types of inventory, such as special order and drop ship items.

For more information, see the help topic [Inventory Display](#).

Item Badges

SuiteCommerce Item Badges lets you display labels, such as New, On Sale, or Best Seller, on a product. These badges appear on the product detail, product listings, and image carousel sections.

For more information, see the help topic [Item Badges](#).

Stock Notifications

SuiteCommerce Stock Notifications lets users sign up for an email notification alerting them when an out-of-stock item again becomes available. Users can see a stock notification option on the Product Details

and Product Listings Pages. If logged in to the web store, users can visit the Stock Notifications tab of their My Account page to view details of the items to which they are subscribed, the notification statuses, and the option to cancel a notification.

For more information, see the help topic [Stock Notifications](#).

February 19, 2019

Bundle ID	SuiteApp	Documentation	Version
249788	SC Map & Contact	Map & Contact	1.1.0

Map & Contact

SuiteCommerce Map & Contact lets you add a web map using a third-party map service, include contact information, and add a contact form. You can select various layout settings such as map position and section size. The extension has been updated to allow the addition of a contact form on your website. You can customize a contact form by selecting which fields will be shown to the user and what feedback messages will be returned.

For more information, see the help topic [Map & Contact](#).

February 6, 2019

Bundle ID	SuiteApp	Documentation	Version
251720	SC Order Status	Order Status	1.0.1
251993	SC Product Lead Time	Product Lead Time	1.0.1

Order Status

SuiteCommerce Order Status lets you display the billing and shipping information of a purchase order to users on your website. Both guests and registered users can view order fulfillment progress, tracking information, and payment details. Registered users can log in to view their full purchase history, and guests have the option to register.

For more information, see the help topic [Order Status](#).

Product Lead Time

SuiteCommerce Product Lead Time lets you display the estimated wait time for an out-of-stock item to again become available for purchase. The extension uses NetSuite's Lead Time feature to calculate the wait time that is then displayed to users on the product pages of your webstore.

For more information, see the help topic [Product Lead Time](#).

January 8, 2019

Bundle ID	SuiteApp	Documentation	Version
-----------	----------	---------------	---------

250407	SC Product Feeds	SuiteCommerce Product Feeds	1.02.0
--------	------------------	---	--------

SuiteCommerce Product Feeds

SuiteCommerce Product Feeds lets you share your product inventory in a structured format and present your brand consistently across multiple channels. The extension has been updated to support non-inventory, kit/package, download, and gift certificate item types, as well as inventory items.

The item caching process has also been updated to automatically check for changes in item details every 15 minutes and to perform a full rebuild of the item cache every 2 hours. The feed status page lets you clear the existing item cache and rebuild a new item cache in the event of feed error.

For more information, see the help topic [Product Feeds](#).

December 11, 2018

Bundle ID	SuiteApp	Documentation	Version
248547	SC Gift Wrap & Message	SuiteCommerce Gift Wrap & Message	1.00.1
249263	SC Newsletter Sign Up	SuiteCommerce Newsletter Sign Up	1.00.2
250407	SC Product Feeds	SuiteCommerce Product Feeds	1.01.0

SuiteCommerce Gift Wrap & Message

SuiteCommerce Gift Wrap & Message lets you add gift wrap options to your web store. You can create multiple gift wrap items, determine products to be gift wrapped and the gift wrap options to be used, and display gift wrap colors and gift wrap images in the web store. The extension has been updated to include an option to disable gift wrap options in specific domains or websites.

For more information, see the help topic [Gift Wrap & Message](#).

SuiteCommerce Newsletter Sign Up

SuiteCommerce Newsletter Sign Up lets you add a subscription box to your website using Site Management Tools. The extension has been updated to let you determine whether new subscribers are created as individual or company lead records. It also includes a scriptlet to provide elevated permissions to the service during installation.

For more information, see the help topic [Newsletter Sign Up](#).

SuiteCommerce Product Feeds

SuiteCommerce Product Feeds lets you share your product inventory in a structured format and present your brand consistently across multiple channels. The extension has been updated to include a default saved search template to help you in creating product feeds in CSV format.

For more information, see the help topic [Product Feeds](#).

November 6, 2018

Bundle ID	SuiteApp	Documentation	Version
-----------	----------	---------------	---------

250929	SC Blog	SuiteCommerce Blog	1.01.0
250341	SC Google Tag Manager Editor	SuiteCommerce Google Tag Manager	1.0.1
250407	SC Product Feeds	SuiteCommerce Product Feeds	1.00.1

SuiteCommerce Blog

SuiteCommerce Blog lets you create blog posts for your website using Site Management Tools. You can add images and rich text, include post previews, and determine the posts shown in the blog list by categories. With this update, blog categories are created as custom records, rather than custom lists.

For more information, see the help topic [Blog](#).

SuiteCommerce Google Tag Manager

SuiteCommerce Google Tag Manager Editor lets you connect your SuiteCommerce site to Google Tag Manager and manage third-party tags without having to edit your site source code. The extension has been updated to let you integrate your SuiteCommerce website with Hotjar and Zendesk Chat services.

For more information, see the help topic [Google Tag Manager](#).

SuiteCommerce Product Feeds

SuiteCommerce Product Feeds lets you share your product inventory in a structured format and present your brand consistently across multiple channels. The extension has been updated to include a feed status page that provides an overview of all product feed generation and item caching processes, and synchronize Google product categories.

For more information, see the help topic [Product Feeds](#).

September 25, 2018

Bundle ID	SuiteApp	Documentation	Version
250929	SC Blog	Blog	1.0.0
250732	SC Featured Category	Newsletter Sign Up	1.0.0
250724	SC Featured Product	Featured Product	1.0.0
248547	SC Gift Wrap & Message	Gift Wrap & Message	1.0.0
250341	SC Google Tag Manager Editor	Google Tag Manager Editor	1.0.0
250407	Product Feeds	Product Feeds	1.0.0

Blog

SuiteCommerce Blog lets you create blog posts for your website using Site Management Tools. You can add images and rich text, include post previews, and determine the posts shown in the blog list by categories. This extension uses the SMT user interface to add content directly to your pages without editing Sass or HTML templates.

For more information, see the help topic [Blog](#).

Featured Category

SuiteCommerce Featured Category lets you highlight a recommended commerce category on your website. You can select how products are sorted within the section and the number of rows of items displayed. You can add a button that links to the category page. This extension uses the SMT user interface to add content directly to your pages without editing Sass or HTML templates.

For more information, see the help topic [Featured Category](#).

Featured Product

SuiteCommerce Featured Product lets you highlight a recommended product on your website. You can display the item's availability and price, and add a ribbon to the product. You can display the product image or upload a new image to be shown. This extension uses the SMT user interface to add content directly to your pages without editing Sass or HTML templates.

For more information, see the help topic [Featured Product](#).

Gift Wrap & Message

SuiteCommerce Gift Wrap & Message lets you add gift wrap options to your web store. You can create multiple gift wrap items, determine products to be gift wrapped and the gift wrap options to be used, and display gift wrap colors and gift wrap images in the web store.

For more information, see the help topic [Gift Wrap & Message](#).

Google Tag Manager Editor

SuiteCommerce Google Tag Manager Editor lets you connect your SuiteCommerce site to Google Tag Manager and manage third-party tags without having to edit your site source code. With this extension, you can integrate third-party services such as Google Analytics, Google Ads, Facebook Pixel, Optimizely, Bing, Criteo, and LiveChat.

For more information, see the help topic [Google Tag Manager](#).

Product Feeds

SuiteCommerce Product Feeds lets you share your product inventory in a structured format and present your brand consistently across multiple channels. You can create product feeds for Google Shopping and Facebook Dynamic Ads. You can also create data feeds in custom CSV format. For Google Shopping product feeds, you can include item promotion data for use with Merchant Promotions.

For more information, see the help topic [Product Feeds](#).

September 18, 2018

The following SuiteCommerce Extensions SuiteApps are released:

- [Columns](#)
- [Image Text Overlay](#)
- [Map & Contact Info](#)
- [Newsletter Sign Up](#)
- [Photo Gallery](#)
- [Shipping Bar](#)

- [Size Chart](#)
- [Slideshow](#)
- [SuiteCommerce McAfee Secure](#)

Bundle ID	SuiteApp	Documentation	Version
249263	SC Columns	Columns	1.0.0
249292	SC Image Text Overlay	Image Text Overlay	1.0.0
249788	SC Map & Contact Info	Map & Contact Info	1.0.0
249263	SC Newsletter Sign Up	Newsletter Sign Up	1.0.0
249422	SC Photo Gallery	Photo Gallery	1.0.0
250442	SC Shipping Bar	Shipping Bar	1.0.0
249416	SC Size Chart	Size Chart	1.0.0
250352	SC Slideshow	Slideshow	1.0.0
249425	SC McAfee Secure	SuiteCommerce McAfee Secure	1.0.0

Columns

SuiteCommerce Columns lets you add up to three columns of text with images and call-to-action buttons. You can choose to add one, two or three columns and the layout adapts to fit the width, according to the screen size. This extension uses the SMT user interface to add content directly to your pages without editing Sass or HTML templates.

For more information, see the help topic [Columns](#).

Image Text Overlay

SuiteCommerce Image with Text Overlay lets you add an image, a text that displays over the image, and a call-to-action button. Images can be enhanced with dark and light overlays. You can choose the text color based on your theme settings, and select the position of your content. This extension uses the SMT user interface to add content directly to your pages without editing Sass or HTML templates.

For more information, see the help topic [Image Text Overlay](#).

Map & Contact Info

SuiteCommerce Map & Contact Info lets you add a third-party map and include contact information on your website. You can select various layout settings such as map position, section height, and icons. This extension uses the SMT user interface to add content directly to your pages without editing Sass or HTML templates.

For more information, see the help topic [Map & Contact Info](#).

Newsletter Sign Up

SuiteCommerce Newsletter Sign Up lets you add a subscription box to your website. You can customize the appearance and behavior of the form and select vertical or horizontal layout, show name fields, and customize notification messages. This extension uses the SMT user interface to add content directly to your pages without editing Sass or HTML templates.

For more information, see the help topic [Map & Contact](#).

Photo Gallery

SuiteCommerce Photo Gallery lets you add up a gallery of up to 8 images to your web page. You can select the size of your gallery and choose grid or carousel view. The gallery adapts automatically to the number of images uploaded. This extension uses the SMT user interface to add content directly to your pages without editing Sass or HTML templates.

For more information, see the help topic [Photo Gallery](#).

Shipping Bar

SuiteCommerce Shipping Bar lets you inform shoppers of free or special rate shipping offers with dynamic messages that change to indicate how much more shoppers must spend to qualify for shipping.

For more information, see the help topic [Shipping Bar](#).

Size Chart

SuiteCommerce Size Chart lets you display sizing information in your web store. You can provide information on item sizes in shoppers' preferred unit of measurement and offer tips on measurements and fit.

For more information, see the help topic [Size Charts](#).

Slideshow

SuiteCommerce Slideshow lets you add a carousel of up to 8 images to your web page, with image overlays, text and call-to-action buttons. You can upload several images, select the focus of the image, and apply a dark or light overlay. Images slide automatically, and you can select the duration in seconds between each slide transition. This extension uses the SMT user interface to add content directly to your pages without editing Sass or HTML templates.

For more information, see the help topic [Slideshow](#).

SuiteCommerce McAfee Secure

SuiteCommerce McAfee Secure lets you integrate your SuiteCommerce website with the McAfee SECURE service, checking it for malware, viruses, phishing attacks, and other malicious activities.

For more information, see the help topic [McAfee Secure](#).

September, 4

The following SuiteCommerce Extensions SuiteApps are released:

- [Logo List](#)
- [Testimonials](#)

Bundle ID	SuiteApp	Documentation	Version
248750	SC Logo List	Logo List	1.0.0
248760	SC Testimonials	Testimonials	1.0.0

Logo List

SuiteCommerce Logo List lets you add a list of up to 12 logo images to your web page, include descriptive text, and specify an external URL link. You can select various layout settings to give your logo list the appearance and behavior you want. This extension uses the SMT user interface to add content directly to your pages without editing Sass or HTML templates.

For more information, see the help topic [Logo List](#).

Testimonials

SuiteCommerce Testimonials lets add up to 3 customer testimonials that combine text and image to your web page. You can select various layout settings to give your testimonials the appearance and behavior you want. This extension uses the SMT user interface to add content directly to your pages without editing Sass or HTML templates.

For more information, see the help topic [Testimonials](#).

August 23, 2018

The following SuiteCommerce Extensions SuiteApps are released:

- [Best Sellers](#)
- [Custom Fields](#)

Bundle ID	SuiteApp	Documentation	Version
244097	SC Best Sellers	Best Sellers	1.0.0
247488	SC Custom Fields	Custom Fields	1.0.0

Best Sellers

SuiteCommerce Best Sellers adds a sorting option to your web store that lets you feature best-selling items and sort by best sellers for a given period. You can choose to exclude specific items or override the best-seller calculation to highlight specific items in the product list pages, custom landing pages, and merchandising zones. You can use either sales quantity or sales amount to determine whether an item is a best seller for a given period.

For more information, see the help topic [Best Sellers](#).

Custom Fields

SuiteCommerce Custom Fields lets you add custom transaction body fields to the checkout application to request or provide additional information, such as shipping instructions and special order requests. You can include text, check box, and date-type fields to a separate module before or after existing modules.

For more information, see the help topic [Create Custom Fields Using an Extension](#).

July 10, 2018

The following SuiteCommerce Extensions SuiteApp is released:

- [Gift Certificate Value Check](#)

Bundle ID	SuiteApp	Documentation	Version
243340	SC Gift Certificate Value Check	Gift Certificate Value Check	1.0.0

Gift Certificate Value Check

SuiteCommerce Gift Certificate Value Check lets you add a predefined landing page in which shoppers can check the balance of gift certificates without having to log into their account area. Shoppers can check the remaining value on gift certificates by entering the gift certificate code in the field. They can view the gift certificate's remaining value and the expiration date, if applicable. If the gift certificate has expired, a message is displayed to the shopper that indicates the expiration date.

For more information, see the help topic [Gift Certificate Management](#).

Previous Releases

2025.1 Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount

Welcome to the 2025.1 release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced (SCA)!

Important: Features and enhancements in this release have dependencies on NetSuite 2025.1. You must implement this release in a **2025.1** NetSuite account.

The 2025.1 release incorporates periodic updates to the application. Refer to the following release notes for updates included in the major release and any subsequent minor releases. How you use these release notes depends on your web store:

- **SuiteCommerce** and **SuiteCommerce MyAccount** – These changes apply to your SuiteCommerce account automatically according to a scheduled update. Use these release notes as an informative guide to understand the changes applied to your account.
- **SuiteCommerce Advanced** – These changes do not apply to your SCA account automatically. To update your site, you must manually migrate your website to the latest SCA release. Use these release notes to determine if migration is necessary for your SCA implementation. This update does not alter the existing bundle ID. If you determine an update is necessary, see the help topic [Migrate SuiteCommerce Advanced](#) for instructions.

Note: For more information about updates to this release, see the help topic [Patches and Upgrades](#).

The following SuiteApps are available:

SuiteApp	Bundle ID
SuiteCommerce (Includes SuiteCommerce MyAccount)	562499

SuiteApp	Bundle ID
SuiteCommerce Advanced 2025.1.30	562977

Other important bundles include:

SuiteApp	Bundle ID
SuiteCommerce Configuration	381166
SuiteCommerce Extension Management	521562
SuiteCommerce Base Theme	562552
SuiteCommerce Google Tag Manager Editor	250341
Reference Product Lists Records	53051

Explore the following release notes:

- [2025.1.0 Release SC/SCA/SCMA](#)
- [2025.1.20 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced](#)

2025.1.0 Release SC/SCA/SCMA

Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount

The 2025.1.0 major release includes the following features and enhancements:

- [Ability to Return Assembly Items](#)
- [Configuration Properties Updates](#)
- [Node.js Requirement](#)
- [Third-Party Library Updates](#)
- [Issue Fixes](#)

These enhancements typically apply to SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced; however, some features could apply to a subset of each. The following enhancements explain the implementations to which they apply.

Ability to Return Assembly Items

Applies to: SuiteCommerce, SuiteCommerce Advanced, SuiteCommerce MyAccount

With the 2025.1 release, your customers can now return assembly items. For more information about assembly items, see the help topic [Assembly Items](#).

Configuration Properties Updates

No new SuiteCommerce configuration properties have been added with the 2025.1.0 release.

Node.js Requirement

Applies to: SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

With the 2025.1.0 release, the developer tools continue to support Node.js version **20.10.0**. To use the Theme, Extension, or core SCA 2025.1 developer tools, you must use this Node.js version.

For more information, see the help topic [Install Node.js](#).

Third-Party Library Updates

No library updates have been made for this release.

SuiteCommerce Extension Management Updates

Bundle ID	SuiteApp	Documentation	Version
521562	SuiteCommerce Extension Management	SuiteCommerce Extension Management	2025.1.0

SuiteCommerce Extension Management

Version 2025.1.0 of the SuiteCommerce Extension Management bundle includes the following enhancements:

- Enhanced error messages to provide more clear context
- Extended DevTools support to be compatible with more domains
- Improved handling of activation origin triggers

Issue Fixes

Applies to: SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

The 2025.1.0 release includes all minor release fixes, improvements, and security updates of the previous release. See [2024.2.x Minor Releases](#) for details.

2025.1.x Minor Releases

Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount

Refer to the following minor release notes for the latest updates to SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced:

- [2025.1.30 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced](#)
- [2025.1.20 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced](#)

2025.1.30 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

Fixes

- Fixed an issue that prevented the Open Invoices list on the My Account area of Commerce websites from updating when a filter option was selected.

This issue has been fixed for SuiteCommerce and the 2025.1 release of SuiteCommerce Advanced.

- Fixed an issue with creating then deleting new product lists (wishlists) in the My Account area of SuiteCommerce and SuiteCommerce Advanced websites.

This issue caused the spinner to get stuck and an error message to appear instead of a confirmation.

2025.1.20 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

Fixes

- The correct facet value is now displayed for the canonical URL.
- The icon next to **Status: Shipped** on the sales order now toggles the package items correctly when clicked.

2024.2 Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount

Welcome to the 2024.2 release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced (SCA)!

Important: Features and enhancements in this release have dependencies on NetSuite 2024.2. You must implement this release in a **2024.2** NetSuite account.

The 2024.2 release incorporates periodic updates to the application. Refer to the following release notes for updates included in the major release and any subsequent minor releases. How you use these release notes depends on your web store:

- **SuiteCommerce** and **SuiteCommerce MyAccount** – These changes apply to your SuiteCommerce account automatically according to a scheduled update. Use these release notes as an informative guide to understand the changes applied to your account.
- **SuiteCommerce Advanced** – These changes do not apply to your SCA account automatically. To update your site, you must manually migrate your website to the latest SCA release. Use these release notes to determine if migration is necessary for your SCA implementation. This update does not alter the existing bundle ID. If you determine an update is necessary, see the help topic [Migrate SuiteCommerce Advanced](#) for instructions.

Note: For more information about updates to this release, see the help topic [Patches and Upgrades](#).

The following SuiteApps are available:

SuiteApp	Bundle ID
SuiteCommerce (Includes SuiteCommerce MyAccount)	543875
SuiteCommerce Advanced 2024.2.40	544210

Other important bundles include:

SuiteApp	Bundle ID
SuiteCommerce Configuration	381166
SuiteCommerce Extension Management	521562
SuiteCommerce Base Theme	544093
SuiteCommerce Google Tag Manager Editor	250341
Reference Product Lists Records	53051

Explore the following release notes:

- [2024.2.0 Release SC/SCA/SCMA](#)
- [2024.2.x Minor Releases](#)

2024.2.0 Release SC/SCA/SCMA

i Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount

The 2024.2.0 major release includes the following features and enhancements:

- [Ability to Make URLs Public on Password Protected and SuiteCommerce MyAccount Sites](#)
- [Configuration Properties Updates](#)
- [Node.js Requirement](#)
- [Third-Party Library Updates](#)
- [Issue Fixes](#)

These enhancements typically apply to SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced; however, some features could apply to a subset of each. The following enhancements explain the implementations to which they apply.

Ability to Make URLs Public on Password Protected and SuiteCommerce MyAccount Sites

Applies to: SuiteCommerce, SuiteCommerce Advanced, SuiteCommerce MyAccount

With the 2024.2.0 release, you can specify URLs that can be accessed publicly by anonymous users, even if your website requires a user to log in first. This applies if your site is a SuiteCommerce MyAccount site or if your web store has the **Password-Protect Entire Site** setting checked.

To make some of your pages publicly accessible, enter their paths into the **Public URLs** table in your site's SuiteCommerce Configuration record. For example, you may want to make your home page, a product category page, or your Advanced Sign Up page, publicly available.

For more information, see the help topic [Set Public URLs](#).

Configuration Properties Updates

Applies to: SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

The following SuiteCommerce configuration property has been added with the 2024.2.0 release. Refer to the appropriate section for more information.

Property Label (SuiteCommerce Configuration Record)	Property ID	More Information	Property Location (SuiteCommerce Configuration Record Tab > Subtab)
Public URLs	overview.publicUrls	Public URLs	My Account > Overview

Node.js Requirement

Applies to: SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

With the 2024.2.0 release, the developer tools continue to support Node.js version **20.10.0**. To use the Theme, Extension, or core SCA 2024.2 developer tools, you must use this Node.js version.

For more information, see the help topic [Install Node.js](#).

Third-Party Library Updates

Applies to: SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

No library updates have been made for this release.

Issue Fixes

Applies to: SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

The 2024.2.0 release includes all minor release fixes, improvements, and security updates of the previous release. See [2024.1.x Minor Releases](#) for details.

2024.2.x Minor Releases

Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount

Refer to the following minor release notes for the latest updates to SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced:

- [2024.2.40 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced](#)
- [2024.2.30 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced](#)
- [2024.2.20 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced](#)
- [2024.2.10 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced](#)

2024.2.40 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

This release provides updates affecting background processing in NetSuite but does not impact customers.

2024.2.30 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

Enhancements

- □ For SuiteCommerce and SuiteCommerce Advanced versions 2024.2 and later, you can now specify if you want to let your customers view and create product reviews on your Commerce website. A new checkbox, **Enable Product Reviews**, has been added to the SuiteCommerce Configuration record. This setting is enabled by default. If you do not want your customers to view and create product reviews, you can clear the **Enable Product Reviews** box. See the help topic [Enable Product Reviews](#).

For SuiteCommerce Advanced versions 2024.1 and earlier, install the Reference Review Records SuiteApp. See the help topic [Product Reviews for SuiteCommerce Advanced 2024.1 and Earlier](#)

Fixes

- Fixed an issue that caused the shipping cost to be set to \$0 when PayPal was selected as the Payment Method.
- Fixed an issue that caused the shipping price on the Review Your Order page to change from the one displayed on the Order Summary page.
- Fixed an issue in which custom records of product reviews were incorrectly created after customers updated the SuiteCommerce bundle.
- Corrected the See Help link under **Public URLs** so that they point to the correct place in the NetSuite Help center, instead of the homepage.

2024.2.20 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

Enhancements

- Changed the word "Tweet" to "post" on product description pages of Commerce websites with Twitter/X integrations.

Fixes

- Fixed an issue that caused shoppers to be directed to the home page instead of the order confirmation page after they clicked **Place Order** on the checkout page of some Commerce websites. This issue occurred in SuiteCommerce and SuiteCommerce Advanced accounts where Google Tag Manager was configured and Google AdWords was added as a service.

2024.2.10 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

Fixes

- Fixed an issue in My Account that caused cancelled return requests not to update to a status of **Cancelled**.
- Fixed an issue in My Account, which caused a blank page to display when new customers clicked on **My List**. Now, customers will now see the following message, "You don't have items in this list yet. Explore the store or search for an item you would like to add."

- Fixed an issue in My Account > Purchases > Purchase History that caused FedEx tracking links not to redirect to the correct page.
- Fixed an issue with strike-through pricing that caused matrix child items to display with the default price level struck through in web stores. The struck-through price is now not displayed for matrix child items when the default price level is empty, equal to, or lower than the online price.
- Fixed an issue that prevented customers from checking out items in their shopping carts if a phone number was not entered in their customer profiles. Now, customers who do not enter a phone number can check out items.

2024.1 Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount

Welcome to the 2024.1 release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced (SCA)!

Important: Features and enhancements in this release have dependencies on NetSuite 2024.1. You must implement this release in a **2024.1** NetSuite account.

The 2024.1 release incorporates periodic updates to the application. Refer to the following release notes for updates included in the major release and any subsequent minor releases. How you use these release notes depends on your web store:

- **SuiteCommerce** and **SuiteCommerce MyAccount** – These changes apply to your SuiteCommerce account automatically according to a scheduled update. Use these release notes as an informative guide to understand the changes applied to your account.
- **SuiteCommerce Advanced** – These changes do not apply to your SCA account automatically. To update your site, you must manually migrate your website to the latest SCA release. Use these release notes to determine if migration is necessary for your SCA implementation. This update does not alter the existing bundle ID. If you determine an update is necessary, see the help topic [Migrate SuiteCommerce Advanced](#) for instructions.

Note: For more information about updates to this release, see the help topic [Patches and Upgrades](#).

The following SuiteApps are available:

SuiteApp	Bundle ID
SuiteCommerce (Includes SuiteCommerce MyAccount)	520497
SuiteCommerce Advanced 2024.1.30	519481

Other important bundles include:

SuiteApp	Bundle ID
SuiteCommerce Configuration	381166
SuiteCommerce Extension Management	521562

SuiteApp	Bundle ID
SuiteCommerce Base Theme	522267
SuiteCommerce Google Tag Manager Editor	250341
Reference Product Lists Records	53051

Explore the following release notes:

- [2024.1.0 Release SC/SCA/SCMA](#)
- [2024.1.x Minor Releases](#)

2024.1.0 Release SC/SCA/SCMA

Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount

The 2024.1.0 major release includes the following features and enhancements:

- [Clear Cart Button](#)
- [Ability to Modify Checkout Flows for SuiteCommerce MyAccount](#)
- [Configuration Properties Updates](#)
- [Node.js Requirement](#)
- [Third-Party Library Updates](#)
- [SuiteCommerce Extension Management Updates](#)
- [Issue Fixes](#)

These enhancements typically apply to SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced; however, some features could apply to a subset of each. The following enhancements explain the implementations to which they apply.

Clear Cart Button

Applies to: SuiteCommerce, SuiteCommerce Advanced

With the 2024.1 release, a new button, **Clear Cart**, will be displayed in the shopping cart area of your Commerce website. This button lets your customers empty their shopping cart with a single click rather than removing one product at a time.

Ability to Modify Checkout Flows for SuiteCommerce MyAccount

Applies to: SuiteCommerce MyAccount

With the 2024.1 release, merchants who use SuiteCommerce MyAccount can choose between the following three checkout flows — standard checkout, one page checkout, or billing first checkout. By letting you select the checkout flow that best suits your business needs, the checkout experience becomes smoother and reduces the likelihood of customers abandoning their carts.

To learn more about checkout flows, see the help topic [Checkout Flows](#).

Note: With SuiteCommerce MyAccount, checkout flows are only used for reordering items.

To give SuiteCommerce MyAccount users access to all the checkout and payment settings they need, some of the properties on the SuiteCommerce Configuration record in NetSuite have been moved to different tabs and subtabs.

- The Checkout tab is now available for SuiteCommerce MyAccount users.
- The subtabs and properties available under the Checkout tab have been moved so that they can be hidden from or made visible for SuiteCommerce MyAccount users.
Subtabs and properties that are only available for SuiteCommerce and SuiteCommerce Advanced users are hidden from SuiteCommerce MyAccount users. All other subtabs and properties are visible for SuiteCommerce, SuiteCommerce Advanced, and SuiteCommerce MyAccount users.
- A new Checkout subtab, Checkout Experience, has been created for properties that are only available for SuiteCommerce and SuiteCommerce Advanced users. This subtab is hidden from SuiteCommerce MyAccount users.
- Properties for payment instruments and methods have been moved to a new tab, Payment Instruments & Methods. SuiteCommerce, SuiteCommerce Advanced, and SuiteCommerce MyAccount users have access to this tab.
- The following subtabs that appear under the Integrations tab are hidden from SuiteCommerce MyAccount users:
 - Twitter
 - Pinterest
 - Facebook
 - Google Universal Analytics
 - Categories

For more information about SuiteCommerce Configuration tabs, subtabs, and properties, see the help topic [Configuration Properties Reference](#).

Configuration Properties Updates

Applies to: SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

No new SuiteCommerce configuration properties have been added with the 2024.1.0 release. However, the following property was added with the 2023.2.4 release.

Property Label (SuiteCommerce Configuration Record)	Property ID	More Information	Property Location (SuiteCommerce Configuration Record Tab > Subtab)
Show Quantity Available on the Out-of-Stock Error Message	checkoutApp.showItemRemainingQuantity	Quantity Stock Message Subtab	Checkout > Quantity Stock Message

As stated, new SuiteCommerce configuration properties were not added with the 2024.1.0 release. However, to give SuiteCommerce MyAccount users access to all the checkout and payment settings they need, some of the properties on the SuiteCommerce Configuration record in NetSuite have been moved to different tabs and subtabs. See [Ability to Modify Checkout Flows for SuiteCommerce MyAccount](#).

Node.js Requirement

Applies to: SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

With the 2024.1.0 release, the developer tools continue to support Node.js version **20.10.0**. To use the Theme, Extension, or core SCA 2024.1 developer tools, you must use this Node.js version.

For more information, see the help topic [Install Node.js](#).

Third-Party Library Updates

Applies to: SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

No library updates have been made for this release.

SuiteCommerce Extension Management Updates

Bundle ID	SuiteApp	Documentation	Version
521562	SuiteCommerce Extension Management	SuiteCommerce Extension Management	2024.2.0

SuiteCommerce Extension Management

Version 2024.2.0 of the SuiteCommerce Extension Management bundle includes the following enhancements:

- An additional parameter in the Suitelet's external URL: &ns-at=<VALUE>
- Updated the gulp command, so when deploying a theme locally, there is improved asset deployment
- Updated libraries for minor improvements

Issue Fixes

Applies to: SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

The 2024.1.0 release includes all minor release fixes, improvements, and security updates of the previous release. See [2023.2.x Minor Releases](#) for details.

2024.1.x Minor Releases

i Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount

Refer to the following minor release notes for the latest updates to SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced:

- [2024.1.30 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced](#)
- [2024.1.2 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced](#)
- [2024.1.1 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced](#)

2024.1.30 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

Enhancements

- Updated the naming convention for minor releases of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced. This is to permit the naming any hotfixes that might be released between minor releases.
 - For example, this major release is called 2024.1. This third minor release would have previously have been called 2024.1.3 but it has been renamed 2024.1.30. If there is a hotfix released between 2024.1.30 and the next minor release, 2024.1.40, it will be named 2024.1.31.

- With the 2024.1.30 release, the `third_parties` folder in SuiteCommerce and SuiteCommerce Advanced source files has been moved to another location. This is to avoid having two different Git repositories for the same application.
- SuiteCloud Command Line Interface (CLI) for Node.js has been updated to version 1.9.0.

Fixes

- Fixed an issue that caused customers to be redirected to the My Account page instead of the Payment and Review page on some Commerce websites. This issue occurred when customers paid for an invoice with their PayPal account.
- Fixed an issue that caused the character, "-", to be added after the currency symbol of a negative deposit subtotal in the My Account area of SuiteCommerce and SuiteCommerce Advanced websites. This issue occurred when customers paid an open invoice with a deposit. With this fix, \$-1.00 will now be displayed as -\$1.00.
- Fixed an issue that occurred when running the gulp command, `create_acp --product Online`, which returned the following error: `ENOENT: no such file or directory, scandir '/Users/luzmonfil/Desktop/suitecommerce/third_parties/require.js/2.3.6'`

2024.1.2 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

Fixes

CMS Records for Site Management Tools

An issue has been fixed that caused CMS Page Type website records to not display in some Commerce websites. This issue occurred when CMS Page records were linked to CMS Page Types with a custom record, like a blog, linked.

With this fix, all CMS Page Type custom record scripts will be lazy loaded. This means that the information that is specific to that custom record will be loaded when the linked CMS page is requested. Because custom records require a permission level of Create or higher to work in Commerce websites, the elevated permission of the Store Manager role will be enabled and set to run without login.

With this fix, all CMS page types should now display on your website. If some of your web pages still do not display, you can edit custom records you have created by adding the Store Manager role to the permissions list.

Important: This process only applies to custom records you have created. For information about NetSuite custom records and custom records used by third-party extensions, see the help topic [Custom Record for Custom Content Type](#).

To add the Store Manager role to a custom record permissions list:

1. Go to Customization > Lists, Records, & Fields > Record Types > New.
2. Select the custom record you want to update.
3. Go to the Permissions tab.
4. From the **Role** list, select Store Manager, and from **Level**, select Create or a higher level.
5. Click **Add**.
6. Click **Save**.

The **CMS Pages Lazy Load** setting has been removed from the SuiteCommerce configuration record. This setting, found under the Integrations tab and the Site Management Tools subtab, let you control which CMS page settings were lazy loaded. Since all page settings will now be lazy loaded, this configuration setting is no longer required.

Help topics that reference the **CMS Pages Lazy Load** setting have also been removed from the help center.

2024.1.1 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

Enhancements

- After customers cancel a purchase, the request is now sent through POST command instead of GET.

Fixes

- Fixed an issue that caused the character, ")", to be added to the end of the deposits subtotal in the My Account area of SuiteCommerce and SuiteCommerce Advanced websites. This issue occurred when customers paid an open invoice with a deposit.

With this fix, \$1.00) will now be displayed as \$1.00.

- Fixed a compilation error with jQuery-bxslider that occurred when running gulp commands.
- Fixed issues that occurred when running the gulp release sdf_release command which returned the following errors:
 - The file referenced by the attribute file is missing.
 - The following tasks did not complete: sdf_release, create_acp, <parallel>, cleanAcp. Did you forget to signal async completion?
- Fixed an issue with quote payments that meant customers were not redirected to the confirmation page after paying for a quote with an invoice. This issue occurred when 3D Secure payments is enabled.
- Fixed an issue that occurred after customers made a payment using a 3D Secure challenge. This issue caused some of the required GET parameters not to be forwarded in the URL sent to payment gateway partners.
- Fixed an issue that occurred when customers edit an optional item transaction line in the shopping cart of Commerce websites.
- Fixed an issue that caused the Theme Customizer not to display when using Site Management Tools.
- Fixed an issue that caused icons and fonts not to load in some deployments of SuiteCommerce Advanced.

2023.2 Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

📘 Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount

Welcome to the 2023.2 release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced (SCA)!

Important: Features and enhancements in this release have dependencies on NetSuite 2023.2. You must implement this release in a **2023.2** NetSuite account.

The 2023.2 release incorporates periodic updates to the application. Refer to the following release notes for updates included in the major release and any subsequent minor releases. How you use these release notes depends on your web store:

- **SuiteCommerce** and **SuiteCommerce MyAccount** – These changes apply to your SC account automatically according to a scheduled update. Use these release notes as an informative guide to understand the changes applied to your account.
- **SuiteCommerce Advanced** – These changes do not apply to your SCA account automatically. To update your site, you must manually migrate your website to the latest SCA release. Use these release notes to determine if migration is necessary for your SCA implementation. This update does not alter the existing bundle ID. If you determine an update is necessary, see the help topic [Migrate SuiteCommerce Advanced](#) for instructions.

Note: For more information about updates to this release, see the help topic [Patches and Upgrades](#).

The following SuiteApps are available:

SuiteApp	Bundle ID
SuiteCommerce (Includes SuiteCommerce MyAccount)	496890
SuiteCommerce Advanced 2023.2.4	497321

Other important bundles include:

SuiteApp	Bundle ID
SuiteCommerce Configuration	311614
SuiteCommerce Extension Management	500777
SuiteCommerce Base Theme	497478
SuiteCommerce Google Tag Manager Editor	250341
Reference Product Lists Records	53051

Explore the following release notes:

- [2023.2.0 Release SC/SCA/SCMA](#)
- [2023.2.x Minor Releases](#)

2023.2.0 Release SC/SCA/SCMA

Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount

The 2023.2.0 major release includes the following features and enhancements:

- [Out-of-Stock Message](#)
- [Item Quantity Updates in Shopping Cart](#)

- [SuiteCommerce Extension Management Updates](#)
- [SuiteCommerce Base Theme Improvements](#)
- [New Command to Create a Custom Theme](#)
- [Configuration Properties Updates](#)
- [Node.js Requirement](#)
- [Third-Party Library Updates](#)
- [Issue Fixes](#)

These enhancements typically apply to SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced; however, some features could apply to a subset of each. The following enhancements explain the implementations to which they apply.

Out-of-Stock Message

Applies to: SuiteCommerce, SuiteCommerce Advanced

With the 2023.2 release, the out-of-stock error message lists the items that are not in stock so that the user can go back and edit the order on SuiteCommerce and SuiteCommerce Advanced websites.

To learn more about out-of-stock error messaging, see the help topic [Out-of-Stock Messaging During Checkout](#).

Item Quantity Updates in Shopping Cart

Applies to: SuiteCommerce, SuiteCommerce Advanced

With the 2023.2 release, after a shopper changes an item's quantity in the shopping cart, the quantity of items in the cart is updated by a call to the Commerce API. Previously, the item was removed from the cart and re-added. This new approach improves shopping cart performance. If the item is a matrix item, the item will continue to be removed and re-added if the shopper updates its quantity in the cart.

To know more about item quantity for web store orders, see the help topic [Order Quantity](#).

SuiteCommerce Extension Management Updates

The SuiteCommerce Extension Management bundle version 2023.2 includes the following enhancements:

- Support of custom themes based on new architecture - With SC Extension Management 2023.2, you can take advantage of a new way to create a custom theme. Using the new themes architecture and a new gulp command, you can create your own theme by building off the Base Theme.
- New on-screen messaging to notify you of theme updates - The Extension Manager now provides update alerts for custom themes in the following scenarios:
 - When there is an update to the Base Theme, you will see an icon next to your custom theme instructing you to reactivate your theme to take advantage of these changes.
 - When there is an update to your custom theme (each time you customize your theme to create a new version), you will see an icon in the Update Available column, which encourages you to update your theme to take advantage of these changes.

For more information, see [SuiteCommerce Base Theme Improvements](#) and [New Command to Create a Custom Theme](#).

SuiteCommerce Base Theme Improvements

Applies to: SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

The SuiteCommerce Base Theme has been updated to include several improvements including the following:

- Appearance improvements to the theme, including to the header, footer, and MyAccount areas. Updates were made to make the theme more intuitive and aesthetically pleasing, including changes to fonts, backgrounds, and the search field.
- New CMS areas in the footer and MyAccount areas.
For more information, see the help topic [SuiteCommerce Base Theme Templates and Areas](#).
- Four new skins:
 - Aqua
 - Dark Mode: Green
 - Deep Sea
 - Earth
 For more information, see the help topic [Commerce Themes and Skins](#).
- Updates allowing for a new method of creating a custom theme based on the Base Theme.
For more information, see [New Command to Create a Custom Theme](#).

New Command to Create a Custom Theme

With this release, there is a new way to create a custom theme using a gulp command: **gulp theme:create**.

Leveraging updates to the Themes architecture and the new gulp command, you can create your own theme by building off the Base Theme. Using gulp theme:create, you can quickly create a new theme that inherits the Base Theme files in addition to using your customized files. Because your new theme inherits files from the Base Theme, when there is a new feature or update released using the Base Theme, you can quickly reactivate your theme, and you are able to take advantage of the new features.

After creating your theme, you can activate it using gulp commands or the Extension Manager. Then you can customize your theme further by changing the Sass and template files. For areas you customize, your theme will pull from your customized files. For areas you do not customize, your theme will pull from the Base Theme.

For more information, see the help topic [Create a Custom Theme](#).

Configuration Properties Updates

No new SuiteCommerce configuration properties have been added with the 2023.2.0 release.

Node.js Requirement

Applies to: SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

With the 2023.2.0 release, the developer tools continue to support Node.js version **14.19.0**. To use the Theme, Extension, or core SCA 2023.2 developer tools, you must use this Node.js version.

For more information, see the help topic [Install Node.js](#).

Third-Party Library Updates

Applies to: SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

The following third-party libraries have been updated with the 2023.2.0 release. Library version information is also shown in the distro.json file. Ensure that any themes and extensions using these

libraries are compatible with the update and make any appropriate changes. If you are migrating SCA to this release, ensure that no deprecated methods exist in your implementation before migrating.

Library	Old Version	New Version
uglify-js	3.14.3	3.12.4
is-my-json-valid	2.20.4	2.20.6
typescript-eslint/eslint-plugin	1.13.0	2.34.0
node-sass	7.0.0	8.0.0

Issue Fixes

Applies to: SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

The 2023.2.0 release includes all minor release fixes, improvements, and security updates of the previous release. See [2023.1.x Minor Releases](#) for details.

2023.2.x Minor Releases

Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount

Refer to the following minor release notes for the latest updates to SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced:

- [2023.2.4 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced](#)
- [2023.2.3 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced](#)
- [2023.2.2 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced](#)
- [2023.2.1 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced](#)

2023.2.4 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

Enhancements

- Removed the gulp tasks related to LibSass and its Node.js dependencies.
Starting from the 2024.1 release of NetSuite, the LibSass library will no longer be supported. Therefore, the commands to compile using the libsassNew gulp task in the theme and extension developer tools have been removed.
- You can now select whether to display the quantity of in-stock items on the out-of-stock error message. The error message displays on the review page of your Commerce website's checkout flow if a customer orders a larger quantity of an item than you have in stock. The customer can then edit their order to request a quantity of the item that correlates with the quantity that you have in stock.
A new checkbox, **Show Quantity Available on the Out-of-Stock Error Message**, has been added to the SuiteCommerce Configuration. Check this box to include the quantity of items that are available in the out-of-stock error message. See the help topic [Out-of-Stock Messaging During Checkout](#).

The following SuiteCommerce configuration property has been added with the 2022.2.4 release. Refer to the appropriate section for more information.

Property Label (SuiteCommerce Configuration Record)	Property ID	More Information	Property Location (SuiteCommerce Configuration Record Tab > Subtab)
Show Quantity Available on the Out-of-Stock Error Message	checkoutApp.showItemRemainingQuantity	Quantity Stock Message Subtab	Checkout > Quantity Stock Message

Fixes

- Fixed an issue that prevented customers from toggle viewing all items included in their order.
This issue occurred when customers used a mobile device to access the My Account > Purchases > Purchase History area of a Commerce website and clicked on **Purchase Order** for an order with a status of **Pending Approval** or **Pending Fulfillment**. In some cases, the arrow toggle that expands/collapses to display/hide the items in the order did not respond when customers clicked it.
- Fixed an issue in the Purchase History area of Commerce websites that caused all records in a purchase order row to be clickable.
The only record that should contain a clickable link is the purchase number.
- Fixed an issue that caused sales orders not to be displayed in the Purchase History area of Commerce websites.
This issue occurred when a sales order had multiple email contacts and the **Shopping Cart Sharing** mode on the website setup record in NetSuite was set to Individual Carts for Each Customer Contact.
- Fixed an issue that caused an incorrect quantity and amount value to be displayed in credit memos in the My Account > Billing > Transaction History area of Commerce websites.
- Fixed an issue that prevented customers from changing the preferred store location for store pickup orders in their shopping cart.
- Fixed an issue that caused the Google Tag Manager AddtoCart event to be called twice instead of one time.

2023.2.3 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

Fixes

- Fixed the tracking links under Purchase History so that they correctly redirect to the tracking information of the orders.
- Fixed an issue that was causing Quantity Pricing Schedule rate and Total Amount to be calculated incorrectly.

2023.2.2 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

Fixes

- Fixed an issue that caused the menu to be omitted from some SuiteCommerce MyAccount websites when using the SuiteCommerce Base Theme version 2023.2.0.
- Fixed an issue that caused credit card images to be displayed incorrectly in the Placed Orders area of SuiteCommerce and SuiteCommerce Advanced websites. The error occurred for tokenized credit cards.

- Fixed an error in the SuiteCommerce Extensibility API that caused the `getCookieOptions` method to change the value of an instance by adding an additional property.

 **Note:** The `getCookieOptions` method retrieves cookie preferences. The SuiteCommerce Analytics Data feature uses your customers' cookie preferences to determine whether their website behavior data can be processed in NetSuite.

- Fixed an issue with the guest checkout experience when using PayPal that caused the 500 error, `TypeError: Cannot read property "length" from null`, to be returned.

2023.2.1 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

Fixes

- Fixed an issue that prevented customers from successfully logging in to your web store or proceeding to the checkout page if both of the following conditions existed:
 - Google Analytics 4 was installed on your web store.
 - A malware plugin or ad blocker was active on the customer's browser.
- Fixed an issue that resulted in an error, "Phone number is required," when customers updated their address in the My Account area of your website and left the phone number field blank. The phone number field is optional and customers can now update their address without providing a phone number.
- Fixed an issue with the SEO Page Generator that added a "noscript" tag around images. This caused images to be unavailable for SEO if JavaScript was used on the web page.
- Fixed an issue that caused an error to occur when guest users attempted to make ACH payments.
- Fixed an issue that caused invoice headers to contain mismatched data if the feature, Enable Invoice Columns Management, was enabled.

2023.1 Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

 **Applies to:** SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount

Welcome to the 2023.1 release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced (SCA)!

 **Important:** Features and enhancements in this release have dependencies on NetSuite 2023.1. You must implement this release in a **2023.1** NetSuite account.

