This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish, or display any part, in any form, or by any means. Reverse engineering, disassembly, or decompilation of this software, unless required by law for interoperability, is prohibited.

The information contained herein is subject to change without notice and is not warranted to be error-free. If you find any errors, please report them to us in writing.

If this is software, software documentation, data (as defined in the Federal Acquisition Regulation), or related documentation that is delivered to the U.S. Government or anyone licensing it on behalf of the U.S. Government, then the following notice is applicable:

U.S. GOVERNMENT END USERS: Oracle programs (including any operating system, integrated software, any programs embedded, installed, or activated on delivered hardware, and modifications of such programs) and Oracle computer documentation or other Oracle data delivered to or accessed by U.S. Government end users are "commercial computer software," "commercial computer software documentation," or "limited rights data" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, the use, reproduction, duplication, release, display, disclosure, modification, preparation of derivative works, and/or adaptation of i) Oracle programs (including any operating system, integrated software, any programs embedded, installed, or activated on delivered hardware, and modifications of such programs), ii) Oracle computer documentation and/or iii) other Oracle data, is subject to the rights and limitations specified in the license contained in the applicable contract. The terms governing the U.S. Government's use of Oracle cloud services are defined by the applicable contract for such services. No other rights are granted to the U.S. Government.

This software or hardware is developed for general use in a variety of information management applications. It is not developed or intended for use in any inherently dangerous applications, including applications that may create a risk of personal injury. If you use this software or hardware in dangerous applications, then you shall be responsible to take all appropriate fail-safe, backup, redundancy, and other measures to ensure its safe use. Oracle Corporation and its affiliates disclaim any liability for any damages caused by use of this software or hardware in dangerous applications.

Oracle®, Java, and MySQL are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Intel and Intel Inside are trademarks or registered trademarks of Intel Corporation. All SPARC trademarks are used under license and are trademarks or registered trademarks of SPARC International, Inc. AMD, Epyc, and the AMD logo are trademarks or registered trademarks of Advanced Micro Devices. UNIX is a registered trademark of The Open Group.

This software or hardware and documentation may provide access to or information about content, products, and services from third parties. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to third-party content, products, and services unless otherwise set forth in an applicable agreement between you and Oracle. Oracle Corporation and its affiliates will not be responsible for any loss, costs, or damages incurred due to your access to or use of third-party content, products, or services, except as set forth in an applicable agreement between you and Oracle.

If this document is in public or private pre-General Availability status:

This documentation is in pre-General Availability status and is intended for demonstration and preliminary use only. It may not be specific to the hardware on which you are using the software. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to this documentation and will not be responsible for any loss, costs, or damages incurred due to the use of this documentation.

If this document is in private pre-General Availability status:

The information contained in this document is for informational sharing purposes only and should be considered in your capacity as a customer advisory board member or pursuant to your pre-General Availability trial agreement only. It is not a commitment to deliver any material, code, or functionality, and should not be relied upon in making purchasing decisions. The development, release, timing, and pricing of any features or functionality described in this document may change and remains at the sole discretion of Oracle.

This document in any form, software or printed matter, contains proprietary information that is the exclusive property of Oracle. Your access to and use of this confidential material is subject to the terms and conditions of your Oracle Master Agreement, Oracle License and Services Agreement, Oracle PartnerNetwork Agreement, Oracle distribution agreement, or other license agreement which has been executed by you and Oracle and with which you agree to comply. This document and information contained herein may not be disclosed, copied, reproduced, or distributed to anyone outside Oracle without prior written consent of Oracle. This document is not part of your license agreement nor can it be incorporated into any contractual agreement with Oracle or its subsidiaries or affiliates.

Documentation Accessibility

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at <https://www.oracle.com/corporate/accessibility>.

Access to Oracle Support

Oracle customers that have purchased support have access to electronic support through My Oracle Support. For information, visit <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info> or visit <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs> if you are hearing impaired.

Sample Code

Oracle may provide sample code in SuiteAnswers, the Help Center, User Guides, or elsewhere through help links. All such sample code is provided "as is" and "as available", for use only with an authorized NetSuite Service account, and is made available as a SuiteCloud Technology subject to the SuiteCloud Terms of Service at www.netsuite.com/tos.

Oracle may modify or remove sample code at any time without notice.

No Excessive Use of the Service

As the Service is a multi-tenant service offering on shared databases, Customer may not use the Service in excess of limits or thresholds that Oracle considers commercially reasonable for the Service. If Oracle reasonably concludes that a Customer's use is excessive and/or will cause immediate or ongoing performance issues for one or more of Oracle's other customers, Oracle may slow down or throttle Customer's excess use until such time that Customer's use stays within reasonable limits. If Customer's particular usage pattern requires a higher limit or threshold, then the Customer should procure a subscription to the Service that accommodates a higher limit and/or threshold that more effectively aligns with the Customer's actual usage pattern.

Beta Features

This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish, or display any part, in any form, or by any means. Overview

i Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount | SuiteCommerce InStore

Themes and extensions are self-contained packages of files that extend your site in some way. You can install themes and extensions as bundled SuiteApps or as custom-built code deployed to your account by in-house site designers and developers. After installation, you use the Extension Manager in NetSuite to activate them for a domain associated with your NetSuite account.

- **Themes** – A Theme is a special type of extension that only affects a domain's layout. Each theme presents a different style (colors, fonts, spacing, etc.) and layout for any domain linked to your Commerce website. When you activate a theme, you're changing what visitors see when they visit your site.
- **Extensions** – An extension introduces added functionality to your website. Extensions let you add all kinds of features or functions to domains associated with your website. This could be a blog, a shipping bar, or a set of social media icons, to name a few examples. When you activate an extension, NetSuite adds the new features to your website, so you don't need any programming or site development experience.