The 2023.1 release incorporates periodic updates to the application. Refer to the following release notes for updates included in the major release and any subsequent minor releases. How you use these release notes depends on your web store:

- **SuiteCommerce** and **SuiteCommerce MyAccount** – These changes apply to your SC account automatically according to a scheduled update. Use these release notes as an informative guide to understand the changes applied to your account.
- **SuiteCommerce Advanced** – These changes do not apply to your SCA account automatically. To update your site, you must manually migrate your website to the latest SCA release. Use these release

notes to determine if migration is necessary for your SCA implementation. This update does not alter the existing bundle ID. If you determine an update is necessary, see the help topic [Migrate SuiteCommerce Advanced](#) for instructions.

Note: For more information about updates to this release, see the help topic [Patches and Upgrades](#).

The following SuiteApps are available:

SuiteApp	Bundle ID
SuiteCommerce (Includes SuiteCommerce MyAccount)	468619
SuiteCommerce Advanced 2023.1.2	468610

Other important bundles include:

SuiteApp	Bundle ID
SuiteCommerce Configuration	311614
SuiteCommerce Extension Management	477064
SuiteCommerce Base Theme	468574
SuiteCommerce Google Tag Manager Editor	250341
Reference Product Lists Records	53051

Explore the following release notes:

- [2023.1.0 Release SC/SCA/SCMA](#)
- [2023.1.x Minor Releases](#)

2023.1.0 Release SC/SCA/SCMA

Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount

The 2023.1.0 major release includes the following features and enhancements:

- [ACH Available in the Checkout Flow](#)
- [Strike-Through Pricing Support for Matrix Items](#)
- [Support for Google Analytics 4 Existing Events](#)
- [SuiteCommerce Extension Management Updates](#)
- [Configuration Properties Updates](#)
- [Node.js Requirement](#)
- [Third-Party Library Updates](#)
- [Issue Fixes](#)

These enhancements typically apply to SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced; however, some features could apply to a subset of each. The following enhancements explain the implementations to which they apply.

ACH Available in the Checkout Flow

Applies to: SuiteCommerce, SuiteCommerce Advanced

With the 2023.1 release, ACH payment methods will be available on the standard checkout flow of SuiteCommerce and SuiteCommerce Advanced websites. Commerce website users will be able to:

- Add an ACH payment method.
- Save an ACH payment method added during checkout.
- Save an ACH payment method added during make a payment.

Merchants can use this feature to offer ACH payments as a payment method on their web store for customers who have their customer profile set to **Company** or **Individual**.

ACH payments were previously only available on the make a payment flow in My Account. Under My Account, ACH payments are only available for invoice payments. With the 2023.1 release, shoppers can use ACH payment methods to purchase items from a web store that they have added to their shopping cart.

See the help topic [ACH Payments](#) for more information about the different options for ACH payments.

Strike-Through Pricing Support for Matrix Items

Applies to: SuiteCommerce, SuiteCommerce Advanced

With the 2023.1 release, the Strike-Through Pricing feature will apply to matrix items as well as non-matrix items.

See the help topic [Strike-Through Pricing](#) for more information about strike-through pricing.

 **Note:** The Strike-Through Pricing feature was updated to apply to matrix items in the 2022.2.1 release, but it is also included in the 2023.1 release.

Support for Google Analytics 4 Existing Events

The following Google Analytics events, that can already be used and tracked with Google Universal Analytics, are now supported if you use Google Analytics 4:

- Wishlist
- Add to Cart
- View Items
- Product Click
- Transaction
- View Cart

See the help topics [Tracked Events](#) and [Google Analytics 4 \(with Google Tag Manager Commerce Extension\)](#) for more information about Google Analytics event tracking.

SuiteCommerce Extension Management Updates

Applies to: SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

With the 2023.1 release, the following updates were made:

- The following gulp commands have been added and can be used with extension and theme developer tools:
 - `gulp reactivate` - triggers a reactivation process of all the extensions and themes installed on your website
 - `gulp reactivate --async` - triggers a reactivation process of all the extension and themes installed in your website asynchronously
 - `gulp reactivate --update` - triggers a reactivation process of all the extensions and themes installed in your website, updating each to the latest available version
 - `gulp extension:deploy --reactivate` - allows you to deploy and reactivate the extensions and themes on your website
 - `gulp theme:deploy --reactivate` - allows you to deploy and reactivate the extensions and themes on your website

For more information, see the help topic [Gulp Command Reference for Theme and Extension Developer Tools](#).

- The SuiteCommerce Extension Management bundle has been updated to support token-based authentication (TBA). To take advantage of the update, complete the following steps:
 1. Create an integration record.

For more information, see the help topic [Create Integration Records for Applications to Use TBA](#).

 - a. In the **Name** field, enter a name for the integration record.
 - b. In the **State** field, select **Enabled**.
 - c. Check the **Token-Based Authentication** box.
 - d. Check the **TBA: Authorization Flow** box.
 - e. In the **Callback URL** field, enter: `http://localhost:7777/tba`.
 - f. Clear the **Authorization Code Grant** box.
 - g. Check the **User Credentials** box.
 2. Save the integration. Be sure to save the consumer key/secret before closing the page.
 3. Copy and paste the consumer key/secret in the .env file.

Note: This file is inside the root extension and theme developer tools folders that were downloaded when setting up developer tools. For more information about locating this folder, see the help topics [Download the Extension Developer Tools](#) and [Download Theme Developer Tools](#).

Configuration Properties Updates

Applies to: SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

The following configuration properties have been added with the 2023.1.0 release. Refer to the appropriate section of the following table for more information.

Property Label (SuiteCommerce Configuration Record)	Property ID	More Information	Property Location (SuiteCommerce Configuration Record Tab > Subtab)
Enable ACH Payments This setting lets B2B customers make ACH payments using the checkout flow on your website.	checkoutApp.isAchEnabledIn Checkout	Checkout Tab	Checkout

Property Label (SuiteCommerce Configuration Record)	Property ID	More Information	Property Location (SuiteCommerce Configuration Record Tab > Subtab)
Enable ACH Payments for B2C Customers This setting lets all customers (B2B and B2C) make ACH payments using the checkout flow on your website.	checkoutApp.isAchEnabledForAllCustomers	Checkout Tab	Checkout
Maximum Number of Invoices That Can Be Paid	checkoutApp.invoiceMaxCountPayment	Invoice Subtab	Advanced > Invoice

Node.js Requirement

Applies to: SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

With the 2023.1.0 release, the developer tools continue to support Node.js version **14.19.0**. To use the Theme, Extension, or core SCA 2023.1 developer tools, you must use this Node.js version.

For more information, see the help topic [Install Node.js](#).

Third-Party Library Updates

No library updates have been made for the 2023.1.0 release.

Issue Fixes

Applies to: SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

The 2023.1.0 release includes all minor release fixes, improvements, and security updates of the previous release. See [2022.2.x Minor Releases](#) for details.

2023.1.x Minor Releases

i Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount

Refer to the following minor release notes for the latest updates to SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced:

- [2023.1.3 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced](#)
- [2023.1.2 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced](#)
- [2023.1.1 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced](#)

2023.1.3 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

Enhancements

- In the 2023.1.3 release, the following third-party library has been added:
 - sass 1.62.1

Fixes

- This release also provides other updates affecting background processing in NetSuite but does not impact the end user.

2023.1.2 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

Enhancements

- The following Google Analytics 4 (GA4) tracking events have been integrated with the Google Tag Manager Commerce extension:
 - **Add Payment Information** – This event signifies a user has submitted payment information.
 - **Add Shipping Information** – This event signifies a user has submitted their shipping information.
 - **Refund** – This event signifies a refund was issued.
 - **Remove from Cart** – This event signifies that an item was removed from a cart.
 - **Search** – Use this event to contextualize search operations. The search event helps you identify your application's most popular content.
 - **Share** – This event signifies a user has shared content.

See the following help topics for more information about GA4 events:

- [Google Analytics 4 \(with Google Tag Manager Commerce Extension\)](#)
- [Supported Google Tag Manager Services](#)
- [Tracked Events](#)
- Added a new configuration property, **Add Headers to SSP Responses**, to provide a field in which to enter your security headers. This new property appears in the **Advanced** tab under the **Security** subtab.

See the following help topics for more information about security headers:

 - [HTTPS Header Information](#)
 - [Security Subtab](#)
- Updated text and translation context notes to comply with Oracle translatability requirements.

2023.1.1 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

Enhancements

- The Underscore.js library has been updated to version 1.13.1.
- The Handlebars library has been updated to version 4.7.7.
- The VM2 (oraclesuitecloud-cli) library has been updated to version 1.7.2.

Fixes

- Fixed an issue in the raw request of the Cardholder Authentication event that caused the security code to be null instead of displaying the tokenized value of the CSC entered on the payment page.
- Fixed an issue that prevented customers from enabling the 3DS2 feature for Make A Payment, Quotes, and Reorder flows.

- Fixed an issue that caused the CUR parameter under Shopping to be null instead of being set to ShoppingUserEnvironment.Service.ss.
- Fixed an issue that caused invoices to display \$0.00 under Payment Summary.
- Fixed an issue that prevented shoppers from viewing the Transaction History section by updating ActivationContext and SuiteScript2 services.

2022.2 Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount

Welcome to the 2022.2 release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced (SCA)!

Important: Features and enhancements in this release have dependencies on NetSuite 2022.2. You must implement this release in a **2022.2** NetSuite account.

The 2022.2 release incorporates periodic updates to the application. Refer to the following release notes for updates included in the major release and any subsequent minor releases. How you use these release notes depends on your web store:

- **SuiteCommerce** and **SuiteCommerce MyAccount** – These changes apply to your SC account automatically according to a scheduled update. Use these release notes as an informative guide to understand the changes applied to your account.
- **SuiteCommerce Advanced** – These changes do not apply to your SCA account automatically. To update your site, you must manually migrate your website to the latest SCA release. Use these release notes to determine if migration is necessary for your SCA implementation. This update does not alter the existing bundle ID. If you determine an update is necessary, see the help topic [Migrate SuiteCommerce Advanced](#) for instructions.

Note: For more information about updates to this release, see the help topic [Patches and Upgrades](#).

The following SuiteApps are available:

SuiteApp	Bundle ID
SuiteCommerce (Includes SuiteCommerce MyAccount)	453732
SuiteCommerce Advanced 2022.2.1	453986

Other important bundles include:

SuiteApp	Bundle ID
SuiteCommerce Configuration	381166
SuiteCommerce Extension Management	455185
SuiteCommerce Base Theme	454603

SuiteApp	Bundle ID
SuiteCommerce Google Tag Manager Editor	250341
Reference Product Lists Records	53051

Explore the following release notes:

- [2022.2.0 Release SC/SCA/SCMA](#)
- [2022.2.x Minor Releases](#)

2022.2.0 Release SC/SCA/SCMA

Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount

The 2022.2.0 major release includes the following features and enhancements:

- [3D Secure 2.0 Available in the Make a Payment Flow](#)
- [Google Analytics 4 Supported by SuiteCommerce Websites](#)
- [Missing Translations Added to SuiteCommerce Application Areas](#)
- [Configuration Properties Updates](#)
- [Node.js Requirement](#)
- [Third-Party Library Updates](#)
- [SuiteCommerce Extension Management Issue Fixes](#)
- [Issue Fixes](#)

These enhancements typically apply to SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced; however, some features could apply to a subset of each. The following enhancements explain the implementations to which they apply.

3D Secure 2.0 Available in the Make a Payment Flow

Applies to: SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

With the 2022.2 release, 3D Secure 2.0 functionality is available in the Make a Payment and Quote Purchase flows.

See the help topic [3D Secure Payment Authentication](#) for more information about 3D Secure.

Google Analytics 4 Supported by SuiteCommerce Websites

Applies to: SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

Introduced a new configuration setting to support Google Analytics 4 (GA4) on SuiteCommerce websites. Google will no longer support Universal Analytics and the feature will be replaced with GA4.

See the help topic [Google Analytics 4](#) for more information about GA4.

Missing Translations Added to SuiteCommerce Application Areas

Applies to: SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

As a step toward improving Oracle's translatability compliance, missing translations have been added to the following application areas:

- Shopping > Item > Product Detail Page: "No Reviews yet"
- Shopping > Item > Add item to cart > Confirmation modal: "Quantity"
- Submitting a Product Review: "Back to xxxxxxx" (xxxxxx being the product name)
- Billing > Invoices > Make a Payment: "SELECT INVOICES TO PAY" and the Wizard breadcrumb (1. SELECT INVOICES TO PAY / 2. PAYMENT AND REVIEW)
- Billing > Account Balance: "Deposits:", "Other Credits:", "Term:" and "Currency:"

See the help topic [Manage Translations](#) for more information about the NetSuite translation process.

Configuration Properties Updates

Applies to: SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

The following configuration properties have been added with the 2022.2.0 release. Refer to the appropriate section for more information.

Property Label (SuiteCommerce Configuration Record)	Property ID	More Information	Property Location (SuiteCommerce Configuration Record Tab > Subtab)
Google Analytics 4 ID	tracking.googleAnalyticsFour.propertyID	Google Analytics 4 Subtab	Integrations > Google Analytics 4
Google Analytics 4 Domain	tracking.googleAnalyticsFour.domainName	Google Analytics 4 Subtab	Integrations > Google Analytics 4
Google Analytics 4 Secure Domain	tracking.googleAnalyticsFour.domainNameSecure	Google Analytics 4 Subtab	Integrations > Google Analytics 4
Invoice Terms and Conditions  Note: This property has been moved from the Checkout tab to a new Invoice subtab under the Advanced tab. This is to make the property accessible for SuiteCommerce MyAccount.	checkoutApp.invoiceTermsAndConditions	Invoice Subtab	Advanced > Invoice

Node.js Requirement

Applies to: SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

With the 2022.2.0 release, the developer tools continue to support Node.js version **12.21.0**. To use the Theme, Extension, or core SCA 2022.2 developer tools, you must use this Node.js version.

For more information, see the help topic [Install Node.js](#).

Third-Party Library Updates

Applies to: SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

With the 2022.2.0 release, the following third-party library has been added:

- dotenv 16.0.1

No other library updates have been made for this release.

SuiteCommerce Extension Management Issue Fixes

Applies to: SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

With the 2022.2.0 release, the following fixes were made:

- Fixed an issue with that caused an error downloading extension files when using the gulp commands `gulp extension:fetch` or `gulp extension:deploy`.
- Fixed an issue with the SuiteCommerce Extension Management and SuiteCommerce Advanced developer tools that caused some users to receive a CORS-related message after running their local setup on Chrome or Edge browsers.

Issue Fixes

Applies to: SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

The 2022.2.0 release includes all minor release fixes, improvements, and security updates of the previous release. See [2022.1.x Minor Releases](#) for details.

2022.2.x Minor Releases

Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount

Refer to the following minor release notes for the latest updates to SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced:

- [2022.2.1 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced](#)

2022.2.1 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

Enhancements

- The Strike-Through Pricing feature is now available for matrix items as well as non-matrix items. See the help topic [Strike-Through Pricing](#).
- Updated the SuiteCloud library referenced in the `package.json` file to SuiteCloud Command Line Interface (CLI) for Node.js version 1.6.2.

For SuiteCommerce and SuiteCommerce Advanced versions 2022.2.1 and later, you should use Node.js version 14.19.0. See the help topic [Install Node.js](#).

Fixes

- Fixed an issue that caused items searched not to be displayed with the number of results on the Search Results page.
- Fixed an issue that caused inconsistent information about cut-off time and pick-up day to be displayed on some Commerce websites when customers order an item for pick up in store.
- Fixed an issue causing incorrect payment processing profiles to be used when paying an invoice in the following situations:
 - At least two payment processing profiles use the same payment method.
 - The Payments Instrument feature is enabled.

- Fixed an issue with promo codes that prevented customers from placing an order when items in their shopping cart were ineligible for promotion.
- Fixed an issue that caused error messages not to be displayed when customers paid an invoice using 3D Secure 2 and an error occurred.
- Unlocked files in the following folder:
Web Site Hosting Files > Live Hosting Files > SSP Applications > NetSuite Inc. - SCA 2022.2.0 > Development

2022.1 Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount

Welcome to the 2022.1 release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced (SCA)!

Important: Features and enhancements in this release have dependencies on NetSuite 2022.1. You must implement this release in a **2022.1** NetSuite account.

The 2022.1 release incorporates periodic updates to the application. Refer to the following release notes for updates included in the major release and any subsequent minor releases. How you use these release notes depends on your web store:

- **SuiteCommerce** and **SuiteCommerce MyAccount** – These changes apply to your SC account automatically according to a scheduled update. Use these release notes as an informative guide to understand the changes applied to your account.
- **SuiteCommerce Advanced** – These changes do not apply to your SCA account automatically. To update your site, you must manually migrate your website to the latest SCA release. Use these release notes to determine if migration is necessary for your SCA implementation. This update does not alter the existing bundle ID. If you determine an update is necessary, see the help topic [Migrate SuiteCommerce Advanced](#) for instructions.

Note: For more information about updates to this release, see the help topic [Patches and Upgrades](#).

The following SuiteApps are available:

SuiteApp	Bundle ID
SuiteCommerce (Includes SuiteCommerce MyAccount)	422680
SuiteCommerce Advanced 2022.1.4	422673

Other important bundles include:

SuiteApp	Bundle ID
SuiteCommerce Configuration	311614
SuiteCommerce Extension Management	426586

SuiteApp	Bundle ID
SuiteCommerce Base Theme	422857
SuiteCommerce Google Tag Manager Editor	250341
Reference Product Lists Records	53051

Explore the following release notes:

- [2022.1.0 Release SC/SCA/SCMA](#)
- [2022.1.x Minor Releases](#)

2022.1.0 Release SC/SCA/SCMA

i Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount

The 2022.1.0 major release includes the following features and enhancements:

- [SMT Areas Added to Base Theme](#)
- [Internet Explorer 11 No Longer Supported](#)
- [Configuration Properties Updates](#)
- [Node.js Requirement](#)
- [Third-Party Library Updates](#)
- [Issue Fixes](#)

These enhancements typically apply to SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced; however, some features could apply to a subset of each. The following enhancements explain the implementations to which they apply.

SMT Areas Added to Base Theme

Applies to: SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

With the 2022.1 release, the following Site Management Tools (SMT) areas were added to the SuiteCommerce Base Theme:

New Area Name	Area Scope	Area Type	Module	Template File
banner_caselist	all pages	Support cases page	Case	case_list.tpl
banner_invoiceopenlist	all pages	Invoices page	Invoice	invoice_open_list.tpl
banner_myaccount_bottom	all pages	My Account pages	MyAccountApplication	myaccount_layout.tpl

See the help topic [Area and Scope](#) for information about SMT areas.

Internet Explorer 11 No Longer Supported

Applies to: SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

With the 2022.1.0 release, SuiteCommerce and SuiteCommerce MyAccount no longer support Internet Explorer (IE) 11 and earlier.

Previous versions of SuiteCommerce Advanced (SCA) continue to support IE 11, but IE 11 is not supported for SCA version 2022.1.0 and later.

Because IE 11 may cause breaking changes on SuiteCommerce, SuiteCommerce MyAccount, and SCA 2022.1.0 and later sites, do not use IE 11 and earlier for these sites. Install, and direct your customers to install, a currently supported browser version.

For more information, see the help topic [Supported Browsers for Commerce Websites](#).

Configuration Properties Updates

Applies to: SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

The following configuration properties have been updated with the 2022.1.0 release. Refer to the appropriate section for more information.

Property Label (SuiteCommerce Configuration Record)	Property ID	More Information	Property Location (SuiteCommerce Configuration Record Tab > Subtab)
Enable Personalized Item Search API Endpoints  Note: This label was previously called Enable new search API endpoints.	isNewSearchApiEnabled	Enable Personalized Search API Endpoints	Shopping Catalog

Node.js Requirement

Applies to: SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

With the 2022.1.0 release, the developer tools continue to support Node.js version **12.21.0**. To use the Theme, Extension, or core SCA 2022.1 developer tools, you should use this Node.js version. However, other Node.js versions may also work.

For more information, see the help topic [Install Node.js](#).

Third-Party Library Updates

Applies to: SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

With the 2022.1.0 release, the following third-party library has been added:

- node-sass 7.0.0

The node-sass library was added because gulp-sass 5.0.0 no longer includes node-sass.

The following third-party libraries have been updated with the 2022.1.0 release. Library version information is also shown in the distro.json file. Ensure that any themes and extensions using these libraries are compatible with the update and make any appropriate changes. If you are migrating SCA to this release, ensure that no deprecated methods exist in your implementation before migrating.

Library	Old Version	New Version
gulp-sass	4.1.0	5.0.0

Library	Old Version	New Version
Handlebars	4.5.3	4.7.7
is-my-json-valid	2.20.2	2.20.4
TypeScript	4.1.2	4.1.6
underscore.js	1.10.2	1.13.1

Issue Fixes

Applies to: SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

The 2022.1.0 release includes all minor release fixes, improvements, and security updates of the previous release. See [2021.2.x Minor Releases](#) for details.

2022.1.x Minor Releases

Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount

Refer to the following minor release notes for the latest updates to SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced:

- [2022.1.4 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced](#)
- [2022.1.3 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced](#)
- [2022.1.2 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced](#)
- [2022.1.1 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced](#)

2022.1.4 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

Fixes

- Fixed an issue that caused newly created landing pages to inherit layout elements of a previously viewed page.

2022.1.3 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

Fixes

- Wrote patch instructions to remove the NLAAuth authorization header from token-based authentication flows to continue to support token-based authentication on all versions of the SuiteCommerce Advanced developer tools. See the help topic [Token-Based Authentication Updates for Developer Tools](#).
- Fixed an issue that caused landing pages not to open correctly when using Site Management Tools.

- Fixed an issue that returned the error 500: UNEXPECTED_ERROR when the payment card token feature was enabled for display in the web store.
- Fixed an issue that caused terms and conditions pages on the Checkout page to display with default text content instead of customized text.

2022.1.2 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

Fixes

- Starting with the 2022.1.2 minor release, Commerce websites configured for External Checkout Only in the Payment Processing profile now allow customers to be successfully redirected to an external payment page to pay their invoices. Prior to the 2022.1.2 minor release, this behavior was not supported because external payments were implemented as alternative payments and not the main payment method.
- Fixed an issue occurring when shoppers use an external payment method and return to the Payment Methods page to make a correction. This was causing an empty error message to be displayed and did not allow shoppers to continue with the checkout flow unless they re-selected the payment method.
- Fixed an issue with installing SuiteCommerce Advanced bundles when using Node 12.21.0 and Gulp 4.0.2 to compile the source code.
- Fixed an issue that caused the Commerce Category records pages to be displayed incorrectly when using Site Management Tools.
- Fixed an issue that caused the pricing on the Product Display page not to update based on the product quantity purchased.

2022.1.1 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

Fixes

- Fixed an issue that caused the author of a Web Store item review to be captured as a string. A customer who writes an item review is now correctly captured as an author as prescribed by JSON-LD schema.

2021.2 Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

 **Applies to:** SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount

Welcome to the 2021.2 release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced (SCA)!

Important: Features and enhancements in this release have dependencies on NetSuite 2021.2. You must implement this release in a **2021.2** NetSuite account.

The 2021.2 release incorporates periodic updates to the application. Refer to the following release notes for updates included in the major release and any subsequent minor releases. How you use these release notes depends on your web store:

- **SuiteCommerce** and **SuiteCommerce MyAccount** – These changes apply to your SC account automatically according to a scheduled update. Use these release notes as an informative guide to understand the changes applied to your account.
- **SuiteCommerce Advanced** – These changes do not apply to your SCA account automatically. To update your site, you must manually migrate your website to the latest SCA release. Use these release notes to determine if migration is necessary for your SCA implementation. This update does not alter the existing bundle ID. If you determine an update is necessary, see the help topic [Migrate SuiteCommerce Advanced](#) for instructions.

 **Note:** For more information on updates to this release, see the help topic [Patches and Upgrades](#).

The following SuiteApps are available:

SuiteApp	Bundle ID
SuiteCommerce (Includes SuiteCommerce MyAccount)	391989
SuiteCommerce Advanced 2021.2.3	391979

Other important bundles include:

SuiteApp	Bundle ID
SuiteCommerce Configuration	311614
SuiteCommerce Extension Management	390093
SuiteCommerce Base Theme	390015
SuiteCommerce Google Tag Manager Editor	250341

- [2021.2.x Minor Releases](#)

2021.2.0 Release SC/SCA/SCMA

 **Applies to:** SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount

The 2021.2.0 major release includes the following features and enhancements:

- [ACH Payments Available for SuiteCommerce Websites](#)
- [Cacheable and Personalized Endpoints](#)
- [Extensibility API Updates](#)
- [Configuration Properties Updates](#)
- [Node.js Requirement](#)
- [Third-Party Library Updates](#)

■ Issue Fixes

These enhancements typically apply to SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced; however, some features could apply to a subset of each. The following enhancements explain the implementations to which they apply.

ACH Payments Available for SuiteCommerce Websites

Applies to: SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

With the 2021.2 release, website users can select and pay for invoices using an Automated Clearing House (ACH) transaction. Users can also add, edit, or remove ACH payment instruments.

You enable the ACH Payments feature to give website users the option to pay for invoices using the ACH payment instruments.

For more information, see the help topic [ACH Payments](#).

The 2021.2 release included the following ACH templates and Syntactically Awesome StyleSheets (SASS):

- Templates:
 - Advanced/PaymentWizard/Templates/payment_wizard_paymentmethod_ach_module.tpl
 - Advanced/PaymentInstrumentACH/Templates/paymentinstrument_ach.tpl
 - Advanced/PaymentInstrumentACH/Templates/paymentinstrument_ach_edit.tpl
 - Advanced/PaymentInstrumentACH/Templates/paymentinstrument_ach_edit_form.tpl
 - Advanced/PaymentInstrumentACH/Templates/paymentinstrument_ach_list.tpl
- SASS:
 - Advanced/PaymentWizard/Sass/_payment-wizard-paymentmethod-ach-module.scss
 - Advanced/PaymentInstrumentACH/Sass/_paymentinstrument-ach-edit.scss
 - Advanced/PaymentInstrumentACH/Sass/_paymentinstrument-ach-edit-form.scss
 - Advanced/PaymentInstrumentACH/Sass/_paymentinstrument_ach.scss
 - Advanced/PaymentInstrumentACH/Sass/_paymentinstrument_ach_list.scss

Cacheable and Personalized Endpoints

Applies to: SuiteCommerce and SuiteCommerce Advanced

With the 2021.2 release, the following additional endpoints have been made available for the Item Search API:

- /cacheable/items
- /personalized/items

Cacheable or personalized API endpoints are automatically used depending on whether a user is logged in to your Commerce website and whether the personalized endpoint configuration option has been enabled. For more information, see the help topic [Cacheable and Personalized Endpoints](#).

Extensibility API Updates

The following components have been updated with new methods in the 2021.2.0 release:

Cart – You can now trigger the add to cart behavior of a web store in an extension with the `triggerAddToCartConfirmation()` method. When an extension calls this method, it triggers the add to cart

behavior that is configured in the web store settings, which gives a visual confirmation to the shopper that the item was added successfully to the cart.

Environment – This release includes a new method in the Environment component which lets you change how the Item Search API works. With the `defineSearchMasterOptions()` method, you can modify the value of any of the search API master options configured in the NetSuite account. Specifically, it enables you to update the `searchApiMasterOptions` configuration property of the web store by modifying or adding to any of its child properties. For example, if your extension enhances the PDP (product details page) and requires specific item information, you can use this method to change the field set that is used by the item search API on the PDP.

UserProfile – With the `getCustomerSegments()` method, you can now determine the customer segments that a website visitor belongs to. A customer segment is a group of customers to which you can assign a personalized catalog view (PCV). **Note:** To use this method the [Personalized Catalog Views](#) feature must be enabled in the NetSuite account.

The UserProfile component also includes two new methods that enable you to create a custom cookie consent extension. The `setCookieOptions()` method saves a customer's cookie preferences on the customer record. The `getCookieOptions()` method retrieves the cookie preferences. The SuiteCommerce Analytics Data feature uses the customer's cookie preferences to determine whether the customer's website behavior data can be processed in NetSuite.

PDP – The `getPrice()` method lets you get price information of the item displayed on the PDP (product details page). Price information includes both the base price of the item and the current price of the item according to the currently selected quantity and item options.

See the [Extensibility API reference](#) for detailed information about the updates to these components.

Configuration Properties Updates

Applies to: SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

The following configuration properties have been added with the 2021.2.0 release. Refer to the appropriate section for more information.

Property Label (SuiteCommerce Configuration Record)	Property ID	More Information	Property Location (SuiteCommerce Configuration Record Tab > Subtab)
Enable ACH Payments	paymentInstrument ACHEnabled	Enable ACH Payments	My Account > Payment Instrument ACH
Enables New Search API Endpoints	isNewSearchApiEnabled	Enable Personalized Search API Endpoints	Shopping Catalog
Zoom Level for Store Details  Note: This label was previously called Zoom Level in PDP .	storeLocator. zoomInDetails	Zoom Level for Store Details	Store Locator > Store Locator

Node.js Requirement

Applies to: SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

With the 2021.2.0 release, the developer tools continue to support Node.js version **12.21.0**. To use the Theme, Extension, or core SCA 2021.2 developer tools, you must use this Node.js version.

For more information, see the help topic [Install Node.js](#).

Third-Party Library Updates

Applies to: SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

The following third-party libraries have been updated with the 2021.2.0 release. Library version information is also included in the `distro.json` file. Ensure that any themes and extensions using these libraries are compatible with the update. If you are migrating SCA to this release, ensure that no deprecated methods exist in your implementation before migrating.

Library	Old Version	New Version
bignumber	9.0.0	9.0.1

Issue Fixes

Applies to: SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

The 2021.2.0 release includes all minor release fixes, improvements, and security updates of the previous release. See [2021.1.x Minor Releases](#) for details.

2021.2.x Minor Releases

i Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount

Refer to the following minor release notes for the latest updates to SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced:

- [2021.2.4 Minor Release of SuiteCommerce and SuiteCommerce MyAccount](#)
- [2021.2.3 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced](#)
- [2021.2.2 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced](#)
- [2021.2.1 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced](#)

2021.2.4 Minor Release of SuiteCommerce and SuiteCommerce MyAccount

i Note: The 2021.2.4 minor release applied only to SuiteCommerce and SuiteCommerce MyAccount. The following fixes will be implemented to SuiteCommerce Advanced in the 2022.1 release.

Fixes

- Fixed an issue where the Theme Customizer was not working in the My Account area. The following help topics have been updated to clarify that a single secure domain is required to update the My Account area of Commerce websites using SMT:
 - [Does SuiteCommerce MyAccount support Site Management Tools?](#)

▫ [Site Management Tools Overview](#)

- Fixed an issue so that invoices with the status Pending Approval are not displayed in the My Account area. This is because these invoices cannot be opened.
- Fixed an issue causing text and metadata on the SEO Page Generator output not to be translated.

2021.2.3 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

Fixes

- Fixed an issue where new customers were able to register and create an account when this action should have been limited to existing customers per the Customer Registration preference on the Website Setup Record.
- Fixed an issue with Multi-Domain translation configuration by changing the language code for Norwegian from nb_NO to no_NO.

2021.2.2 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

Fixes

- Fixed an issue where an item with a free gift promotion was reverting from a pickup in store to a shipping delivery method.

2021.2.1 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

Fixes

- This release provides updates affecting background processing in NetSuite but does not impact the end user.

2021.1 Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

📘 Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount

Welcome to the 2021.1 release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced (SCA)!

Important: Many of the features and enhancements in this release have dependencies on NetSuite 2020.2. You must implement this release in a **2021.1** NetSuite account.

The 2021.1 release incorporates periodic updates to the application. Refer to the following release notes for updates included in the major release and any subsequent minor releases. How you use these release notes depends on your web store:

- **SuiteCommerce** and **SuiteCommerce MyAccount** – These changes apply to your account automatically according to a scheduled update. Use these release notes as an informative guide to understand the changes applied to your account.
- **SuiteCommerce Advanced** – You must manually migrate your web store to the latest minor release to incorporate these changes. Use these release notes to determine if migration is necessary for your SCA implementation. This update does not alter the existing bundle ID. If you determine an update is necessary, see the help topic [Migrate SuiteCommerce Advanced](#) for instructions.

 **Note:** For more information on updates to this release, see the help topic [Patches and Upgrades](#).

The following SuiteApps are available:

SuiteApp	Bundle ID
SuiteCommerce (Includes SuiteCommerce MyAccount)	369366
SuiteCommerce Advanced 2021.1.7	375099

Other important bundles include:

SuiteApp	Bundle ID
SuiteCommerce Configuration	311614
SuiteCommerce Extension Management	374045
SuiteCommerce Base Theme	375075
SuiteCommerce Google Tag Manager Editor	250341
Reference Product Lists Records	53051

Explore the following release notes:

- [2021.1.0 Release SC/SCA/SCMA](#)
- [2021.1.x Minor Releases](#)

2021.1.0 Release SC/SCA/SCMA

 **Applies to:** SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount

The 2021.1.0 major release includes the following features and enhancements:

- [Reorder Items on Your SuiteCommerce MyAccount Site](#)
- [Manage Subscriptions Using Commerce Websites](#)
- [SuiteCommerce Developer Tools Require Token-Based Authentication](#)
- [Extensibility API Updates](#)
- [Configuration Changes](#)
- [Node.js Requirement Change](#)

- [Third-Party Library Updates](#)
- [Issue Fixes](#)

These enhancements typically apply to SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced; however, some features could apply to a subset of each. The following enhancements explain the implementations to which they apply.

Reorder Items on Your SuiteCommerce MyAccount Site

Applies to: SuiteCommerce MyAccount

With the 2021.1 release, website users can reorder a previously ordered item using SuiteCommerce MyAccount. Website users access their Reorder Items page using the site's My Account application. The Reorder Items page lets logged in users view basic information about items they have previously ordered including product name, last purchased date, and price.

Enable the Reorder Items feature to give website users the option to reorder past purchases.

For more information, see the help topic [Reorder Items](#).

Manage Subscriptions Using Commerce Websites

Applies to: SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

With the 2021.1 release, website users can view and manage their existing subscription services using the site's My Account application. Subscriptions for Commerce websites lets website users perform some subscription-management tasks typically handled by company employees through the NetSuite interface. Users can also view and manage non-inventory items.

SuiteBilling Subscriptions for Commerce websites integrates with NetSuite's SuiteBilling feature. Enable SuiteBilling to use SuiteBilling Subscriptions. You can create subscription plans, price books, price plans, and billing accounts through SuiteBilling. After SuiteBilling setup is complete, you can configure several key options to control what a site user can change via the Subscriptions for Commerce websites user interface.

For more information, see the help topic [SuiteBilling Subscriptions for Commerce Websites](#).

SuiteCommerce Developer Tools Require Token-Based Authentication

Applies to: SuiteCommerce, SuiteCommerce Advanced, and SiteBuilder

All versions of the SuiteCommerce Developer Tools, including the Extension, Theme, and SuiteCommerce Advanced command-line tools, now require token-based authentication when connecting to NetSuite. Starting with NetSuite release 2021.1.0, the developer tools no longer accept user credentials for authentication with NetSuite. This change is required for compliance with the Mandatory Two-Factor Authentication (2FA) policy for Administrators and other highly privileged roles. For more information, see the help topic [Token Based Authentication](#).

For SuiteCommerce Advanced and SiteBuilder implementations, apply a patch to prepare your installation for token-based authentication as described in [Enable Token-Based Authentication](#).

Extensibility API Updates

The 2021.1.0 release of SuiteCommerce includes new components as well as updates to existing components:

Search – The Search component is a new component in release 2021.1. It enables you to get the base URL of the Item Search API. You can pass in a number of parameters, which are attached as querystring parameters to the returned URL.

Environment – The Environment component includes two new methods to register trackers in the application (`addTracker()`) and to trigger custom events (`triggerEvent()`). Trackers enable you to do something in response to application events such as cart updates, page views, or the completion of a transaction. You define a tracker as an object with application events as properties and a function as a value of the property. Custom events can be triggered with the new method `triggerEvent()`. Define custom events in a tracker object and register them with `addTracker()`. Then trigger the custom event elsewhere in the extension to invoke the function.

UserProfile – Retrieve credit card details with the new method `getCreditCards()` in the UserProfile component. This method returns an array of all credit cards of the visitor currently logged in to your SuiteCommerce web store. Credit card information includes data such as the card holder name, card number, and expiration date.

Cart – The following new methods are available in the Cart component in this release:

- `getLatestAddition()` - Retrieves information about the item that was last added to the cart.
- `setPurchaseOrderNumber()` and `getPurchaseOrderNumber()` - These methods enable you to set a purchase order number on the order and retrieve the purchase order number if it is already set.
- `setShipMethod()` - Sets the shipping method on the order.
- `setTransactionBodyField()` - Lets you set the value of a custom transaction body field.

See the [Extensibility API reference](#) for detailed information about the updates to these components.

Configuration Changes

Applies to: SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

The following configuration properties have been added with the 2021.1.0 release. Refer to the appropriate section for more information.

Property Label (SuiteCommerce Configuration Record)	Property ID	More Information	Property Location (SuiteCommerce Configuration Record Tab > Subtab)
Allow user to reorder items	myAccountPreferences.reorderEnabled	Allow User to Reorder Items	My Account > Preferences
Subscription line status change	subscriptions.lineStatusChange	Subscription Line Status Change	My Account > Subscriptions
Allow the user to cancel/suspend required lines	subscriptions.allowToCancelSuspendRequiredLines	Allow the User to Cancel/Suspend Required Lines	My Account > Subscriptions
Subscription general status change	subscriptions.generalStatusChange	Subscription General Status Change	My Account > Subscriptions
Disallow the user to upgrade quantity	subscriptions.disallowUpgradeQuantity	Disallow the User to Upgrade Quantity	My Account > Subscriptions
Disallow the user to downgrade quantity	subscriptions.disallowDowngradeQuantity	Disallow the User to Downgrade Quantity	My Account > Subscriptions
List of translations	extraTranslations.en_AU extraTranslations.en_CA	Translations Subtab	Multi-Domain > Translations

Property Label (SuiteCommerce Configuration Record)	Property ID	More Information	Property Location (SuiteCommerce Configuration Record Tab > Subtab)
	extraTranslations.en_GB extraTranslations.fi_FI extraTranslations.id_ID extraTranslations.nb_NO extraTranslations.vi_VN		

Node.js Requirement Change

Applies to: SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

With the 2021.1.0 release, the developer tools have been modified to support Node.js version **12.21.0**. To use the Theme, Extension, or core SCA 2021.1 developer tools, you must update Node.js to this version.

For more information, see the help topic [Install Node.js](#).

Third-Party Library Updates

Applies to: SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

With the 2021.1.0 release, the following third-party libraries have been removed:

- almond
- require.js

No other library updates have been made for this release.

Issue Fixes

Applies to: SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

The 2021.1.0 release includes all minor release fixes, improvements, and security updates of the previous release. See [2020.2.x Minor Releases](#) for details.

2021.1.x Minor Releases

Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount

Refer to the following minor release notes for the latest updates to SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced:

- [2021.1.7 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced](#)
- [2021.1.6 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced](#)
- [2021.1.5 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced](#)
- [2021.1.4.1 Minor Release of SuiteCommerce and SuiteCommerce Advanced](#)

- [2021.1.4 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced](#)
- [2021.1.3 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced](#)
- [2021.1.2 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced](#)
- [2021.1.1 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced](#)

2021.1.7 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

Fixes

- Fixed an issue where the URL gclid parameter was being removed when using the setDisplay function of the Extensibility API.
- Fixed an issue where an item with a free gift promotion was reverting from a pickup in store to a shipping delivery method.

2021.1.6 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

Fixes

- This release provides updates affecting background processing in NetSuite but does not impact the end user.

2021.1.5 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

Fixes

- Fixed an issue where recently viewed items were not displayed in the customer's Shopping Cart page.
- Fixed an issue where discounts were not being applied to the customer's subtotal, total, or final payment of an invoice.
- Fixed an issue where only four items were displayed in dropdown search results.
- Fixed an issue where the status column on the Quotes page displayed incorrect values.

2021.1.4.1 Minor Release of SuiteCommerce and SuiteCommerce Advanced

Fixes

- Fixed an issue where customers received the following error when attempting to checkout as Guest: **NOT ALLOWED - Sorry you have no permission to view this page**. This issue occurred when **Customer Registration** was configured as **Disabled** on the Website record.

2021.1.4 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

Fixes

- Fixed an issue with the Store Locator feature causing Google Maps to display the incorrect store location.

2021.1.3 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

Fixes

- Fixed an issue in My Account where the **Back** and **Submit** buttons were disabled and customers could not edit and submit their credit card payment information.
- Fixed an issue in My Account preventing the language selector from displaying.
- Fixed an issue with Extension Management to include item options in query parameters so that URLs can update without reloading the page.
- Fixed a permissions issue that prevented customers from viewing their transaction history on the web store.
- Fixed an issue to prevent related items from overlapping on the Product Details Page.
- Fixed an issue that caused a number of strings in the My Account menu items area not to be translated.

2021.1.2 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

Fixes

- Fixed an issue preventing the SuiteCommerce Extension Manager from functioning as expected when used with 2020.2 and earlier versions of SuiteCommerce Advanced.
- Fixed an issue preventing the EN_CA translation key from displaying in the Translations subtab of the SuiteCommerce Advanced Multi-Domain configuration tab.
- Fixed an issue preventing Terms and Conditions from displaying for Invoice payments during checkout.
- Fixed an issue preventing items added to the shopping cart from displaying when the SuiteCommerce domain configuration includes an integration with Google Tag Manager.

2021.1.1 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

Fixes

- Fixed a SuiteCommerce Extension Manager issue preventing the extension developer tools from creating a list of available extensions to fetch when running `gulp extension:fetch`.
- Fixed a SuiteCommerce Extension Manager issue preventing the SCDeployer role from authenticating properly when fetching from or deploying to NetSuite using the theme or extension developer tools.

- Other minor, internal fixes and improvements.

2020.2 Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount

Welcome to the 2020.2 release of SuiteCommerce, SuiteCommerce My Account, and SuiteCommerce Advanced (SCA)!

Important: Many of the features and enhancements in this release have dependencies on NetSuite 2020.2. You must implement this release in a **2020.2** NetSuite account.

The 2020.2.0 release incorporates periodic updates to the application. Refer to the following release notes for updates included in the major release and any subsequent minor releases. How you use these release notes depends on your web store:

- SuiteCommerce** and **SuiteCommerce MyAccount** – These changes apply to your account automatically according to a scheduled update. Use these release notes as an informative guide to understand the changes applied to your account.
- SuiteCommerce Advanced** – You must manually migrate your web store to the latest minor release to incorporate these changes. Use these release notes to determine if migration is necessary for your SCA implementation. This update does not alter the existing bundle ID. If you determine an update is necessary, see the help topic [Migrate SuiteCommerce Advanced](#) for instructions.

Note: For more information on updates to this release, see the help topic [Patches and Upgrades](#).

The following SuiteApps are available:

SuiteApp	Bundle ID
SuiteCommerce (Includes SuiteCommerce MyAccount)	356230
SuiteCommerce Advanced 2020.2.7	356248

Other important bundles include:

SuiteApp	Bundle ID
SuiteCommerce Configuration	311614
SuiteCommerce Extension Management	343577
SuiteCommerce Base Theme	343576
SuiteCommerce Google Tag Manager Editor	250341
Reference Product Lists Records	53051

Explore the following release notes:

- [2020.2.0 Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced](#)
- [2020.2.x Minor Releases](#)

2020.2.0 Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

📘 Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount

The 2020.2.0 major release includes the following features and enhancements:

- [SuiteCommerce Advanced Ends Support for Internet Explorer 9](#)
- [Measuring Performance of Commerce Websites](#)
- [Extension Manager Displays Automated Activations](#)
- [Provide Translations in Custom Themes and Extensions](#)
- [Enable Strike-Through Price Display for Configured Items](#)
- [Hide the Add to Cart Button](#)
- [Extensibility API Updates](#)
- [Configuration Changes](#)
- [Field Set Changes](#)
- [Node.js Requirement Change](#)
- [Third-Party Library Updates](#)
- [Issue Fixes](#)

The enhancements listed herein typically apply to SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced; however, some features could apply to a subset of each. The following enhancements explain the implementations to which they apply.

SuiteCommerce Advanced Ends Support for Internet Explorer 9

Applies to: SuiteCommerce Advanced

As of December 2020, SuiteCommerce Advanced web store implementations no longer support the use of Internet Explorer 9. Support for IE9 and older is discontinued for all versions of SuiteCommerce Advanced. Discontinued support of IE9 does not mean that your Commerce web store will crash on IE9 users. However, it does mean that IE 9 users may experience unexpected behaviors. For more information, see the help topic [Supported Browsers for Commerce Websites](#).

Measuring Performance of Commerce Websites

Applies to: SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

The new SuiteCommerce Application Performance Management (APM) SuiteApp measures the performance of your SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced (SCA) websites. The SuiteApp is now available for SuiteCommerce and SCA implementations of 2020.1.1 release and later.

You can use SuiteCommerce APM to view content display times and view counts filtered according to page type, device, or navigation type. Web store managers can use SuiteCommerce APM to monitor

website metrics that can contribute to performance issues. Administrators can use the SuiteApp to find the causes of performance issues and investigate specific actions and timing.

SuiteCommerce APM includes the following dashboards:

- **SuiteCommerce Performance Dashboard** – Serves as the starting point for investigating potential concerns. View high-level information about the SuiteCommerce SuiteApp in use, trends in view counts, and statistics for each page type and action on your website.
- **SuiteCommerce Page Type Diagnostics** - View detailed timing and view counts of specific web and modal addresses on the page type that you want to investigate. Use this dashboard to view detailed page data during specific times.
- **SuiteCommerce Action Diagnostics** - View information about actions that users performed on the website and domain that you want to investigate. Use this dashboard to view detailed performance data about actions performed on the site.

SuiteCommerce APM is a managed SuiteApp. After you install it, updates and enhancements are pushed automatically to your account. You do not need to update it manually.

For more information, see the help topic [Application Performance Management \(APM\) for Commerce](#).

 **Note:** Some tables found in SuiteCommerce APM include links to pages available with the APM SuiteApp. To open these pages, you must first install the APM SuiteApp. For more information, see the help topic [Application Performance Management \(APM\)](#).

Extension Manager Displays Automated Activations

Applies to: SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

With the 2020.2.0 release, the Extension Manager has been modified to include a new **Activated By** column. This new column displays either:

- The ID of a bundle that automatically activated the extension during installation.
- The ID of a user within the current account who activated the extension.

When an extension has been automatically activated by a specific bundle, you can click the **View Info** link next to the bundle ID to learn more about the activation.

For more information, see the help topic [Extension Manager Overview](#).

Provide Translations in Custom Themes and Extensions

Applies to: SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

With the 2020.2.0 release, developers can provide translations for the text and templates included in their customizations. Developers can add .json translation files for one or more languages to any extension or theme and then apply those translations to their Commerce website. Developers can also translate other text in each Commerce application, Shopping, My Account, or Checkout, if they need to update areas of the user interface that are related to their customizations.

 **Note:** Currently, translations included in themes and extensions cannot be tested locally. This capability will be supported in a future release.

For more information, see the help topic [Include Translations in Themes](#).

Enable Strike-Through Price Display for Configured Items

Applies to: SuiteCommerce and SuiteCommerce Advanced

The 2020.2.0 release introduces support for strike-through pricing.

With strike-through pricing enabled, your site displays lower prices set on particular items for particular customers next to the higher default prices. The higher default prices display with a strike through them so customers can immediately see the reduced prices they are being offered on configured items.

For more information, see the help topic [Strike-Through Pricing](#).

Commerce Frontend Module Updates

Applies to: SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

The 2020.2.0 release includes updates to some frontend modules. For example, the name of the SC.Configuration frontend module has been changed to Configuration. The way in which Footer.View and other frontend modules are exported has also been changed. These updates will not affect most implementations. However, they may cause issues for customizations developed in a way other than as recommended via the Extensibility framework.

If your implementation includes customizations that were achieved in a way other than as recommended:

- SuiteCommerce and SuiteCommerce MyAccount implementations: Check your customizations for potential issues when SuiteCommerce 2020.2.0 is released.
- SuiteCommerce Advanced implementations: Test these types of cutomizations before upgrading to 2020.2.0.

Hide the Add to Cart Button

Applies to: SuiteCommerce and SuiteCommerce Advanced

The 2020.2.0 release supports a new Personalized Catalog Views (PCV) feature letting you hide the Add to Cart button based on one or more customer segments.

If you use Personalized Catalog Views on SuiteCommerce or SuiteCommerce Advanced 2020.2 or later, the Add to Cart button in your web store can be hidden for one or more customer segments.

To configure the button's visibility, use the Website Visibility Level options available in Customer Segments Manager. There are two visibility options:

- Display Fully - members of customer segments with this visibility level are able to see all items in the item segment and are able to add them to their shopping carts.
- Disable Purchase - members of customer segments with this visibility level are able to see all items in the item segment but they cannot add them to their shopping carts.

Note: The Disable Purchase option will come into effect on the website after you have upgraded to the 20.2 release of SuiteCommerce or SuiteCommerce Advanced. Do not use the Disable Purchase website visibility level prior to this upgrade.

A third visibility option, Hide Fully, is available only for the Unmapped Items item segment. This item segment contains all items that are not mapped to a customer segments. You can use the visibility options to define whether these items should be displayed to or hidden from all users.

For more information, see the help topic [Managing which Customer Segments can Access Item Segments](#).

Extensibility API Updates

Applies to: SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

The 2020.2.0 release introduces several new components to the SuiteCommerce Extensibility API. The new components are designed to help you work with views in a SuiteCommerce extension. Use `SCView` to create new views and child views, use `SCCollectionView` to display collections of elements, and use `SCFormView` to work with form data and validation.

SCView

`SCView` is a new component that builds on `Backbone.View`. It provides methods that enable you to get and validate context data required by views, define events in views, and retrieve JSON-LD.

Important: Starting with the 2020.2 release of SuiteCommerce, you should now use `SCView` in your extensions instead of `Backbone.View`. `SCView` extends from `Backbone.View`, inheriting all its methods and properties. `SCView` also provides additional methods specific to SuiteCommerce.

For more information, see the [extensibility API reference](#).

SCCollectionView

The `SCCollectionView` component provides an abstract class (`SCCollectionView`), which enables you to display a collection of elements, usually in a grid pattern. Use this component when you want to modify how multiple items are displayed on the page.

For more information, see the [extensibility API reference](#).

SCFormView

`SCFormView` provides functions to validate form data and save the form data to the associated model. With `SCFormView`, you can perform type checking on input data before it is validated and saved to the model. `SCFormView` includes several methods that let you control the behavior of form validation and submission.

For more information, see the [extensibility API reference](#).

Deprecation of Backbone.Model, Backbone.View, and Backbone.Collection

Applies to: SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

With the 2020.2.0 release, usage of the following Backbone.js modules is now considered deprecated in the SuiteCommerce extensibility API. Use the following SuiteCommerce components instead of the equivalent native Backbone modules. See the [extensibility API reference](#) for more information about the SuiteCommerce components.

Do Not Use	Use	Available Since
Backbone.View	SCView	2020.2 and later
Backbone.Model	SCModel	2020.1 and later
Backbone.Collection	SCCollection	2020.1 and later

Configuration Changes

Applies to: SuiteCommerce and SuiteCommerce Advanced

The following configuration properties have been added with the 2020.2.0 release. Refer to the appropriate section for more information.

Property Label (SuiteCommerce Configuration Record)	Property ID	More Information	Property Location (SuiteCommerce Configuration Record Tab > Subtab)
Enable strike-through behavior	priceLevel.enabled	Enable Strike-Through Behavior	Shopping Catalog
Default price level	priceLevel.default	Default Price Level	Shopping Catalog

Field Set Changes

Applies to: SuiteCommerce and SuiteCommerce Advanced

With the 2020.2.0 release, the Field Set Setup Script was updated to add the following field sets. Field IDs:

- ispricevisible
- ispricevisible_detail
- ispurchasable_detail
- isdisplayable_detail

Applied to the following Field sets:

- search
- details
- matrixchilditems
- matrixchilditems_search
- correlateditems
- relateditems
- order
- typeahead
- itemssearcher

These fields are required to support updates to the Personalized Catalog Views feature included with this release. New customers must run the Field Set Setup Script when setting up their site. Existing SuiteCommerce customers should automatically receive the corrected field sets with the 2020.2.0 update. If you are migrating your SCA implementation, you should add these field sets manually.

For more information, see the help topic [Initial Field Sets for SuiteCommerce and SuiteCommerce Advanced](#).

Node.js Requirement Change

Applies to: SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

With the 2020.2.0 release, the developer tools have been modified to support Node.js version **12.16.3**. To use the Theme, Extension, or core SCA 2020.2 developer tools, you must update Node.js to this version.

For more information, see the help topic [Install Node.js](#).

Third-Party Library Updates

Applies to: SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

The following third-party libraries have been updated with the 2020.2.0 release. Library version information is also shown in the `distro.json` file. Ensure that any themes and extensions using these libraries are compatible with the update and make any appropriate changes. If you are migrating SCA to this release, ensure that no deprecated methods exist in your implementation before migrating.

Library	Old Version	New Version
almond	0.3.3*	0.3.3 (using standard version)
bootstrap-datepicker	1.8.1	1.9.0
jQuery	3.4.1*	3.5.1*
sass.js	0.10.10	0.11.1*
underscore.js	1.9.1	1.10.2*

*customized version

Issue Fixes

Applies to: SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

The 2020.2.0 release includes all minor release fixes, improvements, and security updates of the previous release, including:

- 2020.1.11.1 Fixes
 - Issue causing "Please select a credit card" error message to display instead of the Review Your Order page when shoppers click the Back button on the Checkout page. This issue was isolated to web sites configured for One Page Checkout and shoppers with terms included on their customer records.
 - Issue preventing auto-population of credit card street and zip code information on the Billing tab for a Sales order due to AVS Street Match and AVS Zip match failing with an "Unsupported by processor" error. This issue was isolated to sites where the Payment Instruments feature was enabled for payment processing.
- 2020.1.10 Fixes
 - Issues when clicking **I want to ship to multiple addresses** using one-page checkout. This issue resulted in blank shipping and delivery method sections, relying on the shopper to click **Continue** to redirect to the correct flow.
- 2020.1.9 Fixes
 - Issue creating two Item Search API calls for `relateditems_details` and `correlateditems_details`.
 - Issue causing the Cart to sort items by Internal ID, not according to sequence when added to the Cart, as expected.
 - Issue preventing matrix item images from zooming on mouse over.
 - Issue causing a shopper's Purchase History to display a purchased quantity of 1, regardless of the actual quantity ordered.
- 2020.1.8 Fixes

- Issue preventing users from sorting product reviews with multiple pages.
 - Issue preventing credit card authentication process during checkout on websites with 3D Secure 2.0 enabled.
 - Issue triggering an incorrect Google Tag Manager **SearchItem-end** event.
- 2020.1.7 Fixes
 - Issue causing the shipping method to continuously reload after a user edits one of its fields during guest checkout.
 - Issue where enabling the **Same as shipping address** option during checkout causes removal of the name provided for the shipping address and failure to populate the billing address fields. This behavior was isolated to users logged in as Company customers.
- 2020.1.6 Fixes
 - Issue causing customer credit card information to be saved for open invoices paid from the My Account > Billing page when the **Save Credit Card Info by Default** preference is disabled.
 - Currency conversion issue causing the total amount of a customer's return authorization to be less than the amount from the original sales order.
 - Issue preventing mobile users from accessing the Save for Later page from their shopping cart.
- 2020.1.5 Fixes
 - Issue preventing users from removing, selecting, or adding a shipping address during checkout on sites configured for One-Page checkout flow.
 - Issue preventing multi-language sites from displaying the correct language on the Phone Number entry validation message. For example, a multi-language site properly configured for Japanese incorrectly displays, **Phone is required**, in English.
 - Issue preventing users from setting a default credit card on sites implementing the payment instruments feature.
- 2020.1.4 Fixes and Improvements
 - In the 2020.1.2 release of SuiteCommerce and SuiteCommerce Advanced, a new Security subtab was added to the Advanced tab of the Configuration Record. The Security subtab provides settings to control whether your site's pages can be rendered in a frame. For more information, see the help topic [Security Subtab](#). The default setting, which disallows framing by all domains other than your own, is now active. You should change the default if you want to continue to allow other domains to render pages in a frame.
 - Updated the jQuery JavaScript library to version 3.5.1.
 - Added an **Enable Zoom for Images** option to the Shopping Catalog Tab of the Configuration Record. This new option is enabled by default so that images in the Product Details Page and Quick View display at zoom size when a user hovers over them. For more information, see the help topic [Shopping Catalog Tab](#).
 - Updated SuiteCommerce and SuiteCommerce Advanced to ensure HTTP security headers are included in all SuiteCommerce and SuiteCommerce Advanced sites.
 - Issue causing the error message, **Please Provide a Billing Address**, to be displayed to customers who have provided a billing address during checkout in the One Page Checkout and Billing First flows.
 - Issue causing images that include a zoom size in the image resizing options to resize when a user hovers over them.
 - Issue that allows customers with Quote permissions to place an order and complete the checkout flow from the Quote Detail Page without selecting a billing address.
 - Issue preventing changes made to custom skins using the SMT Theme Skin Manager from being saved.

- Issue preventing customers from removing previously entered zip codes in the Estimate Tax and Shipping field during checkout.
 - Issue causing all associated images for a selected item to display at the same time on the Product Details Page or in the Quick View.
 - Extension Manager issue causing Font Awesome icons to display as question marks on sites that do not use UTF-8 character encoding.
- 2020.1.3 Fixes
 - Issue resulting in a blank My Account page for customers with more than 1000 invoices. As a result, you may see an error in the console such as: Uncaught SyntaxError: Unexpected token '<' on MyAccountEnvironment.Service.ssp.
 - Issue preventing multiple image scrolling on a product's details page after launching a modal window, such as might occur after clicking the **Add to Cart** button.
 - Product reviews issue resulting in no feedback or acknowledgement after the shopper selects yes or no when asked **Was this review helpful?**. As a result, you may see an error in the console such as: jQuery.Deferred exception: Cannot set property 'innerText' of undefined TypeError: Cannot set property 'innerText' of undefined.
 - Issue resulting in an incorrect message to the shopper. In this case, a shopper adding an item quantity that is unavailable receives a message alerting them to reduce their order and click a link. This issue displayed a URL for the link instead of text.
 - Issue preventing shoppers from accessing or editing payment methods when checking out (on webstores set up for one-page checkout) or when editing settings in My Account.
 - Issue customizing the LoginRegister.Register.View module using the Extension Developer Tools. Implementing the addToViewContextDefinition method results in the following error: INVALID_PARAM: The specified view_id ('LoginRegister.Register.View') is not valid for the current component or the callback is not a function.
- 2020.1.2 Fixes and Improvements
 - A new Security subtab has been added to the Advanced tab of the Configuration Record. The Security subtab provides settings to control whether your site's pages can be rendered in a frame. For more information, see the help topic [Security Subtab](#). The default setting disallows framing by all domains other than your own, so you need to change the default if you want to continue to allow other domains to render pages in a frame. The default setting is not yet active to ensure you have time to change it if needed. Monitor future release notes to learn when the new default setting is activated.
 - Issue causing customers who try to place an order from a Quote Detail page to be redirected to the Thank You page instead of the External Payment page.
 - Issue where enabling the Payment Instruments feature for your company causes blank pages to be displayed for users who try to access the My Account and Checkout pages.
 - Issue preventing cash sales made via SuiteCommerce InStore from displaying in Purchase History for My Account.
 - Issue preventing the cartView event being triggered on the Cart page in the Google Tag Manager data layer when using the Criteo service.
 - Issue causing product images to move to the left when viewing successive images using the zoom feature.
- 2020.1.1.1 Fixes
 - The OrderHistory and ReturnAuthorization modules have been rolled back to SuiteScript 1.0. Migration of these modules to SuiteScript 2.0 in SuiteCommerce/SuiteCommerce Advanced release 2020.1.0 caused unexpected issues with field sets.
 - Issue with instrumentation module negatively impacting SEO page generator.

- 2020.1.1 Fixes
 - Issue preventing the quantity number for an order displayed in My Account > Purchase History from matching the original quantity number.
 - Issue causing a missing Product Internal ID in the data layer communicating to Google Tag Manager on product-related events, such as productList and productView.
 - Issue involving http 301 responses (permanent URL redirection) resulting in the following error: **ERR_TOO_MANY_REDIRECTS**. This occurred when the URL for an item contained multiple URL fragments.
 - Issue causing external payment methods to fail, resulting in the following message: **Payment method is not supported for this gateway**.
 - Issue preventing pending or partially paid invoices from displaying in the **Invoices** menu of My Account.
 - One-page checkout issue resulting in both the shipping and billing addresses defaulting to one address after shoppers enter two separate addresses (**Same as Shipping** option remains unchecked).
 - Issue causing the following error when using the SC Inventory Display extension:
QuotaExceededError: DOM Exception 22: An attempt was made to add something to storage that exceeded the quota. This error occurred on secure domains with CDN enabled.

2020.2.x Minor Releases

① **Applies to:** SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount

Refer to the following minor release notes for the latest updates to SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced (and any related SuiteApps):

- [2020.2.7 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced](#)
- [2020.2.6 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced](#)
- [SuiteCommerce Extension Management SuiteApp \(2020.2.3\)](#)
- [2020.2.5 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced](#)
- [2020.2.4 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced](#)
- [2020.2.3 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced](#)
- [2020.2.2 Minor Release of SuiteCommerce and SuiteCommerce Advanced](#)
- [2020.2.1 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced](#)

2020.2.7 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

Fixes

- This release provides updates affecting background processing in NetSuite but does not impact the end user.

2020.2.6 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

Fixes

- Fixed an issue allowing Guest shoppers to erroneously checkout and submit purchases when the **Customer Registration** field is set to **Required** on the Web Site Setup record.
- Fixed an issue on SuiteCommerce Advanced sites causing a blank page to display instead of an expected order placement confirmation.

SuiteCommerce Extension Management SuiteApp (2020.2.3)

Fixes

- Fixed a SuiteCommerce Extension Manager issue that caused a blank shopping page to display when testing an extension on a local server with the `gulp extension:local` command.
- Fixed a SuiteCommerce Extension Manager issue that caused unexpected errors to occur when deploying an extension using a saved authentication token with the `gulp extension:deploy --to` command.
- Fixed a SuiteCommerce Extension Manager issue that caused unexpected errors to occur when deploying an extension using the 2018.2.1 developer tools.

2020.2.5 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

Enhancements

- Moved field locations to give SuiteCommerce MyAccount (SCMA) administrators access to configure field IDs for transaction records on the customer webstore. SCMA administrators did not have access to the configuration settings on the **Shopping Catalog** tab > **Item Options** subtab.

The **Show only items listed in: item options and custom transaction column fields** checkbox and the **Item options and custom transaction column fields** configuration fields have moved from this location to the **Advanced** tab > **Items Options** subtab. The **Item Options** subtab under the **Shopping Catalog** tab is renamed **Item Options Templates**.

- Fixed **Out of Stock Behavior** that was not honored when set to "Disallow backorder but display out of stock message." Out of stock items went into backorder when the **Multi-Location Inventory** and **Make Inventory on Web Site** features were enabled.

Fixes

- Fixed an issue where the gift wrapping price was not included on the transaction record.
- Fixed a page loading error where the loading icon did not display and it was unclear that the page was loading.
- Fixed an issue where token-based authentication was not supported for sandbox accounts.
- Fixed an issue to remove memorized sales orders (transactions set up to recur in the future) from the list of transactions displayed in My Account.

2020.2.4 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

Enhancements

Theme and extension developer tools have been updated to support token-based authentication when connecting with NetSuite. This update is required so that the Commerce developer tools, including the extension, theme, and SuiteCommerce Advanced command-line developer tools, are compliant with the mandatory 2FA policy for NetSuite administrators and other highly privileged roles. Commerce developer tools will no longer accept NetSuite user credentials for authentication with NetSuite and instead will require token-based authentication.

For SuiteCommerce implementations, you should download and set up the most recent version of the theme and extension developer tools as described in the [Set Up the Developer Environment](#) topics. The updated developer tools require tokens when connecting with NetSuite. For more information about using token-based authentication, see the help topic [Token Based Authentication](#).

For SuiteCommerce Advanced implementations, you need to apply a patch to prepare your installation of SuiteCommerce Advanced to use token-based authentication. Successful completion of the patch is required before continuing to use the developer tools. Be sure to follow the patch instructions appropriate for the version of SuiteCommerce Advanced you have implemented. See the help topic [Enable Token-Based Authentication](#) for details. After successfully completing the patch, you need to supply tokens for developer tool authentication when connecting with NetSuite. For more information about using token-based authentication, see the help topic [Token Based Authentication](#).

Fixes

- Issue preventing multi-language translations, as entered on the SC Configuration record, from translating on the website (**Multi-Domain** tab, **Translations** subtab).
- Issue preventing users from adding Maestro credit cards as valid payment methods using the My Account interface on the site.
- Issue causing inconsistencies for items with multiple images. After users add an item to the cart and continue shopping on the site, the item details page displays incorrect images when users click on other product items.
- Issue causing the site to display a blank page when users with over 1000 open invoice records attempt to view invoices in My Account.

2020.2.3 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

Fixes

- Issue with multi-language-enabled sites preventing the **Log In** button from appearing on the Product Details Page (PDP) or Product Listing Page (PLP) when the default language is set to English (CA).
- Issue causing an internal error when attempting to visit a non-existing page on the website. Corrected behavior is a message stating **Page Not Found**.
- Issue with gift certificates preventing a confirmation email being sent to the shopper when purchasing a gift certificate.
- Issue with support cases. When shoppers selected **I want to use another email address for this case** and entered a new address, email replies associated with the case were sent to the wrong address.

2020.2.2 Minor Release of SuiteCommerce and SuiteCommerce Advanced

Fixes

- Fixed an issue causing out-of-stock items to appear as hidden, but still return as available. This issue occurred when shoppers attempted to reorder items from My Account > Order History or My Account > Orders > Reorder Items and the items were out of stock.
- Fixed an issue in checkout causing the **Same as Shipping** check box to be selected with no way to clear the selection.

2020.2.1 Minor Release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced

Fixes

- Added a new Extensions subtab to the Advanced Tab of the Configuration Record. The new Extensions subtab includes an **Extensibility Layer Safe Mode** option. Enabling this option is recommended so that you are aware of extensions developed in a way other than as recommended via the Extensibility API layer and can take action to revise them. When enabled, this option causes a notification to display in the web browser console at runtime when an extension that directly customizes or imports private core modules is being loaded into your site. An error is generated when an extension customizes or imports a core module that is disallowed. A warning is generated when an extension customizes or imports a core module that is allowed for now, but will be disallowed in the future. For more information, see the help topic [Extensibility Layer Safe Mode](#).
- Fixed an issue preventing customers from disabling the **Same as Shipping Address** option for the Billing Address during checkout.
- Fixed an issue causing 404 errors for CMS landing pages and CMS zones to display without content when the **Multi-Language** option is disabled for a company.

2020.1 Release of SuiteCommerce and SuiteCommerce Advanced

 **Applies to:** SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount

Welcome to the 2020.1 release of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced!

Important: Many of the features and enhancements in this release have dependencies on NetSuite 2020.1. You must implement this release in a **2020.1** NetSuite account.

The 2020.1 releases of SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced (SCA) incorporate periodic updates to the application, as described below. Refer to the following release notes for updates included in the major release and any subsequent minor releases. How you use these release notes depends on your web store:

- **SuiteCommerce** – These changes apply to your account automatically according to a scheduled update. Use these release notes as an informative guide to understand the changes applied to your account.

- **SuiteCommerce Advanced** – You must manually migrate your web store to the latest minor release to incorporate these changes. Use these release notes to determine if migration is necessary for your SCA implementation. This update does not alter the existing bundle ID. If you determine an update is necessary, see the help topic [Migrate SuiteCommerce Advanced](#) for instructions.

The following SuiteApps are available:

SuiteApp	Bundle ID
SuiteCommerce (Includes SuiteCommerce MyAccount)	311589
SuiteCommerce Advanced 2020.1.12	311390

Other important bundles include:

SuiteApp	Bundle ID
SuiteCommerce Configuration	311614
SuiteCommerce Extension Management	317001
SuiteCommerce Base Theme	317888
SuiteCommerce Google Tag Manager Editor	250341
Reference Product Lists Records	53051

Explore the following release notes:

- [2020.1.0 Release of SuiteCommerce and SuiteCommerce Advanced](#)
- [2020.1.x Minor Releases](#)

2020.1.0 Release of SuiteCommerce and SuiteCommerce Advanced

Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount

The 2020.1.0 major release of SuiteCommerce and SuiteCommerce Advanced (SCA) includes the following features and enhancements:

The following features will be available in the upcoming 2020.1 release of SuiteCommerce and SuiteCommerce Advanced:

- [Introducing SuiteCommerce MyAccount](#)
- [3D Secure 2.0 Support](#)
- [JSON-LD Structured Data Markup](#)
- [Internet Explorer 9 and 10 No Longer Supported](#)
- [Extensibility API Updates](#)
- [Extension Manager Support for SuiteScript 2.0 Services](#)
- [Conditional Display of Configuration Record Groups and Subtabs](#)
- [Commerce Module Migration to SuiteScript 2.0](#)

- [Commerce Module Migration to TypeScript](#)
- [Configuration Changes](#)
- [Node.js Requirement Change](#)
- [Third-Party Library Updates](#)

These enhancements apply to all Commerce web stores; however, some might apply to SuiteCommerce Advanced only. Each of the following enhancements explains the implementations to which they apply.

Introducing SuiteCommerce MyAccount

SuiteCommerce MyAccount is a new self-service web portal where website users manage account information, view recent orders, and pay for invoices. SuiteCommerce MyAccount helps SuiteCommerce customers who desire an online, customer-facing account management dashboard, but do not require shopping or checkout applications.

SCMA includes various features and information in the My Account area of your site:

- Purchases area, including information about current and past purchases and the ability to request returns or refunds
- Request Quotes
- Billing information, including account balances, invoices, transaction history, and printable statements
- Account settings, such as email preferences, password management, and so on.
- Support case management

SuiteCommerce MyAccount leverages the same architecture that drives SuiteCommerce implementations. This means that extensions and themes are available to help customize your experience. You can also use Site Management Tools (SMT) to customize your site.

SuiteCommerce MyAccount requires installing the following SuiteApps:

- SuiteCommerce
- SuiteCommerce Extensions Management
- SuiteCommerce Base Theme
- SuiteCommerce Configuration

For more information on SuiteCommerce MyAccount, see the help topic [SuiteCommerce MyAccount Overview](#).

3D Secure 2.0 Support

With the 2020.1.0 release of SuiteCommerce and SuiteCommerce Advanced, 3D Secure 2.0 is supported in the checkout flow of Commerce websites. For a transaction to be processed using 3D Secure 2.0, the issuer of the credit card and the payment gateway must also support 3D Secure 2.0.

3D Secure 2.0 meets the requirements of Strong Customer Authentication per European directive PSD2.

JSON-LD Structured Data Markup

The 2020.1.0 release of SuiteCommerce and SuiteCommerce Advanced implements JSON-LD structured data markup to automatically add structured data to the HTML header sections of product detail pages (PDPs). Major search engines use structured data markup to provide detailed information about a page and enhance search results. Product list pages do not include the JSON-LD markup.

For more information about the properties included in the markup, see the help topic [Structured Data Markup](#).

Internet Explorer 9 and 10 No Longer Supported

With the 2020.1.0 release of SuiteCommerce and SuiteCommerce Advanced, implementations no longer support Internet Explorer (IE) 10 and earlier. Since January 12, 2016, Microsoft no longer provides security updates or technical support for IE 10 and earlier.

Because IE 10 may cause breaking changes on SuiteCommerce and SuiteCommerce Advanced sites and users may be exposed to security vulnerabilities, do not use IE 10 and earlier. Install, and direct your customers to install, a currently supported browser version.

For more information, see the help topic [Supported Browsers for Commerce Websites](#).

Extensibility API Updates

New Method in Visual Component to Modify JSON-LD of Views

With the 2020.1.0 release of SuiteCommerce and SuiteCommerce Advanced, the Visual component in the Extensibility API has been updated with a new method (`modifyViewJsonLd()`), which lets you modify the JSON-LD associated with a view. This method supports the JSON-LD Structured Data Markup feature.

If your extension modifies the data shown in a view, you should update the JSON-LD to ensure the view and the JSON-LD embedded on the page are consistent. Use `modifyViewJsonLd()` to add, remove, or change the JSON-LD data before the view is rendered.

More information about this method is available in the [Extensibility API Reference](#).

SCModel and SCCollection Components

The 2020.1.0 release of SuiteCommerce and SuiteCommerce Advanced introduces two new components to work with models and collections: `SCModel` and `SCCollection`. These components extend their native equivalents in Backbone.js, specifically `Backbone.Model` and `Backbone.Collection`. Both components are written in TypeScript and inherit all their respective Backbone.js methods and properties. In extensions built on SuiteCommerce or SuiteCommerce Advanced 2020.1 and later, you should use these new components instead of `Model` and `Collection` in Backbone.js.

More information about these components is available in the [Extensibility API Reference](#).

Extension Manager Support for SuiteScript 2.0 Services

With the 2020.1.0 release of SuiteCommerce and SuiteCommerce Advanced, the Extension Manager has been modified to support extensions that include SuiteScript 2.0 services. These updates include the addition of SuiteScript 2.0 as a supported file type when creating a baseline extension and additional modules using the extension developer tools.

For more information, see the help topics [Create a Baseline Extension](#) and [Create Additional Modules for an Extension](#).

Conditional Display of Configuration Record Groups and Subtabs

With the 2020.1.0 release of SuiteCommerce and SuiteCommerce Advanced, developers can add additional metadata to module and extension JSON configuration files to control the display of SuiteCommerce Configuration groups (tabs) and subtabs. For more information, see the help topic [Conditional Display of Groups and Subtabs](#).

Commerce Module Migration to SuiteScript 2.0

The 2020.1.0 release of SuiteCommerce and SuiteCommerce Advanced includes progress made in ongoing efforts to migrate source code to SuiteScript 2.0. The effort to leverage the benefits of SuiteScript 2.0 spans multiple releases and will ultimately enable Commerce application developers to interact with core NetSuite records in a unified way. In this release, the following My Account modules have been refactored to use SuiteScript 2.0:

- OrderHistory
- ReturnAuthorization
- StoreItem
- Transaction
- TransactionHistory

All other modules remain compatible with SuiteScript 1.0 and the Commerce API at this time.

For more information, see the help topic [Commerce Migration to SuiteScript 2.0](#).

Commerce Module Migration to TypeScript

The 2020.1.0 release of SuiteCommerce and SuiteCommerce Advanced continued code migration from JavaScript to TypeScript. In this release, two new bases classes were implemented using TypeScript:

- Collection
- Models

In addition, the following code was migrated to TypeScript:

- Utils.ts
- Case.Model
- Case.Collection

For more information, see the help topic [TypeScript](#).

Important: This migration applies to core SuiteCommerce and SuiteCommerce Advanced source code only and does not apply to Commerce theme and extension development.

Configuration Changes

The following configuration properties have been added with the 2020.1.0 release of SuiteCommerce and SuiteCommerce Advanced. Refer to the appropriate section for more information.

Property Label (SuiteCommerce Configuration Record)	Property ID	More Information	Property Location (SuiteCommerce Configuration Record Tab > Subtab)
Markup Type	structureddatamarkup.type	Markup Type	Shopping Catalog > Structured Data Markup
Out of Stock Behavior (When Item Back Orders Are Allowed)	structureddatamarkup.availabilityonbackorder	Out of Stock Behavior (When Item Back Orders are Allowed)	Shopping Catalog > Structured Data Markup
Subscription Line Status Change	subscriptions.lineStatusChange	Subscription Line Status Change	My Account > Subscriptions

Property Label (SuiteCommerce Configuration Record)	Property ID	More Information	Property Location (SuiteCommerce Configuration Record Tab > Subtab)
Allow The User to Cancel/Suspend Required Lines	subscriptions.allowToCancelSuspendRequiredLines	Allow the User to Cancel/Suspend Required Lines	My Account > Subscriptions
Subscription General Status Change	subscriptions.generalStatusChange	Subscription General Status Change	My Account > Subscriptions
Disallow The User to Upgrade Quantity	subscriptions.disallowUpgradeQuantity	Disallow the User to Upgrade Quantity	My Account > Subscriptions
Disallow The User to Downgrade Quantity	subscriptions.disallowDowngradeQuantity	Disallow the User to Downgrade Quantity	My Account > Subscriptions

Node.js Requirement Change

With the 2020.1.0 release of SuiteCommerce, the developer tools have been modified to support Node.js version **12.14.x**, where x equals the most current minor release. To use the theme, extension, or core SCA 2020.1 developer tools, you must update Node.js to this version. See the help topic [Install Node.js](#) for more information.

Third-Party Library Updates

With the 2020.1.0 release of SuiteCommerce, the third-party libraries shown in the table below have been updated. Library version information is also shown in the distro.json file. Ensure that any themes and extensions using these libraries are compatible with the update and make any appropriate changes. If you are migrating SCA to this release, ensure that no deprecated methods exist in your implementation before migrating.

Library	Old Version	New Version
Backbone.js	1.3.3*	1.4.0*
Bignumber	7.2.1	9.0.0
Font Awesome	4.2.1	4.7.0*
Handlebars	4.0.12	4.5.3
jQuery	3.3.1	3.4.1*
Require.js	2.3.5	2.3.6

*customized version

2020.1.x Minor Releases

Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount

Refer to the following minor release notes for the latest updates to SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced:

- [2020.1.12 Release of SuiteCommerce and SuiteCommerce Advanced](#)
- [2020.1.11.1 Release of SuiteCommerce and SuiteCommerce Advanced](#)

- [2020.1.10 Release of SuiteCommerce and SuiteCommerce Advanced](#)
- [2020.1.9 Release of SuiteCommerce and SuiteCommerce Advanced](#)
- [2020.1.8 Release of SuiteCommerce and SuiteCommerce Advanced](#)
- [2020.1.7 Release of SuiteCommerce and SuiteCommerce Advanced](#)
- [2020.1.6 Release of SuiteCommerce and SuiteCommerce Advanced](#)
- [2020.1.5 Release of SuiteCommerce and SuiteCommerce Advanced](#)
- [2020.1.4 Release of SuiteCommerce and SuiteCommerce Advanced](#)
- [2020.1.3 Release of SuiteCommerce and SuiteCommerce Advanced](#)
- [2020.1.2 Release of SuiteCommerce and SuiteCommerce Advanced](#)
- [2020.1.1.1 Release of SuiteCommerce and SuiteCommerce Advanced](#)
- [2020.1.1 Release of SuiteCommerce and SuiteCommerce Advanced](#)

2020.1.12 Release of SuiteCommerce and SuiteCommerce Advanced

Fixes

- Issue preventing the Order Received notification email from being sent when customers choose Pick Up In Store during checkout.
- Issue preventing customers from selecting payment methods that support 3D Secure 2.0. Merchants can now communicate payment gateway challenges using `Window.postMessage()`.

2020.1.11.1 Release of SuiteCommerce and SuiteCommerce Advanced

Fixes

- Issue causing "Please select a credit card" error message to display instead of the Review Your Order page when shoppers click the Back button on the Checkout page. This issue was isolated to web sites configured for One Page Checkout and shoppers with terms included on their customer records.
- Issue preventing auto-population of credit card street and zip code information on the Billing tab for a Sales order due to AVS Street Match and AVS Zip match failing with an "Unsupported by processor" error. This issue was isolated to sites where the Payment Instruments feature was enabled for payment processing.

2020.1.10 Release of SuiteCommerce and SuiteCommerce Advanced

Fixes

- Issues when clicking **I want to ship to multiple addresses** using one-page checkout. This issue resulted in blank shipping and delivery method sections, relying on the shopper to click **Continue** to redirect to the correct flow.

2020.1.9 Release of SuiteCommerce and SuiteCommerce Advanced

Fixes

- Issue creating two Item Search API calls for `relateditems_details` and `correlateditems_details`.

- Issue causing the Cart to sort items by Internal ID, not according to sequence when added to the Cart, as expected.
- Issue preventing matrix item images from zooming on mouse over.
- Issue causing a shopper's Purchase History to display a purchased quantity of 1, regardless of the actual quantity ordered.

2020.1.8 Release of SuiteCommerce and SuiteCommerce Advanced

Fixes

- Issue preventing users from sorting product reviews with multiple pages.
- Issue preventing credit card authentication process during checkout on websites with 3D Secure 2.0 enabled.
- Issue triggering an incorrect Google Tag Manager **SearchItem-end** event.
- Issue preventing special characters from being used in the phone number field.

2020.1.7 Release of SuiteCommerce and SuiteCommerce Advanced

Fixes

- Issue causing the shipping method to continuously reload after a user edits one of its fields during guest checkout.
- Issue where enabling the **Same as shipping address** option during checkout causes removal of the name provided for the shipping address and failure to populate the billing address fields. This behavior was isolated to users logged in as Company customers.

2020.1.6 Release of SuiteCommerce and SuiteCommerce Advanced

Fixes

- Issue causing customer credit card information to be saved for open invoices paid from the My Account > Billing page when the **Save Credit Card Info by Default** preference is disabled.
- Currency conversion issue causing the total amount of a customer's return authorization to be less than the amount from the original sales order.
- Issue preventing mobile users from accessing the Save for Later page from their shopping cart.

2020.1.5 Release of SuiteCommerce and SuiteCommerce Advanced

Fixes

- Issue preventing users from removing, selecting, or adding a shipping address during checkout on sites configured for One-Page checkout flow.
- Issue preventing multi-language sites from displaying the correct language on the Phone Number entry validation message. For example, a multi-language site properly configured for Japanese incorrectly displays, **Phone is required**, in English.
- Issue preventing users from setting a default credit card on sites implementing the payment instruments feature.

2020.1.4 Release of SuiteCommerce and SuiteCommerce Advanced

Security

In the 2020.1.2 release of SuiteCommerce and SuiteCommerce Advanced, a new Security subtab was added to the Advanced tab of the Configuration Record. The Security subtab provides settings to control whether your site's pages can be rendered in a frame. For more information, see the help topic [Security Subtab](#). The default setting, which disallows framing by all domains other than your own, is now active. You should change the default if you want to continue to allow other domains to render pages in a frame.

Improvements

- Updated the jQuery JavaScript library to version 3.5.1.
- Added an **Enable Zoom for Images** option to the Shopping Catalog Tab of the Configuration Record. This new option is enabled by default so that images in the Product Details Page and Quick View display at zoom size when a user hovers over them. For more information, see the help topic [Shopping Catalog Tab](#).

Fixes

- Updated SuiteCommerce and SuiteCommerce Advanced to ensure HTTP security headers are included in all SuiteCommerce and SuiteCommerce Advanced sites.
- Issue causing the error message, **Please Provide a Billing Address**, to be displayed to customers who have provided a billing address during checkout in the One Page Checkout and Billing First flows.
- Issue causing images that include a zoom size in the image resizing options to resize when a user hovers over them.
- Issue that allows customers with Quote permissions to place an order and complete the checkout flow from the Quote Detail Page without selecting a billing address.
- Issue preventing changes made to custom skins using the SMT Theme Skin Manager from being saved.
- Issue preventing customers from removing previously entered zip codes in the Estimate Tax and Shipping field during checkout.
- Issue causing all associated images for a selected item to display at the same time on the Product Details Page or in the Quick View.
- Extension Manager issue causing Font Awesome icons to display as question marks on sites that do not use UTF-8 character encoding.

2020.1.3 Release of SuiteCommerce and SuiteCommerce Advanced

Fixes

- Issue resulting in a blank My Account page for customers with more than 1000 invoices. As a result, you may see an error in the console such as: Uncaught SyntaxError: Unexpected token '<' on MyAccountEnvironment.Service.ssp.
- Issue preventing multiple image scrolling on a product's details page after launching a modal window, such as might occur after clicking the **Add to Cart** button.
- Product reviews issue resulting in no feedback or acknowledgement after the shopper selects yes or no when asked **Was this review helpful?**. As a result, you may see an error in the console such as: jQuery.Deferred exception: Cannot set property 'innerText' of undefined TypeError: Cannot set property 'innerText' of undefined.

- Issue resulting in an incorrect message to the shopper. In this case, a shopper adding an item quantity that is unavailable receives a message alerting them to reduce their order and click a link. This issue displayed a URL for the link instead of text.
- Issue preventing shoppers from accessing or editing payment methods when checking out (on webstores set up for one-page checkout) or when editing settings in My Account.
- Issue customizing the LoginRegister.Register.View module using the Extension Developer Tools. Implementing the addToViewContextDefinition method results in the following error: INVALID_PARAM: The specified view_id ('LoginRegister.Register.View') is not valid for the current component or the callback is not a function.

2020.1.2 Release of SuiteCommerce and SuiteCommerce Advanced

Security

A new Security subtab has been added to the Advanced tab of the Configuration Record. The Security subtab provides settings to control whether your site's pages can be rendered in a frame. For more information, see the help topic [Security Subtab](#). The default setting disallows framing by all domains other than your own, so you need to change the default if you want to continue to allow other domains to render pages in a frame. The default setting is not yet active to ensure you have time to change it if needed. Monitor future release notes to learn when the new default setting is activated.

Fixes:

- Issue causing customers who try to place an order from a Quote Detail page to be redirected to the Thank You page instead of the External Payment page.
- Issue where enabling the Payment Instruments feature for your company causes blank pages to be displayed for users who try to access the My Account and Checkout pages.
- Issue preventing cash sales made via SuiteCommerce InStore from displaying in Purchase History for My Account.
- Issue preventing the cartView event being triggered on the Cart page in the Google Tag Manager data layer when using the Criteo service.
- Issue causing product images to move to the left when viewing successive images using the zoom feature.

2020.1.1.1 Release of SuiteCommerce and SuiteCommerce Advanced

Fixes:

- The OrderHistory and ReturnAuthorization modules have been rolled back to SuiteScript 1.0. Migration of these modules to SuiteScript 2.0 in SuiteCommerce/SuiteCommerce Advanced release 2020.1.0 caused unexpected issues with field sets.
- Issue with instrumentation module negatively impacting SEO page generator.

2020.1.1 Release of SuiteCommerce and SuiteCommerce Advanced

Fixes:

- Issue preventing the quantity number for an order displayed in My Account > Purchase History from matching the original quantity number.

- Issue causing a missing Product Internal ID in the data layer communicating to Google Tag Manager on product-related events, such as `productList` and `productView`.
- Issue involving http 301 responses (permanent URL redirection) resulting in the following error: **ERR_TOO_MANY_REDIRECTS**. This occurred when the URL for an item contained multiple URL fragments.
- Issue causing external payment methods to fail, resulting in the following message: **Payment method is not supported for this gateway.**
- Issue preventing pending or partially paid invoices from displaying in the **Invoices** menu of My Account.
- One-page checkout issue resulting in both the shipping and billing addresses defaulting to one address after shoppers enter two separate addresses (**Same as Shipping** option remains unchecked).
- SEO issue caused by exceeding the browser's `localStorage` capacity, resulting in the following error: **QuotaExceededError: DOM Exception 22: An attempt was made to add something to storage that exceeded the quota.** This error occurred on secure domains with CDN enabled.

2019.2 Release of SuiteCommerce and SuiteCommerce Advanced

Welcome to the 2019.2 release of SuiteCommerce and SuiteCommerce Advanced (SCA)!

Important: Many of the features and enhancements in this release have dependencies on NetSuite 2019.2. You must implement this release in a **2019.2** NetSuite account.

The 2019.2 releases of SuiteCommerce and SCA incorporate periodic updates to the application, as described below. Refer to the following release notes for updates included in the major release and any subsequent minor releases. How you use these release notes depends on your web store:

- **SuiteCommerce** – These changes apply to your account automatically according to a scheduled update. Use these release notes as an informative guide to understand the changes applied to your account.
- **SuiteCommerce Advanced** – You must manually migrate your web store to the latest minor release to incorporate these changes. Use these release notes to determine if migration is necessary for your SCA implementation. This update does not alter the existing bundle ID. If you determine an update is necessary, see the help topic [Migrate SuiteCommerce Advanced](#) for instructions.

The following bundles are available:

SuiteApp	Bundle ID
SuiteCommerce	295132
SuiteCommerce Advanced 2019.2.5	295131

Other important bundles include:

SuiteApp	Bundle ID
SuiteCommerce Configuration	267359
SuiteCommerce Extension Management	295133
SuiteCommerce Base Theme	295134

SuiteCommerce Google Tag Manager Editor	250341
Reference Product Lists Records	53051

Explore the following release notes:

- [2019.2.0 Release of SuiteCommerce and SuiteCommerce Advanced](#)
- [2019.2.x Minor Releases](#)

2019.2.0 Release of SuiteCommerce and SuiteCommerce Advanced

The 2019.2.0 Major Release of SuiteCommerce and SuiteCommerce Advanced (SCA) includes the following features and enhancements:

- [Target Versions for Themes and Extensions](#)
- [Personalized Catalog Views Support](#)
- [Configuration Changes](#)
- [Page Type Enhancements](#)
- [Source Code Migration to TypeScript](#)
- [Source Code Migration to a SuiteScript 2.0](#)
- [Source Code Structure Changes](#)
- [Extensibility API Updates](#)
- [Code Changes to Support APM](#)
- [Node.js Requirement Change](#)
- [Third-Party Library Updates](#)

Some of these enhancements apply to all Commerce web stores; others apply to SuiteCommerce Advanced only. Each of the following enhancements specifies the implementations to which they apply.

Target Versions for Themes and Extensions

With the 2019.2.0 release of SuiteCommerce and SuiteCommerce Advanced, theme and extension developers can now specify compatibility with specific releases of SuiteCommerce, SuiteCommerce Advanced, or SuiteCommerce InStorep.

The theme and extension developer tools (provided with the 2019.2.0 release of the Extension Management bundle) now include prompts to specify a **Target Version**. This information prevents site managers from accessing incompatible themes and extensions on their site.

For more information, see the help topic [Declare Target Versions](#).

Personalized Catalog Views Support

The 2019.2.0 release of SuiteCommerce and SuiteCommerce Advanced introduces support for the Personalized Catalog Views (PCV) feature.

The PCV feature enables businesses to provide different customers with access to different items. You can divide customers into groups and provide each group with access to a tailored selection of catalog items. This is useful in many scenarios, particularly for B2B websites.

See the help topic [Personalized Catalog Views](#) for additional information about SuiteCommerce support for Personalized Catalog Views.