Read the following topics to set up themes and extensions:

Installing Theme and Extension SuiteApps

Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount | SuiteCommerce InStore

Before you can activate any published themes or extensions, you must install them as bundled SuiteApps into your NetSuite account.

Installing a theme or extension doesn't activate it for any domain. Installation simply adds the theme or extension source files to your NetSuite File Cabinet. You must activate the theme or extension for a domain using the Extension Manager in NetSuite for it to apply.

Note: SuiteCommerce MyAccount implementations: The only theme published by Oracle NetSuite available to SuiteCommerce MyAccount sites is the SuiteCommerce Base Theme. Any themes listed under [Commerce Themes](#) won't work with these sites. However, some third-party themes might be compatible.

To install a theme or extension SuiteApp:

1. In NetSuite, go to Customization > SuiteBundler > Search & Install Bundles.
2. In the **Keywords** field, enter the Bundle ID or name of the theme or extension you want to install and click **Search**.
3. Make sure that the correct theme or extension SuiteApp is returned in the search and select it.
4. Review the SuiteApp details and then click **Install**.
5. In the confirmation popup, click **OK**.
6. Review the SuiteApp details on the **Preview Bundle Install** page and then click **Install Bundle**.
7. In the confirmation popup, click **OK**.

When the SuiteApp installation is complete, you are ready to activate the associated extension or theme. See [Manage Themes and Extensions](#).

To uninstall a theme or extension SuiteApp:

1. Use the Extension Manager to deactivate the theme or extension related to the SuiteApp you want to uninstall. To deactivate a theme, you must activate a different theme in its place.
Repeat this step for all domains that are currently using the theme or extension.

Important: If you try to delete a SuiteApp associated with an active theme or extension, you'll get an error.

2. Uninstall the SuiteApp. See the help topic [Uninstalling a Bundle](#) for details.

Manage Themes and Extensions

Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount | SuiteCommerce InStore

Activate Themes and Extensions

The **Extension Manager** lets you manage themes and extensions for each domain linked to your Commerce website. The Extension Manager lets you:

- Activate or deactivate available themes and extensions for a domain
- Implement available updates to active themes and extensions
- View the currently active themes and extensions by domain
- View the status of any activations currently being processed

Important: If your site is using SuiteCommerce, SuiteCommerce MyAccount, or SuiteCommerce Advanced (Aconcagua release or later), you must activate a theme using the Extension Manager.

Note: Themes and extensions must either be installed as published SuiteApps or deployed to your NetSuite account by a site developer to be available for activation. Themes and extensions are also created with versioning in mind. So, the Extension Manager only lists themes and extensions that work with your Commerce implementation and release.

Before You Begin

Be aware of the following information before using the Extension Manager:

- To use the Extension Manager, you need SuiteCommerce, SuiteCommerce MyAccount, or SuiteCommerce Advanced (Aconcagua release or later).
- The Extension Manager lets you set up multiple activations simultaneously. NetSuite processes them one at a time, but the Extension Manager creates a Pending queue and provides the status of each activation.
- SuiteCommerce MyAccount only supports the SC Base Theme and certain SC Extensions. You can activate the SC Base Theme for a domain. You can also activate custom and third-party themes that are compatible with SCMA.
- If you're using the 2019.1 release of the SuiteCommerce Extension Management bundle or later, you must be logged into NetSuite as an Administrator role. Otherwise, admins can set up Script Deployments to permit other roles to activate themes and extensions. See [Setting Up Script Deployments for Themes and Extensions](#) for details.
- Sass development files are not included with SuiteCommerce Advanced source code in any releases later than Aconcagua.
- Themes and extensions must either be installed from published SuiteApps or deployed to your NetSuite account by a site developer to be available for activation.
- You can activate any number of extensions or none at all.

- You must activate a theme for each domain. You can only activate one theme per domain at a time, but you can activate the same theme on multiple domains.
- If you're activating any of the following themes on your SuiteCommerce or SuiteCommerce Advanced site, you must also activate the companion theme extension that comes with the SuiteApp.

 **Note:** These themes are not compatible with SuiteCommerce MyAccount.

- Bridge Theme
- Horizon Theme
- Manor Theme
- Posh Theme
- Summit Theme
- Threads Theme

For details, see [Available Commerce Themes and Supported Features](#).

 **Important:** Don't edit NetSuite records associated with the Extension Manager or activations directly. This includes editing the priority value of records to define the processing order. This capability will be replaced in a future release. Until then, don't manually edit these records. Doing so can compromise the processing integrity of the Extension Manager.

To use the Extension Manager:

1. Confirm that your script deployments are set up properly. See [Setting Up Script Deployments for Themes and Extensions](#) for details.
2. In NetSuite, go to Commerce > Extensions > Extension Manager.
If you do not see this option, make sure you have installed the SuiteCommerce Extensions Management bundle. See the help topic [Install Your Commerce Website Applications](#) for information and the Bundle ID.
3. Perform one of the following:
 - a. Click **Create Activation** to start a new activation.
 - b. Click **Edit** next to any preexisting activation to add, remove, or update themes and extensions for the associated domain.
4. Choose from the following topics, as applicable:

Topic	Description
Setting Up Script Deployments for Themes and Extensions	This topic explains how to set up script deployments. If you are using the 2019.1 release of the SuiteCommerce Extension Management bundle or later, you must read this section.
Extension Manager Overview	This topic describes the Extension Manager interface.
Creating a New Activation	This topic explains how to create a new activation for a specific site and domain. Do this if you have never activated a theme or extension for the intended domain.
Activating Themes and Extensions	This topic explains how to add, remove, or update themes and extensions for a newly created or preexisting activations.

Setting Up Script Deployments for Themes and Extensions

Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount | SuiteCommerce InStore

If you're using the 2019.1 release of the SuiteCommerce Extension Management bundle or later and want to activate a theme or extension, you must log in as an Administrator role. If you want to activate themes and extensions using a different role, admins can set up the **customdeploy_ext_mech_installer_event** deployment script to give other roles this capability.