Configuration Changes

The following configuration properties have been added with the 2019.2.0 release of SuiteCommerce. Refer to the appropriate section for more information.

Property Label (SuiteCommerce Configuration Record)	Property ID	More Information	Property Location (SuiteCommerce Configuration Record Tab > Subtab)
Exclude Empty Categories	Categories.excludeEmptyCategories	Exclude Empty Categories	Integrations > Categories
Google AdWords ID	tracking.googleAdWordsConversion.id	Google AdWords ID	Integrations > Adwords
Google AdWords Value	tracking.googleAdWordsConversion.value	AdWords Value	Integrations > Adwords
Google AdWords Label	tracking.googleAdWordsConversion.label	Google AdWords Label	Integrations > Adwords
Show Recognized Shopper	header.showRecognizedShopper	Show Recognized Shopper	Layout > Header
Days Before Expiration Notification	quote.daysToExpirationNotification	Days Before Expiration Notification	My Account > Quotes
Request a Quote Bottom Message	quote.requestAQuoteWizardBottomMessage	Request a Quote Bottom Message	My Account > Quotes
Request a Quote Business Days	quote.contactBusinessDaysMessage	Request a Quote Business Days	My Account > Quotes

Page Type Enhancements

With the 2019.2.0 release of Commerce and SuiteCommerce Advanced, we added the options object to the PageType component. This object registers additional data that the view constructor receives. Options are passed as the arguments when initializing the view.

See the help topic [Register a Page Type](#) for details.

Source Code Migration to TypeScript

The 2019.2.0 release of SuiteCommerce Advanced includes the early stages of a code migration from JavaScript to TypeScript.

As a result, observe the following changes to the SCA source:

- Core SCA JavaScript filenames change from JavaScript (.js) to TypeScript (.ts).
- The module system changes from Asynchronous Module Definitions (AMD) to a TypeScript-compatible (common JavaScript) system.

Important: This migration applies to core SuiteCommerce Advanced source code only and does not apply to Commerce theme and extension development.

Keep in mind that the best practice to customize SCA is to themes and extensions. Therefore this change only affects SCA developers customizing core source code. All source TypeScript code automatically compiles to JavaScript when executing `gulp local` and `gulp deploy` commands using the core SCA developer tools.

TypeScript is an open source superset of JavaScript designed to make large JavaScript project development as efficient as possible. TypeScript code compiles to simple JavaScript code.

For more information, see the help topic [TypeScript](#).

To learn more about TypeScript in general, see [Typescriptlang.org](https://typescriptlang.org).

Source Code Migration to a SuiteScript 2.0

The 2019.2.0 release of SuiteCommerce Advanced includes the early stages of a code migration to improve the SCA developer experience and support SuiteScript 2.0. This is a phased migration that spans multiple releases. In this release, the source code for SCA includes a code refactor of the Case module to migrate logic to use SuiteScript 2.0. All other modules remain compatible with SuiteScript 1.0 and the Commerce API at this time.

Important: This migration applies to core SuiteCommerce Advanced source code only and does not apply to Commerce themes and extensions.

This release includes the migration or addition of the following My Account modules, utilizing SuiteScript 2.0 services:

- Case
- OrderHistory

For more information, see the help topic [Commerce Migration to SuiteScript 2.0](#).

Source Code Structure Changes

The 2019.2.0 release of SuiteCommerce Advanced introduces changes to the structure of SCA source code. This change organizes modules to better accommodate component dependencies with other Commerce offerings, such as SuiteCommerce InStore.

Important: This change applies to core SuiteCommerce Advanced source code only and does not apply to Commerce themes and extensions.

This change impacts the source code in the following ways:

- Modules are divided among the Advanced, Backend, and Commons directories.
- The directory from which you execute gulp commands with core SCA developer tools changes.
- The package.json file moves to a new **SC_19.2_Live** directory, which contains the workspace for SuiteCommerce Advanced source code. You execute npm and gulp commands from this location (not the root development directory).
- The distro.json file moves to the new **Advanced** directory.
- The third-parties directory moves outside of the workspace, as these files are used globally.

See the following topics for more information:

- See the help topic [SCA Source Directory](#) for more information about the structure, including details about each new directory.

Directory Example (New)

1 | Root Development Directory/

```

2 | SC_19.2_Live/
3 |   Advanced/
4 |     Account/
5 |     ...
6 |     distro.json
7 |   Backend/
8 |   Commons/
9 |   gulp
10 |   ...
11 |   package.json
12 |   third_parties/

```

Directory Example (2019.1 and Earlier)

```

1 | Root Development Directory/
2 |   gulp/
3 |   Modules/
4 |     extensions/
5 |     suitecommerce/
6 |       Account@2019.1.0/
7 |       third_parties/
8 |     ...
9 |   distro.json
10 |   package.json

```

Also with the 2019.2.0 release of SuiteCommerce and SuiteCommerce Advanced, source code modules names no longer include Semantic Versioning notation (examples include @1.0.0 or @2019.1.0). Historically, this notation has been part of the module naming convention, but is no longer included.

Extensibility API Updates

With the 2019.2.0 release of SuiteCommerce and SuiteCommerce Advanced, the Visual component includes two new methods to show and hide messages (`showMessage()` and `closeMessage()`) in the notification area of a Commerce web store page. Use these methods with the Layout component or any other component that inherits from Visual component, such as the `ProductListPage` component or the `ProductDetails` component.

You can specify the text of the message and the type of message (info, warning, error, or success). If the default notification area is not suitable for the message, you can specify any other data-view placeholder on the page. Additionally, you can use a timeout property for toast-style notifications that disappear after the specified duration.

For more information, see the Layout component in the [extensibility API reference](#).

Code Changes to Support APM

With the 2019.2.0 release of SuiteCommerce and SuiteCommerce Advanced, source code includes instrumentation to eventually make webstore performance data available through Application Performance Management (APM). This addition will eventually allow users to view basic website performance metrics and identify the root cause of slow performing websites.

Changes to the source code during this release have no impact on your web store. However, new sensors have been put in place to support a future update to the Application Performance Management bundle.

Node.js Requirement Change

With the 2019.2.0 release of SuiteCommerce and SuiteCommerce Advanced, the developer tools have been modified to support Node.js version **10.16.x**, where x equals the most current release. To use the

theme, extension, or core SCA 2019.2.0 developer tools, you must update Node.js to this version. See the help topic [Install Node.js](#) for more information.

Third-Party Library Updates

With the 2019.2.0 release of SuiteCommerce and SuiteCommerce Advanced, the third-party library shown in the table below has been updated. Library version information is also shown in the `distro.json` file. Ensure that any themes and extensions using this library are compatible with the update and make any appropriate changes. If you are migrating SCA to this release, ensure that no deprecated methods exist in your implementation before migrating.

Library	Old Version	New Version
JQuery	3.3.1	3.4.1

2019.2.x Minor Releases

- [2019.2.5 Release of SuiteCommerce Advanced](#)
- [2019.2.4 Release of SuiteCommerce and SuiteCommerce Advanced](#)
- [2019.2.3.a Release of SuiteCommerce and SuiteCommerce Advanced](#)
- [2019.2.3 Release of SuiteCommerce and SuiteCommerce Advanced](#)
- [2019.2.2 Release of SuiteCommerce and SuiteCommerce Advanced](#)
- [2019.2.1 Release of SuiteCommerce and SuiteCommerce Advanced](#)

2019.2.5 Release of SuiteCommerce Advanced

The following apply to SuiteCommerce Advanced implementations only.

Fixes

- Issue causing customers who try to place an order from a Quote Detail page to be redirected to the Thank You page instead of the External Payment page.
- Issue where enabling the Payment Instruments feature for your company causes blank pages to be displayed for users who try to access the My Account and Checkout pages.
- Issue preventing cash sales made via SuiteCommerce InStore from displaying in Purchase History for My Account.
- Issue preventing the `cartView` event being triggered on the Cart page in the Google Tag Manager data layer when using the Criteo service.

2019.2.4 Release of SuiteCommerce and SuiteCommerce Advanced

Fixes

- Password reset issue. The Reset Password link (sent through a customer's email) briefly sends users to the Reset Password page, but immediately redirects users to a Log In page, preventing them from resetting their password.
- Issue when ordering an item whose order quantity exceeds the quantity available for the item. Users in this situation received the following error: **An Error Has Occurred** instead of a message explaining how to correct their order.

- Issue preventing users from returning specific items from the entire Sales Order. Instead, users receive the following error: **Error: The minimum quantity for this item is x.** This issue occurred on items with a minimum quantity set in the Item record in NetSuite.
- Issue preventing users from editing multiple item options in the product details page, resulting in the following message: **Sorry, there is a problem with this Item and can not be purchased at this time. Please check back later.**

2019.2.3.a Release of SuiteCommerce and SuiteCommerce Advanced

Fixes

- SEO issue where canonical URL, meta description, meta keywords, and title tags are missing for a site.
- Issue preventing site search/links from working properly. This issue resulted in customers needing to click on result/link multiple times to select the item.
- Issue preventing Google Analytics tags from appearing when the SC Google Tag Manager extension is activated on a domain. This issue occurred the first time a customer accessed the site only.
- Issue preventing customers from selecting a shipping address during Checkout. This issue appeared for customers with a default shipping address saved.
- This release also rolls back one issue to its previous state prior to the 2019.2.3 release: **Issue creating duplicate customer/lead shipping addresses**, as described in [2019.2.3 Release of SuiteCommerce and SuiteCommerce Advanced](#).

2019.2.3 Release of SuiteCommerce and SuiteCommerce Advanced

Improvements

- Updated the SuiteCommerce bundle installation script to deploy the SuiteCommerce SS2 SSP application to the same domains or sites as the SuiteCommerce SSP application. This is expected behavior and was not functioning properly in the 2019.2.2 release of SuiteCommerce. See the help topic [Install Your Commerce Website Applications](#) for more details on SS2 SSP applications.
- Application Performance Management (APM) data collection is now enabled for SuiteCommerce and SuiteCommerce Advanced, regardless of whether the **SuiteCommerce Real User Monitoring** feature is enabled or disabled (Enable Features record).

Fixes

- Issue preventing updated Item Options on matrix items in a wishlist from updating in the Cart.
- Console error on gulp local command using the core SCA developer tools: **jQuery.Deferred exception: generator.childViewInstance.getContextDataRequest is not a function TypeError**
- Issue creating duplicate customer/lead shipping addresses. This duplication occurs on the website and in the Customer record when a new user registers on a site configured for One Page Checkout and the user sets the Billing Address Same as Shipping Address.
- Issue when deploying SuiteCommerce or SuiteCommerce Advanced causing all files in the file cabinet to be incorrectly marked as "available without login".
- Issue preventing the Shipping Estimator from displaying the correct shipping rate during Checkout.
- Issue preventing SEO generator errors from logging. This caused a **ReferenceError: Can't find variable: Map** error.

2019.2.2 Release of SuiteCommerce and SuiteCommerce Advanced

Improvements

- Removed a redundant Development folder from the SuiteCommerce Advanced 2019.1 bundle.

Fixes

- The See More link was removed from the Product Details Page (PDP) in this release of the SuiteCommerce Base Theme. If you have SCA 2019.2 implemented, you will need to remove the link from any other theme developed on top of this Base Theme release.
- Checkout issue preventing shoppers from checking out as guest using Firefox in Private Window mode.
- Issue preventing shoppers from using the browser to navigate back to the home page after performing a keyword search from the site's Home page.
- Issue preventing Analytics Blockers from working with Google Universal Analytics.
- Web store item display issue, resulting in items not displaying after logging in to Site Management Tools.
- Commerce Category issue resulting in category title being replaced by bread crumb information.
- Custom Transaction Item Option issue erroneously displaying a non-functioning **Add to Cart** button in Product List Pages.
- Auto-apply SuitePromotion issue when requesting a quote resulting in the following error: An nlobjSearchFilter contains an invalid operator, or is not in proper syntax: internalid.
- Category collapse/expand issue. Clicking the Category collapse/expand caret symbol influences the facet list behavior.
- Shipping Address issue resulting in a disabled delivery method after editing the shipping address during checkout review.
- Google AdWords parameter issue where the &gclid=[Unique Code] parameter was removed from the URL. (SuiteCommerce Advanced Only Issue)
- Issue involving SCA 2019.1 Development SSP folder moving outside of the expected location upon bundle installation, resulting in Web Store Page Not Found message. (SuiteCommerce Advanced Only Issue)
- Invoice details issue resulting in the following internal error: An nlobjSearchColumn contains an invalid column, or is not in proper syntax: ccexpdate. (SuiteCommerce Advanced Only Issue)

2019.2.1 Release of SuiteCommerce and SuiteCommerce Advanced

Improvements

- Updated Twitter Bootstrap Sass version to 3.4.1

Fixes

- Translation issues on My Account and Checkout pages
- Home page URL parameters stripping issue
- Incorrect shipping cost issue on Sales Orders

- Purchase History date picker translation issue
- Token payment method display issue during checkout
- Return Authorization issue allowing the return of items that are greater than the fulfilled quantity

2019.1 Release of SuiteCommerce and SuiteCommerce Advanced

Welcome to the 2019.1 release of SuiteCommerce and SuiteCommerce Advanced!

Important: If implementing SuiteCommerce Advanced (SCA), you **must** install the 2019.1 release of SCA in a **NetSuite 2019.1** account. Many of the features and enhancements in this release have dependencies on NetSuite 2019.1.

Note: If implementing SCA, take advantage of new features in existing SCA implementations by migrating the new code to your existing code base. For details, see the help topic [Migrate SuiteCommerce Advanced](#).

The following SuiteApps are available:

SuiteApp	Bundle ID
SuiteCommerce	267288
SuiteCommerce Advanced 2019.1	273662
SuiteCommerce Configuration	267359
SuiteCommerce Extension Management	269415
SuiteCommerce Base Theme	267294
SuiteCommerce Google Tag Manager Editor	250341
Reference Product Lists Records	53051

Commerce Applications

The 2019.1 release of SuiteCommerce and SuiteCommerce Advanced (SCA) includes the following enhancements:

Note: The following features apply to SuiteCommerce and SuiteCommerce Advanced unless otherwise noted.

- [SuiteCommerce Extension Management Updates](#)
- [Site Management Tools Requirement](#)
- [Page Type and Layout Extensions](#)
- [My Account Columns Management](#)
- [Order Visibility for Business Customer Contacts](#)
- [SuiteCommerce SuiteTax Support](#)

- [Payment Instruments Support](#)
- [Changes to Shipping and Payment Interfaces](#)
- [Default Product Images](#)
- [Field Set Script Changes](#)
- [SuiteCommerce Configuration Changes](#)
- [Node.js Requirement Change](#)
- [Extensibility API Components](#)
- [HTTP/2 Compliant SuiteCommerce Site Headers](#)
- [Secure Shopping Support for Site Builder](#)
- [Third-Party Library Updates](#)

SuiteCommerce Extension Management Updates

The 2019.1 release of the SuiteCommerce Extension Management bundle is available as a phased release beginning June 17, 2019.

This is a managed update and includes an updated user interface for activating themes and extensions plus new developer tools to create, test, and deploy themes and extensions.

Extension Manager

The Extension Manager has been updated to allow multiple activations. NetSuite still only processes one activation at a time, but the Extension Manager now lets you set up more than one activation in a new processing queue. This update also streamlines error reporting.

After you receive this automated update, the Extension Manager displays the status of all activations in a new **Status** column. Available statuses are:

- **Complete** – Indicates that the theme and any extensions listed for the activation are complete and active for the associated domain.
- **In Process** – Indicates that the activation is currently processing.
- **Pending** – Indicates that the activation has not started processing. If you initiate more than one activation simultaneously, the Extension Manager builds a processing queue. Any activations awaiting processing display this status.
- **Error** – Indicates that the activation process has failed. This status includes a link to open a popup Activation Log to aid in troubleshooting.

Important: If you are using the 2019.1 release of the SuiteCommerce Extension Management bundle and you want to activate a theme or extension, you must log in as an Administrator role. If you want to activate using a different role, you can set up the `customdeploy_ext_mech_installer_event` deployment script to give other roles this capability.

See the help topic [Manage Themes and Extensions](#) for details.

Theme and Extension Developer Tools

The 2019.1 release of the SuiteCommerce Extension Management Bundle includes new developer tools for use with your 2019.1 release of SuiteCommerce or SuiteCommerce Advanced. How you proceed with these tools depends on your implementation.

SuiteCommerce Developers:

If your account reflects this update, then you can download and use the updated developer tools on your 2019.1 implementation of SuiteCommerce. See the help topic [Set Up the Developer Environment](#) for details.

SuiteCommerce Advanced Customers:

Due to a delayed release of this bundle, it was necessary to customize your core 2019.1 SuiteCommerce Advanced developer environment to use the 2018.2 theme and extension developer tools as a temporary solution.

- If your account reflects the 2019.1 update and you previously customized your SCA developer environment, you must revert your customized developer environment before deploying code to NetSuite.
- If your account does not reflect the 2019.1 update, continue using the developer tools available with the 2018.2 release of the SuiteCommerce Extension Management bundle until you receive the automated update.
- If your account reflects the 2019.1 update and you did not make any changes to your core SCA developer environment, you can download and use the updated developer tools on your 2019.1 implementation of SuiteCommerce. See the help topic [Set Up the Developer Environment](#) for details.

Site Management Tools Requirement

With the 2019.1 release of the SuiteCommerce, **Site Management Tools** is now a required feature when setting up SuiteCommerce on a NetSuite account. Ensure that this feature is enabled on the **Web Presence** tab of the Enable Features record in NetSuite before installing SuiteCommerce, SuiteCommerce Advanced, or any update introduced as a minor release.

See the help topic [Enable Features and Set Preferences](#) for more information.

PageType

Commerce extension developers can now register new page types and templates by calling the following methods, which are both part of the new PageType component:

- `registerPageType()` – register a page type and set the template for the default layout.
- `registerTemplate()` – register a template as an alternate layout for multiple page types.

See the [PageType](#) page in the API reference for more details.

My Account Columns Management

With the 2019.1 release of SuiteCommerce, you can add columns to transaction lists in the My Account area of your site. By enabling columns management in the SuiteCommerce Configuration record, you can specify the fields that display as columns for the following transaction lists and the order in which they appear. You can also include custom fields to these lists.

- Returns
- Quotes
- Order History
- Open Invoices

■ Paid Invoices

For example, you can set up a domain to display **Purchase Date** and **Purchase Amount** columns for the Purchase History transaction list. Alternatively, you can include an **Order Status** column or custom field to the list.

For more information, see the help topic [Transaction Lists](#).

Order Visibility for Business Customer Contacts

The NetSuite 2019.1 release lets site administrators configure each site to use either a single shared cart for all business customer contacts or individual carts for each business customer contact. You can select a different sharing mode for each of your sites. The SuiteCommerce 2019.1 release and later supports this feature and allows you to configure the My Account section to contain only the orders placed by the logged in B2B contact.

See the help topic [Shopping Cart Options for Business Customers](#) for additional information about B2B shopping cart options.

SuiteCommerce SuiteTax Support

The 2019.1 release of SuiteCommerce introduces support for the NetSuite SuiteTax feature for customers in the United States and Canada.

SuiteTax lets you use third-party tax engines or the internal SuiteTax engine to calculate taxes. You can select a different third-party tax engine for each tax registration (nexus) on subsidiary records to enhance compliance with each tax jurisdiction or geographic area.

See the help topic [SuiteCommerce SuiteTax Support](#) for additional information about SuiteCommerce support for SuiteTax.

Payment Instruments Support

The 2019.1 release of SuiteCommerce introduces support for the NetSuite Payment Instruments feature.

With payment instruments support:

- Site administrators can add tokenized payment instruments as payment methods.
- Tokenized payment instruments make payment cards more secure by substituting sensitive payment card data with a payment card token that does not include sensitive data. See the help topic [Tokenization](#) for details.
- Site users can manage their debit and credit card payment instruments in Checkout and My Account.

Important: SuiteCommerce Advanced customers must implement SuiteCommerce Advanced 2019.1 or later to use tokenized payment instruments.

See the help topic [SuiteCommerce Payment Instruments Integration](#) for details.

Changes to Shipping and Payment Interfaces

The 2019.1 release of SuiteCommerce introduces a new user interface to manage shipping addresses and payment instruments. This new interface uses a card format that lets you add, edit, remove, and select shipping addresses and payment methods in Checkout and My Account.

To see the new interface, you must have a domain with an active theme built using SuiteCommerce Base Theme 2019.1 or later. This version of the SuiteCommerce Base Theme includes the templates required to render this new interface.

Examples of the new user interface are shown below.

Default Product Images

With the 2019.1 release of SuiteCommerce, you can now designate a default image to display on the product list page and product details pages. When using two or more images for a product, you can designate one of the images as the default to display by adding `.default` to the end of the file name.

See the help topic [Image File Naming Guidelines](#) for details.

Field Set Script Changes

With the 2019.1 release of SuiteCommerce, the Field Set Script was updated to add the `saleunit` field to the details, matrixchilditems, and order field sets when the value of the `has_sale_units` variable is not

false. Customers with sites that specify sale units of measure in inventory item records and see incorrect quantity value in checkout can run v7 of the Field Set Setup Script to add the saleunit field or manually add the saleunit field into the details, matrixchilditems, and order field sets.

See the help topic [Set Up Initial Field Sets](#) for details.

SuiteCommerce Configuration Changes

The following configuration properties have been added with the 2019.1 release of SuiteCommerce. Refer to the appropriate section for more information.

Property Label (SuiteCommerce Configuration Record)	Property ID	More Information	Property Location (SuiteCommerce Configuration Record Tab > Subtab)
Enable Return Authorization Columns Management	transactionListColumns.enableReturnAuthorization	Enable Return Authorization Columns Management	My Account > Transaction List Columns
Transaction List Columns Return Authorization	transactionListColumns.ReturnAuthorization	Transaction List Columns Return Authorization	My Account > Transaction List Columns
Transaction List Columns Return Authorization	transactionListColumns.returnAuthorization.id	Transaction List Columns Return Authorization	My Account > Transaction List Columns
Transaction List Columns Return Authorization	transactionListColumns.returnAuthorization.label	Transaction List Columns Return Authorization	My Account > Transaction List Columns
Enable Quotes Columns Management	transactionListColumns.enableQuote	Enable Quotes Columns Management	My Account > Transaction List Columns
Transaction List Columns Quote	transactionListColumns.quote	Transaction List Columns Quote	My Account > Transaction List Columns
Transaction List Columns Quote	transactionListColumns.quote.id	Transaction List Columns Quote	My Account > Transaction List Columns
Transaction List Columns Quote	transactionListColumns.quote.label	Transaction List Columns Quote	My Account > Transaction List Columns
Enable Purchase History Columns Management	transactionListColumns.enableOrderHistory	Enable Order History Columns Management	My Account > Transaction List Columns
Transaction List Columns Order History	transactionListColumns.orderHistory	Transaction List Columns Order History	My Account > Transaction List Columns
Transaction List Columns Order History	transactionListColumns.orderHistory.id	Transaction List Columns Order History	My Account > Transaction List Columns
Transaction List Columns Order History	transactionListColumns.orderHistory.label	Transaction List Columns Order History	My Account > Transaction List Columns
Enable Invoice Columns Management	transactionListColumns.enableInvoice	Enable Invoice Columns Management	My Account > Transaction List Columns

Time to Wait for CMS Content	cms.contentWait	Time to Wait for CMS Content (ms)	Integrations > Site Management Tools

Page Type and Layout Extensions

With the 2019.1 release of SuiteCommerce, developers can introduce new CMS page types and page layouts (as templates) through SuiteCommerce extensions. Page types let site administrators create and manage a variety of customized pages in a web site using Site Management Tools (SMT).

SuiteCommerce developers register new page types and layouts using the Extensibility API. When the extension is installed and activated for a domain, any registered page types become selectable options to SMT admins creating new pages. For example, an extension can introduce a new Blog or New Event page type.

Extensions can also introduce templates as either default or alternative layouts when creating new or editing existing pages. SMT admins using the new Layout Selector can choose either a default layout or from a list of available alternatives, as defined by the extension.

This functionality is a new addition to the current extension development process. See the help topic [Create Page Types](#) for details.

Node.js Requirement Change

With the 2019.1 release of SuiteCommerce, the developer tools have been modified to support Node.js version **10.15.xx**, where xx equals the most current minor release. To use the theme, extension, or core SCA 2019.1 developer tools, you must update Node.js to this version. See the help topic [Install Node.js](#) for more information.

Extensibility API Components

The 2019.1 release of SuiteCommerce introduces four new components to the Extensibility API:

- **UserProfile**
- **MyAccountMenu**
- **LoginRegisterPage**
- **PageType**

UserProfile

The UserProfile component gives you access to information about the logged-in user on a SuiteCommerce web store, for example the user's first and last name, the user's addresses, and some

payment information such as credit limit and current balance. If the user is a returning user, but is not logged in, the component also gives you information about the user, but with less details. For example, it can give you information such as the user's first and last name last name, but does not give you information about credit limits or the user's current balance.

See the [UserProfile](#) page in the API reference for details.

MyAccountMenu

Add new menu items to the menu on the My Account page and link them to account landing pages. You can set permissions on each new menu item to control which users can see the menu items. The MyAccountMenu component works with the main menu on the My Account page. (With the default theme, the main menu is displayed on the left side of the page.)

See the [MyAccountMenu](#) page in the API reference for more details.

LoginRegister

The LoginRegister component enables you to build extensions that work with the Login/Register page on a SuiteCommerce web store. Specifically, it lets you:

- Listen for login and register events on the Login/Register page, and then either cancel the event or let the event complete.
- Add fields to the login and registration forms to capture and process additional information. Additional field data from the registration form can be stored in NetSuite in custom entity fields after the registration process has completed. Field data from the login form is discarded after the login process has completed.

See the [LoginRegister](#) page in the API reference for more details.

HTTP/2 Compliant SuiteCommerce Site Headers

In the 2019.1 release of SuiteCommerce, sites use Hypertext Transfer Protocol version 2 (HTTP/2) compliant headers. HTTP/2 provides opportunities to optimize applications and improve performance.

Secure Shopping Support for Site Builder

The 2019.1 release of SuiteCommerce introduces Secure Shopping support on some Site Builder sites.

If you are implementing standard Site Builder or the Elbrus or Kilimanjaro release of Site Builder Extensions or Site Builder Extensions Premium, you can take advantage of SSL certificates to secure the shopping portion of your site. See the help topic [Set Up a Domain](#) for details.

However, if you are using the following advanced Site Builder implementations you must also apply a patch to take advantage of this functionality:

Implementation	Patching Instructions
■ Site Builder Extensions Premium Vinson ■ Site Builder Extensions Vinson	Secure Shopping for Site Builder Extensions (Vinson)
■ Reference Checkout 2.05 ■ Reference Checkout 2.04 ■ Reference My Account Premium 1.06	Secure Shopping for Site Builder (Pre-Denali)

Implementation	Patching Instructions
- Reference My Account 1.06 - Reference My Account Premium 1.05 - Reference My Account 1.05	

Important: If setting up Secure Shopping on a Site Builder site, you must set up the shopping portion of your site to use an HTTPS domain. You cannot set up a single secure domain for Shopping and Checkout.

Note: This release does not include support for the Denali or Mont Blanc release of Site Builder Extensions or Site Builder Extensions Premium.

Third-Party Library Updates

With the 2019.1 release of SuiteCommerce, the third-party libraries shown in the table below have been updated. Library version information is also shown in the `distro.json` file. Ensure that any themes and extensions using these libraries are compatible with the update and make any appropriate changes. If you are migrating SCA to this release, ensure that no deprecated methods exist in your implementation before migrating.

Library	Old Version	New Version
jQuery	1.11.1	3.3.1
Backbone	1.1.2	1.3.3
Underscore	1.8.3	1.9.1
Handlebars	4.0.10	4.0.12
Font Awesome	4.0.10	4.2.1

2018.2 Release of SuiteCommerce and SuiteCommerce Advanced

Welcome to the 2018.2 release of SuiteCommerce and SuiteCommerce Advanced!

Important: If implementing SuiteCommerce Advanced, you **must** install the 2018.2 release of SCA in a **NetSuite 2018.2** account. Many of the features and enhancements in this release have dependencies on NetSuite 2018.2.

Note: If implementing SCA, take advantage of new features in existing SCA implementations by migrating the new code to your existing code base. For details, see the help topic [Migrate SuiteCommerce Advanced](#).

The following SuiteApps are available:

SuiteApp	Bundle ID
SuiteCommerce	244701

SuiteCommerce Advanced 2018.2	244699
SuiteCommerce Extension Management	248721
SuiteCommerce Base Theme	245062
SuiteCommerce Google Tag Manager Editor	250341
SuiteCommerce Configuration	244234
Reference Product Lists Records	53051

Commerce Applications

The 2018.2 release of SuiteCommerce and SuiteCommerce Advanced (SCA) include the following enhancements:

- [SCA Release Naming Convention Changes](#)
- [Two-Factor Authentication Support](#)
- [Theme and Extension Activation Improvements](#)
- [Theme and Extension Version Management](#)
- [Google Tag Manager Editor](#)
- [Site Search Bar Enhancements](#)
- [SuiteCommerce Configuration Changes](#)
- [SMT Category Visibility Dates Support](#)
- [SuiteCommerce InStore Extensions Support](#)
- [Legacy Tab Added to SuiteCommerce Configuration Record](#)
- [Footer Support](#)
- [Newsletter Support](#)
- [Node.js Requirement Change](#)
- [Extensibility API Updates](#)

SCA Release Naming Convention Changes

With the 2018.2 release of SCA, we have deprecated the mountain name convention. In the past, SCA releases had names like Denali, Mont Blanc, Elbrus, etc. As of the 2018.2 release, we are naming SCA releases by date and major release, such as **SuiteCommerce Advanced 2018.2**.

Two-Factor Authentication Support

With the 2018.2 release of NetSuite, accounts are provisioned with Two-Factor Authentication (2FA). The 2018.2 release of SuiteCommerce accommodates this requirement. However, you must use a new role when using the SuiteCommerce developer tools to access a NetSuite account provisioned with 2FA.

You must use the new role, called **SCDeployer**, when using any of the following developer tool commands:

- `gulp extension:fetch`
- `gulp extension:deploy`

- gulp theme:fetch
- gulp theme:deploy
- gulp deploy

The SuiteCommerce Extension Management SuiteApp (2018.2 release) contains this new role. However, you must perform some set up tasks for this role to function properly.

For more information on how to use this role, see the help topic [Developer Tool Roles and Permissions](#).

Theme and Extension Activation Improvements

In the 2018.2 release of SuiteCommerce, we are introducing usability enhancements for activating themes and extensions. These changes are included with the latest update to the SuiteCommerce Extension Management SuiteApp (2018.2). Because this is a managed bundle, these changes are automatically implemented when you receive the update.

The new Extension Manager lets you:

- View all themes and extensions activated for each website and domain associated with your NetSuite account.
- Edit existing activations for a domain or create a new activations.
- Easily determine if an update is available for an active theme or extension.

You access the Extension Manager in the same way (Commerce > Extensions > Extension Manager), but the process is streamlined to provide a better user experience.

For more information, see the help topic [Manage Themes and Extensions](#).

Theme and Extension Version Management

In the 2018.2 release of SuiteCommerce, theme and extension developers can update versions of their themes and extensions released within bundled SuiteApps.

For more information on bundling and updating a theme or extension, see the help topic [Bundle Themes and Extensions as SuiteApps](#).

Also part of the improvements to the Extension Activation user interface, the 2018.2 release of SuiteCommerce includes a way to recognize and activate updates to themes and extensions. If an update is available for any active theme or extension, the Extension Manager alerts you of the update with an alert icon . You can either maintain your current activation or update your domain with the latest version using the Extension Manager.

For more information on activating the latest version of a theme or extension, see the help topic [Manage Themes and Extensions](#).

Note: This alert icon only appears next to themes and extensions that are currently activated. If an update is available for a theme or extension that is not currently activated on your domain, the updated version is the only option to activate.

Google Tag Manager Editor

With the 2018.2 release of SuiteCommerce and SuiteCommerce Advanced, you can use SuiteCommerce Google Tag Manager Editor to connect your SuiteCommerce site to Google Tag Manager and manage

third-party tags without having to edit your site source code. With the editor, you can integrate third-party services such as Google Analytics, Google Ads, Facebook Pixel, Optimizely, Bing, Criteo, and LiveChat.

The SuiteCommerce Google Tag Manager Editor is available as a bundled SuiteApp.

For more information, see the help topic [Google Tag Manager](#).

Site Search Bar Enhancements

With the 2018.2 release of SuiteCommerce, theme developers can now customize how a theme displays site search elements. These elements include the site search button (magnifying glass) and input bar. Theme developers can use any combination that makes sense within a theme and can place these elements together within the same template or independently within different templates.

This functionality gives theme developers a few options:

- Include the site search button and input bar using the default behavior: Site users must click the site search button (magnifying glass) to display the search input bar.
- Include the site search input bar as visible by default within any template, without displaying a site search button.

For more information on how to customize the site search button and input bar, see the help topic [Customize Site Search Elements](#).

SuiteCommerce Configuration Changes

With the 2018.2 release of SuiteCommerce, the following configuration properties have been added. Refer to the appropriate section for more information.

Property Label (SuiteCommerce Configuration Record)	Property ID	More Information	Property Location (SuiteCommerce Configuration Record) Tab > Subtab
Show Request A Quote Hyperlink	quote.showHyperlink	Show Request A Quote Hyperlink	My Account > Quotes
Hyperlink Text	quote.textHyperlink	Hyperlink Text	
Show Quick Order Hyperlink	quickOrder.showHyperlink	Show Quick Order Hyperlink	Shopping > Quick Order
Hyperlink Text	quickOrder.textHyperlink	Hyperlink Text	

With the 2018.2 release of SuiteCommerce, the following configuration properties have been moved. Refer to the appropriate section for more information.

Property Label (SuiteCommerce Configuration Record)	Property ID	More Information	Property Location (SuiteCommerce Configuration Record) Tab > Subtab
Company Name	newsletter.companyName	Company Name	Legacy > Newsletter
Generic First Name	newsletter. genericFirstName	Generic Last Name	Legacy > Newsletter

Property Label (SuiteCommerce Configuration Record)	Property ID	More Information	Property Location (SuiteCommerce Configuration Record) Tab > Subtab
Generic Last Name	newsletter. genericLastName	Generic First Name	Legacy > Newsletter
Footer Navigation Links	footer.navigationLinks	Footer Navigation	Legacy > Footer
Footer Navigation Links Text	footer.navigationLinks.text	Footer Navigation	Legacy > Footer

SMT Category Visibility Dates Support

The 2018.2 release of SuiteCommerce supports Site Management Tools (SMT) Category Visibility Dates. This enables you to control when your category is displayed on your website, preview categories, and stage new items in a category set to display at a future date.

Requirements for full feature support include:

- SuiteCommerce or SuiteCommerce Advanced 2018.2 and later
- Site Management Tools v3

For more information, See the help topic [View Site as of a Specific Date in Site Management Tools](#).

SuiteCommerce InStore Extensions Support

With the 2018.2 release, SuiteCommerce supports SuiteCommerce InStore extensions. The 2018.2 release includes changes to the extension activation process to accommodate this functionality.

For more information, see the SCIS Release Notes at [SuiteCommerce InStore](#).

Legacy Tab Added to SuiteCommerce Configuration Record

In the 2018.2 release of SuiteCommerce, the SuiteCommerce Configuration record displays a new **Legacy** tab. This tab provides SuiteCommerce customers with access to legacy feature properties, including properties related to the Footer and Newsletter.

The properties exist on this tab for backward compatibility with previous implementations of SuiteCommerce only. If you are configuring a theme created prior to the 2018.2 release, you can use these properties to configure the footer and the Newsletter feature.

However, if you are implementing SuiteCommerce for the first time at the 2018.2 release, you do not have the templates necessary to use the properties on the **Legacy** tab, so it does not apply to you.

Customers implementing SCA (2018.2) do not have access to these properties.

Footer Support

In the 2018.2 release of SuiteCommerce, the Footer configuration properties are now available on a new **Legacy** tab in the SuiteCommerce Configuration record. SuiteCommerce Base Theme and SuiteCommerce Advanced source code no longer include the templates necessary to configure the footer. Therefore, these properties are included in the new tab for backward compatibility with previous implementations.

Footer configuration is being implemented within a future SuiteCommerce Extension.

Newsletter Support

In the 2018.2 release of SuiteCommerce, the Newsletter configuration properties are now available on a new **Legacy** tab in the SuiteCommerce Configuration record. SuiteCommerce Base Theme and SuiteCommerce Advanced source code no longer include the templates necessary to configure the Newsletter feature. Therefore, these properties are included in the new tab for backward compatibility with previous implementations.

Newsletter configuration is being implemented within a future SuiteCommerce Extension.

Node.js Requirement Change

With the 2018.2 release of SuiteCommerce, the developer tools have been modified to support Node.js version **8.11.4**. To use the theme, extension, or core SCA 2018.2 developer tools, you must update Node.js to this version. See the help topic [Install Node.js](#) for more information.

Extensibility API Updates

In the 2018.2 release of SuiteCommerce, we are introducing two new methods to LayoutComponent:

- `registerView()`
- `showContent()`

Use `registerView()` to make a child view available in any template attached to the component. The `registerView()` method lets template developers include a child view in a template by adding an HTML element and specifying the child view as a data attribute.

The `showContent()` method lets developers show additional content on the page, either as a modal or as a replacement of the main view.

See the help topic [Overview](#) to learn more about the SuiteCommerce extensibility API.

Aconcagua R2 Release of SuiteCommerce Advanced

The following release notes apply to the Aconcagua R2 release of **SuiteCommerce Advanced** only. This version includes the following enhancements:

- [Added Environment.Component to Extensibility API](#)
- [Backbone Version Change](#)
- [Issue Fixes](#)

Important: This release is available as an **update** to the existing Aconcagua release of SuiteCommerce Advanced. If you are working with the existing Aconcagua release of SuiteCommerce Advanced, this update overwrites content in the Development folder in the NetSuite File Cabinet. If you have previously deployed customizations to the Development folder, you must manually migrate any customizations you may already have in place to the new source code directory. For implementations prior to the Aconcagua release of SuiteCommerce Advanced, migration to this latest version requires a re-implementation.

Added Environment.Component to Extensibility API

With this release of SuiteCommerce Advanced, a new component is available using the Extensibility API. `Environment.Component` provides access to information about the SuiteCommerce environment, such as configuration details, site settings, and user session details.

For more information on this component, see the help topic [Environment](#).

Backbone Version Change

The original Aconagua release of SuiteCommerce Advanced included Backbone.js version 1.3.3.

At the Aconagua R2 release of SCA, we rolled back to Backbone.js 1.2.2 to solve an issue where customers were incorrectly redirected to the Home page while adding items to a Request for Quote.

Issue Fixes

This release includes fixes for the following issues:

Issue	Issue Description	Modules Updated
No Results Display When Searching Within a Category	If a user has selected one or more facets and searches for a product using the site search, the application searches without taking into account the selected facets.	Facets SiteSearch
Search Not Working on Home Page and PDP	When using the site search from the Home Page or the Product Details Page, item searches do not display in the search results.	Facets SiteSearch
Log In Page Loading When Session Expired on Password-Protected Site	When implementing a password-protected site, the site redirects users to a login page when the session expires. In some cases, the login page keeps refreshing continually, preventing users from logging in.	CheckoutApplication
Checkout is Not Scrolling to Display Error Message	In Checkout, if a user has not chosen a shipping method, the application does not scroll the page up to view the error message to alert the user.	Wizard
Error When Combining Free Gift Promotions	When adding two promotions for a free gift, some users do not see an extra free gift added to the cart.	LiveOrder
No Image or Incorrect Image Displayed in Social Media Sites	When sharing a link in a Facebook post, no image, or an incorrect image appears in Facebook Share.	ShoppingApplication
Content Duplicates on Multiple Landing Pages	When adding content using Site Management Tools for a content area of type: This Page , the content is duplicated across all created landing pages. The actual result should only affect the specific landing page where the content was placed.	CMSAdapter
Items are Not Showing on Review and Submit Pages	When using the Pick-up In Store feature, some items do not appear on the Review and Submit page. The pages display the error: Multi-location Inventory Error (MLI_LOCATION_REQUIRED): this transaction or its items must have locations.	OrderWizard.Module.CartItems
Unable to Edit the Quantity and Item Option Together	When users edit an order in Checkout and change both an item option and a quantity	LiveOrder

Issue	Issue Description	Modules Updated
	together, the item option does not change throughout the entire checkout process.	

Aconcagua Release of SuiteCommerce and SuiteCommerce Advanced

Welcome to the Aconcagua release of SuiteCommerce and SuiteCommerce Advanced!

The Aconcagua release introduces a new product line, **SuiteCommerce**, along with a major change to how you can enhance your web store experience using the **Extension Framework**. You can create additional functionality as extensions that you can then install and activate for your account. Extensions can be developed and shared by our partner community which then provides you with a range of choices for improving your web store to meet your business needs. These changes are detailed in this document along with related commerce applications, commerce platform, and Site Management Tools enhancements.

 **Important:** If you are implementing the Aconcagua release of SuiteCommerce Advanced, make sure you get the latest bundle from NetSuite SuiteBundler. You can find the changes included in the Aconcagua R2 release. See [Aconcagua R2 Release of SuiteCommerce Advanced](#).

The following bundles are available:

Bundle ID	SuiteApp
222167	SuiteCommerce
228165	SuiteCommerce Advanced Aconcagua
228895	SuiteCommerce Extension Management
228676	SuiteCommerce Base Theme
222173	SuiteCommerce Configuration
53051	Reference Product Lists Records

 **Important:** You **must** install the Aconcagua release of SuiteCommerce in a **NetSuite 2018.1** account. Many of the features and enhancements in this release have dependencies on NetSuite 2018.1.

 **Note:** To take advantage of new features in existing SuiteCommerce Advanced implementations, you must migrate the new code to your existing code base. For details, see the help topic [Migrate SuiteCommerce Advanced](#).

Commerce Applications

The Aconcagua release of SuiteCommerce and SuiteCommerce Advanced (SCA) includes the following enhancements:

- [SuiteCommerce](#)

- Themes and Extensions
- Extensibility API and the Extension Framework
- SuiteCommerce Base Theme
- SuiteCommerce Theme Customizer Support
- Documentation Changes
- Copy Configuration
- Intercompany Cross-Subsidiary Fulfillment
- Free Gift Promotion
- Libraries Update
- Standard Header and Footer in Checkout

 **Note:** The features listed herein apply to SuiteCommerce and SuiteCommerce Advanced unless otherwise noted.

SuiteCommerce

SuiteCommerce lets you create, customize, and configure dynamic and engaging web stores without the in-depth development required of SuiteCommerce Advanced (SCA). With SuiteCommerce, you can quickly activate predefined **themes** to alter the look and feel of a web store and activate **extensions** to introduce functionality and features. This lets site administrators build SuiteCommerce web stores quickly, without requiring development or access to the core functionality or application architecture.

SuiteCommerce also leverages the new Site Management Tools Theme Customizer, which enables Site Management Tools administrators to customize a theme through the SMT user interface without editing Sass or HTML templates.

SuiteCommerce requires the implementation of a few SuiteApps. The SuiteCommerce, SuiteCommerce Extensions Management, SuiteCommerce Base Theme, and SuiteCommerce Configuration SuiteApps are all required.

 **Note:** SuiteCommerce is available as a managed SuiteApp. This means that all updates to the platform are automatic. All upcoming changes to SuiteCommerce will be communicated in advance of any released updates.

Because SuiteCommerce is built on the same architecture as SuiteCommerce Advanced, much of the online documentation applies to both platforms. The documentation highlights what product or product release applies to each topic. Look for the **Applies To** tags within each topic to determine what application or release the topic applies to.

 **Note:** Some procedures in this documentation direct you through NetSuite user interface elements, such as menus and menu items, that state **SuiteCommerce Advanced**. In these cases, follow the procedures as directed.

Themes and Extensions

With this release, users implement themes and extensions to improve their web stores. Themes and extensions are self-contained packages that extend your site in some way. Site administrators can install themes and extensions as bundled SuiteApps or as custom-built code deployed to an account by in-house theme designers and site developers.

To implement this functionality to your SuiteCommerce or SuiteCommerce Advanced web store, you must install the SuiteCommerce Extensions Management SuiteApp, which adds the Manage Extensions Wizard to your account.

Manage Extensions Wizard

This wizard lets SuiteCommerce and SuiteCommerce Advanced site administrators:

- Activate predefined themes to alter the look and feel of a web store.
- Activate predefined extensions to introduce functionality and features.

Predefined themes and extensions are available as SuiteApps using the NetSuite SuiteBundler. Predefined (published) themes and extensions must be installed into a NetSuite Account before you can activate them. Themes and extensions can also be deployed to an account by site developers using the theme and extension developer tools.

See the help topic [Themes & Extensions](#) for more information on installing and activating themes and extensions.

Theme and Extension Developer Tools

One key aspect of themes and extensions is how things change from previous releases. You no longer edit distro files and compile code for deployment. Now, you deploy a theme or extension to a NetSuite account, making it available for activation (using the Manage Extensions Wizard). When an administrator activates a theme or extension, NetSuite then compiles the code and applies it to a specified domain.

The Extensions Management SuiteApp includes two different developer tools, one specific to creating themes, the other for extensions. In this way, SuiteCommerce and SuiteCommerce Advanced developers are now theme developers, extension developers, or both.

These developer tools let SuiteCommerce and SuiteCommerce Advanced site developers and partners:

- Develop Sass and HTML templates and deploy as themes.
- Expose Sass variables to the Site Management Tools Theme Customizer.
- Develop JavaScript, SuiteScript, or configuration objects that are accessible using the Extensibility API and deploy as extensions.
- Test themes and extensions on a local server.
- Create Custom Content Types (CCTs) as extensions.

SuiteCommerce Advanced Developers:

As an SCA developer, the Aconcagua release gives you access to themes and extensions. Developers for Aconcagua sites now use themes to alter the look and feel of the site using Sass and HTML files. The Aconcagua release of SuiteCommerce Advanced includes the Source and Development distributions within the File Cabinet as expected in previous implementations. However, these distributions no longer contain HTML templates or Sass files. Therefore, you must implement themes to develop HTML templates and Sass files.

To introduce new functionality to a site through JavaScript and SuiteScript, you can now use the Extensibility API to build a portable, extensible application through the new Extension Framework.

However, if you are developing JavaScript, SuiteScript, or configuration objects that are not accessible using the Extension Framework, you must use the core SCA developer tools and follow SCA module customization practices. See the help topic [Customize with SCA Tools](#) for information.

See the help topic [SuiteCommerce Extensibility API](#) for a list of components exposed using the Extensibility API.

Extensibility API and the Extension Framework

This release introduces a new way to customize and extend your SuiteCommerce or SuiteCommerce Advanced web store. Developers now create extensions using the Extensibility API to introduce new features or functionality. Developers build code within an extension to make API calls to components. These components then interact with the application. This separates custom developer code from the application itself and helps ensure future extensibility of the application.

The best practice is to build extensions using JavaScript, SuiteScript, or configuration objects available within the Extensibility API. See the help topic [Extensibility API Components](#) for a list of components available using the Extensibility API.

Note: If you are customizing objects that are not accessible using the Extensibility API, you can use the core SCA developer tools and customization practices to customize these objects.

For more details on the Extensibility API and procedures on how to access components while building extensions, see the help topic [SuiteCommerce Extensibility API](#).

SuiteCommerce Base Theme

Along with the introduction of themes and extensions, this release includes the SuiteCommerce Base Theme SuiteApp. Best practice for theme developers is to use this theme as a baseline for any theme development. Simply install this SuiteApp and use the Manage Extensions Wizard to activate it for a domain. Then, use the theme developer tools to fetch the theme files into your theme development workspace and start developing your theme.

You must activate a theme before you can develop or test code locally. This theme is built using best practices for creating HTML and Sass and using established an [Commerce Sass Style Definitions](#) for developing Sass.

- For information on how to install this theme as a SuiteApp, see the help topic [Install Your Commerce Website Applications](#).
- For information about using the theme developer tools to fetch these files to use a a baseline theme, see the help topic [Fetch Active Theme Files](#).
- For information about developing your theme, see the help topic [Develop Themes](#).

SuiteCommerce Theme Customizer Support

With this release of SuiteCommerce, theme developers can customize Sass files to expose variables to the Site Management Tools Theme Customizer. Within your Sass structure, you can also establish a schema for displaying each variable in the SMT user interface.

Exposing Sass takes the form of an `editable()` function call wrapped inside a comment in a theme's Sass files. When a site administrator activates a theme with exposed Sass, SMT displays those variables, and SMT administrators can alter the exposed variables to further customize their web store.

This customization can include preset skins. A skin is a selectable set of predefined settings that change the appearance of a theme in SMT. One theme can include any number of skins that SMT administrators select to change that theme's appearance. From a development perspective, a skin is a JSON file that defines each exposed variable and the new values.

See the help topic [Expose Sass Variables for Customization](#) for details.

Documentation Changes

With this release of SuiteCommerce, the online documentation has been reorganized. For the web store topics, we have separated most developer-specific content from user content.

 **Note:** URLs to most topics have not changed, so any local bookmarks to existing topics are maintained.

You will now see two new sections as follows:

Storefront – These topics explain everything you need to know to set up your web store to deliver a full shopping, checkout, and my account experience to your customers. Some of what you can learn about from here includes how to:

- Apply themes and extensions
- Set up and manage transactions
- Prepare items for availability and search in your store
- Optimize your store for SEO and analytics

Developer Documentation – These topics are written for theme and extension developers and web store administrators. Some of what you can learn about from here includes how to:

- Set up domains
- Create themes and extensions
- Use the available APIs to customize your web store experience

Copy Configuration

With this release, you can use the Copy Configuration functionality to copy a SuiteCommerce configuration record from one domain to another.

Copy Configuration is part of the SuiteCommerce Configuration SuiteApp. After installing this SuiteApp, Copy Configuration is available by going to Setup > SuiteCommerce Advanced > Configuration and selecting your website and domain.

If you are implementing an SCA site, the two domains do not have to be on the same release. For example, you can copy a Kilimanjaro configuration record to another domain on a later release of SCA. Since it is common for later versions of SCA to have fields that do not exist in previous releases, the tool copies the values of all fields that are common between the two releases and uses default values for the additional fields.

Common scenarios where this feature is useful include:

- Moving a web store from staging to production
- Moving from one SuiteCommerce Advanced release to another

For additional information see the help topic [Copy a SuiteCommerce Configuration Record](#).

Intercompany Cross-Subsidiary Fulfillment

With this release, SuiteCommerce and SuiteCommerce Advanced support Intercompany Cross-Subsidiary Fulfillment.

This feature only applies to OneWorld accounts with multiple subsidiaries and requires proper setup in NetSuite. See the help topic [Intercompany Cross-Subsidiary Fulfillment](#) for setup information.

After you properly configure Intercompany Cross-Subsidiary Fulfillment in NetSuite, users can order an item from a subsidiary site regardless of inventory level at that subsidiary as long as there is sufficient inventory to fulfill the order at a related subsidiary. This capability applies to all types of orders including ones set to ship or set for pickup in store.

Free Gift Promotion

With this release, the SuitePromotions Free Gift option is available in your web store. After adding a Free Gift promotion, the free gift is automatically applied to qualifying orders. Users can elect to delete the free gift if they do want to receive the gift item.

Keep the following in mind with Free Gift promotions:

- Free Gift promotions do not work with the Multi Ship To feature.
- Best Offer logic does not apply to Free Gift promotions.
- Parent matrix items cannot be selected as a free gift.
- Items with options cannot be selected as a free gift.

If your site is not already configured to use SuitePromotions, see the help topic [Promotions in Commerce Web Stores](#) for information about how to add SuitePromotions to your site.

Libraries Update

With this release, the third-party libraries shown in the table below have been updated. Library version information is also shown in the `distro.json` file. If you are migrating to the Aconcagua release of SuiteCommerce Advanced, ensure that no deprecated methods exist in your implementation before migrating.

Library	Old Version	New Version
Almond	0.3.0	0.3.3
Backbone	1.1.2	1.3.3
Backbone.Stickit	0.8.0	0.9.2
Bignumber	1.5.0	4.0.4
html5shiv	3.7.2	3.7.3
jQuery-Zoom	1.7.13	1.7.20
json2	2.0.1	2.0.2
require	2.1.15	2.3.5
twitter-bootstrap-sass	3.3.1	3.3.7
underscore	1.7.0	1.8.3

Standard Header and Footer in Checkout

With this release, you can elect to use the standard website header on checkout pages rather than the default checkout header and footer. This property is available on the Configuration record Checkout Tab.

Kilimanjaro Release of SuiteCommerce Advanced

Applies to: SuiteCommerce Advanced | Kilimanjaro

Welcome to the Kilimanjaro release of SuiteCommerce Advanced!

Important: You **must** install the Kilimanjaro release of SuiteCommerce Advanced in a **NetSuite 2017.2** account. Many of the features and enhancements in this release have dependencies on NetSuite 2017.2. For details on enhancements and changes in NetSuite 2017.2, see [Release Notes 2017.2](#).

This version includes the following enhancements:

- [3D Secure Payments](#)
- [Change Email Address](#)
- [Custom Content Types](#)
- [Display of VAT/GST/PST](#)
- [Field Set Setup Script Changes](#)
- [Node.js Requirement Changes](#)
- [Sass Style Guide](#)
- [Style Definition Changes](#)
- [SuiteCommerce Configuration Updates](#)
- [SuitePromotions Enhancements](#)

The following bundles are available:

- SuiteCommerce Advanced Kilimanjaro: Bundle ID – **194217**
- Site Builder Extensions Kilimanjaro : Bundle ID – **194218**
- Site Builder Extensions Premium Kilimanjaro : Bundle ID – **194219**
- SuiteCommerce Configuration: Bundle ID – **194222**
- Reference Product Lists Records: Bundle ID – **53051**: This bundle is required even if Product Lists records are not leveraged for your implementation. If not installed, the following error is returned when shoppers navigate to the cart: The record type [CUSTOMRECORD_NS_PL_PRODUCTLIST] is invalid.

Important: To take advantage of new features in existing implementations, you must migrate the new code to your existing code base. For details, see the help topic [Migrate SuiteCommerce Advanced](#).

3D Secure Payments

With the Kilimanjaro release of SuiteCommerce Advanced, the use of 3D Secure authentication through payment provider accounts such as Cybersource or MerchantE is supported. 3D secure authentication provides for additional fraud protection by allowing users to create and assign a password to their credit and debit cards. The password is then verified when a user processes a transaction through your store.

For more information, see the help topic [3D Secure Payment Authentication](#).

Change Email Address

With the Kilimanjaro release of SuiteCommerce Advanced, users can now change their registered email address in the My Account application. Once a user submits the change request, they receive an email to confirm the change. When the user clicks the confirmation link, a confirmation message is displayed within the login/checkout screen.

Note: This feature is available by default in the Kilimanjaro release of SuiteCommerce Advanced. For instructions on backporting the feature to previous releases of SuiteCommerce Advanced, see the help topic [Change Email Address Patch](#).

For more details, see the help topic [Change Email Address](#).

Custom Content Types

With the Kilimanjaro release of SuiteCommerce Advanced, users can create Custom Content Types.

To implement this feature, you create a custom module within your application source code. This is similar to any customization you implement in SCA. You must also set up the CCT in NetSuite and implement it into your SCA site using Site Management Tools.

Note: You must be using SMT Version 3 to implement CCTs.

For more information on building a custom CCT module for SCA, see the help topic [Create Custom Content Types for SMT](#).

For more information on implementing a CCT using Site Management Tools, see the help topic [Create Custom Content Types for SMT](#).

Display of VAT/GST/PST

With the Kilimanjaro release of SuiteCommerce Advanced, the display of VAT, GST, and PST tax amounts for Canadian, UK, and Australian editions of NetSuite is supported. For details, see the help topic [Commerce Web Store Taxes](#).

Field Set Setup Script Changes

With the Kilimanjaro release of SuiteCommerce Advanced, you can now configure a custom matrix child item search field set using the SuiteCommerce Configuration record. This includes a default matrixchilditems_search field set. To account for this new functionality, the field set setup script now includes a default matrix child item field set.

For more information on the configurable properties related to this feature, see the help topic [Shopping Catalog Tab](#).

For more information on how to implement the field set setup script, see the help topic [Set Up Initial Field Sets](#).

Node.js Requirement Changes

With the Kilimanjaro release of SuiteCommerce Advanced, the developer tools have been modified to support Node.js version 6.11.x (where x is the most current minor release). See the help topic [Install Node.js](#) for more information.

Sass Style Guide

With the Kilimanjaro release of SuiteCommerce Advanced, you can now use the developer tools to create a style guide automatically.

A style guide helps you document and use the various style elements defined for your site. Contributors can refer to a style guide to create new pages and elements or customize existing ones. A style guide can also ensure that your best practices for site design are being met by multiple contributors.

See the help topic [Style Guide](#) for details and instructions on how to build a style guide using the developer tools.

As a prerequisite for a style guide, SCA uses Knyle Style Sheet (KSS) notation to document and define elements within source Sass files. As a best practice when customizing SCA Sass files, use KSS notation.

See the help topic [KSS Notation](#) for details.

Style Definition Changes

To help you maintain and develop Sass variables, SuiteCommerce Advanced introduces the following Sass style definitions with the Kilimanjaro release. This provides better optimized Sass and more comprehensible variable definitions. These enhancements include the following:

- Redefined color palette, typography, and spacing definitions
- Human-readable, standardized variable definitions
- More elegant element definition through Sass code nesting

For details, See the help topic [Style Definitions](#).

Colors

Neutral shades and theme colors are handled differently from previous releases. Both neutral shades and theme color pallets now use a shading scale from 1000 (dark) to 0 (light).

Example: Kilimanjaro Release and Later

```

1 | $sc-color-primary: #e23200;
2 | $sc-color-secondary: #15607b;
3 |
4 | // ...
5 |
6 | $sc-neutral-shade-base: #222426;
7 | $sc-neutral-shade-900: $sc-neutral-shade-base;
8 | $sc-neutral-shade-600: lighten($sc-neutral-shade-base, 18);
9 | $sc-neutral-shade-300: lighten($sc-neutral-shade-base, 55);
10 | $sc-neutral-shade-0: lighten($sc-neutral-shade-base, 100);
11 |
12 | // ...
13 |
14 | $sc-color-theme-base: $sc-color-secondary;
15 | $sc-color-theme-900: $sc-color-theme-base;
16 | $sc-color-theme-400: desaturate(lighten($sc-color-theme-base, 45), 18);
17 | $sc-color-theme-300: desaturate(lighten($sc-color-theme-base, 60), 22);
18 | $sc-color-theme-200: desaturate(lighten($sc-color-theme-base, 68), 22);

```

Example: Previous Releases

```

1 | $sc-color-theme: #5b7f8c;
2 | $sc-color-theme-light: #9cb6bf;
3 | $sc-color-theme-background: #e4eff5;
4 | $sc-color-theme-background-light: lighten($sc-color-theme-background, 3.5);
5 | $sc-color-theme-background-lightest: lighten($sc-color-theme-background, 6);
6 | $sc-color-theme-border: desaturate(darken($sc-color-theme-background, 8), 3);

```

```

7 $sc-color-background-list: #f1f8fa;
8
9 $sc-color-primary: #f15c28;
10 $sc-color-secondary: #15607B;
11 $sc-color-tertiary: #ffffff;
12
13 $sc-color-success: #4a7f35;
14 $sc-color-success-background: #eef7e4;
15 $sc-color-warning: #8e7728;
16 $sc-color-warning-background: #f9f5cd;
17 $sc-color-error: #C33C48;
18 $sc-color-error-background: #FFE9F1;
19 $sc-color-info: $sc-color-theme-light;
20 $sc-color-info-background: $sc-color-theme-light;

```

Typography

Typography variables now employ a more familiar sizing method of extra-small (xs) through triple-extra-large (xxxl) within the variable definition. Each of these sizes is calculated from a base font size (\$sc-font-size-base) expressed as rem units (relative em).

Example: Kilimanjaro Release and Later

In the following example, the value for \$sc-font-size-m (medium) equals 15px (1 x 15px):

```

1 $sc-font-size-base: 15px;
2
3 $sc-font-size-xs: 0.75rem;
4 $sc-font-size-xs: 0.87rem;
5 $sc-font-size-s: 0.93rem;
6 $sc-font-size-m: 1rem;
7 $sc-font-size-l: 1.067rem;
8 $sc-font-size-xl: 1.2rem;
9 $sc-font-size-xxl: 1.47rem;
10 $sc-font-size-xxxl: 1.73rem;

```

Example: Previous Releases

```

1 $sc-base-font-size: 15px;
2 $sc-smallest-font-size: 11px;
3 $sc-small-font-size: 13px;
4 $sc-h1-font-size: 26px;
5 $sc-h1-font-size-mobile: 22px;
6 $sc-h2-font-size: 22px;
7 $sc-h2-font-size-mobile: 18px;
8 $sc-h3-font-size: 22px;
9 $sc-h3-font-size-mobile: 18px;
10 $sc-h4-font-size: 18px;
11 $sc-h4-font-size-mobile: 15px;
12 $sc-h5-font-size: $sc-base-font-size;
13 $sc-button-large-font-size: $sc-base-font-size * 1.067;
14 $sc-button-medium-font-size: $sc-base-font-size;
15 $sc-button-small-font-size: $sc-small-font-size;

```

Spacing

SuiteCommerce Advanced now introduces **levels** to indicate the added or reduced space for a class relative to a base padding or margin style. Each level designation in the named variable equals the multiplier.

In the following example, the value for \$sc-padding-1v2 equals 10px (2 x 5px):

Example: Kilimanjaro Release and Later

```

1 $sc-padding-base: 5px;
2 $sc-padding-lv1: $sc-padding-base;
3 $sc-padding-lv2: $sc-padding-base * 2;
4 $sc-padding-lv3: $sc-padding-base * 3;
5 $sc-padding-lv4: $sc-padding-base * 4;
6 $sc-padding-lv5: $sc-padding-base * 5;
7 $sc-padding-lv6: $sc-padding-base * 6;
8 $sc-padding-lv7: $sc-padding-base * 7;
9 $sc-padding-lv8: $sc-padding-base * 8;

```

Example: Previous Releases

```

1 $sc-base-padding:5px;
2 $sc-base-margin:5px;
3
4 $sc-small-margin:$sc-base-margin * 2;
5 $sc-medium-margin:$sc-base-margin * 4;
6 $sc-large-margin:$sc-base-margin * 8;
7 $sc-xlarge-margin:$sc-base-margin * 12;
8
9 $sc-padding-small: $sc-base-padding * 5 $sc-base-padding * 3;
10 $sc-padding-medium: $sc-base-padding * 6;
11
12 $button-safe-margin:$sc-base-margin * 2;

```

SuiteCommerce Configuration Updates

With the Kilimanjaro release of SuiteCommerce Advanced, the following configuration properties have been added. Refer to the appropriate section for more information.

Property Label (SuiteCommerce Configuration Record)	Property ID	More Information	Property Location (SuiteCommerce Configuration Record) Tab > Subtab
Require a Phone Number With Addresses	addresses.isPhone Mandatory	Require a Phone Number With Addresses	My Account > Addresses (new subtab)
Enable 3D Secure Payments	isThreeDSecureEnabled	Enable 3D Secure Payments	Checkout
If the Information is Available to your Country, shows detailed taxes in the Cart	showTaxDetailsPerLine	If the Information is Available to your Country, shows detailed taxes in the Cart	Shopping Catalog
Allow custom matrix child search in the item list	matrixchilditems.enabled	Matrix child items fieldset for search	
If the Information is Available to your Country, shows detailed taxes in the Cart	matrixchilditems.fieldset	If the Information is Available to your Country, shows detailed taxes in the Cart	
Favicon of the Website	faviconPath	Favicon of the Website	Advanced > Favicon Path

Property Label (SuiteCommerce Configuration Record)	Property ID	More Information	Property Location (SuiteCommerce Configuration Record) Tab > Subtab (new subtab)

SuitePromotions Enhancements

With the Kilimanjaro release of SuiteCommerce Advanced, the following promotions enhancements are available:

- **Auto-Apply Promotions** – You can configure promotions to be automatically applied when certain criteria are met.
- **Best Offer Promotions** – Automatically configured for promotions where auto-apply is enabled. For example, if a user has applied multiple promotions to an order including a promotion that is defined as exclusive, the best combination of promotions is automatically determined.
- **Audit and Visibility of Promotions** – Shows if a promotion was added by the user or by best offer. If a promotion is not applied, it also displays the reasons why it was not applied.

 **Note:** Due to dependencies on enhanced Commerce APIs, to use these promotions enhancements you must have the Kilimanjaro release of SuiteCommerce Advanced installed in a 17.2 NetSuite account.

To get started with using Auto-Apply promotions, you must do the following:

- Enable the **SuitePromotions** feature.
- Enable **This Promotion Can Be Automatically Applied** on the promotions record and define any promotions requirements.
- Enable **Auto-Apply Promotions** on the shopping tab of the web site setup record.

For detailed information on setting up and configuring SuitePromotions in SuiteCommerce Advanced, see the help topic [Promotions in Commerce Web Stores](#).

 **Note:** These features are available by default in the Kilimanjaro release of SuiteCommerce Advanced. For instructions on backporting to the Elbrus release of SuiteCommerce Advanced, see the help topic [Auto-Apply Promotions for Elbrus](#).

Elbrus Release of SuiteCommerce Advanced

 **Applies to:** SuiteCommerce Advanced | Elbrus

Welcome to the Elbrus release of SuiteCommerce Advanced!

 **Important:** You **must** install the Elbrus release of SuiteCommerce Advanced in a **NetSuite 2017.1** account. Many of the features and enhancements in this release have dependencies on NetSuite 2017.1. For details on enhancements and changes in NetSuite 2017.1, see  [Release Notes 2017.1](#).

This version includes the following enhancements:

- [Custom Field Support](#)

- [Facets as URL Parameters](#)
- [Handlebars.js Helper Additions](#)
- [Internet Explorer 8 No Longer Supported](#)
- [Mastercard 2-Series BIN Range Support](#)
- [Multi-Image Option Enhancements](#)
- [Store Pickup for Commerce Websites](#)
- [Product Details Page Architecture Changes](#)
- [Quantity Pricing](#)
- [Quick Order](#)
- [Script Debugger Change for Field Set Setup Script](#)
- [Single Secure Domain for Shopping and Checkout](#)
- [Secure Shopping Domain](#)
- [SuiteCommerce Configuration Updates](#)
- [SuitePromotions](#)
- [View Architecture Changes](#)

The following bundles are available:

- SuiteCommerce Advanced Elbrus: Bundle ID — **165410**
- Site Builder Extensions Elbrus: Bundle ID — **165411**
- Site Builder Extensions Premium Elbrus: Bundle ID — **165412**
- SuiteCommerce Configuration: Bundle ID — **135010**
- Reference Product Lists Records: Bundle ID — **53051**: This bundle is required even if Product Lists records are not leveraged for your implementation. If not installed, the following error is returned when shoppers navigate to the cart: The record type [CUSTOMRECORD_NS_PL_PRODUCTLIST] is invalid.

Important: To take advantage of new features in existing implementations, you must migrate the new code to your existing code base. For details, see the help topic [Migrate SuiteCommerce Advanced](#).

Custom Field Support

With the Elbrus release of SuiteCommerce Advanced, you can access core and custom field values through the Commerce API, Items API, and SuiteScript. You can configure SuiteCommerce Advanced and customize template files to render information or ask for information stored in these fields on your web store's Shopping, Checkout, and My Account pages.

SuiteCommerce Advanced supports the following kinds of custom field records:

- **Custom Item Fields** – adds custom item field data associated with an item. These fields can render in the Product Details Page (PDP), Checkout, and My Account.
- **Custom Transaction Body Fields** – adds custom transaction fields to the body of a web store transaction (order as a whole). You can also include some field metadata (such as the field label or item options). These fields can render in Checkout and My Account.
- **Custom Transaction Column Fields** – adds a custom transaction field to the column of a transaction record (across multiple transaction lines in an order). These fields can render in the PDP, Cart, Checkout, and My Account.

- **Custom Transaction Item Options** – adds a custom transaction field that applies to a transaction line (one line item within an order). These fields can render in the PDP, Cart, Checkout, and My Account.

Setting up Custom Fields for your SCA site requires NetSuite field set up, web site configuration, and template customization. For detailed information, see the help topic [Commerce Custom Fields](#).

Facets as URL Parameters

When using Faceted Navigation with the Elbrus release of SuiteCommerce Advanced, you have the option to include facets in the URL as either part of the path or as URL parameters. SCA gives you the following configuration options:

- Configure all facets as part of the URL path (default)
- Configure all facets to act as URL parameters
- Configure individual facets as either URL parameters or part of the path.

For more information, see the help topic [Facets as Parameters](#).

Handlebars.js Helper Additions

With the Elbrus release of SuiteCommerce Advanced, the HandlebarsExtras module defines the following additional Handlebars.js helpers:

- `breaklines`
- `ifEquals`

Internet Explorer 8 No Longer Supported

As of the Elbrus release of SuiteCommerce Advanced, implementations no longer support the use of Internet Explorer 8 (IE8) and older. SuiteCommerce Advanced implementations and features prior to the Elbrus release of SuiteCommerce Advanced are not affected by this change.

Discontinued support of IE8 does not mean that your SuiteCommerce Advanced website will crash on IE8 users. However, it does mean that users may experience unexpected behaviors. Test all development for browser compatibility. For more information, see the help topic [Supported Browsers for Commerce Websites](#).

Mastercard 2-Series BIN Range Support

SuiteCommerce Advanced now supports the latest Mastercard 2-Series BIN range. The `PaymentMethods.json` file contains the latest regex string as the default value for the `paymentmethods.regex` configuration property.

For more information, see the help topic [Payment Methods Subtab](#).

Multi-Image Option Enhancements

With the Elbrus release of SuiteCommerce Advanced, you can configure more than one item option ID to determine the images that display in your web store. This capability can more accurately depict items in the product details page (PDP) based on multiple option selections. In previous versions of SuiteCommerce Advanced, you could only configure one item option ID to trigger an image change in the

PDP, regardless of other option selections. With Elbrus release, your web store can now depict images based on multiple selections.

For more information, see the help topic [\(Optional\) Configure Multi-Image Options](#).

Store Pickup for Commerce Websites

With the Elbrus release of SuiteCommerce Advanced, the Store Pickup for Commerce Websites feature is available. Store Pickup offers a new order fulfillment choice for NetSuite customers.

When you enable this feature, your customers have the option to pick up their orders at nearby retail locations instead of paying to ship the items.

 **Note:** Added permissions for roles and scripts will be included with the bundle.

Some of the enhancements and options included are as follows:

- Configure your retail locations to allow Store Pickup.
- Create or modify a customized sales order form to fit Store Pickup.
- Enable the Store Locator feature to show the nearest location to the customer.
- Set up inventory items to indicate whether they are eligible for pickup at retail locations.
- Specify hours for pickup and give customers a cutoff time for pickup on the same day.
- Set a stock buffer so that an item only appears as available for pickup if you have a specific amount of items in stock at the given location.

For more information [Store Pickup for SuiteCommerce Websites](#).

Product Details Page Architecture Changes

The product details page provides users with detailed information about a product and lets shoppers add items to their cart. To ensure a positive user experience, the PDP needs to create intuitive interactions and return information from the server quickly and efficiently. The architecture of the PDP is designed to accommodate these challenges.

With the Elbrus release of SCA, changes in the architecture of the PDP provide the following enhancements to the user experience:

- Performance enhancements — This new architecture aligns code with existing SCA architecture, reducing maintenance cost and enhancing extensibility
- Clear distinction between Quick View and Full PDP view
- Structured architecture with the PDP as a form, using the same automatic logic validation as other forms used by SCA
- Faster image loading
- Quicker message feedback for user errors
- Configuration enhancements
- Consistent product images throughout the shopping and checkout applications
- Multiple-image selection enhancements
- Enhanced mobile experience
- Readable URLs

For more information on the PDP architecture changes, see the help topic [Product Details Page Architecture](#).

Modules Affected

The following table explains the changes to the different modules that affect the PDP.

 **Important:** The architectural changes introduced in this release will affect how your site displays and processes information in the Product Details Page, the Cart, and throughout transactions. Make note of the following changes. Some modules include code changes. Others are added or removed.

* = This symbol indicates that the module is new with Elbrus release of SCA.

Modules Removed	Transformed Into
Item Details	Product * Item * ProductDetails * ProductLine *
ItemOptionsHelper	Product *
ItemsKeyMapping	Item *
ItemViews	Transaction.Line.Views *
Order	Transaction

 **Note:** To enhance extensibility, SCA uses two different item option templates, one for the PDP and another for search result (Facets).

Item.KeyMapping.js

As part of the architecture changes to the PDP, the ItemsKeyMapping module has been removed with the Elbrus release of SCA. The logic performs the same function, but now exists in the Item module as item.KeyMapping.js. This file contains mapping definitions of what is returned by the Search API. For example, if you want to set the name of items for data stored in a custom field instead of the default **Display Name** field, you extend the mapping in the Item.KeyMapping file, as opposed to customizing each instance across the entire code base.

Quantity Pricing

With the Elbrus release of SuiteCommerce Advanced, the Quantity Pricing feature is available for NetSuite customers who offer quantity-based price breaks. This feature uses the Search API to return an item's quantity pricing details from NetSuite (in JSON format) and display results in a chart that describes the pricing discounts available based on the quantity requested. This information is collapsed by default and available at the user's request by clicking on a link at various locations throughout your website.

The module for this feature is available by default with the Elbrus release bundle, but you must configure NetSuite to enable quantity pricing capabilities. For instructions on how to enable this feature in NetSuite, see the help topic [Using Quantity Pricing](#). You can disable this feature by editing the distro.json file.

For more information on this feature, see the help topic [Quantity Pricing](#).

 **Note:** The Quantity Pricing feature relies on the Search API and is not available with SiteBuilder Extensions.

Quick Order

With the Elbrus release of SuiteCommerce Advanced, the Quick Order feature is available for shoppers who prefer to quickly search for and add multiple items to their cart. This feature is designed for merchants who allow catalog ordering or provide wholesale products on their site. Quick Order assists shoppers who are familiar with a merchant's catalog and wish to shop for items by Stock Keeping Unit (SKU), Part Number, or other known identifier.

Users can click a **Quick Order** link in the header or view their Cart and expanding the **Quick Add** accordion. Users can then quickly search for, add, or remove multiple items to an order and adjust quantities in a list format. This feature offers an alternative to browsing through the web store.

This feature is enabled by default with the Elbrus release bundle, but you must set up Search Fields in NetSuite to ensure proper operation. You can disable this feature by editing the `distro.json` file.

For more information on this feature, see the help topic [Quick Order](#).

 **Note:** The Quick Order feature relies on the Search API and is not available with SiteBuilder Extensions.

Script Debugger Change for Field Set Setup Script

In the SuiteScript debugger tool, there is now an option to select the API Version to run scripts against. When running the Field Set Setup script, you must explicitly select the Version 1.0 API. For more information, see the help topic [Set Up Initial Field Sets](#).

Single Secure Domain for Shopping and Checkout

SuiteCommerce Advanced now supports a single secure (HTTPS) domain for the checkout and shopping applications. A single domain provides consumers with a seamless buying experience. It removes the delays associated with shopping in one domain and moving to another for checkout.

For more information, see the help topic [Set Up a Domain](#).

Patch files are available for backporting to the Denali, Mont Blanc, and Vinson implementations of SuiteCommerce Advanced. For more information, see the help topic [SCA Patches](#). Detailed instructions are also available for backporting to pre-Denali implementations of SuiteCommerce Advanced. See the help topic [Secure Shopping Domain \(pre-Denali\)](#).

Secure Shopping Domain

SuiteCommerce Advanced now supports a secure shopping (HTTPS) domain using Secure Sockets Layer (SSL) certificates. Including HTTPS technology in your shopping area assures your customers that their activities on your site are secure. Using HTTPS can also increase site traffic since search engines tend to rank secure sites higher than non-secure sites.

 **Important:** When using HTTPS, you **must** install the Elbrus release of SuiteCommerce Advanced in a **NetSuite 2017.1** account. If you are working with an older release of SCA, you must also install the patch files for using HTTPS. See the help topic [SCA Patches](#).

You can either set up a new secure shopping domain or directly switch from an existing non-secure shopping domain to a secure shopping domain. For more details on this feature, see the help topic [Set Up a Domain](#).

SuiteCommerce Configuration Updates

With the Elbrus release of SuiteCommerce Advanced, the following configuration properties have been added or updated. Refer to the appropriate section for more information.

Property Label (SuiteCommerce Configuration Record)	Property ID	More Information	Property Location (SuiteCommerce Configuration Record) Tab > Subtab
Facets as URL Parameters	facetsAsUrlParameters	Facets as URL Parameters	Shopping Catalog > Facets
Facets > Is URL Parameter?	facets.isParameter	Facets	
Facets > Max	facets.max		
Allow Adding More Than One Promo Code	promocodes.allowMultiples	Allow Adding More Than One PromoCode	Shopping Catalog

SuitePromotions

With the Elbrus release of SuiteCommerce Advanced, the SuitePromotions feature is available. With SuitePromotions, your customers can add multiple eligible promo codes to their order on your SuiteCommerce Advanced website. Customers can see the applied promotions in their cart and remove them if needed.

SuitePromotions include item promotions, order promotions, and shipping promotions. You can configure each promotion to be completely exclusive (not stackable) or you can prevent stacking only for the same promotion types. For example, you allow stacking of a shipping promotion and an item promotion, and you prevent customers from stacking two different shipping promotions.

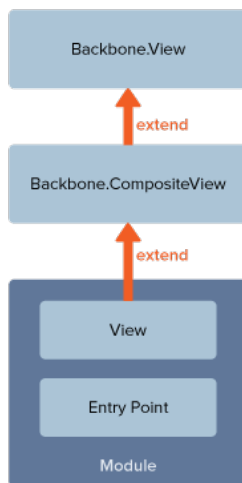

See the help topic [Promotions in Commerce Web Stores](#) for more details.

View Architecture Changes

With the Elbrus release of SuiteCommerce Advanced, all Backbone.Views are composite views by default.

New Architecture

With the Elbrus release of SuiteCommerce Advanced, all Backbone.Views are now Backbone.CompositeViews by default. Composite views are simply Views that contain Child Views. These Child Views further modularize the application, so views can be used in multiple contexts. For example, some modules define Child Views that are extensions of Backbone.View. As a consequence, those Child Views are also now Backbone.CompositeViews. This ensures that data displays in a consistent way across the application.

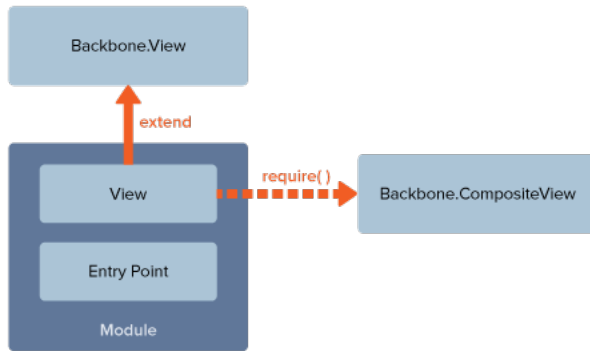

With the Elbrus release of SCA, Views no longer need to declare themselves as composite views using the `require( )` method.

See the help topic [View Architecture](#) for detailed information.

To make this change backward compatible with earlier releases of SCA, Backbone.CompositeView.js includes a `CompositeView.add( )` method as a no operation (noop) method. This prevents any errors when calling it from any custom code in any implementations prior to Elbrus release.

Previous Architecture

In previous releases of SCA, all views extended Backbone.View and declared themselves as a composite views using the `require( )` method.

Vinson Release of SuiteCommerce Advanced

Applies to: SuiteCommerce Advanced | Vinson

Welcome to the Vinson release of SuiteCommerce Advanced! This version includes the following enhancements. Many of the features and enhancements in this release have dependencies on the 2016.2 release of NetSuite. For details, see the [NetSuite 2025.2 Release Notes](#).

- [Alternative Payment Methods](#)
- [Application Performance Management \(APM\) Changes](#)
- [Category Integration](#)
- [Checkout Usability Improvements](#)
- [Configuration Changes](#)
- [Device Fingerprinting for Transactions](#)
- [Field Set Setup Script](#)
- [Header Improvements](#)
- [Newsletter](#)
- [Quotes Enhancements](#)
- [Save Credit Card Information](#)
- [SCIS Integration](#)
- [Services Architecture Changes](#)
- [Site Access Restriction](#)
- [Store Locator](#)

The following bundles are available:

- SuiteCommerce Advanced Vinson: Bundle ID — **134179**
- Site Builder Extensions Vinson: Bundle ID — **134180**
- Site Builder Extensions Premium Vinson: Bundle ID — **134181**
- SuiteCommerce Configuration: Bundle ID — **135010**

Important: To take advantage of new features in existing implementations, you must migrate the new code to your existing code base. For details, see the help topic [Migrate SuiteCommerce Advanced](#).

Alternative Payment Methods

This release of SuiteCommerce Advanced includes an update to Alternative Payment Methods. Previously, Alternative Payment Methods were available to users only when making a payment during a standard checkout. Now you can use alternative payment methods in the following situations:

- When paying for sales orders converted from a Request for Quote
- When making payments to an invoice

These improvements do not require any configuration or setup beyond that required for the overall feature. For more information about this feature, see the help topic [Alternative Payment Methods](#).

Application Performance Management (APM) Changes

With this release of SuiteCommerce Advanced the data stored by the Application Performance Management (previously known as Real User Management — or RUM) has been updated. For more information about the overall APM feature, see the help topic [Application Performance Management \(APM\)](#).

A diff in the form of a .patch file for backporting APM enhancements to Mont Blanc is also available. For details on implementing this patch, see the help topic [How to Apply .patch Files](#).

Category Integration

With this release of SuiteCommerce Advanced you can integrate NetSuite Categories into your SCA website.

With Categories enabled, you can create a hierarchical structure of product categories, subcategories, and products to organize your store catalog. Each site can have one catalog, with categories assigned to it. This structure lets you present items to shoppers in a structured and organized fashion.

To enable Categories for your SCA site, some setup and configuration in NetSuite is required. For more information about implementing Categories into your SCA site, see the help topic [Commerce Categories](#). For information about configuration properties for this feature, see the help topic [Categories Subtab](#).

Checkout Usability Improvements

This release of SuiteCommerce Advanced includes an update to the Checkout experience and includes the following enhancements:

- [Search by Purchase Order](#)
- [Guest User Checkout Fields](#)
- [Save Credit Card Information](#)

Search by Purchase Order

You can now set your SuiteCommerce Advanced site preferences (Commerce > Websites > Website List) to allow users to add Purchase Order (PO) numbers to the Payment Information page of your web store.

The **Display Purchase Order Field on Payment Info Page** setting displays or hides a text field where customers can enter PO numbers. This PO number automatically appears on sales orders generated from your web store. POs are also searchable by PO number.

This setting has been available for Site Builder and is now available for SCA sites. For information about these preferences, see the help topic [Payments Page](#).

Guest User Checkout Fields

You can now configure your site to provide **Name** and **Email** input fields for guest users. The new forms.loginAsGuest.showName property displays or hides first and last name input fields when a user registers as a guest. Likewise, the new forms.loginAsGuest.showEmail property provides an email address input field. If enabled, these fields become required for guest users visiting your site.

You can also choose to make these fields automatically populate throughout the guest's checkout experience. The new autoPopulateNameAndEmail property enables or disables auto-population of the guest's name and email in any forms throughout checkout. If this property is enabled, forms.loginAsGuest.showName and forms.loginAsGuest.showEmail properties must be enabled (as applicable) to auto-populate.

Configure these properties using the new SuiteCommerce Configuration tool. For descriptions of configuration properties, see the help topic [Forms Subtab](#).

For details on the new Configuration Tool, see the help topic [Configure Properties](#).

Save Credit Card Information

You can now set your SuiteCommerce Advanced site preferences (Commerce > Websites > Website List) to:

- **Display 'Save My Credit Card Info' Field** – enables users to choose whether to save credit card information.
- **Save Credit Card Info by Default** – saves credit card information in a Customer record by default.

If you set **Display 'Save My Credit Card Info' Field** to true, your site displays an option during checkout, and users can choose to save their card information for their future use. If you enable both preferences, users can still clear this option and choose not to save their card information. These settings have been available for Site Builder and are now available for SCA sites.

For information about these preferences, see the help topic [Payments Page](#).

Configuration Changes

This release of SuiteCommerce Advanced includes significant changes to how you configure your SuiteCommerce Advanced website. Configuration is no longer contained in JavaScript configuration files as part of the application source code. These properties are now stored in JSON configuration files and set using a new SuiteCommerce Configuration record in NetSuite.

Pre-Vinson

In previous versions of SuiteCommerce Advanced, configuration properties were stored in the following locations:

- Configuration.js (backend)
- SC.Configuration (frontend)

- SC.Checkout.Configuration (frontend)
- SC.MyAccount.Configuration (frontend)
- SC.Shopping.Configuration (frontend)

Vinson

With the Vinson release of SuiteCommerce Advanced, configuration properties are stored in JSON files as part of the SuiteCommerce Advanced source code. Any module that defines configuration properties contains a subdirectory called Configuration. This directory contains the JSON configuration files associated with the module. The JSON files contain the schemas used to manage configuration settings plus default property values for the associated domain. Any default configuration settings are included in the Vinson source code, but you must create new JSON configuration files for your custom modules.

With the Vinson release of SuiteCommerce Advanced there is a new SuiteCommerce Configuration bundle (bundle ID: 135010). After installation, you can edit existing properties using the SuiteCommerce Configuration record at Commerce > Websites > Configuration.

For a description of Configuration for both pre-Vinson and Vinson implementations, see the help topic [Configure Properties](#).

For detailed descriptions of configurable properties (regardless of SCA implementation), see the help topic [Configuration Properties Reference](#).

Device Fingerprinting for Transactions

For this release of SuiteCommerce Advanced, device fingerprinting for online orders as part of the advanced fraud management features available with CyberSource Decision Manager is supported. For more information, see the help topic [Device Fingerprinting](#).

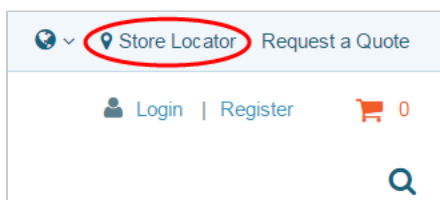

Field Set Setup Script

This release of SuiteCommerce Advanced includes a new field set named Items Searcher. This field set is required for use with [Quotes for Commerce Websites](#). See the help topic [Set Up Initial Field Sets](#) for details.

Header Improvements

This release of SuiteCommerce Advanced includes an update to the code and layout of the website header. These changes alter the appearance and behavior of the website header.

These changes include the addition of the Store Locator feature. The header now loads with a Store Locator link and pin icon (mobile devices display only the pin icon). When a user loads the Store Locator page, the site prompts them to enable geolocation. Other capabilities within the header function in the same manner as the previous release.

Newsletter

This release of SuiteCommerce Advanced includes a Newsletter feature to manage email subscriptions to an established email marketing campaign. With this feature:

- Your site displays a newsletter sign up link in the site's footer.
- The email address entered is validated against any existing NetSuite Customer or Lead records with a matching address.
- A Soft Opt-In global Subscription Status to new subscribers is created.
- Your site displays a confirmation message after the shopper signs up.
- For each newsletter subscriber, the NetSuite Customer record for existing customers is updated or a new Lead record for new shoppers is created.

 **Note:** This is an email subscription opt-in feature only. It is not a marketing campaign or content management tool. After a user opts in, it is the merchant's responsibility to manage subscriptions for each Lead or Customer record. For detailed information about creating and managing an email marketing campaign using NetSuite, see the help topic [Email Marketing Campaigns](#).

To enable the Newsletter feature to work, do the following in your NetSuite account:

- Enable subscriptions for your account
- Create a new Employee Center role
- Set up Elevated Permissions
- Configure feature properties

For detailed information about this feature, see the help topic [Newsletter](#).

Quotes Enhancements

With this release of SuiteCommerce Advanced, users with permissions to create quotes now see an **Add to Quote** button on product details pages. After pressing this button, SCA sites display a message informing the user that the item and specified quantities are added to their quote. These items appear in the user's request for quote. If a user does not have permissions to create quote requests, this button does not appear.

 **Note:** If a user adds an item using this button and requests a quantity lower than the minimum required, the item is added to the quote request, but at the minimum quantity required for purchase.

For detailed information, see the help topic [Quotes for Commerce Websites](#).

This enhancement requires a new field set called Items Searcher. The Items Searcher field set is included in the field set setup script. For details, see the help topic [Set Up Initial Field Sets](#).

SCIS Integration

This release of SuiteCommerce Advanced includes an update to the SCIS Integration feature.

Using the previous release of this feature, shoppers could view all of their purchases in one list on their Purchase History page, differentiating between the Online or In Store purchases using the **Origin** column.

With the Vinson release of SuiteCommerce Advanced, shoppers can also:

- View and print a PDF of an individual purchase from the Purchase Details page.

- Determine if a purchase is associated with an existing sales quote.

These improvements do not require any configuration or setup beyond that required for the overall feature. For more information about this feature, see the help topic [SuiteCommerce InStore Integration](#).

Services Architecture Changes

This release of SuiteCommerce Advanced includes a significant change to how SCA organizes and manages services.

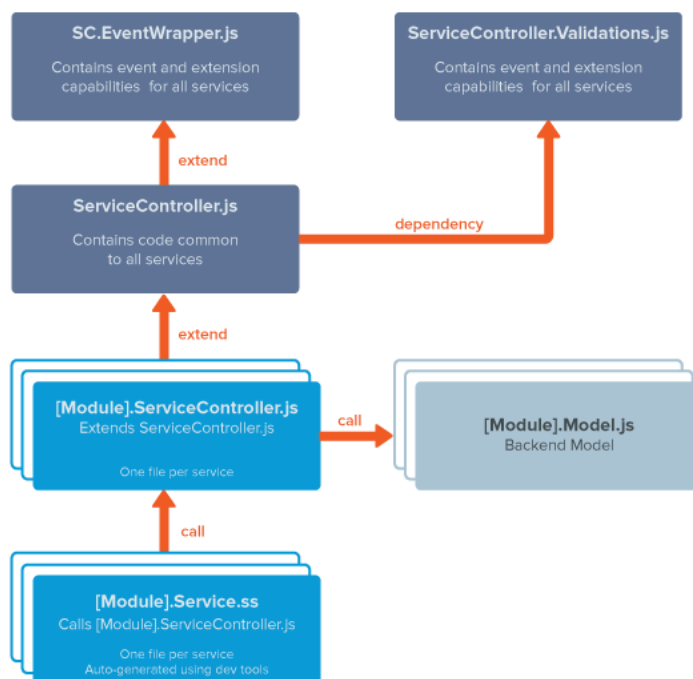

Previous Releases of SCA

In previous releases of SCA, each service required a .ss file to handle data transactions with NetSuite. Each .ss file handled HTTP requests sent by the frontend application to access data in NetSuite. Each .ss file maintained its own logic, but also included code common to all services. One .ss file existed per service.