To set up a role to activate themes and extensions:

1. In NetSuite, go to Customization > Scripting > Script Deployments.
2. Set the following filters:
 - **Type:** User Event
 - **API Version:** 2.0
3. Click **Edit** next to the **customdeploy_ext_mech_installer_event** ID.
4. Set the **Execute as Role** field to **Administrator**.
5. In the **Audience** tab, add the role you want to use to the **Roles** list.
To select multiple roles, hold down the CTRL key while clicking each role.
6. Click **Save**.

Your account is now prepared to use the specified roles to activate themes and extensions.

Extension Manager Overview

Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount | SuiteCommerce InStore

Extension Manager									
1	New Activation								
2	3	4	5	6	7	8	9	10	11
Edit	Website	Domain	Subsidiary	Location	Theme	Active Extensions	Status	Last Activation Date	Activated By
Edit	Env/Team2	tp2.suitecommercedoc.com	All	All	Horizon - 3.0.3	Horizon Theme Extension - 3.0.3	Error (view log)	8/12/2024 10:09 am	N. Wolfe
Edit	Env/Team2	tp2.sca2020.2.commerceapplication.com	All	All	Summit - 3.5.3	Item Badges - 11.4	Completed	8/12/2024 11:37 am	N. Wolfe
Edit	Env/Team2	tp2.base.suitecommercedoc.com	All	All	Horizon - 3.2.2	- Core Content Extension - 1.0.0 - Item Badges - 11.4	Completed	8/12/2024 10:17 am	N. Wolfe

Item	Description
1	Click the New Activation button if you need to activate a theme and extensions for a domain for the first time. For more information, see Creating a New Activation .
2	Click Edit next to any preexisting activation to add, remove, or update themes and extensions for the associated domain.
3	Shows the website associated with the activation.
4	Shows the domain associated with the activation. NetSuite allows one domain per activation.
5	Shows the subsidiary associated with the activation. This applies to SCIS domains only.

Item	Description
6	Shows the location associated with the activation. This applies to SCIS domains only.
7	Shows the currently active theme for the activation. If NetSuite is currently processing the activation, this column shows the theme currently being processed. You can only have one theme per domain/activation.
8	Shows all currently active extensions for the activation. If NetSuite is currently processing the activation, this column shows the extensions currently being processed. You can activate any number of extensions or none at all. If an update is available for an active theme or extension this column displays an alert icon. You must edit the activation to apply the update. For more information, see Updating Themes and Extensions .
9	Shows one of the following statuses: ■ Complete – Means that the theme and any extensions listed for the activation are complete and active for the associated domain. ■ In Process – Means that the activation is currently processing. ■ Pending – Means that the activation has not started processing. If you create or edit more than one activation simultaneously, the Extension Manager builds a processing queue. Any activations awaiting processing display this status. ■ Error – Means that the activation process has failed. This status includes a link to open a log popup to aid in troubleshooting.  Note: If an activation experiences an error, at least one theme or extension has failed and requires troubleshooting. Troubleshooting is an advanced effort that requires knowledge of JavaScript, SuiteScript, JSON, and Sass. See Troubleshoot Activation Errors for assistance.
10	Shows the date of the most recent activation. If an activation fails, the date of the most recent attempt to activate is displayed.
11	Shows one of the following IDs: ■ The ID of the bundle that completed the automatic activation during its installation. You can click the link to see more information about an automatic activation. ■ The ID of a user in the current account who performed the activation.

Creating a New Activation

 **Applies to:** SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount | SuiteCommerce InStore

If you're activating themes and extensions on a domain for the first time, you must create a new activation. If you or anyone else has already activated a theme or extension for a domain, that activation should be listed in the Extension Manager.

 **Note:** If you go through the New Activation procedure for an existing domain, the Extension Manager simply launches the active themes and extensions for that domain.

To create a new activation:

1. In NetSuite, go to Commerce > Extensions > Extension Manager.
2. Click **New Activation**.
3. Select a site from the **Select a Web Site** list. This field is required.
4. Select the domain you want from the **Select a Domain** list. This field is required.

5. If you're activating themes and extensions on an SCIS domain:
 - a. Select the subsidiary from the **Select Subsidiary** list.
 - b. Select the location from the **Select Location** list.

Note: If you leave either of these fields blank, NetSuite sets the subsidiaries and locations to **All** by default.

6. Click **Next** to select themes and extensions for the domain, or click **Cancel** to abort the activation.

Note: If you select a domain that's already activated, the Extension Manager launches the activation as if you clicked **Edit** on the preceding page.

7. Follow the instructions in [Activating Themes and Extensions](#).

Activating Themes and Extensions

Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount | SuiteCommerce InStore

When you create or edit an activation, the Activate Themes and Extensions page is opened. See [Extension Manager Overview](#) for details on how to create or edit an activation.

The **Active Themes & Extensions** tab shows all activations for the selected web site and domain, as shown below. Note that a theme or extension must also be compatible with your current version of SuiteCommerce or SuiteCommerce Advanced to be listed in the **Active Themes & Extensions** tab.

Activate Themes and Extensions

Website: Em Team2 Domain: tp2.suitecommerce.com

Name	Type	Vendor Name	Version #	Update Available	Update Status	Description
Horizon	Theme	SC	3.0.3	3.2.2		SC Horizon is a custom theme that allows your outdoors web store to showcase your products with a bold black background and prominent images. You can grab the user's attention with eye-catching photographs and bold lettering.
Horizon Theme Extension	Extension	SC	3.0.3	3.1.0		Extension that adds extra configurable content to the Horizon theme

Important: SuiteCommerce MyAccount only supports the SC Base Theme and certain SC Extensions. You can also activate custom and third-party themes that are compatible with SCMA.

Note: If an activation has an error, at least one theme or extension has failed and needs troubleshooting. Troubleshooting is an advanced effort that requires knowledge of JavaScript, SuiteScript, JSON, and Sass. See [Troubleshoot Activation Errors](#) for assistance.

To activate themes or extensions:

1. In NetSuite, go to Commerce > Extensions > Extension Manager.
2. Create a new activation or click **Edit** next to an existing activation on the Extension Manager page. See [Extension Manager Overview](#) for details.
3. On the Activate Themes and Extensions page, do one or more of the following tasks, as needed:
 - [Activating a Theme](#)

- [Activating Extensions](#)
- [Updating Themes and Extensions](#)
- [Updating Unmanaged Themes](#)
- [Troubleshoot Activation Errors](#)

When you click **Activate**, it activates the selected themes and extensions, takes you back to the Extension Manager page, and triggers one of the following:

- If this is the only activation being processed, the Extension Manager processes all selected themes and extensions, removes any you deselected, and compiles your domain's run-time files.
- If the Extension Manager is already processing another activation, NetSuite adds your activation to the processing queue and sets the status to **Pending**.

Important: As a best practice, test all activations and updates on a development domain before activating on a live site.

Note: For themes and extensions to be available for activation, they must either be installed as a published SuiteApp or be deployed to your account by in-house site developers. For more information about installing themes as SuiteApps, see [Installing Theme and Extension SuiteApps](#). For more information about developing your own themes, see the help topic [Overview](#).

Activating a Theme

Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount

The **Themes** tab shows all themes currently available for activation. Use this tab to select a theme to activate.

Important: SuiteCommerce MyAccount only supports the SC Base Theme. You can also activate custom and third-party themes that are compatible with SCMA.

To activate a theme:

1. On the Activate Themes and Extensions page, select the **Themes** tab.
2. Check the **Active** box next to the theme you want to activate.

You can only activate one theme per domain at a time. You can deactivate any theme by clearing the **Active** box. However, you must activate at least one theme to proceed with the activation.

Active	Theme Name	Vendor Name	Version #	Update Available	Update	Update Status	Description
☒	Horizon	SC	3.0.3	3.2.2	☐		SC Horizon is a custom theme that allows your outdoors web store to showcase your products with a bold black background and prominent images. You can grab the user's attention with eye-catching photographs and bold lettering.
☐	SuiteCommerce Base Theme	SuiteCommerce	2010		☐		
☐	Summit	SC	3.5.3		☐		SC Summit is a custom theme that allows your industry supply web store to showcase your products on a sleek, simple background. You can create a seamless user experience while displaying clear headings, professional images, and explanatory text.

3. Do one of the following:
 - If you want to select one or more extensions to activate with your theme, click the **Extensions** tab. See [Activating Extensions](#) to proceed.

Important: If you're activating any of the following themes, you must also activate the companion theme extension that comes with the SuiteApp.

- [Bridge Theme](#)
- [Horizon Theme](#)
- [Manor Theme](#)
- [Posh Theme](#)
- [Summit Theme](#)
- [Threads Theme](#)

For details, see [Available Commerce Themes and Supported Features](#).

- If you're ready to process your activations, click **Activate**.
 - To cancel the activation, click **Cancel**.
4. If this is the first activation for a domain, clear the domain's cache by triggering a cache invalidation request. See the help topic [Cache Invalidation](#) for details.

Activating Extensions

Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount | SuiteCommerce InStore

The **Extensions** tab shows extensions that are available for activation. Use this tab to select any extensions to activate.

Important: If you're activating any of the following themes, you must also activate the companion theme extension that comes with the SuiteApp.

- Bridge Theme
- Horizon Theme
- Manor Theme
- Posh Theme
- Summit Theme
- Threads Theme

For details, see [Available Commerce Themes and Supported Features](#).

To activate extensions:

1. On the Activate Themes and Extensions page, select the **Extensions** tab.
2. Check the **Active** box next to any extensions you want to activate.

You can activate as many extensions as you want for a domain or none at all.

Activate Themes and Extensions

Website: EnvTeam2 Domain: tp2.suitecommerceadoc.com

Active	Extension Name	Vendor Name	Version #	Update Available	Update	Update Status	Description
☐	Core Content Extension	CXExtensibility	1.0.6		☐		An extension for installing SMT core content types
☒	Gift Wrap	SuiteCommerce	1.0.2		☐		The SuiteCommerce Gift Wrap & Message extension lets you add gift wrap options to your web store, allowing shoppers to choose different wrap options and send a personalized message to the gift recipient.
☒	Horizon Theme Extension	SC	3.0.3	3.1.0	☒		Extension that adds extra configurable content to the Horizon theme
☒	Item Badges	SuiteCommerce	11.4		☐		The SuiteCommerce Item Badges extension allows you to display promotional badges on a product. Badges appear on the product detail and product listings pages, as well as in image carousels.
☐	Summit Theme Extension	SC	3.4.0		☐		The SuiteCommerce Summit theme provides a polished custom theme for your industry supply web store.

3. To deactivate an extension, clear the associated **Active** box.
4. Do one of the following:
 - If you want to select a theme to activate, select the **Themes** tab and see [Activating a Theme](#). You must choose a theme to proceed with the activation.
 - If you're ready to process your activations, click **Activate**.
 - To cancel the activation, click **Cancel**.
5. If this is the first activation for a domain, clear the domain's cache by triggering a cache invalidation request. See the help topic [Cache Invalidation](#) for details.

Updating Themes and Extensions

Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount | SuiteCommerce InStore

The Extension Manager lets you know if an update is available for an active theme or extension. The Extension Manager shows the latest version available with an update alert icon . In both the **Themes** and **Extensions** tabs, the **Update** box is checked for the theme or extensions to be updated, as shown in the example below.