Vinson Release and Later

The Vinson release of SuiteCommerce Advanced relies on more files to achieve the same result. This new architecture may appear more complex, but it helps maintain services in a more structured way than previous versions of SCA.

SC.EventWrapper.js – contains centralized, extensible Before and After Event listening capabilities plus extension capabilities for use by all service methods.

ServiceController.js – maintains extensible code common to all services. The code that used to be maintained across all .ss files is now maintained here. This new ServiceController module extends SC.EventWrapper.js and references validation methods declared in ServiceController.Validations.js.

[Module].ServiceController.js – processes requests for a specific service. It does this by extending ServiceController.js. Code is maintained in one location and made available to all services. Each service-specific controller can call a backend model, which communicates with NetSuite as in previous releases.

[Module].Service.ss – handles communication between the frontend SuiteCommerce application and the associated service's [Module].ServiceController. Each service still requires one service (.ss file) to communicate with the frontend, but this file is now automatically generated using the dev tools and simply calls its related, service-specific controller.

ServiceController.Validations.js – contains the validation methods for requests common to all services.

Note: The ns.package.json file of the module associated with the service signals the dev tools to auto-generate your [Module].Service.ss file and associates it with a specific service controller.

For detailed information about how to build custom services, see the help topic [Create a Service to Handle HTTP Requests](#).

Site Access Restriction

This release of SuiteCommerce Advanced includes changes to how you set up website access restrictions. If implementing Vinson release or later, you enable these features in the Web Site Setup in NetSuite. In the previous release of SCA, this required changing the backend Configuration.js file.

For more information about setting up restrictions to your entire website or restricting access to pricing information, see the help topic [Website Restriction](#). For information about setting up

Store Locator

This release of SuiteCommerce Advanced includes a Store Locator feature. Store Locator lets shoppers search for physical store locations on your site. Any search returns results within proximity of the shopper's location or specified address. A link to the Store Locator page appears in the Header, along with Pin icon.

With this feature enabled, shoppers can:

- View store locations as a list and on an interactive map
- View stores near their current location
- Search for stores near a specific address, city, or zip code
- Choose from a list of results to view information about a location, including address and store hours
- View a complete list of all stores
- Get directions to a particular store

To implement the Store Locator feature, you must use NetSuite to create a custom Customer Center Role and set up Elevated Permissions for the associated backend service (.ss file). You must also configure feature properties. For detailed information about setting up this feature, see the help topic [Store Locator](#).

Note: The Vinson release bundle of SuiteCommerce Advanced uses Google Maps as the default map engine for Store Locator.

Mont Blanc Release of SuiteCommerce Advanced

Applies to: SuiteCommerce Advanced | Mont Blanc

Welcome to the Mont Blanc release of SuiteCommerce Advanced! This version includes the following enhancements:

- [Change in Supported Version of Node.js](#)
- [Quotes](#)
- [Site Access Restriction](#)
- [SCIS Integration](#)
- [Alternative Payment Methods](#)
- [Cancel Order](#)
- [Real User Monitoring \(RUM\) Integration](#)
- [Google Tag Management](#)
- [My Account Changes](#)
- [URLs for Major Payment Methods](#)
- [Issue Fixes](#)
- [Updated and New Modules](#)

The following bundles are available:

- SuiteCommerce Advanced MontBlanc: Bundle ID — **107016**
- Site Builder Extensions MontBlanc: Bundle ID — **107017**
- Site Builder Extensions Premium MontBlanc: Bundle ID — **107018**

Important: To take advantage of new features in existing implementations, you must migrate the new code to your existing code base. For details, see the help topic [Migrate SuiteCommerce Advanced](#).

Click the following link to download a .zip file containing .patch files for the Mont Blanc release:

[Mont_Blanc_2.0_Patch_Files.zip](#)

These .patch files contain the complete diffs between this release and the Denali R2 release.

Use a tool such as Crucible to open these files and graphically visualize all additions, deletions, and modifications. You can also view .patch file in a text editor. They are displayed with appropriate syntax highlighting when the syntax is set to diff.

Change in Supported Version of Node.js

With this release of SuiteCommerce Advanced, the developer tools were modified to support Node.js version 4.2.6 in addition to support for version 0.12.x. See the help topic [Install JavaScript Utilities](#) for more information.

Quotes

With this release of SuiteCommerce Advanced, users can now create quotes from your website. With this feature enabled, a **Request a Quote** link appears by default to all users (logged in or not) in your site's Shopping and My Account header. These links direct users to a page where they can search for and add items, enter shipping information, and add optional user comments to build a quote request.

Users can eventually make purchases from a quote, but only after the quote reaches a certain status in the corresponding Estimate record. You configure the status that triggers this functionality by editing code in the Configuration.js file. You can also configure the time (in days) that all quotes expire after initial submittal.

To enable this feature you must perform the following tasks:

- Install the latest SCA and Reference Product List Records bundles.
- Edit the Customer Center Role permissions.
- Set up Search Fields.
- Customize the Standard Quote form to include shipping information.
- Configure the Configuration.js to set the Customer Status Internal ID that will allow a quote to be purchased.
- Configure the Configuration.js to define the invoice form used to create a purchase from a quote.

Note: The Quotes feature will function without the Reference Product List Records bundle installed. However, items built in a product list will be non-persistent and will be lost if the user leaves the site before submitting the quote. Installing the Reference Product List Records bundle ensures that product list items are persistent. Shipping information and user comments are non-persistent, regardless of bundle installation.

Optional customizations include:

- Disabling the Create a Quote functionality, allowing users to view quotes and make purchases, without directly creating quotes
- Customizing sales representative information

For detailed information about enabling the Quotes feature, see the help topic [Quotes for Commerce Websites](#).

Purchases From Quotes

After a user submits a quote request, any web site links to Review or Purchasing pages are disabled. This prevents users from making a purchase from that quote until the merchant allows it.

In NetSuite, the Estimate record's **Status** field lists all available Customer Statuses for the quote. When the merchant manually changes this field to the Customer Status whose Internal ID matches the ID you set in the Configuration.js file, all web site links to Review or Purchasing pages are enabled. The user can then make a purchase.

The Customer Status List at Setup > Sales > Customer Statuses displays the Customer Statuses configured for your account and their associated Internal IDs. You declare this Internal ID using the purchase_ready_status_id property in the Configuration.js file.

All quotes use the same configurable expiration, in days. After this time expires, the quote can no longer become a purchase. You set this expiration using the days_to_expire property in the Configuration.js file.

In the following example, quotes created on your site expire 14 days after the initial RFQ. Assuming a quote has not expired, it becomes available for purchase when its associated Estimate record reaches the **Qualified** Customer Status (Internal ID = 7).

```

1 | , quote: {
2 |     days_to_expire: 14
3 | ,   purchase_ready_status_id: '7'
4 | }

```

You must also configure what transaction form is used to create the purchase. You set the Internal ID of the chosen transaction form using the `invoice_form_id` property in the `Configuration.js` file.

```

1 | , quote_to_salesorder_wizard: {
2 |     invoice_form_id: '89'
3 | }

```

Disable Create a Quote Functionality

After setting up your account for quotes, you can configure SuiteCommerce Advanced to disable a user's ability to create a quote from your site. Users can view quotes and make purchases, but they can not create a quote directly using your site.

To do this, delete all lines within the `distro.json` file that contain either of the following references:

```

1 | RequestQuoteAccessPoints
2 | RequestQuoteWizard

```

See the help topic [Disable Quotes](#) for detailed information.

Customize Sales Representative Information

The Quotes feature displays Sales Representative information about your site's Quote Details page. You can customize your web site to display the Sales Representative as configured in NetSuite. If your NetSuite account does not have Sales Representative information set up, or you do not want to display the information, you can add a customized message instead.

What displays on your site depends on the **SalesRep** field on the quote's Estimate record in NetSuite.

- If the **SalesRep** field for the quote lists a sales representative whose contact information (phone number and e-mail address) is set up in NetSuite, that information displays on the Quote Details page.
- If the **SalesRep** field lists a sales representative whose contact information is not set up in NetSuite, your site defaults to display contact information found in the `SC.MyAccount.Configuration.js` file. You can customize the contact information displayed.
- If the **SalesRep** field is blank, your site displays two disclaimer messages, one under the Order Summary and one at the bottom of the page. You can customize the text of these messages in the `SC.MyAccount.Configuration.js` file.

See the help topic [Customize Sales Representative Information](#) for instructions.

More Information

Before setting up the Quotes feature on your SuiteCommerce Advanced web site, understand the following information:

- This feature does not function in Site Builder Basic. Site Builder Premium supports creating quotes and making purchases.
- This feature does not support subsidiaries.
- Users can add items to a quote, regardless of the item's out of stock behavior.

- Users cannot change the delivery method of a quote after the quote becomes a sales order. The site's default delivery method is used.
- Handling costs are not displayed in the summary total of the quote, but they are added to the order total after the quote becomes a purchase.
- Parent matrix items cannot be added to a quote, only specific child items.
- The Multiple Ship To feature is not available when making a purchase from a quote.
- Payment methods through external gateways are not available when making purchase from a quote.
- Gift Certificates cannot be added to quotes.
- When a user submits a quote, SuiteCommerce Advanced does not automatically send an email notification of the submission by default. This action can be set up in NetSuite as a Workflow Action (see the help topic [Workflow Elements](#)) or as a User Event Script (see the help topic [User Event Scripts](#)).

Site Access Restriction

With this release of SuiteCommerce Advanced, you can now restrict access to your web site in one of two ways:

- Protect your entire website so that only registered customers can log in to view your web site.
- Protect pricing information only. Visitors can view your site, but they must register and log in to view pricing information.

These features are disabled by default and require set up in NetSuite and some minor customization of the Configuration.js file to function.

Warning: The Search API is public and contains all the information exposed by the fieldset being used. Enabling password protection restricts users from accessing some or all of your site. However, a user who knows a URL that calls the Search API could access some of this information.

Restrict Access to Your Entire Site

You can now restrict your entire site to only logged in users. If this feature is enabled, visitors must register and log in to see the contents of your site. The site redirects unauthenticated visitors to a Login page with a link to a Registration form where they must register on your site to gain access. After a logged in user does not interact with the site for 30 minutes, their session ends. The first action they perform that calls a service redirects them to a Login page.

To enable this feature, you must perform some minor NetSuite set up and set the passwordProtectedSite property to true in the Configuration.js file. For detailed information about restricting all access to your site, see the help topic [Restrict Access to Your Entire Site](#)

Restrict Access to Pricing Information

You can now restrict pricing information to only registered users. If enabled, visitors have access to your site but they must log in to view prices and purchase products or services. This feature lets you hide prices from competitors or wholesalers and encourages users to register on your site.

With this feature enabled and a user is not logged in, SuiteCommerce Advanced replaces prices with a log in message and link. The user can follow this link to access a Login/Registration page where they must register on your site to view prices or make purchases. After a logged in user does not interact with the site for 30 minutes, their session ends. The first action they perform that calls a service redirects them to a Login page.

 **Note:** Restricting access to your entire site overrides this feature.

To enable this feature, you must set the `loginToSeePrices` property to true in the `Configuration.js` file. For detailed information about restricting all access to your site, see the help topic [Restrict Access to Pricing Information](#)

SCIS Integration

With this release of SuiteCommerce Advanced, integration with the SuiteCommerce InStore platform is now possible. SuiteCommerce InStore is a web-based point-of-sale application that uses an in-store, tablet-delivered commerce portal connected to your NetSuite backend.

With this feature enabled, you can incorporate your SuiteCommerce InStore transactions into your SuiteCommerce Advanced web site order management and billing components. With this feature, your shoppers can now:

- View details of all online (SCA) and in-store (SCIS) purchases and returns in their My Account section of your web site.
- Distinguish between online and in-store purchases.
- Archive in-store purchase information (receipts) as a PDF.
- Initiate an online return of a product purchased in store.
- Reorder items online for products purchased in store.
- View cash sales from all channels in their Transaction History page.
- Make online payments for in store purchases that were settled on terms (invoices).

SuiteCommerce purchases originate from either online (SCA) or in-store (SCIS) sales. In the backend, NetSuite manages these different purchase types using different types of Transaction records. For example, an order placed online through your SCA site creates a Sales Order transaction record. Another purchase placed in your store using SCIS may require the Cash Sale or the Invoice record, depending on the transaction type.

The SuiteCommerce InStore Integration feature displays all of a user's transactions in several My Account pages, marking each as Online or In Store, regardless of the Transaction record used. This creates a seamless omni-channel experience for your customers.

 **Important:** Users will see an **Origin** column in their Purchase History and Transaction History pages where the Status column used to be. This **Origin** column designates the purchases's origin as Online or In Store.

The following table lists the purchase origin (as displayed on your web site) and its associated SuiteCommerce application, transaction type, and NetSuite record.

Origin	Application	Transaction Type	Transaction Record in NetSuite
Online	SuiteCommerce Advanced	Online purchase Shipped to a single address	Sales Order
	SuiteCommerce Advanced	Online purchase Shipped to multiple addresses	Sales Order Multi-Ship To
In Store	NetSuite	Added directly into NetSuite	Sales Order
	SuiteCommerce InStore	In-store purchase	Cash Sale

Origin	Application	Transaction Type	Transaction Record in NetSuite
	NetSuite Point of Sale	Single payment method	
	SuiteCommerce InStore	In-store purchase	Invoice
	NetSuite Point of Sale	Multiple payment methods	
	SuiteCommerce InStore	In-store purchase	Sales Order Multi-Ship To
	NetSuite Point of Sale	Mixed delivery	Cash Sale
		Single payment method	
	SuiteCommerce InStore	In-store purchase	Sales Order Multi-Ship To
	NetSuite Point of Sale	Mixed delivery	Invoice
		Multiple payment methods	

To implement SCIS Integration, you must have the latest SuiteCommerce InStore and SuiteCommerce Advanced bundles installed in your account. You must also set the `isSCISIntegrationEnabled` property to true in the `Configuration.js` file. For detailed information about this feature, see the help topic [SuiteCommerce InStore Integration](#).

Alternative Payment Methods

With this release of SuiteCommerce Advanced, setting up a third-party payment option is now available. With this feature enabled, users have the option to check out using third party companies offering payment processing services, such as Google Wallet. This selection redirects users to a third-party web site for payment. Users are then prompted to leave your site and enter the third-party payment site for authentication.

This feature does not require any code customization. However, you must set up your NetSuite account for external payments. See the help topic [Alternative Payment Methods](#) for detailed information.

Important: To create a payment gateway to a third-party payment service provider, an administrator must install the correct SuiteApp that integrates the payment method into your account. You must install a SuiteApp developed and distributed by a SuiteCloud Developer Network (SDN) Partner. See [SuiteApp.com](#) for more information about third-party SuiteApps developed and supported by SDN Partners.

If no payment service provider offers a SuiteApp to meet your needs, you can create your own Payment Processing implementation. To build, test, and bundle a Payment Processing plug-in implementation, you must have the appropriate authorization from NetSuite. You must also be a member of the SuitePayments program. To obtain this authorization and to be considered for the program, see [SuiteApp.com](#).

Note: With Mont Blanc release of SuiteCommerce Advanced, the Order Details page no longer provides information about the shipping method, shipping address, billing information, or payment type.

Cancel Order

With this release of SuiteCommerce Advanced, users can now cancel a purchase that has been submitted but not processed. Users have the option of clicking a **Cancel Purchase** button in the Purchase Details page.

Visibility of this button is dependent on the purchase fulfillment status. If the Sales Order record's **Status** field lists anything other than **Pending Approval**, the purchase cannot be canceled, and the **Cancel Purchase** button does not appear. This button appears when the Sales Order record lists any other status.

The feature does not require any setup or code customization.

Real User Monitoring (RUM) Integration

This release of SuiteCommerce Advanced provides integration for the Real User Monitoring (RUM) feature. Real User Monitoring enables you to extract and store metrics about how users interact with your website. This information is stored in a backend database in NetSuite.

You can analyze this data using tools available in an upcoming release of the Application Performance Management (APM) SuiteApp.

To implement this feature, SuiteCommerce Advanced uses the Sensor utility module. When Real User Monitoring is enabled, this module is automatically loaded when the application starts.

Google Tag Management

This release of SuiteCommerce Advanced includes the new Google Tag Manager module. GTM enables you to manage site tracking and analysis tags and code snippets on your site. This eliminates the requirement to maintain individual pieces of code for things such as Google Universal Analytics or Adwords because everything is managed through GTM. GTM is vendor neutral and enables you to manage not only Google tags, but also tags from third parties such as Bing.

The [GTM Container Generator](#) aids you in implementation of GTM by using your tracking account information to generate a JSON file. This JSON file is imported into your GTM account. For more information about implementing and using Google Tag Manager, see the help topic [Google Tag Manager](#).

My Account Changes

With this release of SuiteCommerce Advanced, new labels on your web site's My Account pages are displayed. In the My Account overview page, the label, **Orders**, in the My Account accordion list is replaced with **Purchases**. Also, the **My Orders** page is now titled **My Purchases**.

This is a global change and is not configurable.

URLs for Major Payment Methods

With this release, SuiteCommerce Advanced changes the way it locates Payment Method logos to display during checkout. Therefore, you must make minor changes to your NetSuite Payment Method records to display the bundled logos that were used in the previous release. These changes are described in [Previous Approach](#).

Previous Approach

Previously, SuiteCommerce Advanced used URLs configured in the SC.Configuration.js file to locate Payment Method logos. The `creditCardIcons` object superseded any Flags set up in the Payment Method record in NetSuite and linked to logos that were included in the SuiteCommerce Advanced bundle.

Previous Code

```
1 | creditCardIcons: {
```

```

2 'VISA': 'img/visa.png'
3 , 'Discover': 'img/discover.png'
4 , 'Master Card': 'img/master.png'
5 , 'Maestro': 'img/maestro.png'
6 , 'American Express': 'img/american.png'
7 }

```

Updated Approach

After migrating to the Mont Blanc release of SuiteCommerce Advanced, the SC.Configuration.js file no longer contains the `creditCardIcons` object. The SC.Configuration.js file now uses the `paymentmethods` array to point to the Payment Method record in NetSuite using the Payment Method ID.

To link to the bundled logos, enter the following links in the URL column on the **Payment Visuals** subtab of the associated Payment Method record in NetSuite. See the help topic [Creating a Payment Method](#) for setup instructions.

Note: To maintain layout continuity on your SuiteCommerce Advanced site, you should use the following URLs and the logos bundled with this and previous releases. These differ from the defaults as listed in [Creating a Payment Method](#). Ensure that each image is uploaded to your NetSuite File Cabinet in the appropriate locations.

Payment Method	URL
Visa	img/visa.png
Discover	img/discover.png
Mastercard	img/master.png
Maestro	img/maestro.png
American Express	img/american.png

Updated Code

```

1  , paymentmethods: [
2    {
3      key: '5,5,1555641112' // 'VISA'
4      , regex: /^4[0-9]{12}(?:[0-9]{3})?$/
5    }
6    , {
7      key: '4,5,1555641112' // 'Master Card'
8      , regex: /^5[1-5][0-9]{14}$/
9    }
10   , {
11     key: '6,5,1555641112' // 'American Express'
12     , regex: /^3[47][0-9]{13}$/
13   }
14   , {
15     key: '3,5,1555641112' // 'Discover'
16     , regex: /^6(?:011|5[0-9]{2})[0-9]{12}$/
17   }
18   , {
19     key: '16,5,1555641112' // 'Maestro'
20     , regex: /^(?:5[0678]\d\d|6304|6390|67\d\d)\d{8,15}$/
21   }
22   , {
23     key: '17,3,1555641112' // External
24     , description: 'This company allows both private individuals and businesses to accept payments over the Internet'
25   }
26 ]

```

Issue Fixes

This release includes many issue fixes including:

Product Review Records Imported by CSV are Not Displaying on Product Page

Previously, imported product review records from a comma-separated variable (CSV) file did not display on the Product Page.

To fix this problem, NetSuite updated code in the backend and released a Reference Product Review Records bundle update.

Bundle Update

NetSuite replaced the following code in the **NS_PR_SS_User_Event.js** file within the Reference Product Review Records bundle.

Previous Code:

```

1 function beforeSubmit (action)
2 {
3     'use strict';
4
5     var user = nlapiGetUser()
6     ,   new_review = nlapiGetNewRecord();
7     // false when deleting
8     if (new_review)
9     {
10        var item_id = new_review.getFieldValue('custrecord_ns_prr_item_id');
11        // if the record is beeing created
12        // and the user is logged in
13        if (action.toString() === 'create' && user)
14        {
15            setReviewUser(new_review,user);
16            verifyItemPurchase(new_review, user, item_id);
17        }
18
19        // if the review is not assigned to
20        // the item record
21        if (!new_review.getFieldValue('custrecord_ns_prr_item') && item_id)
22        {
23            setReviewItem(new_review, item_id);
24        }
25    }
26 }
```

Updated Code:

```

1 function beforeSubmit (action)
2 {
3     'use strict';
4
5     var new_review = nlapiGetNewRecord();
6     // false when deleting
7     if (new_review)
8     {
9        var item_id = new_review.getFieldValue('custrecord_ns_prr_item_id')
10        ,   user = new_review.getFieldValue('custrecord_ns_prr_writer');
11        // if the record is beeing created
12        // and the user is logged in
13        if (action.toString() === 'create' && user)
14        {
15            verifyItemPurchase(new_review, user, item_id);
16        }
17    }
18 }
```

```

16     }
17
18     // if the review is not assigned to
19     // the item record
20     if (!new_review.getFieldValue('custrecord_ns_prr_item') && item_id)
21     {
22         setReviewItem(new_review, item_id);
23     }
24 }
25 }

```

Backend Code Update

NetSuite replaced the following code in the **ProductReviews.Model.js**, found in the ProductReviews@2.1.0/SuiteScript folder.

Previous Code:

```

1 | data.writer && data.writer.id && review.setFieldValue('custrecord_ns_prr_writer', data.writer.id);

```

Updated Code:

```

1 | if(session.isLoggedIn2())
2 | {
3 |     review.setFieldValue('custrecord_ns_prr_writer', nlapi.GetUser() + '');
4 | }

```

Rejected Product Review Star Ratings Still Appearing

Previously, when a NetSuite user set a Item record's Product Review **Status** field to **Rejected**, the associated product review still displayed on the web site's Star Ratings area.

Reference Product Review Records bundle fixes this problem.

With this bundle update, you can go to to an item record's **SuiteCommerce Extensions** tab (**Product Reviews** subtab) and change any Product Review's **Status** field to Rejected. The rejected review will no longer appear on your site.

NetSuite replaced the following code in the **NS_PR_SS_User_Event.js** file within the Reference Product Review Records bundle in this release.

Previous Code:

```

1 | function getRating (id)
2 | {
3 |     'use strict';
4 |
5 |     var results = nlapiSearchRecord(
6 |         'customrecord_ns_pr_review', null
7 |         , [
8 |             new nlobjSearchFilter('isinactive', null, 'is', 'F')
9 |             , new nlobjSearchFilter('custrecord_ns_prr_item', null, 'is', id)
10 |             , new nlobjSearchFilter('custrecord_ns_prr_status', null, 'is', approved_status)
11 |         ]
12 |         , [
13 |             new nlobjSearchColumn('internalid', null, 'count')
14 |             , new nlobjSearchColumn('custrecord_ns_prr_rating', null, 'avg')
15 |         ]
16 |     );
17
18 |     if (results && results.length)
19 |     {
20 |         return {

```

```

21     count: results[0].getValue('internalid', null, 'count')
22     ,   average: parseFloat(results[0].getValue('custrecord_ns_prr_rating', null, 'avg')).toFixed(1)
23   };
24 }
25
26 return null;
27 }

```

Updated Code:

```

1  function getRating (id)
2  {
3    'use strict';
4
5    var results = nlapiSearchRecord(
6      'customrecord_ns_pr_review', null
7    , [
8      new nlobjSearchFilter('isinactive', null, 'is', 'F')
9      , new nlobjSearchFilter('custrecord_ns_prr_item', null, 'is', id)
10     , new nlobjSearchFilter('custrecord_ns_prr_status', null, 'is', approved_status)
11   ]
12 , [
13     new nlobjSearchColumn('internalid', null, 'count')
14     , new nlobjSearchColumn('custrecord_ns_prr_rating', null, 'avg')
15   ]
16 );
17
18 if (results && results.length)
19 {
20   var average = parseFloat(results[0].getValue('custrecord_ns_prr_rating', null, 'avg'));
21
22   if (isNaN(average))
23   {
24     average = 0;
25   }
26
27   return {
28     count: results[0].getValue('internalid', null, 'count')
29     ,   average: average.toFixed(1)
30   };
31 }
32
33 return null;
34 }

```

Facet Priority Ignored When Using the URL Component as a FacetID

Previously, the faceted navigation view ignored the priority property configured in the SC.Shopping.Configuration module. Due to an error in the code, facet fields did not display as expected. The error has been corrected, and the priority property now sets the display order of the facet.

The Facets.FacetedNavigationItems function was modified in the following file:

Facets.FacetedNavigation.View.js

Previous Code:

```

1  'Facets.FacetedNavigationItems': function()
2  {
3    var translator = FacetsHelper.parseUrl(this.options.translatorUrl, this.options.translatorConfig)
4    ,   ordered_facets = this.options.facets && this.options.facets.sort(function (a, b) {
5      // Default Priority is 0
6      return (translator.getFacetConfig(b.id).priority || 0) - (translator.getFacetConfig(a.id).priority || 0);
7    });

```

Updated Code:

```

1 'Facets.FacetedNavigationItems': function()
2 {
3     var translator = FacetsHelper.parseUrl(this.options.translatorUrl, this.options.translatorConfig)
4     ,   ordered_facets = this.options.facets && this.options.facets.sort(function (a, b) {
5         // Default Priority is 0
6         return (translator.getFacetConfig(b.url || b.id).priority || 0) - (translator.getFacetConfig(a.url || a.id).priority
7         || 0);
8     });

```

Updated and New Modules

Many of the SuiteCommerce modules have been updated for this release. For a complete comparison of before and after versions, view the [diff-denaliR2-montblanc-distrito.patch](#) file.

New modules for this release include the following:

- cartItems@1.0.0
- promocodeForm@1.0.0
- quickAdd@1.0.0
- QuoteToSalesOrder@1.0.0
- QuoteToSalesOrderWizard@1.0.0
- QuoteToSalesOrderValidator@1.0.0
- RequestQuoteAccessPoints@1.0.0
- RequestQuoteWizard@1.0.0
- Sensors@1.0.0
- Transaction@1.0.0

Denali R2 Release of SuiteCommerce Advanced

i Applies to: SuiteCommerce Advanced | Denali

Welcome to Denali R2 release of SuiteCommerce Advanced! This version includes the following enhancements:

- [Site Management Tools](#)
- [Improved Gulp Deploy](#)
- [Updated Modules](#)

Important: This release is available as an **update** to the existing Denali release of SuiteCommerce Advanced. If you are working with the existing release of SuiteCommerce Advanced, update the bundle from the NetSuite Installed Bundles record, and download the new source code. Migrate any customizations you may already have in place to the new source code directory. For implementations prior to the Denali release of SuiteCommerce Advanced, migration to this latest version requires a re-implementation.

Site Management Tools

With this release of SuiteCommerce Advanced, Site Management Tools are integrated with the Shopping application. A new CMSadapter module provides for the integration and several template files are configured with site management tool areas.

Note: Currently, Site Management Tools are available for the Shopping application only. Secure domains are unsupported (My Account and Checkout).

The new SuiteCommerce Advanced Site Management Tools enable you to manage content on your SuiteCommerce Advanced websites. Content management is facilitated by the Site Management Tools user interface on the website and the areas in your website page templates. With Site Management Tools you can add new content, edit or remove existing content, and rearrange content by dragging it from one location to another. The types of content you can manage include:

- Images and image attributes such as links and alternate text
- Text with traditional WYSIWYG formatting that utilizes the site's style sheets
- Product lists based on pre-defined merchandising rules
- HTML code snippets for embedded videos, social widgets, partner code, and so forth

Content displays site-wide on every page, only on a specific page, or on specific page types depending on the area where the content resides. For example, the areas in the page header and footer are defined as global, which means that any content you place in those areas will display on every page on the site.

Content is managed on an unpublished version of your site. Content changes are visible to visitors on the live site only after you publish the site. These changes include the addition of new content, deletion of content, rearrangement of content, and so on. This enables you to spend several days or weeks developing a new version of your site. You can then publish the site when you are ready for those changes to go live.

Site Management Tools also includes an edit live site feature that lets you make changes to content on the live site. These changes are available immediately and do not require publishing.

With SuiteCommerce Advanced Site Management Tools you can also create and manage landing pages and enhanced landing pages. Included in this is the management of important SEO considerations for the pages such as page titles, meta description, and meta keywords.

Note: With this release, Site Management Tools are enabled by default and Content Delivery is disabled. We recommend using Site Management Tools but for existing implementations you can continue to use Content Delivery if needed.

For additional information, see the help topic [Site Management Tools Overview](#).

Improved Gulp Deploy

Previously, some customers encountered an `SSS_TIME_LIMIT_EXCEEDED` error when deploying to NetSuite. This issue has been fixed by changing our implementation to use SuiteTalk instead of Suitelets for the file upload process. With Suitelets, we made a single request with all file contents. This resulted in some uploads exceeding Suitelet execution time restrictions. With the move to using SuiteTalk for file uploads, this issue has been resolved.

Note: The gulp command uses SuiteTalk to upload files when deploying to your NetSuite account. To use SuiteTalk, your account must have administrator access and you must enable the Web Services feature. See the help topic [Enabling the SOAP Web Services Feature](#) for more information.

We have also significantly improved deployment speeds by uploading only files that have changed. After the initial deployment of all files to NetSuite, a manifest file is created within the NetSuite file cabinet. This file contains the list of files uploaded and a hash of its content. On subsequent deployments, the manifest file is used to determine new or changed files and then only those files are updated during deployment to the NetSuite file cabinet.

For this enhancement, files available in the gulp deploy folder at **gulp/ns-deploy** have been updated.

Updated Modules

The following modules have been updated for this release.

Module	New/Update	Reason for Update
CheckoutApplication	Update	Site Management Tools
CMSadapter	New	Site Management Tools
Content	Update	Site Management Tools
MyAccountApplication	Update	Site Management Tools
NavigationHelper	Update	General Denali R2
SCA	Update	General Denali R2
ShoppingApplication	Update	Site Management Tools
SspLibraries	Update	Site Management Tools

Denali Release of SuiteCommerce Advanced

Applies to: SuiteCommerce Advanced | Denali

Welcome to Denali release of SuiteCommerce Advanced! With this release of SCA, NetSuite is bringing you a revamped SuiteCommerce platform that leverages the latest modern web technologies such as Gulp.js, Handlebars.js, and Node.js. We are also releasing new developer tools to enable efficient local development and deployment processes. The user experience takes a Mobile First approach with a redesigned user interface. Modules are versioned to provide simplified upgrades and customizations. And, we continue to provide advanced SEO solutions for site tracking and analysis.

This document details many of the changes included in the release. For complete documentation, blog posts, and other information visit the new [SuiteCommerce Developer's Portal](#).

Note: For release notes on versions prior to Denali release of SuiteCommerce Advanced, see [Release Notes Prior to SuiteCommerce Advanced Denali](#).

Previously, SuiteCommerce Advanced applications were separately bundled (ShopFlow, My Account, and Checkout). Now, SuiteCommerce Applications are bundled as a single SuiteApp to provide simplified customizations and migrations to future releases. The following bundles are available:

- SuiteCommerce Advanced Denali: Bundle ID — **90208**
- Site Builder Extensions Denali: Bundle ID — **90205**
- Site Builder Extensions Premium Denali: Bundle ID — **90206**

Important: This release is a complete re-architecture of the SuiteCommerce Advanced platform. For existing implementations, migration to this latest version requires a re-implementation.

Some of the highlights of this release include:

- [New Developer Tools](#)
- [Logic-less Templating Using Handlebars](#)
- [Mobile First Design](#)
- [Restructure of Application Modules](#)
- [Converted from LESS to Sass CSS Pre-Processor](#)
- [Use of Composite Views Instead of Macros](#)
- [Updated Configuration Files](#)
- [Updated Content Delivery and Product Merchandising Bundles](#)
- [Translation Support](#)
- [Other Architectural Changes](#)

New Developer Tools

With the Denali release of SuiteCommerce Advanced, new developer tools are supported to enable you to deploy SuiteCommerce Advanced applications directly to NetSuite. Using these tools you can edit and customize the application from your local development environment. You can then run tasks to compile, combine, and minify application files locally before deploying your customized application to NetSuite or a local environment for testing. You are no longer required to go into the NetSuite file cabinet to modify application files.

New Tools and Technologies include:

- **Node.js:** This is the JavaScript based application server. Node.js must be downloaded and installed in your local environment.
- **Gulp.js:** Gulp is a JavaScript task runner that uses Node.js. Gulp.js must also be downloaded and installed in your local environment. After your environment is set up with Node.js and Gulp.js, you can use a set of gulp tasks available from the SCA bundle to compile JavaScript and SASS files, deploy SCA code to NetSuite, and so forth. See
- **SASS Compiler:** compiles Sass style sheets used by template files.

For complete details on how to use the new developer tools, see the help topic [Set Up SCA Developer Tools](#).

Logic-less Templating Using Handlebars

Previously, we used Underscore.js for front-end templating. Now we use Handlebars.js. Handlebars.js provides logic-less semantic templating. Templates contain the HTML used for each module view with placeholder areas defined by double-curly braces where JSON data is injected at run-time.

Note: Although we no longer use Underscore.js for templating, it is still used for many other purposes.

Previously, SCA templates had a .txt extension. All templates now have a .tpl extension and have been moved to a Templates folder within each Module folder. Template files are also now combined locally when you run the Gulp deploy commands available with the new developer tools.

For example, the following section is from the address_list.tpl template located at suite_commerce/Address@x.x.x/Templates. Note the placeholder variables within the double-curly braces.

```
1 <section class="address-list">
2   <h2>{{pageHeader}}</h2>
3   <div class="address-list-button-container">
```

```

4      <a href="/addressbook/new" class="address-list-button-info-cards-new" data-toggle="show-in-modal"> {{translate 'Add New
Address'}}</a>
5    </div>
6
7    <div class="address-list-default-addresses">
8      <div data-view="Addresses.Collection"></div>
9    </div>
10 </section>

```

For more details on Handlebar templating, see the help topic [Logic-less Templates and Handlebars.js](#)

Mobile First Design

SCA is now designed with a Mobile First approach. Mobile First design results in faster and higher performing sites by prioritizing the most important elements for smaller devices first and then scaling the design for larger device sizes. This enhances the user experience by providing a more focused design that allows users to quickly accomplish their core task whether it be finding a product to purchase in a B2C environment or reordering in bulk in a B2B environment.

Using the Mobile First approach, CSS element styles are defined for mobile devices and then scaled progressively for tablet and desktop display.

To support this Mobile First design, SASS styles are now organized in a hierarchy of reusable components. There are Base styles used across applications, template specific styles, and application specific styles. See the help topic [Commerce Sass Style Definitions](#) for details on how to work with design elements in your code base. Visit the [SuiteCommerce Developer's Portal](#) design pages for detailed descriptions of all design elements and page flows.

Restructure of Application Modules

Source files for SCA are organized in multiple versioned modules. Each module directory now contains all of the files specific for that module. Previously, template and style sheet files were separated from the modules directories. When customizing a module, you can now create a copy of the module directory, rename with an applicable version, and then package the required versions for distribution using Node and Gulp.

When migrating to the next version of SCA, you can now migrate on a module by module basis. This will enable you to manage your customizations much more efficiently.

For complete details on the architecture of Modules, see the help topic [SCA Module Architecture](#).

Converted from LESS to Sass CSS Pre-Processor

Sites are now designed using the Sass CSS extension language. With Sass, CSS syntax is fully supported in addition to features such as variables and imports. Sass styles are organized within a hierarchy that defines base styles, template specific styles, and application specific styles. Styles are define as reusable components and can be combined to create increasingly complex structures.

For more information on styling in SuiteCommerce Advanced, see the help topic [Commerce Sass Style Definitions](#).

Use of Composite Views Instead of Macros

In this release of SuiteCommerce Advanced, all macros have been moved to Backbone Views. Parameters previously defined in macros are now within Views for each module and passed to a context object. Some Views in SuiteCommerce Advanced are Composite Views. Composite Views are views that contain child views or subviews.

For more details, see the help topic [Views](#).

Updated Configuration Files

Previously, the same front-end configuration file was used for Shopping, Checkout, and My Account. That configuration file contained all of the same parameters, although some of those parameters were used only by certain applications. Now there is a BaseConfiguration object defined within the SCA.Configuration model that has global attributes shared across applications and a unique configuration file for each application. Each of the application specific configuration files has a dependency on the base configuration model.

The Backend.Configuration.js file has been renamed to Configuration.js and is now included in the SspLibraries module. This file can be used to set many of the same objects server-side as in prior releases as well as some additional objects specific to this release.

Updated Content Delivery and Product Merchandising Bundles

The Content Delivery and Product Merchandising bundles have been updated with new library files. If you have previously installed these bundles, you must upgrade them to the latest version to use them with this version of SuiteCommerce Advanced.

Multi-Currency Support

Multi-currency is supported for the Shopping and Checkout applications in SuiteCommerce Advanced. Multi-currency is not supported in the My Account application.

Translation Support

Language JavaScript files updated for changes in this release of SuiteCommerce Advanced are coming soon after the initial release. The language files currently available in the application modules are those used in prior releases and are not comprehensive.

Other Architectural Changes

The architectural changes in this release are extensive. Following are some key highlights:

- [Update to Bootstrap 3](#)
- [All Models Inherit from SCModel](#)
- [Filter by Site ID](#)
- [ItemsKeyMapping File Converted to an Application Module](#)
- [Passing Fieldset Names as a Parameter](#)
- [Remove ItemDetails Module from Checkout](#)
- [Minimum Field Set Requirement Changes](#)
- [Facebook appId Configuration](#)
- [Updated 3rd Party JavaScript Libraries](#)

Update to Bootstrap 3

SuiteCommerce Advanced has been upgraded from Bootstrap 2 to use Bootstrap 3 for its front-end framework.

All Models Inherit from SCModel

With this release, there is a new base class, `SCModel`, for all backend models. All models inherit from the `SCModel` and must define a name attribute to uniquely identify the model. Several common base functions for validation, authentication, and error handling are defined within the `SC.Model.js` file. In general, this model should not require customization.

For example, in the following code sample from `ProductList.Model.js`, you can see that first the `SCModel` dependency is defined and then the `ProductList.Model` extends from `SCModel`. Also, the name attribute is set as `ProductList`.

```

1  define(
2    'ProductList.Model'
3    , ['SC.Model', 'Application', 'ProductList.Item.Search', 'Utils']
4    , function(SCModel, Application, ProductListItemSearch, Utils)
5    {
6      'use strict';
7
8      return SCModel.extend({
9        name: 'ProductList'
10      });
11    });
12

```

Filter by Site ID

When you have multiple sites set up for a single account, you can now configure Reference My Account to display orders from specified sites only. This is done by editing the `filter_site` setting in the backend `Configuration.js` file at `SspLibraries/SuiteScript/Configuration.js`.

```

1  SC.Configuration = {
2    ...
3    , filter_site: 'current'
4    ...
5  }

```

The following settings are available:

- `filter_site: 'current'`: all orders created for the current site, plus orders created in NetSuite or not assigned to any site are returned
- `filter_site: all`: all orders from all sites in the current account plus orders created in NetSuite or not assigned to any site are returned
- `filter_site: [1,2,3]`: all orders from sites specified by site ID in the array plus orders created in NetSuite or not assigned to any site are returned

Note: Currently, when your account is configured to display orders from multiple sites, those orders are not differentiated by site on the front end.

ItemsKeyMapping File Converted to an Application Module

Previously, the `ItemsKeyMapping` class containing the logic that provided mapping of what is returned from the search API and Commerce API was instantiated in the application object. Now, the `ItemKeyMapping` logic has been made available as an independent `ItemsKeyMapping` module. This improves performance by allowing the class to be instantiated only when a method uses it. For example, the `ItemDetails.Model` now has a dependency on the `ItemsKeyMapping` module and the `ItemsKeyMapping` class is called within the `get` method.

```

1 define('ItemDetails.Model', ['Backbone.CachedModel', 'ItemOptionsHelper', 'Session', 'ItemsKeyMapping', 'SCA.Configuration', 'underscore', 'Utils'])
2 , function (BackboneCachedModel, ItemOptionsHelper, Session, ItemsKeyMapping, Configuration, _)
3 {
4   'use strict';
5   .
6   .
7   .
8   , get: function (attr, dont_cache)
9   {
10    var configuration = (this.application && this.application.Configuration) || {}
11    , keyMapping = _defaults(configuration.itemKeyMapping || {}, ItemsKeyMapping.getKeyMapping(configuration));

```

Passing Fieldset Names as a Parameter

Previously, only fieldset names predefined in the site configuration could be returned in functions used to retrieve and store item information. Now a `fieldset_name` parameter has been added to these functions. You can leverage this logic to create backend services that specify a specific fieldset name, instead of relying on the site fieldset configuration.

Note: Passing a `fieldset_name` parameter to item functions is not required. If a `fieldset_name` parameter is not passed, the fieldset names as defined in the configuration are used.

For example, note the `fieldset_name` parameter in the `preloadItems` function:

Previously:

```

1 preloadItems: function (items)
2 {
3   'use strict';
4
5   var items_by_id = {}
6   , parents_by_id = {}
7   , self = this
8   , is_advanced = session.getSiteSettings(['sitetype']).sitetype === 'ADVANCED';
9   .
10  .
11  .
12 }

```

Updated Code:

```

1 , preloadItems: function (items, fieldset_name)
2 {
3   var self = this
4   , items_by_id = {}
5   , parents_by_id = {};
6
7   items = items || [];
8
9   this.preloadedItems = this.preloadedItems || {};
10  .
11  .
12  .
13 }

```

Remove ItemDetails Module from Checkout

Previously, the entire `ItemDetails` module was included in the Reference Checkout application when only the `ItemDetails` model is required. There is no need for the Router or the entire module definition..

Minimum Field Set Requirement Changes

The isfulfillable field must now be defined for the Matrix Child Items field set. Definition is no longer required for the Details field set.

Facebook appId Configuration

With this release, the Facebook sharing feature requires you to set the appId in the SC.Shopping.Configuration.js file in the ShoppingApplication module. Configuration is no longer set in the Configuration.js file. To set the appId, customize the module or create a custom file override. For more information on the SuiteCommerce Advanced Facebook Share and Like features, see the help topic [Facebook Share](#).

For more information on customizing a module, see the help topic [Develop Your SCA Customization](#).

Updated 3rd Party JavaScript Libraries

In this release, JavaScript libraries have been migrated to newer releases as detailed in the following table.

Library	Prior Version	Current Version
almond	0.3.0	0.3.0
Backbone	1.0.0	1.1.2
Backbone.stickit	—	0.8.0
bignumber	1.4.1	1.5.0
bootstrap	2.3.1	3.3.1
bootstrap-datepicker	-	1.3.1
font-awesome	-	4.3.0
handlebars	—	2.0.0
html5shiv	3.6.1	3.7.2
jquery.bxslider	4.1.1	4.1.2
jquery.cookie	1.3.0	1.4.1
jquery.zoom	1.7.1	1.7.13
jquery	1.10.2	1.11.1
json2	2.0.0	2.0.0
require	2.1.1	2.1.15
twitter-bootstrap	-	3.3.1
twitter-typeahead	-	0.10.5
underscore	1.6.0	1.7.0
Respond.js	-	1.4.2
jasmine	1.2.0	2.1.3

Release Notes Prior to SuiteCommerce Advanced Denali

With the release of SuiteCommerce Advanced Denali, the core architecture and bundling of SuiteCommerce Advanced Reference Implementations was changed.

If you are upgrading an existing Reference Implementation to a newer release, refer to the following for details on changes between releases.

Important: For SuiteCommerce Advanced Denali release notes, see [Denali Release of SuiteCommerce Advanced](#).

Reference ShopFlow:

- [ShopFlow 1.07.0](#)
- [ShopFlow 1.06.1](#)
- [ShopFlow 1.06.0](#)
- [ShopFlow 1.05.0](#)
- [ShopFlow 1.04.0](#)
- [ShopFlow 1.03.0](#)
- [ShopFlow 1.02.0](#)

Reference Checkout:

- [Checkout 2.05.0](#)
- [Checkout 2.04.1](#)
- [Checkout 2.04.0](#)
- [Checkout 2.03.0](#)
- [Checkout 2.02.0](#)
- [Checkout 2.0](#)

Reference My Account

- [My Account 1.06.0](#)
- [My Account 1.05.1](#)
- [My Account 1.05.0](#)
- [My Account 1.04.0](#)
- [My Account 1.03.0](#)
- [My Account 1.02.0](#)

SuiteCommerce Advanced 2015.1

- [ShopFlow 1.06.0](#)
- [Checkout 2.04.0](#)
- [My Account 1.05.0](#)

- [ShopFlow 1.05.0](#)
- [ShopFlow 1.04.0](#)
- [ShopFlow 1.03.0](#)
- [ShopFlow 1.02.0](#)

ShopFlow 1.07.0

 **Note:** The Bundle ID for Reference ShopFlow 1.07 is **96113**.

With this release of ShopFlow, you can now integrate to the new Site Management tools and to Bronto.