Activate Themes and Extensions

Website: EnvTeam2 Domain: tp2.suitecommerceadoc.com

Active	Extension Name	Vendor Name	Version #	Update Available	Update	Update Status	Description
☐	Core Content Extension	CXExtensibility	1.0.6		☐		An extension for installing SMT core content types
☒	Gift Wrap	SuiteCommerce	1.0.2		☐		The SuiteCommerce Gift Wrap & Message extension lets you add gift wrap options to your web store, allowing shoppers to choose different wrap options and send a personalized message to the gift recipient.
☒	Horizon Theme Extension	SC	3.0.3	3.1.0	☒		Extension that adds extra configurable content to the Horizon theme
☒	Item Badges	SuiteCommerce	11.4		☐		The SuiteCommerce Item Badges extension allows you to display promotional badges on a product. Badges appear on the product detail and product listings pages, as well as in image carousels.
☐	Summit Theme Extension	SC	3.4.0		☐		The SuiteCommerce Summit theme provides a polished custom theme for your industry supply web store.

Keep in mind the following important information regarding updates:

- When an update is available, it won't automatically update the theme or extension on your domain. You must manually activate the latest version using the steps described in this section.
- The update alert icon only appears for themes and extensions that are currently active. If an update is available for something that's not currently active on a domain, you won't see the alert icon. Instead, the latest version is available as an option.
- Updates that are part of managed bundles become available for update automatically.
- You are not required to update a theme or extension for a domain.
- As a best practice, activate updates to a development domain and test them before activating to a production domain.
- If you're updating any of the following themes, you must also update the companion theme extension that comes with the SuiteApp.
 - Bridge Theme
 - Horizon Theme
 - Manor Theme
 - Posh Theme
 - Summit Theme
 - Threads Theme

For details, see [Available Commerce Themes and Supported Features](#).

To keep the current version, leave the **Update** box clear (unchecked). The update stays available until you either activate the latest version or deactivate the current version.

To update a theme or extension:

1. On the Activate Themes and Extensions page, select the **Themes** or **Extensions** tab, whichever applies to the update available.
2. Check the **Update** box next to the theme or extension you want to update.
This box is only enabled for themes and extensions that have an update available.
3. Click **Activate** to activate the update, or click **Cancel** to cancel the activation.

Important: If you deactivate the current version without updating, the Extension Manager processes your activation and removes the theme or extension from your domain. The latest version will be your only option to activate next time you open the Extension Manager.

Updating Unmanaged Themes

Applies to: SuiteCommerce | SuiteCommerce Advanced

Commerce themes, versions 3.0.0 and later will be managed bundles only. Unmanaged bundles will no longer be supported. To receive new features, you need to update your account to use the managed theme bundle.

Important: When you update any of the Commerce themes, you must also update the companion theme extension that comes with the SuiteApp. For details, see [Available Commerce Themes and Supported Features](#).

Important: If you're updating an unmanaged theme with customizations, please contact your account manager before applying the update.

Important: You can't reactivate an unmanaged theme after a managed theme is activated.

Note: Fonts you used before might not work after switching to a managed theme. To resolve this, see [Configuring Web Fonts](#).

Theme	Unmanaged Theme Bundle ID	Managed Theme Bundle ID
SC Bridge Theme	239193	312814
SC Horizon Theme	239198	312825
SC Manor Theme	239754	312817
SC Posh Theme	239206	312849
SC Summit Theme	239212	312830
SC Threads Theme	239196	312859

To update unmanaged themes:

1. Install the managed theme SuiteApp. For details, see [Installing Theme and Extension SuiteApps](#).
2. After the bundle is installed, review the Preview Bundle Install page for conflicting objects. For each conflicting object, you need to select **Replace Existing Object** from the dropdown list in the **Actions** menu. For more information, see the help topic [Choose Actions for Conflicting Objects](#).
3. After you resolve any conflicts and the SuiteApp has successfully installed, go to Commerce > Extensions > Extension Manager to update and activate the theme and theme extension. For details, see [Activating a Theme](#).
4. Select the **Theme** subtab and check the **Update** box beside the theme you are updating.
5. Select the **Extensions** subtab and check the **Update** box beside the companion theme extension. For example, if you're updating the SC Bridge Theme, you also need to update the Bridge Theme Extension.
6. Click **Activate**.
7. To check the configuration of the theme, go to Commerce > Websites > Configuration.
8. Select the website and domain where you want to set up the theme.
9. Click **Configure**.
10. To review the properties you can configure, go to the Theme subtab. For details, see [Configuring Themes](#).
11. Make any changes you need, and click **Save**.
12. Clear the domain's cache by triggering a cache invalidation request. See the help topic [Cache Invalidation](#) for details.

Now that your account is using a managed theme bundle, any future updates will be automatically pushed to your account. For more information, see the help topic [Using Managed Bundles](#).

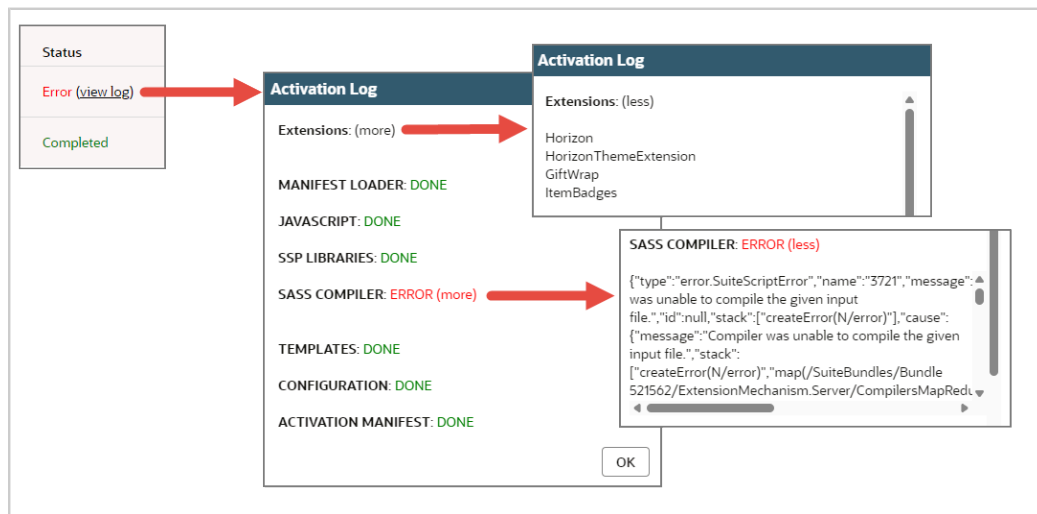

Troubleshoot Activation Errors

Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount | SuiteCommerce InStore

If you experience any errors during activation, you can use the Extension Manager to troubleshoot. If an activation fails, the **Status** column displays **Error (view log)** and provides a log to help with your investigation.

To troubleshoot errors:

1. In NetSuite, go to Commerce > Extensions > Extension Manager.
2. Click the **view log** link next to the error in the **Status** column to open a popup and display the Activation Log.
The Activation Log provides expandable information to help you troubleshoot the error.
3. On the Activation Log popup, do one of the following:
 - a. Click **(more)** next to Extensions to see a list of the theme and extensions that are part of the failed activation.
 - b. Click **(more)** next to the failed process to expand the error log and troubleshoot the cause.
 - c. Click **(less)** to collapse.

Commerce Themes

Applies to: SuiteCommerce | SuiteCommerce Advanced

Note: These themes are not compatible with SuiteCommerce MyAccount and SuiteBilling Subscriptions.

Commerce themes enable you to change the layout and style of your web store. You can use any of the following Commerce themes to leverage your web store for a specific product vertical:

- **Bridge Theme** — Balances clean white space with edgy graphics to create a tech-oriented web store. You can use high-quality, dark images overlaid with clean, white text to highlight the different areas of your site.
- **Horizon Theme** — Designed for the outdoor industry. With this theme you can showcase outdoor products on a black background with prominent images.
- **Manor Theme** — Lets you create a product-focused furniture web store, utilizing blocks of images on a clean, white background. You can showcase suggested looks for rooms and highlight different furniture types.
- **Posh Theme** — Uses an elegant layout of images and text to showcase your health and beauty web store's assorted products. You can use the refined, understated color palette alongside bold images to create a high-end landing page that entices shoppers.
- **Summit Theme** — Enables your industry supply web store to showcase products on a sleek, simple background. You can create a seamless user experience while displaying clear headings, professional images, and explanatory texts.
- **Threads Theme** — Enables your apparel web store to showcase products with a fresh and structured layout.

Note: You must implement SuiteCommerce or the Aconcagua release of SuiteCommerce Advanced and later to use Commerce themes.

NetSuite also offers the SuiteCommerce Base Theme, which developers can use as a starting point for theme development and activation on a domain. For details, see the help topic [Anatomy of the Base Theme](#).

Working with SuiteCommerce Themes

After your theme is installed and activated, you can configure it using the SuiteCommerce Configuration record. You can also change specific elements of the theme's skin with Site Management Tools. If you're looking to further enhance your theme and you're a developer, you can use placeholders in the theme template files to install a custom extension or add a custom content type.

Explore the following help topics to find out more about the different ways you can work with your theme:

- **Configuring Themes** — This help topic outlines how to configure your theme properties, all within the SuiteCommerce Configuration record. This includes configuring the home page, footer, and web fonts.
- **Theme Skin Manager** — This help topic covers how to use each of the skins that are included with your theme. You can quickly change how your site looks by applying a different skin. You can also edit a skin to change certain elements using the Theme Settings panel.
- **Templates and Theme Areas for SuiteCommerce Themes** — This help topic explains the template files included with SuiteCommerce themes and each of the data-view and CMS placeholders. If you're a

developer, you can use these pre-defined areas to install a custom extension or add a custom content type.

Watch the following video to explore the topics available in the NetSuite Help Center and SuiteAnswers that you can use as you work with SuiteCommerce Themes.

 [Getting Started with SuiteCommerce Themes](#)

To find out more about working with Commerce Themes, explore these topics:

- [Prerequisites for Using Commerce Themes](#)
- [Available Commerce Themes and Supported Features](#)
- [Commerce Themes and Skins](#)

Prerequisites for Using Commerce Themes

i Applies to: SuiteCommerce | SuiteCommerce Advanced

To use these themes, your account must meet the following conditions:

- Your account must be provisioned with a Commerce theme bundle. For details, see [Available Commerce Themes and Supported Features](#).
- Your account administrator must install the bundle. For details, see [Installing Theme and Extension SuiteApps](#).
- Your account administrator must activate the theme and the companion theme extension for your website domain. For details, see [Activating Themes and Extensions](#).
- Your account must be using SuiteCommerce or SuiteCommerce Advanced (Aconcagua release or later).
- Your account must have the SuiteCommerce Extension Management SuiteApp installed.

Available Commerce Themes and Supported Features

i Applies to: SuiteCommerce | SuiteCommerce Advanced

⚠ Important: The features available for these themes depend on which version of SuiteCommerce or SuiteCommerce Advanced your account is using. For details, see the help topic [SuiteCommerce, SuiteCommerce MyAccount, and SuiteCommerce Advanced Release Notes](#).

i Note: Commerce themes require SuiteCommerce or the Aconcagua release of SuiteCommerce Advanced or later.

Themes are only available if provisioned, installed, and activated for a selected domain in your account. When you activate any of these themes, you must also activate the companion theme extension that comes with the SuiteApp. For more information, see [Activating Themes and Extensions](#). Make sure you have the latest version of the theme and theme extension in the Extension Manager. For more information, see [Manage Themes and Extensions](#).