- [Bronto Integration](#)
- [Site Management Tools Integration](#)

 **Note:** Bronto integration is also available in Checkout 2.05 or later and My Account 1.06 or later.

Bronto Integration

With this release of Reference ShopFlow, Bronto integration is available. Bronto is a NetSuite company that provides an advanced marketing automation process and solutions for shopping cart abandonment, post-purchase campaigns and so forth. Bronto can be easily integrated with your Reference ShopFlow, My Account, and Checkout implementations.

The following Bronto Applications are supported:

- Cart Recovery
- Conversion Tracking
- Coupon Manager
- Pop-up Manager

To implement Bronto integration, you need to the modify the Configuration.js file to include your accountId.

```
1 | , bronto: {
2 |   accountId: ''
3 | }
4 | });
```

With the accountId configured, the BrontoIntegration module causes a configuration.js file to load after the SuiteCommerce Application has initialized. This configuration.js file is cached in the Bronto CDN and uses the accountId to pull down the appropriate settings to enable and configure the various integrations setup in the Bronto Connector.

Note: The BrontoIntegration module essentially provides an interface to the Bronto CDN. Therefore, any updates or enhancements to Bronto applications are completely separate from SuiteCommerce Advanced releases and will be made available through the Bronto CDN. There is no additional customization needed in the SuiteCommerce source code to take advantage of Bronto enhancements.

For detailed information about configuring and managing your Bronto applications, refer to the Bronto documentation.

Site Management Tools Integration

With this release of Reference ShopFlow, Site Management Tools are integrated. A new CMSadapter module provides for the integration and several template files are configured with site management tool areas.

For detailed information about the default areas defined within the template files for Reference ShopFlow, see the Site Management Tools section in the [SuiteCommerce Advanced & Reference Implementations \(pre-Denali\)](#) PDF guide.

For complete information about how to work with Site Management Tools, see the help topic [Site Management Tools Overview](#).

Before you begin, you must enable the Site Management Tools feature on the Web Presence subtab at Setup > Company > Enable Features.

By default, in this version of ShopFlow Site Management Tools are configured to be used as the default content management tool. If you prefer to use Content Delivery, the useCMS object must be set to false in the Configuration.js file.

```
1  , useCMS: true
2  ,
3  };
```

Important: Although this configuration setting is also available in the My Account and Checkout Reference implementations, Site Management Tools are not supported for those applications. The setting in the Configuration.js file is overridden in the Application.js file for secure domains: `SC.Configuration.useCMS = !isSecure && SC.Configuration.useCMS;`

Integrating to ShopFlow 1.06 Implementations

Site Management Tools can be manually integrated into an existing implementation using Reference ShopFlow 1.06. To do this you'll need to copy files from the new release and manually merge some changes into existing files.

Important: Use care when merging changes to ensure that existing customizations for your site are not overwritten.

To integrate Site Management Tools to Reference ShopFlow 1.06:

1. Enable the Site Management Tools feature on the Web Presence subtab at Setup > Company > Enable Features.
2. Install Reference ShopFlow 1.07.
3. Download the source files from ShopFlow 1.07
4. In your ShopFlow 1.06 source, rename the file 'js/src/app/modules/CMSadapter/CMSadapter.js' to 'adapter.js'.
5. Copy the following files into your ShopFlow 1.06 source in the file cabinet:

- 'js/src/app/modules/CMSadapter/*.*)
- 'ssp_libraries/models/CMSadapter.js'
- 'templates/cmsadapter/cms_landing_page.txt'

6. Migrate the code snippets outlined for the following files to your implementation.

- 'index.ssp'

ShopFlow 1.06.1

Note: The Bundle ID for Reference ShopFlow 1.06.1 is **69016**.

In this release, a bug with Internet Explorer 8 has been fixed. The issue is a result of an unsupported regular expression character ("^") that causes SuiteCommerce pages to improperly render. This issue affects only customers using Internet Explorer 8. All other browsers are not affected by this issue.

To implement the fix, the **Content.EnhancedViews.js** file at Reference js/src/app/modules/Content/Content.EnhancedViews.js was modified with the following change:

Note: This file was also modified in Checkout and My Account. If you are using those implementations, you must also make the change or upgrade to the latest bundle for each.

Previous Code:

```

1  , enhanceMetaTags: function (view)
2  {
3      var enhanced_meta_regex;
4      this.$head
5          // then we add the description
6          .find('meta[name="description"]').attr('content', view.metaDescription || view.getMetaDescription() || '').end()
7          // and keywords meta tags
8          .find('meta[name="keywords"]').attr('content', view.metaKeywords || view.getMetaKeywords() || '').end()
9          // then we append the tags specific to this view
10         // excluding any extra descriptions and keywords meta tags
11         .append(view.getMetaTags().not('[name="description"]').not('[name="keywords"]'));
12
13         /* jshint ignore:start */
14         // related to issue https://github.com/jshint/jshint/issues/823
15         enhanced_meta_regex = /<!\-\-\ EnhanceMetaTags:STARTS[^\-]+EnhanceMetaTags:ENDS \-\-\>/;
16         /* jshint ignore:end */
17         if (document.head.innerHTML.match(enhanced_meta_regex))
18         {
19             document.head.innerHTML = document.head.innerHTML.replace(enhanced_meta_regex, '');
20         }
21
22         if (view.metaextra)
23         {
24             endTo(this.$head);
25         }
26
27         return this;
28     }

```

Updated Code:

```

1  , enhanceMetaTags: function (view)
2  {
3      this.$head
4          // then we add the description
5          .find('meta[name="description"]').attr('content', view.metaDescription || view.getMetaDescription() || '').end()
6          // and keywords meta tags
7          .find('meta[name="keywords"]').attr('content', view.metaKeywords || view.getMetaKeywords() || '').end()
8          // then we append the tags specific to this view
9          // excluding any extra descriptions and keywords meta tags
10         .append(view.getMetaTags().not('[name="description"]').not('[name="keywords"]'));
11
12         // remove head's elements that are between enhanceMetaTagsStart and enhanceMetaTagsEnd
13         var remove_element = false; //flag used to determine when remove elements.
14
15         jQuery('head').children().each(function ()
16         {
17             var $element = jQuery(this)
18             , element_id = $element.attr('id');
19

```

```

20     if (element_id === 'enhanceMetaTagsStart')
21     {
22         remove_element = true;
23     }
24
25     if (remove_element)
26     {
27         $element.remove();
28     }

39     {
40         jQuery('<script id="enhanceMetaTagsStart"></script>' + view.metaextra + '<script id="enhanceMetaTagsEnd"></script>').append
To(this.$head)
41     }
42
43     return this;
44 }

```

ShopFlow 1.06.0

This document details changes to Reference ShopFlow since the previous release. For a complete **DIFF** of files between this release and Reference ShopFlow 1.05.0, click the following link to download the .patch file:

[.patch](#).

Use a tool such as Crucible to open this .patch file and graphically visualize all additions, deletions, and modifications. The .patch file can also be viewed in any text editor and will display appropriate syntax highlighting when syntax is set to Diff.

Note: The Bundle ID for Reference ShopFlow 1.06.0 is **69016**.

Support for URL Component Aliases

With the release of ShopFlow 1.06, URL component aliases are now supported. You can now define aliases for both items and facets. When a user enters a URL alias, they are now redirected to the canonical URL component. If the alias is not defined, a 404 page not found error is thrown. For detailed information about defining URL components in NetSuite, see the help topic [Enable URL Components Alias](#).

Important: Redirection occurs in both the client (browser) and server (SEO) environments.

To implement support for URL component aliases the following modules were modified:

- Facets.js:** The prepareRouter function was modified to include facet aliases as a possible route. Possible facet aliases are retrieved from the siteSettings object in the backend.configuration.js file. The siteSettings object is cached for two hours by default. When aliases are added or modified, those changes will not be effective until the cache is expired. If required, the cache can be disabled in the backend.configuration.js file by changing the cache object to the following:

```

1 | cache: {
2 |     siteSettings: 2 * 60 * 60 * 0 // DISABLED
3 | }

```

- **Facets.Router.js:** This facets router needs to know how to handle URL aliases. The `facetLoading` function has been modified as follows:
 - `model.fetch()` now handles results using a promise and uses the Search API response for retrieving the URL corrections.
 - Added the `getFacetsAliasesMapping(corrections)` function. This function returns a mapping of the facet aliases.
 - Added the `unaliasUrl(aliasUrl, corrections)` function. This function processes the aliased URL and returns the canonical URL.
 - The Search API response is checked to see if corrections are present. If false, the view is rendered as usual. If true, the URL is unaliased by calling a new function named `unaliasUrl(aliasUrl, corrections)`.
- **ItemDetails.Router.js:** The `productDetails(api_query, base_url, options)` function has been modified to support item aliases. The Search API call success callback now checks if the response contains corrections. If corrections are present, then the user is redirected to the canonical item URL.

Issue Fixes

This release contains many bug fixes including:

Images Overflow the Modal

Previously, when the dimensions of an image loading in a modal dialog were greater than its container, the image covered many elements of the page. This has been corrected so that images now load within the wrapping container.

The following files were modified:

- **ImageLoader.js:** updated the `fixImagesForLoader` function.

```

1 | var fixImagesForLoader = function (s)
2 | {
3 |   return s.replace(/<img([>]*)src="([>]*)"/gi, function(all, textBefore, url, textAfter)
4 |   {
5 |     textBefore = textBefore || '';
6 |     textAfter = textAfter || '';
7 |     // do nothing if image contains data-loader="false" attribute
8 |     if ( (textBefore && textBefore.indexOf('data-loader="false"') !== -1) || (textAfter && textAfter.index
Of('data-loader="false"') !== -1) )
9 |     {
10 |       return all;
11 |     }
12 |     var params = _$.parseUrlOptions(url);
13 |     var height = params.resizeh || default_height;
14 |     var style_attrs = 'style="min-height:' + height + 'px;min-width:' + height + 'px"';
15 |     var ret = '" alt="%-
  | thumbnail.altimagetext %>">
```

- **Merchandising.Zone.js:** added the following trigger to the appendItems method.

```
1 | // notify the layout that the content might have changed
2 | this.options && this.options.application && this.options.application.getLayout().trigger('afterRender');
```

addThis Widget is Disabled by Default

In this release the addThis widget is disabled by default in the **Configuration.js** file.

```
1 | , addThis: {
2 |     enable: false
```

Implemented rel='next' and rel='prev' Link Elements

The HTML link elements rel="next" and rel="prev" are used to indicate the relationship between component URLs in a paginated series. These elements were missing in the header and have now been added to improve SEO. To do this, the setLinkRel method has been added to the **Content.EnhancedViews.js**.

```
1 |     if (previous_page)
2 |     {
3 |         this.setLinkRel('prev', previous_page);
4 |     }
5 |
6 |     if (next_page)
7 |     {
8 |         this.setLinkRel('next', next_page);
9 |     }
10 |
11 |     return this;
12 | }
13 |
14 | , setLinkRel: function (rel, link)
15 | {
16 |     jQuery('<link />', {
17 |         rel: rel
18 |         , href: link
19 |     }).appendTo(this.$head);
20 | }
```

Images not Wrapped in noscript Tag In SEO Page Generator

Previously, to prevent loading of images in SEO generated pages, each image tag was wrapped in a <noscript> tag for SEO generated content. To improve performance, the #main div is now wrapped with the noscript tag.

Narrow by Section Displayed with Zero Results

Previously, when using faceted navigation, if zero results were returned the "Narrow By" section did not display. This has been corrected by adding the following conditional statement in the faceted navigation macro faceted_navigation_macro.txt. Now the Narrow By section will display when zero results are returned.

```
1 | <% if (has_facets || applied_facets.length) { %>
```

Last Image is Display when First is Selected in Chrome

Previously, when viewing the item details page in Chrome, the last image of an item was displayed even when the first image was selected. To correct this the following CSS was added to the **image-gallery.less** file.

```
1 | .bx-viewport li { min-height: 1px; min-width: 1px; }
```

Crashing in Internet Explorer 7

Previously, Reference ShopFlow would fail in IE7 due to an incorrect handling of value in the CSS selector of the **.rating-area** style. This style is not used, therefore, it has been commented out of the **rating.less** file.

```
1 | /*.rating-area button[value="0"] {
2 |     left: -20px;
3 |     position: absolute;
4 |     top: 0;
5 | }*/
```

Product Review Error Displayed when Product Reviews not Installed

Previously, when the Reference Product Review Records bundle was not installed, the following error was incorrectly displayed when loading the Product Detail pages:

```
1 | The record type [CUSTOMRECORD_NS_PR_REVIEW] is invalid.
```

To correct this a **REVIEWS_CONFIG** object was added to the **SC.ENVIRONMENT**. **starRating** macros are not rendered when **enabled** is set to **false**. In addition, the review component inside the product display page is not instantiated.

The following files were modified:

- **sc.environment.ssp**: added the **REVIEWS_CONFIG** object.

```
1 | SC.ENVIRONMENT.REVIEWS_CONFIG = {
2 |     enabled: <%= recordTypeExists('customrecord_ns_pr_review') %>
3 | };
```

- **ItemDetails.View.js**:

```
1 | var reviews_enabled = SC.ENVIRONMENT.REVIEWS_CONFIG && SC.ENVIRONMENT.REVIEWS_CONFIG.enabled;
2 |
3 | if (reviews_enabled && product_reviews_placeholder.size() > 0)
```

- **Several macro/template files**: set **showRatingCount** to **false** for the **starRating** div in the **review_form.txt**, **reviews_center_for_item.txt**, and **show_review_macro.txt** files.

```
1 | ,    showRatingCount: false
```

- **product_list_edit_item.txt**: modified the **item-rating** div to set **showRatingCount** to **true**.
Changed:

```
1 | <div class="item-rating" itemprop="aggregateRating" itemscope itemtype="http://schema.org/AggregateRating">
2 |     <%= SC.macros.starRating({
3 |         max: view.options.application.getConfig('productReviews.maxRate')
```

```

4      , value: rating
5      , className: 'star pull-left'
6      , fillRounded: true
7    }) %>
8    <span class="review-total">
9      <%= _('($0)').translate(
10         '<span itemprop="reviewCount">' + item_details.get('_ratingsCount') + '</span>'
11       ) %>
12    </span>
13  </div>

```

To:

```

1  <div class="item-rating" itemprop="aggregateRating" itemscope itemType="http://schema.org/AggregateRating">
2    <%= SC.macros.starRating({
3      max: view.options.application.getConfig('productReviews.maxRate')
4      , value: rating
5      , ratingCount: item_details.get('_ratingsCount')
6      , showRatingCount: true
7      , className: 'star pull-left'
8      , fillRounded: true
9    }) %>
10 </div>

```

Gallery Twitter Card Meta Tags

Previously, Twitter Gallery Cards could not be approved because the `twitter:site` and `twitter:creator` meta tags were not defined. In this release, these meta tags were added to the `metaTagMappingTwitterGalleryCard` object in the **Configuration.js** file.

```

1  , 'twitter:site': seo_twitter_site
2
3  , 'twitter:creator': seo_twitter_creator

```

ShopFlow 1.05.0

This document details changes to Reference ShopFlow since the previous release. For a complete **DIFF** of files between this release and Reference ShopFlow 1.04.0, click the following link to download the .patch file:

[.patch](#).

Use a tool such as Crucible to open this .patch file and graphically visualize all additions, deletions, and modifications. The .patch file can also be viewed in any text editor and will display appropriate syntax highlighting when syntax is set to Diff.

Note: The Bundle ID for Reference ShopFlow 1.05.0 is **59235**.

Save For Later

Using Save For Later, users can move items from the Cart to a list for later reference and then add items from the Save for Later list directly to the Cart.

Note: The Save for Later feature is built on the same architecture as Product Lists.

Save for Later provides the following functionality:

- Items in the Save for Later list are restored with each login session.

- By default, users can change the quantities in the Save for Later list.
- When an item in a Save for Later list goes out of stock, that item can no longer be added to the Cart and an out of stock message is displayed.
- When a shopper is not logged in they are redirected to the Login page when the Save for Later button for an item in the cart is clicked.

For detailed information about Save for Later, see the help topic [Save For Later](#).

List Headers

Reference ShopFlow 1.05.0 now includes the List Header component. This component defines sorting and pagination options used in pages that render lists of items or records. The List Header component can be used within different views and interacts with the collection displayed within that view. It is reusable and configurable to suit a variety of uses.

 **Note:** The List Header component was previously released with Reference My Account 1.03.0.

For detailed information about List Headers, see the help topic [List Headers](#).

ShopFlow 1.04.0

This document details changes to Reference ShopFlow since the previous release. For a complete **DIFF** of files between this release and Reference ShopFlow 1.03.0, click the following link to download the .patch file:

[.patch](#).

Use a tool such as Crucible to open this .patch file and graphically visualize all additions, deletions, and modifications. The .patch file can also be viewed in any text editor and will display appropriate syntax highlighting when syntax is set to Diff.

 **Note:** The Bundle ID for Reference ShopFlow 1.04.0 is **56319**.

The following enhancements have been made:

- [Minimum Field Set Requirements Updated](#)
- [Google Cached Pages Correctly Generated](#)
- [Added Configurable Cache Parameters](#)
- [Performance Enhancements](#)

Minimum Field Set Requirements Updated

The following minimum Field Set requirements changes have been made:

- **New typeahead Field Set:** To support enhanced performance, the **typeahead** Field Set is now required. You can manually add this Field Set to the Fields Sets subtab on the Web Site record at Commerce > Websites > Website List. You can also use the setup script to automatically populate all required Field Sets. For the complete setup script see the help topic [Field Set Script](#). The following Field Set definition has been added to the Setup Script.

```
1 | siteRecord.selectNewLineItem('fieldset');
2 | siteRecord.setCurrentLineItemValue('fieldset', 'fieldsetname', 'Type Ahead');
3 | siteRecord.setCurrentLineItemValue('fieldset', 'fieldsetid', 'typeahead');
```

```

4 | siteRecord.setCurrentLineItemValue('fieldset', 'fieldsetrecordtype', 'ITEM');
5 | siteRecord.setCurrentLineItemValue('fieldset', 'fieldsetfields', 'itemid,displayname,storedisplayname2,urlcomponent,itemimages_detail');
6 | siteRecord.commitLineItem('fieldset');
7 | recId = nlapiSubmitRecord(siteRecord);

```

- **New Field Sets for Related and Correlated Items:** Previously, related and correlated item detail information was included in the detail and order field sets. These have been removed from the detail and order field sets and are now defined in two new field sets. This enables calling the information asynchronously later in the script to improve initial load of the item details page and the cart. The following Field Set information has been added to the Setup Script:

```

1 | siteRecord.selectNewLineItem('fieldset');
2 | siteRecord.setCurrentLineItemValue('fieldset', 'fieldsetname', 'Related Items Details');
3 | siteRecord.setCurrentLineItemValue('fieldset', 'fieldsetid', 'relateditems_details');
4 | siteRecord.setCurrentLineItemValue('fieldset', 'fieldsetrecordtype', 'ITEM');
5 | siteRecord.setCurrentLineItemValue('fieldset', 'fieldsetfields', 'relateditems_detail');
6 | siteRecord.commitLineItem('fieldset');
7 |
8 | siteRecord.selectNewLineItem('fieldset');
9 | siteRecord.setCurrentLineItemValue('fieldset', 'fieldsetname', 'Correlated Items Details');
10 | siteRecord.setCurrentLineItemValue('fieldset', 'fieldsetid', 'correlateditems_details');
11 | siteRecord.setCurrentLineItemValue('fieldset', 'fieldsetrecordtype', 'ITEM');
12 | siteRecord.setCurrentLineItemValue('fieldset', 'fieldsetfields', 'correlateditems_detail');
13 | siteRecord.commitLineItem('fieldset');
14 | recId = nlapiSubmitRecord(siteRecord);

```

Note: For the full setup script, see the help topic [Set Up Initial Field Sets](#).

Google Cached Pages Correctly Generated

Google caches snapshots of each page it crawls. Users can then retrieve cached versions of pages from Google search results. Previously, an error was returned when users attempted to retrieve Google's cache of SuiteCommerce Advanced site URLs.

Now, when our application is loaded from an external domain such as Google cached pages, only the SEO output markup and styles are rendered. No JavaScript is run.

For **Reference ShopFlow 1.04**, a new `isCrossOrigin` method was added to the `index.ssp`:

```

1 | /* declare SC namespace here */
2 | var SC = window.SC = {
3 |   ENVIRONMENT: {
4 |     jsEnvironment: (typeof nsglobal === 'undefined') ? 'browser' : 'server'
5 |   }
6 |   , isCrossOrigin: function()
7 |   {
8 |     return '<%= Environment.currentHostString %>' !== document.location.hostname;
9 |   }
10 |   , isPageGenerator: function()
11 |   {
12 |     return typeof nsglobal !== 'undefined';
13 |   }
14 |   , getSessionInfo: function(key)
15 |   {
16 |     var session = SC.SESSION || SC.DEFAULT_SESSION || {};
17 |     return (key) ? session[key] : session;
18 |   }
19 | };
20 |
21 | and we control when to load or not load things inside the index like this:
22 |
23 | if (!SC.isCrossOrigin())
24 | {
25 | .

```

```

26 |
27 | }

```

If you are updating an existing **Reference ShopFlow 1.03** implementation, add the IF statements, `if ('<%= Environment.currentHostString %>' === document.location.hostname)`, to the `index.ssp` file as shown in the following code snippet. This IF statement checks if the request is from an external domain. When the request is from an external domain, related code then uses this information to ensure that Javascript is not loaded and that the application is not started.

```

1 <body>
2
3 <script>
4   If ('<%= Environment.currentHostString %>' === document.location.hostname)
5   {
6     document.write('<div class="seo-remove">');
7     loadScript({
8       url: '<%= session.getAbsoluteUrl("shopping", "sc.environment.ssp?lang=" + Language + "&cur=" + Currency) %>'
9       , seo_remove: true
10    });
11    document.write('<\\div>');
12  }
13 </script>
14 <script>
15   If ('<%= Environment.currentHostString %>' === document.location.hostname)
16   {
17     document.write('<div class="seo-remove">');
18     for (var i = 0; i < SC.LOAD_FILES.length; i++)
19     {
20       loadScript({
21         url: SC.ENVIRONMENT.baseUrl.replace('{{file}}', SC.LOAD_FILES[i])
22         , seo_remove: true
23       });
24     }
25   }
26   document.write('<\\div>');
27 </script>
28
29 <noscript>
30   <div class="container">
31     <div class="alert alert-error alert-noscript">
32       <strong>Javascript is disabled on your browser.</strong><br>
33       To view this site, you must enable JavaScript or upgrade to a JavaScript-capable browser.
34     </div>
35   </div>
36 </noscript>
37
38 <div id="main" class="main"></div>
39
40 <script>
41   If ('<%= Environment.currentHostString %>' === document.location.hostname)
42   {
43     // This minimizes flickery of the 1st page load!
44     jQuery && jQuery('#main').empty();
45   }
46 </script>
47 </body>

```

Note: Clear your site cache after applying this fix and then wait for Google to regenerate cached pages.

Added Configurable Cache Parameters

Content rendered by the Content Delivery service is cached for two hours, by default. Previously, to modify this caching duration a **time to live (ttl)** parameter needed to be added to the `Content.DataModels.js` module. Now, caching duration can be controlled by modifying the `Configuration.js` file. Two types of cache can be set:

- **CDN Cache:** Content cached on the Content Delivery Network
- **Application Cache:** Data cached on the NetSuite servers

```

1  ,   cache: {
2      // cdn cache duration for content pages. Valid values are 'SHORT', 'MEDIUM', 'LONG'
3      contentPageCdn: 'MEDIUM'
4
5      // application cache for content pages - value in seconds and must be between 2 hours and 5 minutes
6      ,   contentPageTtl: 2 * 60 * 60
7  }

```

The Content.DataModels.js file has been modified to call these two configuration parameters. Previously, this file set the cache as short.

Note: For more information about valid caching values SHORT, MEDIUM, and LONG, see `setCDNCacheable(type)`.

Performance Enhancements

The following performance enhancements have been made in Reference ShopFlow. If you have customizations to the files involved in these changes, you should consider merging these changes or editing your customized files to incorporate the changes. To maximize performance benefits, you should implement **ALL** changes. Each enhancement may not have the same performance gain when implemented in isolation.

- Stop Bootstrapping the Cart
- Remove Duplicate Language File
- Reorganize How the JavaScript is Loaded in the Page
- Optimize Images from SEO Output
- Removed Unnecessary Spaces from SEO Output
- Redirect Users When pushState is not Enabled
- Remove jQuery(document).ready from Starter.js
- Configurable Application Linking
- Optimize Image Loading and Sizes in the PDP
- Move SocialNetworks Initialization to .once(afterAppendView)
- Load SocialNetworks Scripts only if the View Contains Placeholders
- Remove the Timestamp from Images Created with BXSlider
- Parallelize sc.user.environment.ssp
- Stop Bootstrapping Product Lists

Stop Bootstrapping the Cart

Previously, loading the user shopping cart caused delays when loading the `sc.user.environment.ssp`.

Now, the application environment loads first. After the application starts, the shopping cart information is fetched and the shopping cart notifies the application when the cart information is ready to be displayed.

Remove Duplicate Language File

Previously, the language file was loaded on the environment and `user.environment`. Now, the language file is loaded only by the `index.ssp` file.

Reorganize How the JavaScript is Loaded in the Page

Previously, javascript libraries were loaded from a file that was not cached.

Now, the BootUtilities file was removed from the application and its capabilities moved to the following:

- The console and json shim libraries were moved to a combiner file named Libraries-xxxxxxx.js
- The loadScript function was moved to the top of the index.ssp file.
- The html5 shim is included in-line at the top of the index.ssp file.
- Style information was moved to the bottom of the index.ssp file. Although style information is generally loaded at the beginning of a web-based application, this was done for performance improvements.

Optimize Images from SEO Output

Previously, images were loaded in the SEO generated HTML causing a delay in the load of JavaScript files. Now, images are loaded only when the page views and content are rendered.

To prevent loading of images in SEO generated pages, each image tag is wrapped in a `<noscript>` tag for SEO generated content only. The `minifyMarkup()` function within the `Underscore.templates.js` file has been modified in the following two ways:

- Images in template and macro output are wrapped in a `<noscript>` tag:

```

1  minifyMarkup = function (text)
2  {
3      if (isSeo() && text)
4      {
5          text = text
6          ...
7          ...
8
9          // Performance: wrap all images with noscript if in SEO so the browser
10         // don't start loading the images when parsing the SEO markup.
11         // We do this with a regexp instead using parsed object because of the
12         // SEO engine. The following regexp wrap all <img> tags
13         // with <noscript> only if they are not already wrapped. It supports the
14         // three formats: <img />, <img></img> and <img>
15         .replace(/(<img\s+[>]*\s*<\/img>|<img\s+[>]*\/>|(?<img\s+[>]*>)(?!s*<\/img>))(?!s*<s*\/noscript\s*>)/
16         gmi, '<noscript>$1</noscript>');
17     }
18     return text || '';
19 }

```

- The `jQuery.html()` and `jQuery.append()` methods are overridden to apply the `<noscript>` tag:

```

1  if (isSeo())
2  {
3      var jQuery_originalHtml = jQuery.fn.html;
4      jQuery.fn.html = function(html)
5      {
6          if (typeof html === 'string')
7          {
8              html = minifyMarkup(html);
9              html = removeScripts(html);
10          }
11          return jQuery_originalHtml.apply(this, [html]);
12      };
13
14      var jQuery_originalAppend = jQuery.fn.append;
15      jQuery.fn.append = function(html)
16      {

```

```

17     if (typeof html === 'string')
18     {
19         html = minifyMarkup(html);
20         html = removeScripts(html);
21     }
22     return jQuery_originalAppend.apply(this, [html]);
23 };
24 }

```

Removed Unnecessary Spaces from SEO Output

Previously, SEO generated pages included spaces and debug comments in the HTML the same as the rendered views and content. Because each whitespace and comment requires the creation of a new node by the SEO generator, performance is improved by removing them. This is done in the following two files:

- **Underscore.templates.js:** New lines and tabs between HTML tags are removed for SEO generated pages. Also, the `<!-- begin macro` and `<!-- begin template` debug comments are removed.
- **Underscore.templates.js:** The `jQuery.html()` and `jQuery.append()` methods have been overridden to minify markup injected by content rendered by the Content Delivery and Product Merchandising services.

Redirect Users When pushState is not Enabled

By using `pushState`, Reference applications avoid multiple HTTP request-response cycles when updating URLs. Because IE8 and IE9 do not support `pushState`, a function immediately following the open head tag has been added to minimize the time for URL redirects. The user is redirected to a fixed URL as soon as the page loads.

```

1  if (!history.pushState && SC.ENVIRONMENT.jsEnvironment === 'browser' && (location.pathname !== "/" || location.search !== "") &&
2  location.hash === '')
3  {
4      location.replace('/#' + location.pathname + location.search);
5      document.write("");
6  }

```

Remove jQuery(document).ready from Starter.js

Previously, the `application.start()` function was not initiated until document ready. Now, the `application.start()` function is done in parallel with loading additional resources. To accomplish this, the `jQuery(document).ready` function was removed from the `Starter.js` file, and the order of loading core JavaScript files in the `index.ssp` was changed so that the `Application.js` file is loaded last.

```

1  loadScript([
2      '<%= session.getAbsoluteUrl("shopping", 'js/libs/Libraries-0146f82c3202.js') %>'
3      , '<%= session.getAbsoluteUrl("shopping", 'templates/Templates-0146f82c24a9.js') %>'
4      , '<%= session.getAbsoluteUrl("shopping", 'js/Application-0146f82c2a83.js') %>'
5  ]);

```

Note: You can configure from where to load these files. See [Configurable Application Linking](#).

Configurable Application Linking

Previously, the core combined JavaScript files could be loaded from only the `sc.user.environment.ssp` file. Now, you can configure these files to load from the `sc.user.environment.ssp` file, `sc.environment.ssp` file, or `index.ssp` file. By default, the core JavaScript files are loaded from the `index.ssp` file. The following table summarizes the benefits.

Note: Combined JavaScript files include the Libraries.js, Templates.js, and Application.js files.

Location	Cache	Performance
sc.user.environment.ssp	no cache	poor
sc.environment.ssp	MEDIUM (2 hours)	medium
index.ssp (default)	LONG (7 days)	best

Optimize Image Loading and Sizes in the PDP

In the Product Display Page, three sizes of the same image are available: thumbnail, main, and zoom. Previously, for mobile devices, the large zoom image size was downloaded and then shrunk to fit the screen width. Now, only the smaller image size is downloaded for mobile devices. This is done in the `item_image_gallery.txt` template file:

```
1 <% registerMacro('itemImageGallery', function (images, view) {
2   var resizeImage = view.application.resizeImage
3   ,   image_resize_id = SC.ENVIRONMENT.screenWidth < 768 ? 'thumbnail' : 'zoom';
4
5   %>
```

Move SocialNetworks Initialization to .once(afterAppendView)

Previously, social network libraries made two requests prior to a page being rendered. Now, social network requests are made only after the initial page is rendered by moving the request to the first `afterAppendView`.

```
1 mountToApp: function(){
2   layout.on('afterAppendView', function(){
3     if(!scriptLoadedYet && layout.containsPlaceholdersFor('facebook and addthis'))
4     {
5       loadScripts('facebook.js', 'addthis.js')
6     }
7   });
8 }
```

Load SocialNetworks Scripts only if the View Contains Placeholders

Previously, if addThis and Facebook were enabled in the `Configuration.js` file, social media widgets were loaded regardless of whether the page requested had these in the DOM. Now, the addThis and Facebook scripts are loaded only when the DOM has placeholders for these widgets. This is done in the `SocialSharing.js` file:

```
1 mountToApp: function(){
2   layout.on('afterAppendView', function(){
3     if(!scriptLoadedYet && layout.containsPlaceholdersFor('facebook and addthis'))
4     {
5       loadScripts('facebook.js', 'addthis.js')
6     }
7   });
8 }
```

Remove the Timestamp from Images Created with BXSlider

Previously the BXSlider widget included a timestamp internally for onload image events. This caused images to incorrectly cache. Now, the timestamp has been removed. The following line has been commented out of the file `jquery.bxslider.js`:

```
1 | if($(this).is('img')) $(this).attr('src', $(this).attr('src') + '?timestamp=' + new Date().getTime());
```

Parallelize sc.user.environment.ssp

Previously, the application start up was done only after the user profile was loaded by the sc.environment.ssp application. Now, sc.user.environment.ssp is loaded asynchronously and a global promise object is resolved after the asynchronous profile request is completed. This enables core resources to load and the application startup process to begin, postponing rendering of the UI.

To accomplish this, the following changes have been implemented.

- Asynchronous Loading: the sc.environment.ssp file is loaded asynchronously.
- Use of a Global promise object: the promise is resolved after the user profile is loaded.
- Provided a new Asynchronous User Profile Method: the application.getUserPromise() method is provided for asynchronous user profile requests where needed. The existing application.getUser() method is still used for synchronous calls.

Important: Previously, the profile module was ready when any module code was run. Now, a module's mountToApp() function can be run without the profile data being available. Use the getUserPromise() function from static code such as modules to ensure that the promise object is resolved. Use the synchronous getUser() function as needed from views and templates.

- Refactor of the Application Architecture: modules can now be mounted before profile information is available.
- Initial Rendering of Content is Postponed Until the Profile is Ready: The Shopping.Layout.showContent method is overridden to show content only when the profile promise is resolved and the profile has loaded. The Layout.showContent method is now responsible for triggering the routers.

Stop Bootstrapping Product Lists

Previously, Product List data was loaded at the initial startup in sc.user.environment.ssp, which slowed the loading of other core resources. Now, the new method getProductListsPromise() in the ProductList.js module returns a promise resolve only after the Product List data is available. In addition, modules dependent on the ProductList module have been refactored using application.getProductLists.

Changes to files are mostly related to calling the getProductListsPromise() method before displaying the Product List control on the page.

Note: For pages displaying product list information, the application displays a Loading Lists... message until that data is available.

ShopFlow 1.03.0

With the release of Reference ShopFlow 1.03.0 the following enhancements have been made:

Note: The Bundle ID for Reference ShopFlow 1.03.0 is **53050**.

Product Lists

When a web store is using Reference My Account 1.03.0 with this version of Reference ShopFlow, Product Lists (Wishlist) is now supported.

Using product lists, users in a B2B or B2C can do the following:

- Flag Items to be added to a product list as they are browsing in your web store.
- Create new lists when flagging items.
- Edit Item order details from within the Product Lists pages.
- Move Items between Product Lists.
- Add an entire list of products to the shopping cart with a single click.
- Use Product Lists to Reorder lists of items.

For detailed information about Product Lists, see the help topic [Product Lists](#)

Reference Product Lists Bundle

To use the Product Lists feature, you must install the Reference Product Lists Bundle. This bundle installs the custom records required to store and manage Product List data.

 **Note:** The Bundle ID for Reference Product Lists Records is **53051**.

Product Reviews Updates

To better support the bundle upgrades, this version of ShopFlow has decoupled the Product Reviews custom records from the Reference ShopFlow bundle. Now, you must install a separate **Reference Product Reviews Records** bundle to support the product reviews capability.

 **Note:** The Bundle ID for Reference Product Reviews Records is **53053**.

After installing this bundle, product review data can be viewed on Item records under the SuiteCommerce Extensions tab. Also, to support a more user friendly experience, Product Review custom fields have been renamed.

 **Important:** If you are using Product Reviews in a current implementation, do not uninstall the current version of ShopFlow. Uninstalling will remove the Product Review custom records, lists, and fields, and all associated data will be lost. You can keep the current custom records in place to retain all data and install the new Reference Product Reviews bundle for new product reviews data until data migration can take place.

For detailed information about working with Product Review records, see the help topic [SuiteCommerce Product Reviews](#).

Minimum Field Set Requirements Updated

To support the new My Account Billing feature, the **order** Field Set is now required. You can manually add this Field Set to the Fields Sets subtab on the Web Site record at Commerce > Websites > Website List. You can also use the setup script to automatically populate all required Field Sets. For the complete setup script see the help topic [Field Set Script](#). The following Field Set definition has been added to the Setup Script.

```
1 siteRecord.selectNewLineItem('fieldset');
2 siteRecord.setCurrentLineItemValue('fieldset', 'fieldsetName', 'order');
3 siteRecord.setCurrentLineItemValue('fieldset', 'fieldsetid', 'order');
4 siteRecord.setCurrentLineItemValue('fieldset', 'fieldsetrecordtype', 'ITEM');
5 siteRecord.setCurrentLineItemValue('fieldset', 'fieldsetfields', 'itemimages_detail,itemoptions_detail,onlinecustomerprice_detail,displayname,internalid,itemid,storedisplayname2,urlcomponent,outofstockmessage,showoutofstockmessage,isinstock,isbackorderable,ispurchasable,pricelevel1,pricelevel1_formatted,stockdescription,matrixchilditems_detail,itemtype,minimumquantity,isonline,isinactive');
```

```
6 | siteRecord.commitLineItem('fieldset');
```

Pinterest Enhancements

Reference ShopFlow now supports Product Rich Pins from Pinterest in the product details page. By default, shoppers can hover over an image and then click a Pinterest icon, or click a Pinterest button from within the cart details region. The Pinterest entry automatically populates with item details such as the product image, pricing, or availability.

For more information, see the help topic [Pinterest](#).

Support for Twitter Product Cards

Reference ShopFlow now supports Twitter Product Cards which enable the ability to attach media experiences to Tweets that link to product detail pages. Shoppers can Tweet your products by clicking the Twitter button on the product details page and a card visible to all of their followers is automatically added to their Tweet. This Card can show item details including an image, description, and two other key item details such as price, availability, sizes, or colors.

For more information, see the help topic [Twitter Cards](#).

Issue Fixes

This release contains many bug fixes including:

- **Improved Performance of the Live Order Model:** When returning item data to the cart, only item attributes required for display to the user are retrieved. This results in significant performance improvements. Now, approximately 15, cached item attributes are retrieved. Previously, all item attributes were retrieved.
- **Errors When Reordering Items:** Previously, when multiple orders existed in a users account, the error message `Script Execution Usage Limit Exceeded` was thrown when attempting to reorder those orders. This has been resolved.
- **Zero Results in Pasted URLs:** Previously, when copying and pasting URLs with spaces in keywords, zero results were returned due to double encoding of spaces in keywords. Now the correct number of results are returned.
- **Enhanced Cross Site Scripting (XSS) Prevention:** All output from `request.getParameter` calls now compare URL parameters to text and the ability for users to run code through the URL parameter is eliminated.
- **IE Compatibility View Support:** Users that have IE Compatibility View enabled for SuiteCommerce Advanced Sites they are visiting can now successfully proceed to Checkout. Previously, Compatibility View needed to be disabled for the site for the user to proceed.
- **Search Type Ahead Fixes:** Previously, when a user entered search terms and clicked enter without waiting for the type ahead feature to complete, the results page does not display. Now the results page correctly displays based on the search query entered without waiting for the type ahead feature values to complete loading.
- **Misdirection of Items with URL Component Starting with Cart Misdirected Correction:** Previously, when users attempted to go to an item starting with a URL component of `Cart` they were incorrectly redirected to the shopping cart page. This has been fixed so that the user is corrected directed to the item details page.
- **Cart Performance Issue in Site Builder Sites:** To increase cart performance the `items_fields_standard_keys` object in the `backend.configuration.js` file has been modified to restrict the number of fields returned by default.

ShopFlow 1.02.0

With the release of Reference ShopFlow 1.02 the following enhancements have been made:

■ Content Delivery Updates:

- **Content Delivery in Checkout and My Account:** You can now include content generated from the Content Delivery service in Reference Checkout and Reference My Account implementations. When multiple Reference Implementations are being used for your web store, you can specify which implementations use a Content Delivery record by using the **app** tag with the name of the implementation as follows: Checkout, MyAccount, or Shopping. For example, using the tag **app:Shopping** causes the content to display in only the Shopping Reference implementation.
- **Content Delivery in Backbone Modals:** You can now include content generated from the Content Delivery service inside Backbone Modals. To use Content Delivery content inside a modal, the target ID defined in the Content Delivery record must be referenced by adding the prefixViewId "in-modal-". You can also specify whether that content should display only when inside a modal, inside or outside of a modal, or outside of a modal.
- **CDN Caching Enhancement:** Now content returned using the Content Delivery service is cached using CDN.

- **Support for Correlated and Related Items:** By default, when an item has correlated and related items associated with an item on the item record, the Reference ShopFlow implementation now displays those correlated and related items on the item product details page within your site. If you are upgrading from a previous version of ShopFlow, ensure that you have the proper Field Sets defined to support this change. For more information, see the help topics [Define Field Sets](#) and [Correlated and Related Items](#).
- **Matrix Item Support:** Matrix Items are supported and displayed as default functionality. Previously, the itemOptionId values were not available from the Item Search API for matrix items. These values needed to be manually configured in the Configuration.js file. Now, the Item Search API includes this information so manual configuration is NOT needed.

Important: If you are upgrading from a previous version of ShopFlow and have already configured matrix items in your Configuration.js file you should remove these configurations. Any settings in the Configuration.js file take precedence over the default behavior.

- **Google Universal Analytics:** NetSuite now supports Google Universal Analytics tracking code. Universal Analytics gives you access to improved data processing, new collection methods, and more analysis tools.

Note: To prevent historical data from being lost, the Google Analytics (ga.js) technology will continue to be supported. However, for any new implementations, you should use Universal Analytics (analytics.js).

NetSuite now also supports multiple analytics trackers. You simultaneously gather data for both Classic Google Analytics and Google Universal Analytics. You can also add your own custom analytics module to gather data in addition to the Google Analytics data.

For more information, see the help topic [Google Universal Analytics](#).

- **CDN Cache Duration:** The CDN cache duration in the sc.environment.ssp file has been changed from LONG to MEDIUM.
- **New Backend Configuration file:** In this release, a new configuration file has been added that enables you to set multiple server-side objects. Many of the available configuration options provide better performance. The file is located at Web Site Hosting Files > Live Hosting Files > SSP Applications > NetSuite Inc. - Shopping > Reference ShopFlow > ssp_libraries.

For detailed information, see Configuring Backend Objects Using the backend.configuration.js File

■ General SEO Enhancements:

- **Added <h1> to <h5> Tags and Default Placement:** Previously H tags were not used by default on the Facet, Category, and Product pages. Now, H tags are used to give order and hierarchy to the content in the web pages, which improves SEO results.
Examples include:
 - Product pages: H1 is used for Product Names and H2 is used for subtab titles.
 - Faceted pages: H1 is used for the main page title, H2 is used for the Product Name, H3 for the Facet name, and H4 for the Facet options
- **Absolute URLs Used In Canonical Tags:** Previously, relative URLs were used in canonical tags. To improve SEO performance, absolute URLs are now used.
- **Deindexed ShopFlow URLs for Google:** Previously, duplicate indexing was performed because Google crawled the main site as well as the ShopFlow SSP URL. Now a robots.txt file has been added that causes Google to ignore ShopFlow URLs when indexing. You can modify this file as needed and place it in your hosting root.
- **Removed Cases of Double H1s:** Cases of redundant H1s in Faceted search results have been restructured to have a single H1. The duplicate H1s were used for Responsive Design. Now, the H1 for mobile sites has been removed.
- **Quick View Fix:** Previously, due to linking characteristics within the page, search engine results were often returning Quick View, instead of the product title. This has been fixed to ensure that the Quick View links are hidden from search engine crawlers and the product name is correctly returned in search results.
- **Schema.org Fixes:** The Schema.org implementation has been redesigned to properly display structured data information in search engines results.

Reference Checkout

- [Checkout 2.05.0](#)
- [Checkout 2.04.1](#)
- [Checkout 2.04.0](#)
- [Checkout 2.03.0](#)
- [Checkout 2.02.0](#)
- [Checkout 2.0](#)

Checkout 2.05.0

Note: The Bundle ID for Reference Checkout 2.05.0 is **96111**.

With this release of Reference Checkout, Bronto integration is available. Bronto is a NetSuite company that provides an advanced marketing automation engine and solutions for shopping cart abandonment, post-purchase campaigns and so forth. Bronto can be easily integrated with your Reference ShopFlow, My Account, and Checkout implementations.

The following Bronto Applications are supported:

- Cart Recovery
- Conversion Tracking
- Coupon Manager
- Pop-up Manager

To implement Bronto integration, you need to modify the Configuration.js file to include your accountId.

```
1  , bronto: {
2    accountId: ''
3  }
4  });
```

With the accountId configured, the BrontoIntegration module causes a configuration.js file to load after the SuiteCommerce Application has initialized. This configuration.js file is cached in the Bronto CDN and uses the accountId to pull down the appropriate settings to enable and configure the various integrations setup in the Bronto Connector.

Note: The BrontoIntegration module essentially provides an interface to the Bronto CDN. Therefore, any updates or enhancements to Bronto applications are completely separate from SuiteCommerce Advanced releases and will be made available through the Bronto CDN. There is no additional customization needed in the SuiteCommerce source code to take advantage of Bronto enhancements.

For detailed information about configuring and managing your Bronto applications, refer to the Bronto documentation.

Checkout 2.04.1

Note: The Bundle ID for Reference Checkout 2.04.1 is **69019**.

In this release, a bug with Internet Explorer 8 has been fixed. The issue is a result of an unsupported regular expression character ("^") that causes SuiteCommerce pages to improperly render. This issue affects only customers using Internet Explorer 8. All other browsers are not affected by this issue.

To implement the fix, the **Content.EnhancedViews.js** file at Reference js/src/app/modules/Content/Content.EnhancedViews.js was modified with the following change:

Note: This file was also modified in ShopFlow and My Account. If you are using those implementations, you must also make the change or upgrade to the latest bundle for each.

Previous Code:

```
1  , enhanceMetaTags: function (view)
2  {
3    var enhanced_meta_regex;
4    this.$head
5      // then we add the description
6      .find('meta[name="description"]').attr('content', view.metaDescription || view.getMetaDescription() || '').end()
7      // and keywords meta tags
8      .find('meta[name="keywords"]').attr('content', view.metaKeywords || view.getMetaKeywords() || '').end()
9      // then we append the tags specific to this view
10     // excluding any extra descriptions and keywords meta tags
11     .append(view.getMetaTags().not('[name="description"]').not('[name="keywords"]'));
12
13     /* jshint ignore:start */
14     // related to issue https://github.com/jshint/jshint/issues/823
15     enhanced_meta_regex = /\<!\\-\\- EnhanceMetaTags:STARTS[^\]+EnhanceMetaTags:ENDS \\-\\->/;
16     /* jshint ignore:end */
17     if (document.head.innerHTML.match(enhanced_meta_regex))
18     {
19       document.head.innerHTML = document.head.innerHTML.replace(enhanced_meta_regex, '');
20     }
```

```

21
22     if (view.metaextra)
23     {
24         endTo(this.$head);
25     }
26
27     return this;
28 }

```

Updated Code:

```

1  , enhanceMetaTags: function (view)
2  {
3      this.$head
4      // then we add the description
5      .find('meta[name="description"]').attr('content', view.metaDescription || view.getMetaDescription() || '').end()
6      // and keywords meta tags
7      .find('meta[name="keywords"]').attr('content', view.metaKeywords || view.getMetaKeywords() || '').end()
8      // then we append the tags specific to this view
9      // excluding any extra descriptions and keywords meta tags
10     .append(view.getMetaTags().not('[name="description"]').not('[name="keywords"]'));
11
12     // remove head's elements that are between enhanceMetaTagsStart and enhanceMetaTagsEnd
13     var remove_element = false; //flag used to determine when remove elements.
14
15     jQuery('head').children().each(function ()
16     {
17         var $element = jQuery(this)
18         ,     element_id = $element.attr('id');
19
20         if (element_id === 'enhanceMetaTagsStart')
21         {
22             remove_element = true;
23         }
24
25         if (remove_element)
26         {
27             $element.remove();
28         }
29
30         if (remove_element && element_id === 'enhanceMetaTagsEnd')
31         {
32             remove_element = false;
33         }
34     });
35
36     //add meta extra elements between enhanceMetaTagsStart and enhanceMetaTagsEnd
37     if (view.metaextra)
38     {
39         jQuery('<script id="enhanceMetaTagsStart"></script>' + view.metaextra + '<script id="enhanceMetaTagsEnd"></script>').append
40         To(this.$head)
41     }
42
43     return this;
44 }

```

Checkout 2.04.0

This document details changes to Reference Checkout since the previous release. For a complete **DIFF** of files between this release and Reference Checkout 2.03.0, click the following link to download the .patch file:

[.patch](#).

Use a tool such as Crucible to open this .patch file and graphically visualize all additions, deletions, and modifications. The .patch file can also be viewed in any text editor and will display appropriate syntax highlighting when syntax is set to Diff.

 **Note:** The Bundle ID for Reference Checkout 2.04.0 is **69019**.

Multiple Ship To

With this release, the new Multiple Ship To (MST) feature enables you to configure your site so that shipments can be made to different addresses from within the same order. For detailed information, setup, and configuration of MST see the help topic [Multiple Ship To](#).

 **Important:** In this Limited Release version of MST there are several known restrictions. See the help topic [Known Limitations](#) for further details.

Issue Fixes

This release contains many bug fixes including:

Skip Login and Promo Codes

Previously, promo codes added while on the View Cart page resulted in an error. This has been corrected by modifying the following code in the **CheckoutSkipLogin.js** file.

Changed:

```
1 | LiveOrderModel.prototype.save = _.wrap(LiveOrderModel.prototype.save, wrapper);
```

To:

```
1 | if (window.location.protocol !== 'http:') { LiveOrderModel.prototype.save = _.wrap(LiveOrderModel.prototype.save, wrapper); }
```

Skip Login and Guest Email Field

With Skip Login enabled, an anonymous user skips the login/register page when they go to Checkout. Previously, upon login in the Skip Login flow, the guest email field continued to display. To correct this, the following two changes were made in the **OrderWizard.Module.RegisterEmail.js** file:

- The `isActive` function was added to check that the user is logged in before rendering the module.

```
1 | , isActive: function()
2 | {
3 |     return (this.wizard.application.getUser().get('isGuest') === 'T' || (this.wizard.application.getConfig('check
out_skip_login') && this.wizard.application.getUser().get('isLoggedIn') !== 'T'));
4 | }
```

- The render function was changed to check the results of the `isActive` function.

```
1 | , render: function ()
2 | {
3 |     if (!this.isActive())
4 |     {
5 |         return this.$el.empty();
6 |     }
7 |
8 |     var profile = this.profile = this.wizard.options.profile;
9 |
10 |    this._render();
11 |
12 |    if (profile.get('email') && this.wizard.isPaypalComplete())
```

```

13 |     {
14 |         this.trigger('ready', true);
15 |     }
16 | }

```

Blank Review Page in Internet Explorer 8

In this release, the review page now correctly displays in IE8. Previously, it displayed blank. This was corrected by changing the name of the reserved JavaScript keyword `class` to `className` in the following files:

- `credit_memo_details.txt`
- `invoice_details.txt`
- `item_details_line_macro.txt`
- `order_wizard_showshipments_module.txt`
- `quote_details.txt`
- `return_authorization_details.txt`

Pay with Gift Certificate Persists when Feature is Disabled

Previously, the Pay with Gift Certificate option displayed in the Payment Method page even when the feature was disabled in the account. This has been resolved by adding a check to determine if the Gift Certificate module is enabled. The following files have been modified:

- **commons.js:**

```

1 | , giftCertificatesEnabled: context.getSetting('FEATURE', 'GIFTCERTIFICATES') === 'T'

```

- **Module.PaymentMethod.GiftCertificates.js:**

```

1 | // Determines if the current module is valid to be shown and operate with
2 | , isActive: function ()
3 | {
4 |     return SC.ENVIRONMENT.giftCertificatesEnabled;
5 | }
6 |
7 | , render: function()
8 | {
9 |     // Is Active is overridden by child modules, like Shipping to hide this module in Multi Ship To
10 |    if (!this.isActive())
11 |    {
12 |        this.$el.attr('class', '');
13 |
14 |        return this.$el.empty();
15 |    }

```

Checkout 2.03.0

This document details changes to Reference Checkout since the previous release. For a complete **DIFF** of files between this release and Reference Checkout 2.02.0, click the following link to download the .patch file:

[.patch](#).

Use a tool such as Crucible to open this .patch file and graphically visualize all additions, deletions, and modifications. The .patch file can also be viewed in any text editor and will display appropriate syntax highlighting when syntax is set to Diff.

Note: The Bundle ID for Reference Checkout 2.03.0 is 59236.

Skip Login

When Skip Login is enabled, the login/register page is skipped when an anonymous user navigates to Checkout. The user is redirected directly to the first checkout step. By default, Skip Login is disabled. To configure your implementation to use the Skip Login feature, override the `checkout_skip_login` object in the `backend.configuration.js` file and set to `true`.

```
1 | , checkout_skip_login: true
```

Support for Google Universal Analytics

Google Universal Analytics is now supported for Reference Checkout. Previously, the module was available only for Reference ShopFlow. For detailed information about using Google Universal Analytics, see the help topic [Google Universal Analytics](#).

Item Pricing Fixes

Previously, in some cases the Item Price in the shopping cart displays 0.00 and the price is crossed out. This error has been fixed in the current release but you can manually fix this issue without upgrading to the latest bundle.

To manually fix this issue without upgrading to the latest bundle:

1. Download the file `Model.js` located at `Reference Checkout/ssp_libraries`.
2. Look for the following code:

```
1 | var amount = toCurrency(original_line.amount)
2 | // Total may be 0
3 | , total = (original_line.promotionamount !== '') ? toCurrency(original_line.promotionamount) : toCurrency(original_line.amount)
4 | , discount = toCurrency(original_line.promotiondiscount) || 0;
```

And update to the following:

```
1 | var amount = toCurrency(original_line.amount)
2 | // Total may be 0
3 | , total = (original_line.promotionamount) ? toCurrency(original_line.promotionamount) : toCurrency(original_line.amount)
4 | , discount = toCurrency(original_line.promotiondiscount) || 0;
```

Note: The difference in the above code sample is changing `original_line.promotionamount !== ''` to `original_line.promotionamount`.

3. Save `Model.js` with a new name.
4. Upload `Model.js` to the original folder.
5. Update the Reference Checkout SSP Application to reference the new uploaded file.

Reference Checkout Performance Enhancements

The following performance enhancements have been made in this version of Reference Checkout. If you have customizations to the files involved in these changes, you should consider merging these changes

or editing your customized files to incorporate the changes. To maximize performance benefits, you should implement **ALL** changes. Each enhancement may not have the same performance gain when implemented in isolation.

Fewer Redirects

Previously, when a shopper selected Proceed to Checkout, the Reference Checkout performed three redirects.

Now, the application uses HTTP POST rather than GET. This is a general change for all touchpoints within the Reference Implementations. These touchpoints are handled by the module defined in the NavigationHelper.js file. This module uses the following logic when processing a data-touchpoint.

If the following three conditions are true, the Reference Implementations perform a POST operation:

- a shopper clicks a data-touchpoint, and
- the current touchpoint is different from target touchpoint, and
- the target touchpoint is within a secure domain

In all other cases, the Reference Implementation performs a GET operation as before.

DNS Pre-fetching

DNS pre-fetching is a technique to improve performance when loading pages. DNS prefetching attempts to resolve domain names before a shopper clicks on a link. To perform DNS-prefetching, the following was added to the <head> tag of the index.ssp file:

```

1 <script>
2 if (typeof nsglobal === 'undefined')
3 {
4   <%
5     var checkout_tokens = session.getSiteSettings(['touchpoints']).touchpoints.checkout.split('/')
6     ,   prefetch_url = checkout_tokens[0] + '/' + checkout_tokens[2]
7     ,   prerender_url = session.getSiteSettings(['touchpoints']).touchpoints.login;
8   %>
9   var prefetch_url = '<%= prefetch_url %>'
10  ,   prerender_url = '<%= prerender_url %>';
11  document.write('<link rel="prefetch" href="' + prefetch_url + '>');
12  document.write('<link rel="dns-prefetch" href="' + prefetch_url + '>');
13  document.write('<link rel="prerender" href="' + prerender_url + '>');
14 }
15 </script>

```

Changes to Shopping Cart Bootstrap in the Login and Register Pages

Previously, loading the user shopping cart caused delays when loading the sc.user.environment.ssp.

Now, when loading the Login and Register pages, the application environment loads first. After the application starts, the shopping cart information is fetched and the shopping cart notifies the application when the cart information is ready to be displayed.

Checkout pages continue to bootstrap the shopping cart as before.

Checkout / Login Unification

Previously, if a shopper was not logged in and clicked Checkout, they would have to access the Checkout page, then be redirected to the Login page.

Now, if a shopper is not logged in, they are redirected directly to the Login page. To accomplish this, the login.ssp file was removed and its purposefulness moved to the index.ssp file.

Remove Duplicate Language File

Previously, the language file was loaded on the environment and user.environment. Now, the language file is loaded only by the index.ssp file.

Skip Login for Guest Users

Previously, if a shopper was a guest user, they would be directed to the login page before proceeding to checkout.

Now, there is a configurable option that enables guest users to proceed directly to checkout, bypassing the login page.

This option is configured using the checkout_skip_login property in the backend-configuration.js file. By default, this option is disabled. When it is enabled, an anonymous shopper is redirected to the checkout page, skipping the login/register page.

Moved Style Information to Bottom of index.ssp

Style information was moved to the bottom of the index.ssp file. Although style information is generally loaded at the beginning of a web-based application, this was done for performance improvements.

Remove Bootutilities.js

Previously, javascript libraries were loaded from a file that was not cached.

Now, the BootUtilities file was removed from the application and its capabilities moved to the following:

- The console and json shim libraries were moved to a combiner file named Libraries-xxxxxxx.js
- The loadScript function was moved to the top of the index.ssp file.
- The html5 shim is included in-line at the top of the index.ssp file.

Checkout 2.02.0

With the release of Reference Checkout 2.02.0 the following enhancements have been made:

 **Note:** The Bundle ID for Reference Checkout 2.02.0 is now 49333.

- **Limited Fields Returned in Searches:** There is a new backend.configuration.js file that restricts the fields returned in searches, providing enhanced performance. Previously, for Site Builder sites **all** fields were returned using the Commerce API. Now, only a subset of files is returned. For SuiteCommerce Advanced sites, you can customize which fields are returned using the Item Search API for Checkout versus ShopFlow order pages. For both Site Builder sites and SuiteCommerce Advanced sites, you can modify the backend.configuration.js file as needed to return only those fields used in your web store implementation.

For detailed information, see Configuring Backend Objects Using the backend.configuration.js File

- **Multiple Versions of the Bundle can be Installed:** Multiple versions of the Reference Checkout bundle can be installed and deployed to different sites. To differentiate between bundles, unique version information is included in the Root URL and SSP application name. For example the SSP application name for this release is Reference Checkout 2.02.0 and the Root URL is https://checkout-2-02-0.netsuite.com.

Because the version information is included in the SSP application name, you can also differentiate bundle versions when assigning Touch Points.

- **Support for Correlated and Related Items:** By default, for Site Builder sites when an item has correlated and related items associated with an item on the item record, the Reference Checkout implementation now displays those correlated and related items in the View Cart page. For more information, see the help topic [Correlated and Related Items](#).

Checkout 2.0

The latest version of Reference Cart and Checkout has been redesigned to leverage the same modern, scalable, and extendable HTML and JavaScript architecture as the Reference Shopping and My Account bundles available for SuiteCommerce Advanced sites. This new layout provides a flexible, fast, and open front-end solution.

Important: Reference Cart and Checkout is available as a SuiteApp and supports both SuiteCommerce Site Builder and SuiteCommerce Advanced sites. The bundle is released outside of the normal phased release cycle and may not be immediately available when your account is upgraded to Version 2013 Release 2. Consult with your NetSuite account manager for availability. If you are currently using Reference Cart & One Page Checkout, you must re-implement any customizations made to that bundle in the Reference Cart and Checkout bundle. This is due to many core enhancements in Reference Cart and Checkout including architectural backend changes, CSS changes, and the use of different templates.

For details about Reference Cart and Checkout enhancements, see the following:

- [New Reference Cart and Checkout Architecture](#)
- [Checkout Steps Configuration Wizard](#)

New Reference Cart and Checkout Architecture

The Reference Cart and Checkout SuiteApp includes HTML and CSS templates, JavaScript libraries (jQuery.js, Bootstrap.js, Underscore.js, and Backbone.js), and SuiteScript service files. You can use the supplied code to build an out-of-the box cart and checkout solution with little or no customization, or you can modify and extend the code as needed for a fully customized experience.

For detailed information about the new architecture, refer to the following help topics:

- [Set Up SCA Developer Tools](#)
- [Develop Your SCA Customization](#)

Checkout Steps Configuration Wizard

The latest version of this SuiteApp also includes a new checkout steps configuration wizard. Previously, Reference Cart and Checkout was designed with a default three-step checkout process where you could customize the order of the steps. Now, Reference Cart and Checkout is designed with **step groupings** that consist of a set of modules that can be customized.

With the checkout configuration wizard you can:

- Add or remove steps from step groupings as needed
- Customize each step to include or exclude modules as needed
- Add configuration parameters to each module
- Extend the implementation to add your own custom cart and checkout modules

For example, the following code snippet in the configuration.js file defines the **Shipping** step group. The Shipping step group consists of two steps, **Shipping Address** and **Choose delivery method**. The

Shipping Address step contains a single module and the Choose delivery method step contains two modules. You can redefine the Shipping step group by modifying this code.

```
1 { name: 'Shipping' , steps: [ { name: 'Shipping Address' , url: '' , modules: [
2   'OrderWizard.Module.Address.Shipping' ] } , { name: 'Choose delivery method' , url:
3   'shipping/method' , modules: [ 'OrderWizard.Module.Address.Shipping' ,
4   'OrderWizard.Module.Shipmethod' ] } ] }
```

Reference Cart and Checkout includes the following pre-defined modules that you can add as needed:

- OrderWizard.Module.Address.Billing.js
- OrderWizard.Module.Address.js
- OrderWizard.Module.Address.Shipping.js
- OrderWizard.Module.Confirmation.js
- OrderWizard.Module.PaymentMethod.Creditcard.js
- OrderWizard.Module.PaymentMethod.GiftCertificates.js
- OrderWizard.Module.PaymentMethod.Invoice.js
- OrderWizard.Module.PaymentMethod.js
- OrderWizard.Module.PaymentMethod.PayPal.js
- OrderWizard.Module.PaymentMethod.Selector.js
- OrderWizard.Module.RegisterEmail.js
- OrderWizard.Module.RegisterGuest.js
- OrderWizard.Module.Shipmethod.js
- OrderWizard.Module.ShowPayments.js
- OrderWizard.Module.ShowShipments.js
- OrderWizard.Module.TermsAndConditions.js

Reference My Account

- [My Account 1.06.0](#)
- [My Account 1.05.1](#)
- [My Account 1.05.0](#)
- [My Account 1.04.0](#)
- [My Account 1.03.0](#)
- [My Account 1.02.0](#)

My Account 1.06.0

Note: Reference My Account is available in two editions. The Bundle ID for Reference My Account 1.06.0 is **96209**. The Bundle ID for Reference My Account Premium 1.06.0 is **96162**.

With this release of Reference My Account, Bronto integration is available. Bronto is a NetSuite company that provides an advanced marketing automation process and solutions for shopping cart abandonment, post-purchase campaigns and so forth. Bronto can be easily integrated with your Reference ShopFlow, My Account, and Checkout implementations.

The following Bronto Applications are supported:

- Cart Recovery
- Conversion Tracking
- Coupon Manager
- Pop-up Manager

To implement Bronto integration, you need to modify the Configuration.js file to include your accountId.

```
1  , bronto: {
2    accountId: ''
3  }
4  });
```

With the accountId configured, the BrontoIntegration module causes a configuration.js file to load after the SuiteCommerce Application has initialized. This configuration.js file is cached in the Bronto CDN and uses the accountId to pull down the appropriate settings to enable and configure the various integrations setup in the Bronto Connector.

Note: The BrontoIntegration module essentially provides an interface to the Bronto CDN. Therefore, any updates or enhancements to Bronto applications are completely separate from SuiteCommerce Advanced releases and will be made available through the Bronto CDN. There is no additional customization needed in the SuiteCommerce source code to take advantage of Bronto enhancements.

For detailed information about configuring and managing your Bronto applications, refer to the Bronto documentation.

My Account 1.05.1

Note: Reference My Account is available in two editions. The Bundle ID for Reference My Account 1.05.1 is **69018**. The Bundle ID for Reference My Account Premium 1.05.1 is **69017**.

In this release, a bug with Internet Explorer 8 has been fixed. The issue is a result of an unsupported regular expression character ("^") that causes SuiteCommerce pages to improperly render. This issue affects only customers using Internet Explorer 8. All other browsers are not affected by this issue.

To implement the fix, the **Content.EnhancedViews.js** file at Reference js/src/app/modules/Content/Content.EnhancedViews.js was modified with the following change:

Note: This file was also modified in ShopFlow and Checkout. If you are using those implementations, you must also make the change or upgrade to the latest bundle for each.

Previous Code:

```
1  , enhanceMetaTags: function (view)
2  {
3    var enhanced_meta_regex;
4    this.$head
5    // then we add the description
6    .find('meta[name="description"]').attr('content', view.metaDescription || view.getMetaDescription() || '').end()
7    // and keywords meta tags
8    .find('meta[name="keywords"]').attr('content', view.metaKeywords || view.getMetaKeywords() || '').end()
9    // then we append the tags specific to this view
10   // excluding any extra descriptions and keywords meta tags
11   .append(view.getMetaTags().not('[name="description"]').not('[name="keywords"]'));
12
13   /* jshint ignore:start */
```

```

14 // related to issue https://github.com/jshint/jshint/issues/823
15 enhanced_meta_regex = /\<!\-\- EnhanceMetaTags:STARTS[^\>]+\>EnhanceMetaTags:ENDS \-\-\>/;
16 /* jshint ignore:end */
17 if (document.head.innerHTML.match(enhanced_meta_regex))
18 {
19     document.head.innerHTML = document.head.innerHTML.replace(enhanced_meta_regex, '');
20 }
21
22 if (view.metaextra)
23 {
24     endTo(this.$head);
25 }
26
27 return this;
28 }

```

Updated Code:

```

1 , enhanceMetaTags: function (view)
2 {
3     this.$head
4     // then we add the description
5     .find('meta[name="description"]').attr('content', view.metaDescription || view.getMetaDescription() || '').end()
6     // and keywords meta tags
7     .find('meta[name="keywords"]').attr('content', view.metaKeywords || view.getMetaKeywords() || '').end()
8     // then we append the tags specific to this view
9     // excluding any extra descriptions and keywords meta tags
10    .append(view.getMetaTags().not('[name="description"]').not('[name="keywords"]'));
11
12    // remove head's elements that are between enhanceMetaTagsStart and enhanceMetaTagsEnd
13    var remove_element = false; //flag used to determine when remove elements.
14
15    jQuery('head').children().each(function ()
16    {
17        var $element = jQuery(this)
18        ,   element_id = $element.attr('id');
19
20        if (element_id === 'enhanceMetaTagsStart')
21        {
22            remove_element = true;
23        }
24
25        if (remove_element)
26        {
27            $element.remove();
28        }
29
30        if (remove_element && element_id === 'enhanceMetaTagsEnd')
31        {
32            remove_element = false;
33        }
34    });
35
36    //add meta extra elements between enhanceMetaTagsStart and enhanceMetaTagsEnd
37    if (view.metaextra)
38    {
39        jQuery('<script id="enhanceMetaTagsStart"></script>' + view.metaextra + '<script id="enhanceMetaTagsEnd"></script>').append
40        To(this.$head)
41    }
42
43    return this;
44 }

```

My Account 1.05.0

This document details changes to Reference My Account since the previous release. For a complete **DIFF** of files between this release and Reference My Account 1.04.0, click one of the following links to download the .patch file:

- For My Account 1.05.0: [.patch](#).
- For My Account Premium 1.05.0: [.patch](#)

Use a tool such as Crucible to open this .patch file and graphically visualize all additions, deletions, and modifications. The .patch file can also be viewed in any text editor and will display appropriate syntax highlighting when syntax is set to Diff.

Note: Reference My Account is available in two editions. The Bundle ID for Reference My Account 1.05.0 is **69018**. The Bundle ID for Reference My Account Premium 1.05.0 is **69017**.

Issue Fixes

This release contains many bug fixes including:

Credit Memos with Discount Items

Previously, when Credit Memos contained discount items with no internal id, an error was thrown when trying to view those Credit Memos in My Account. This was corrected so that these Credit Memos will display as expected. The following code changes were applied:

- **Model.fix.js:** Updated the loadItem method by adding the following line.

```
1 | itemsToQuery = _compact(_.pluck(itemsToQuery, 'internalid'));
```

- **Model.fix.js:** Updated the setItems method by adding the following.

```
1 | ,      description: record.getLineItemValue('item', 'description', i)
```

- **credit_memo_details.txt:** Added the following line.

```
1 | <%= _('<span class="show-phone">Item: </span>${0}').translate(name || item.get('description') || ' ') %>
```

Invoices when Multicurrency Disabled

Previously, with multiple currencies disabled, the currency column returned null on Invoice list pages and an error occurred when drilling down into an invoice. This has been fixed by making the following changes in the Model.js file.

Change:

```
1 | var filters = [
2 |   new nlobjSearchFilter('appliedtotransaction', null, 'is', receipt.getId())
3 |   , new nlobjSearchFilter('type', null, 'anyof', ['CustCred', 'DepAppl', 'CustPymt'])
4 | ]
```

To:

```
1 | var isMultiCurrency = context.getFeature('MULTICURRENCY')
2 | , amount_field = isMultiCurrency ? 'appliedtoforeignamount' : 'appliedtolinkamount'
3 | , filters = [
4 |   new nlobjSearchFilter('appliedtotransaction', null, 'is', receipt.getId())
5 |   , new nlobjSearchFilter('type', null, 'anyof', ['CustCred', 'DepAppl', 'CustPymt'])
6 | ]
```

Change:

```
1 | , new nlobjSearchColumn('appliedtoforeignamount')
2 | ]
```

To:

```
1 | , new nlobjSearchColumn(amount_field)
2 | ]
```

Change:

```
1 | , appliedtoforeignamount : toCurrency(payout.getValue('appliedtoforeignamount'))
2 | , appliedtoforeignamount_formatted : formatCurrency(payout.getValue('appliedtoforeignamount'))
```

To:

```
1 | , appliedtoforeignamount : toCurrency(payout.getValue(amount_field))
2 | , appliedtoforeignamount_formatted : formatCurrency(payout.getValue(amount_field))
```

Items on Returns not set as Display in Web Site

Previously, when an item was not set as Display in Web Site on the Item record but was part of a Return, the line on the Returns page corresponding to that item displayed undefined and no sku for the name value. This has been corrected in the Model.js file. The getLines function has been modified to preload all items using StoreItem and load inactive items manually.

Blank Credit Memo Page in Internet Explorer 8

In this release, Credit Memo pages now correctly display in IE8. Previously, they displayed blank. This was corrected by changing the name of the reserved JavaScript keyword `class` to `className` in the following files:

- credit_memo_details.txt
- invoice_details.txt
- item_details_line_macro.txt
- order_wizard_showshipments_module.txt
- quote_details.txt
- return_authorization_details.txt

Google Authorship Markup

The ability to embed the Google Authorship markup `rel="author"` or `rel="publisher"` has been added to the SuiteCommerce Advanced solution.

The following files have been modified for this addition:

- **Configuration.js:**

Added the authorship functions:

```
1 | , seo_google_plus_authorship_author = function ()
2 | {
3 |     // Author for individual contents
```

```

4      //return 'https://plus.google.com/+YourAuthorName';
5    }
6    , seo_google_plus_authorship_publisher = function ()
7    {
8      // Publisher for brand contents
9      //return 'https://plus.google.com/+YourPublisherName';
10   }

```

Extended the configuration:

```

1  _extend(application.Configuration, {
2
3    linkTagGooglePlusAuthorship: {
4      'author': seo_google_plus_authorship_author
5      , 'publisher': seo_google_plus_authorship_publisher
6    }

```

■ SocialSharing.js:

```

1  function setMetaTags ()
2  {
3    .
4    .
5    .
6    , link_tag_google_plus_authorship = application.getConfig('linkTagGooglePlusAuthorship');
7    .
8    .
9    .
10   clearMetaTagsByConfiguration(link_tag_google_plus_authorship);
11   clearLinkTagsByConfiguration(link_tag_google_plus_authorship);
12   .
13   .
14   .
15   // In all pages
16   setLinkTagsByConfiguration(self, link_tag_google_plus_authorship);

```

Note: Additional fixes related to meta data tags were implemented in this file. You should review the diffs for this file to ensure that you capture all changes you may require.

Adding Reorder Event Tracking

Previously, orders placed from the Cart and from My Account triggered an add-to-cart event. For tracking purposes, orders placed from My Account should instead trigger a reorder event. To correct this, the trackEventReorderAll method was added to the following views:

■ OrderHistory.Views.js:

```

1  , trackEventReorderAll: function (items)
2  {
3    var self = this;
4
5    0 < items.length && items.forEach(function (item)
6    {
7      self.trackEventReorder(item);
8    });
9  }
10
11 , trackEventReorder: function (item)
12 {
13   var application = this.options.application;
14
15   application.trackEvent && application.trackEvent({
16     category: 'Reorder'
17     , action: 'button'
18     , label: item.get('_url') + item.getQueryString()
19     , value: 1

```

```

20     });
21   }
22   .
23   .
24   .
25   , reorderAll: function (e)
26   {
27     e.preventDefault();
28
29     var self = this
30     ,   add_items = []
31     ,   application = this.options.application;
32   .
33   .
34   .
35     self.trackEventReorderAll(add_items);

```

■ **OrderItem.Views.js:**

```

1   , trackEventReorder: function (item)
2   {
3     var application = this.options.application;
4
5     application.trackEvent && application.trackEvent({
6       category: 'Reorder'
7       , action: 'button'
8       , label: item.get('_url') + item.getQueryString()
9       , value: 1
10    });
11  }
12  .
13  .
14  .
15  , orderItems: function (e)
16  {
17    e.preventDefault();
18
19    var self = this
20    ,   application = this.options.application
21  .
22  .
23  .
24    self.trackEventReorder(itemToCart);

```

Order by Price in Product Lists

Previously, when sorting items in Product Lists by price, some items did not correctly sort because discounts and bulk pricing values were not considered.

To correct this the following two files were modified:

■ **Models.js:** added logic for in memory rules and sorting.

Change:

```

1 | return this.searchHelper(filters, sort_column, sort_direction === '-1' ? 'DESC' : 'ASC', include_store_item);

```

To:

```

1   var search_lines = this.searchHelper(filters, sort_column, sort_direction === '-1' ? 'DESC' : 'ASC', include_store_item);
2
3
4   if (include_store_item && sort_column === 'price')
5   {
6     //-1 for descending, 1 for ascending
7     search_lines = this.sortLinesByPrice(search_lines, sort_direction === '-1' ? -1 : 1);
8   }
9

```

```

10     return search_lines;
11 }
12
13
14 //UX expect the list to be sorted by price considering discounts and bulk pricing
15 //this price is not present on datastore, so in memory rules and sorting are required.
16 , sortLinesByPrice: function (lines, sort_direction)
17 {
18     'use strict';
19     return _.sortBy(lines, function(line)
20     {
21         //defaults to price level 1
22         var price_detail = line.item.onlinecustomerprice_detail || {}
23         ,   price = price_detail.onlinecustomerprice || line.item.pricelevel1 || 0
24         ,   quantity = line.quantity;
25
26         if (quantity && price_detail.priceschedule && price_detail.priceschedule.length)
27         {
28             var price_schedule = _.find(price_detail.priceschedule, function(price_schedule)
29             {
30                 return (price_schedule.minimumquantity <= quantity && quantity < price_schedule.maximumquantity) ||
31                     (price_schedule.minimumquantity <= quantity && !price_schedule.maximumquantity);
32             });
33
34             price = price_schedule.price;
35         }
36
37         return price * sort_direction;
38     });

```

- **ProductListItem.Model.js:** added the following line in the initialize method.

```

1 | itemDetailModel.set('quantity', this.get('quantity'));

```

My Account 1.04.0

This document details changes to Reference My Account since the previous release. For a complete **DIFF** of files between this release and Reference My Account 1.03.0, click one of the following links to download the .patch file:

- For My Account 1.04.0: [.patch](#).
- For My Account Premium 1.04.0: [.patch](#)

Use a tool such as Crucible to open this .patch file and graphically visualize all additions, deletions, and modifications. The .patch file can also be viewed in any text editor and will display appropriate syntax highlighting when syntax is set to Diff.

Note: Reference My Account is available in two editions. The Bundle ID for Reference My Account 1.05.0 is **59233**. The Bundle ID for Reference My Account Premium 1.05.0 is **59234**.

Returns

Returns is available with Reference My Account and Reference My Account Premium Editions. With Returns, shoppers can initiate and track a Returns request from an existing Purchase Order or Invoice. The Return request is automatically linked to a purchase order or invoice. On the Returns views, shoppers can do the following:

- Submit a Return from an Order or Invoice
- Monitor Returns Process
- Cancel Returns

- Receive Email Notification

For detailed information about Returns, see the help topic [Returns](#).

Case Management

The Case Management feature enables users to submit questions or support queries directly from Reference My Account. See the help topic [Case Management](#) for more information.

Quotes

The Quotes feature enables users to receive and view quotes directly from Reference My Account. See the help topic [Quotes](#) for more information.

My Account 1.03.0

With the release of Reference My Account 1.03.0 the following enhancements have been made:

Note: Reference My Account is available in two editions. The Bundle ID for Reference My Account 1.03.0 is **55275**. The Bundle ID for Reference My Account Premium 1.03.0 is **53049**.

Product Lists

When a web store is using Reference My Account 1.03.0 with this version of Reference ShopFlow, Product Lists (Wishlist) is now supported.

Using product lists, users in a B2B or B2C can do the following:

- Flag Items to be added to a product list as they are browsing in your web store.
- Create new lists when flagging items.
- Edit Item order details from within the Product Lists pages.
- Move Items between Product Lists.
- Add an entire list of products to the shopping cart with a single click.
- Use Product Lists to Reorder lists of items.

For detailed information about Product Lists, see the help topic [Product Lists](#).

Reference Product Lists Bundle

To use the Product Lists feature, you must install the Reference Product Lists Bundle. This bundle installs the custom records required to store and manage Product List data.

Note: The Bundle ID for Reference Product Lists Records is **53051**.

Billing

With this version of My Account new Billing and Payments experiences are available. This enables customers in a B2B environment to do the following:

- View account balances and details

- Make partial or full payments against invoices
- View transaction history
- View receipts history
- Print Statements

To simplify the user interface, the My Account navigational menu has also been reorganized. Previously, there was a flat menu structure. This has been changed to a nested structure by default, with the new Billing features captured under a Billing menu item.

For detailed information about Billing, see the help topic [Billing](#).

Issue Fixes

This release contains many bug fixes including:

- **Enhanced Cross Site Scripting (XSS) Prevention:** All output from `request.getParameter` calls now compare URL parameters to text and the ability for users to run code through the URL parameter is eliminated.
- **Support for Printing Receipt Details:** Now users can print receipt details for an invoice from the History & Returns page All Receipts view. Previously, clicking Print from this view resulted in an error.

My Account 1.02.0

With the release of Reference My Account 1.02.0 the following enhancements have been made:

 **Note:** The Bundle ID for Reference My Account 1.02.0 is **50220**.

- **Support for Permissions:** By default, My Account now honors all NetSuite roles and permissions available for the currently logged in user. You can assign permissions attributes to links so that those links do not display unless the minimum permissions requirements are met. You can customize permissions requirements as needed, and define permissions for custom blocks of code. When upgrading from an existing implementation, ensure that any custom templates are updated to reflect the new permissions attributes.

For more information, see the help topic [My Account Menu Permissions](#).

- **Forbidden Access Template:** A new `forbidden_error.txt` template is now available. This template defines the page to render when permissions are not sufficient for the currently logged in user and can be customized as needed.

 **Note:** This page is rendered only in cases where a user may have accessed a link to the page even though they do not have permissions to view that page. Normally, links do not render for these users because the links have permissions attributes tied to them.

- **Limited Fields Returned in Searches:** There is a new `backend.configuration.js` file that restricts the fields returned in order and item objects, providing enhanced performance. Previously, for Site Builder sites **all** fields for item objects were returned using the Commerce API. Now, only a subset of fields is returned. For SuiteCommerce Advanced sites, you can customize which order fields are returned using the Commerce API for Reference My Account & Reference Checkout versus Reference ShopFlow order pages. For SuiteCommerce Advanced sites, you can also specify the Fieldset ID to use for managing item fields. For both Site Builder sites and SuiteCommerce Advanced sites, you can modify the `backend.configuration.js` file as needed to return only those fields used in your web store implementation.

For detailed information, see [Configuring Backend Objects Using the backend.configuration.js File](#)

- **Multiple Versions of the Bundle can be Installed:** Multiple versions of the Reference My Account bundle can be installed and deployed to different sites. To differentiate between bundles, unique version information is included in the Root URL and SSP application name. For example the SSP application name for this release is Reference My Account 1.02.0 and the Root URL is <https://myaccount-1-02-0.netsuite.com>.

Because the version information is included in the SSP application name, you can also differentiate bundle versions when assigning Touch Points.

- **Bug Fixes:** This release contains many bug fixes including:
 - **Additional Role Support for Viewing Orders:** Customers who are assigned **Custom** Customer Center roles can now view Orders Details and Order History & Returns in My Account. Previously, only the Customer Center role was supported. The following error was returned when a user attempted to view order information and they did not have the Customer Center role: "You have entered an Invalid Field Value null for the following field: internalid."
 - **Support for Additional Customer Types:** Customers who are assigned the **Company** type can now update profile information and reset passwords in My Account. Previously, users not assigned as the **Individuals** type received the following error when attempting to update profile information or reset passwords: "Sorry, the information below is either incomplete or needs to be corrected." Contacts are also supported only when:
 1. The company has email set up in the Company record.
 2. Information updated is for the Company record, not the Contact record. The exception to this is when the password is updated. If the password is updated, it is the password for the Contact record, not the Company record.
 - **Reorder Items Page Errors Resolved:** When large numbers of items have been previously ordered and a customer navigates to the Reorder Items page, errors are no longer thrown. The page displays as expected.
 - **Account and Site Number Parameters Added:** The following two parameters have been added to all service and Search API calls to enable access to a SuiteCommerce Advanced sites using the shopping.netsuite.com URL. For example, <http://shopping.netsuite.com/api/items?c=3649491&n=2>
 - c = Account Number
 - n = Site Number
 - **Improved Combining Processes:** JavaScript files are now combined in a unified way across all Reference applications, improving performance.
 - **Update to Tracking links:** Now tracking links are handled so that UPS, FedEx, and other similar links go directly to the service provider's site. Previously, links within My Account linked to Google with the tracking number.
 - **Support of Auto Fill Inputs:** Chrome's form Autofill feature now correctly populates with address and credit card information. Previously, forms without the `method=POST` did not Autofill address and credit card information in Chrome browsers.
 - **New HTML5 Input Types:** The `type="tel"` and `type="email"` input types have been added for all forms in My Account when referencing telephone numbers and email addresses. Now, when editing a phone number on a mobile device, only numbers are shown in the keyboard. In addition, when entering email addresses, the @ and .com options are displayed in supporting applications.
 - **Enhanced Skin Support:** My Account now has its own main skin style sheet.
 - **Updated Libraries:** The following front end libraries have been updated to recent versions:
 - jQuery - 1.9.1 to 1.10.2
 - Underscore.js - 1.4.4 to 1.5.1
 - RequireJS - 2.1.1 to 2.1.8

- Backbone.Validation - 0.7.1 to 0.8.0
- **Product Merchandizing Service Available:** You can now configure your My Account implementation to display Product Merchandizing zones. For detailed information, see the help topic [Product Merchandising](#) Product Merchandising.
- **Item Object Optimization:** Previously, when getting items in an order, all attributes for that item were retrieved. Now, only attributes that are to be displayed to the user are retrieved. This increases performance because approximately 15 of 200 item attributes are necessary.

Core Improvements for SuiteCommerce Advanced 2015.1

Improvement documented in this section are included in the core applications files for each Reference SuiteApp.

Enhanced Support for Multiple Languages

Previously, support for multiple languages in a SuiteCommerce Advanced web store was enabled by defining languages in the site record and then the LanguageSupport module handled translation strings within the application. Now support for multiple languages is handled by defining a unique domain for each language in the backend.configuration.js file.

To enable multiple language support, edit the backend.configuration.js file to include the required hosts.

```

1  ,  hosts: [
2      /*
3      {
4          title:'United States'
5          , currencies:[
6              {
7                  title:'American Dolars'
8                  , code:'USD'
9              }
10         ]
11         , languages:[
12             {
13                 title:'English'
14                 , host:'en.site.com'
15                 , locale:'en_US'
16             }
17         ]
18     }

```

Multiple Language support differs depending on whether you are in the ShopFlow domain versus My Account or Checkout as follows:

- When a user is in the **ShopFlow** domain and changes language, they are redirected to the correct domain based on the definitions provided in the hosts object of the backend.configuration.js file. If no hosts are configured, a language selector is not displayed in the web store.
- When a user is in the **My Account or Checkout** domain, the language is changed using the query string by adding the lang parameter with the locale value. The logic for this is similar to the logic provided in the LanguageSupport module available in previous releases although this logic is now incorporated in a new MultiHostSupport module.

The following modifications were made:

- **LanguageSupport Module:** This module is now obsolete and has been removed from the application.
- **MultiHostSupport.js Module:** This new module was created to handle the language selection.
- **NavigationHelper.js:** This was modified to handle redirection to the correct host when going to the Shopping domain.

- **commons.js:** This was modified so that hosts configuration are retrieved from the backend.configuration.js file.
- **backend.configuration.js:** A placeholder hosts configuration object has been added.
- **language_selector_macro.txt macro:** This macro is now obsolete and has been removed from the application.
- **host_selector_macro.txt:** Added a parameter to determine if the select should trigger a host or a language change.
- **header_top_nav.txt and footer_macro.txt:** These macros were modified to show the host selector.

Use nlapiCache for Caching Site Settings

The Models.js file has been updated to use the nlapiGetCache method for defining cache for the settings object. A default TTL attribute is defined. Caching of the settings object can be customized by redefining the TTL parameters.

Note: Defining the caching durations for the settings object is important for secure sites that do not leverage CDN caching such as Checkout and My Account, but the code is also available for Reference ShopFlow. For Reference ShopFlow pages, the CDN cache takes precedence over settings defined here.

```

1 Application.defineModel('SiteSettings', {
2   cache: nlapiGetCache('Application')
3   // cache duration time in seconds - by default 2 hours - this value can be between 5 mins and 2 hours
4   , cacheTtl: 2 * 60 * 60
5   , get: function ()
6   {
7     'use strict';
8     var settings = this.cache.get('SiteSettings');
9     if (!settings) {
10
11       /* .... get the site settings code here .... */
12
13       settings = JSON.stringify(settings);
14       this.cache.put('SiteSettings', settings, this.cacheTtl);
15     }
16     settings = JSON.parse(settings);
17     settings.is_logged_in = session.isLoggedIn();
18     return settings;
19   }
20 });

```

Support for Adding Meta Data from the Site Setup Record

Following are two ways that you can define meta data in NetSuite records:

- Defining Metatags in the Web Store tab of the Item Detail record (Priority 1)
- Defining Meta Keywords and Meta Description attributes in Enhanced Page records of the Content Delivery service (Priority 2)

Note: When meta data is defined in multiple places, the higher priority meta data takes precedence.

Previously, meta data tags defined in the ADDITION TO <HEAD> did not override the platform default meta tags and did not create a new set of meta tags with class=custom, as expected. Instead, these meta data tags only replaced meta description and meta keywords.

This has been corrected by updating the EnhancedView.js file as follows:

Change:

```

1 | , enhanceMetaTags: function (view)
2 | {
3 |     var custom_meta_tag_class = 'custom';
4 |
5 |     this.$head
6 |         // we remove any existing custom meta tags
7 |         .find('meta.' + custom_meta_tag_class).remove().end()
8 |         // then we add the description
9 |         .find('meta[name="description"]').attr('content', view.getMetaDescription() || '').end()
10 |        // and keywords meta tags
11 |        .find('meta[name="keywords"]').attr('content', view.getMetaKeywords() || '').end()
12 |        //

```

To:

```

1 | , enhanceMetaTags: function (view)
2 | {
3 |     var custom_meta_tag_class = 'custom';
4 |
5 |     this.$head
6 |         // we remove any existing custom meta tags
7 |         .find('meta.' + custom_meta_tag_class).remove().end()
8 |         // then we add the description
9 |         .find('meta[name="description"]').attr('content', view.metaDescription || '').end()
10 |        // and keywords meta tags
11 |        .find('meta[name="keywords"]').attr('content', view.metaKeywords || '').end()

```

User Experience Improvements for SuiteCommerce Advanced 2015.1

The SuiteCommerce Advanced 2015 Release includes many User Experience improvements throughout all three applications. The following sections highlight some of the improvements.

Home Page

The Home Page now includes a default carousel and product merchandising zone.

Orders

The interface for orders has been optimized.

Products and Records Lists

Product and List records now have a single unified look with the following enhancements:

- **List Header:**
 - Unified paging controls
 - Unified positioning of global actions
 - Added an Apply to All button for actions against 2 or more items
 - Standardized sorting and filtering options and display
 - Improved date selection so that you can no longer select a date prior to today in the From field
- **List Body:**
 - The behavior and display of pages when no results are returned has been standardized

- Standardized look and feel for states
- **Mobile and Tablet Improvements**

Summary Box

- There is now a new layout for the summary box.
- The PayPal button is now displayed in a row by itself.

Action Buttons

- Action links have been replaced with buttons.
- The position of action buttons has been standardized.
- A dropdown split button is now used when multiple actions apply to an item.

Forms

Required fields are now indicated and controlled.

Terminology and Copy

- Labels now use consistent terminology for similar concepts.
- Search has been replaced with Search for Products to clarify that records are not searchable.
- Print was replaced with Download to PDF.

My Account

- Arrow icons now point up and down instead of down and right.
- The security CVV fields for credit cards now have an associated explanatory image.
- In Quote records, the Billing Address is now being displayed in the address accordion.
- In the Make a Payment flow, the Order Total Amount is now displayed in the second step.

Footer Placeholder

A footer placeholder has been added.