The following table lists Commerce themes developed and supported by NetSuite, reference sites showcasing each theme, and the features supported by each theme.

Theme	Bundle ID	Companion Theme Extension	Theme Reference Site	Supported Features	Related Help Topic
SC Bridge Theme	312814	Bridge Theme Extension	Bridge Theme Reference Site	- JSON-LD Structured Data Format - Strike-Through Pricing	Bridge Theme
SC Horizon Theme	312825	Horizon Theme Extension	Horizon Theme Reference Site	- JSON-LD Structured Data Format - Strike-Through Pricing	Horizon Theme
SC Manor Theme	312817	Manor Theme Extension	Manor Theme Reference Site	- JSON-LD Structured Data Format - Strike-Through Pricing	Manor Theme
SC Posh Theme	312849	Posh Theme Extension	Posh Theme Reference Site	- JSON-LD Structured Data Format - Strike-Through Pricing	Posh Theme
SC Summit Theme	312830	Summit Theme Extension	Summit Theme Reference Site	- JSON-LD Structured Data Format - Strike-Through Pricing	Summit Theme
SC Threads Theme	312859	Threads Theme Extension	Threads Theme Reference Site	- JSON-LD Structured Data Format - Strike-Through Pricing	Threads Theme

Bridge Theme

Applies to: SuiteCommerce | SuiteCommerce Advanced

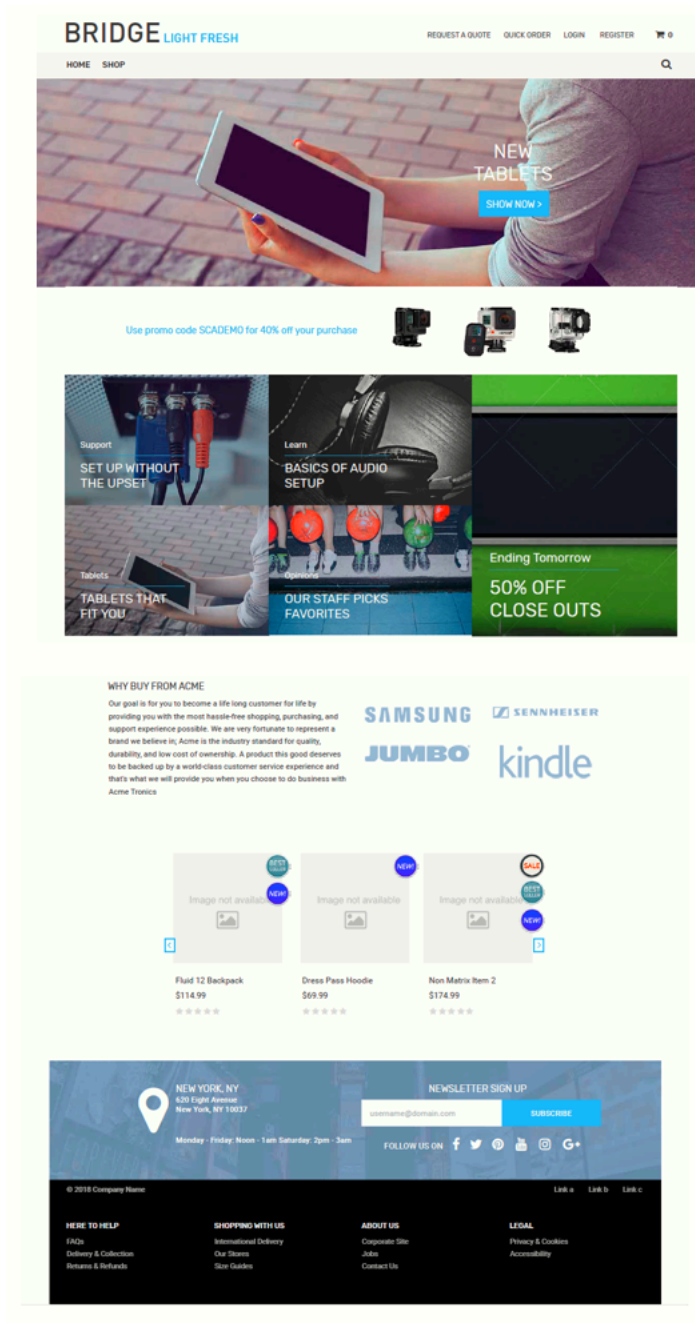

Note: The Bridge Theme requires SuiteCommerce or the Aconcagua release of SuiteCommerce Advanced or later.

The Bridge Theme is a custom theme that lets you create a tech-orientated web store. It's only available if it's provisioned, installed, and activated for a selected domain in your account. For more information, see [Installing Theme and Extension SuiteApps](#).

You can configure the Bridge Theme properties on your domain using the SuiteCommerce Configuration record. For more information, see [Configuring Themes](#).

Important: When activating the Bridge Theme, you must also activate the Bridge Theme extension that comes with the SuiteApp. For details, see [Activating Themes and Extensions](#).

The following image shows what the Bridge Theme looks like before customization. For details on how to customize a theme, see the help topics [Theme Skin Manager](#) and [Site Management Tools Page Layout Selector](#).

Horizon Theme

Applies to: SuiteCommerce | SuiteCommerce Advanced

Note: The Horizon Theme requires SuiteCommerce or the Aconcagua release of SuiteCommerce Advanced or later.

The Horizon Theme lets you showcase products for your outdoor supply web store. It's only available if it's provisioned, installed, and activated for a selected domain in your account. For more information, see [Installing Theme and Extension SuiteApps](#).

You can configure the Horizon Theme properties on your domain using the SuiteCommerce Configuration record. For more information, see [Configuring Themes](#).

Important: When activating the Horizon Theme, you must also activate the Horizon Theme extension that comes with the SuiteApp. For details, see [Activating Themes and Extensions](#).

Horizon V4 Theme

Horizon V4 is an upgraded version of the Horizon custom theme that still gives you a framework for your interior design-focused web store, while also taking advantage of the latest SC Base Theme releases. This means that Horizon V4 can get future updates, fixes, enhancements, and new features from the SC Base Theme by reactivating Horizon V4 in the Extension Manager.

To activate Horizon V4:

1. Go to Commerce > Extensions > Extension Manager and click **Edit** next to the website you want to update.
2. In the **Themes** tab, check the box for **Horizon V4**.
3. Click **Activate**.

Considerations When Activating Horizon V4

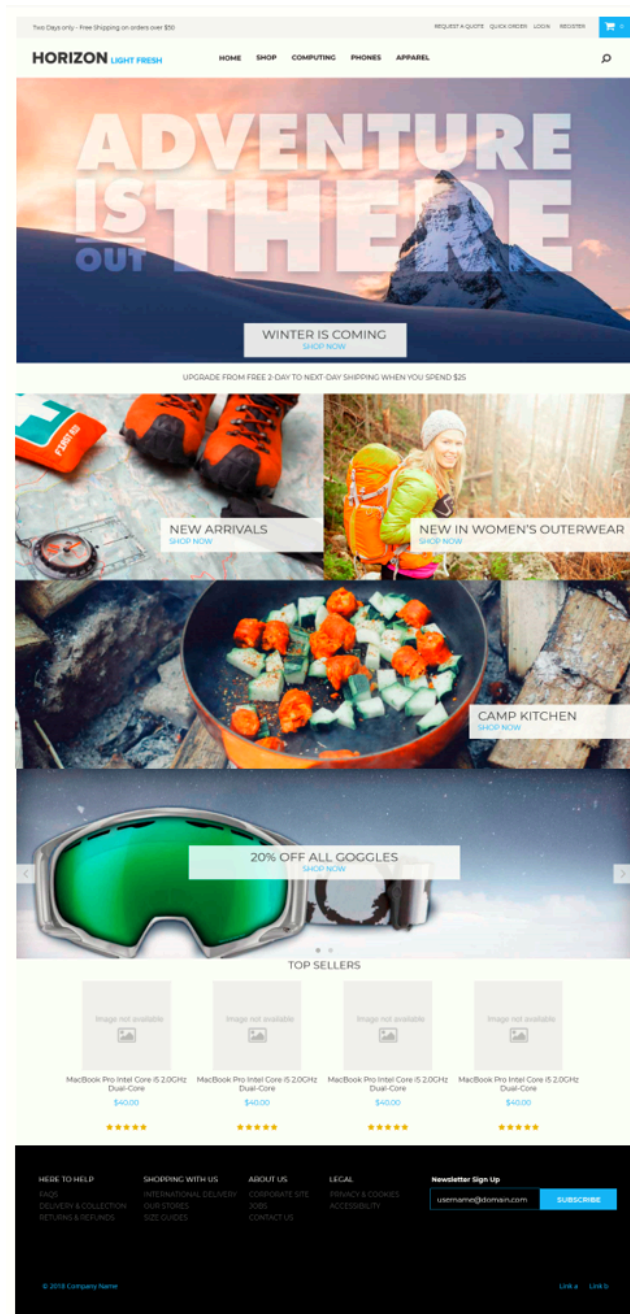

When switching from the Horizon theme to Horizon V4, consider the following:

- Activating Horizon V4 doesn't replace or remove the standard Horizon theme from your list of themes in the Extension manager.
- If you've made customizations to the Horizon theme and then switch to Horizon V4, those changes won't carry over.
- The Horizon Theme Extension (found in the Extensions tab of the Extension Manager) can stay active without any changes.

Customizing the Horizon Theme

You can use additional template areas with the Horizon Theme using SMT or when modifying a page with an extension. For more information, see the help topic [SuiteCommerce Base Theme Templates and Areas](#).

The following image shows what the Horizon Theme looks like before customization. For details on how to customize a theme, see the help topics [Theme Skin Manager](#) and [Site Management Tools Page Layout Selector](#).

Manor Theme

Applies to: SuiteCommerce | SuiteCommerce Advanced

Note: The Manor Theme requires SuiteCommerce or the Aconcagua release of SuiteCommerce Advanced or later.

The Manor Theme lets you create a product-focused furniture web store. It's only available if provisioned, installed, and activated for a selected domain in your account. For more information, see [Installing Theme and Extension SuiteApps](#).

You can configure the Manor Theme properties on your domain using the SuiteCommerce Configuration record. For more information, see [Configuring Themes](#).

Important: When activating the Manor Theme, you must also activate the Manor Theme extension that comes with the SuiteApp. For details, see [Activating Themes and Extensions](#).

Manor V4 Theme

Manor V4 is an upgraded version of the Manor custom theme that still gives you a framework for your interior design-focused web store, while also taking advantage of the latest SC Base Theme releases. This means that Manor V4 can get future updates, fixes, enhancements, and new features from the SC Base Theme by reactivating Manor V4 in the Extension Manager.

To activate Manor V4:

1. Go to Commerce > Extensions > Extension Manager and click **Edit** next to the website you want to update.
2. In the **Themes** tab, check the box for **Manor V4**.
3. Click **Activate**.

Considerations When Activating Manor V4

When switching from the Manor theme to Manor V4, consider the following:

- Activating Manor V4 doesn't replace or remove the standard Manor theme from your list of themes in the Extension manager.
- If you've made customizations to the Manor theme and then switch to Manor V4, those changes won't carry over.
- The Manor Theme Extension (found in the Extensions tab of the Extension Manager) can stay active without any changes.

Customizing the Manor Theme

You can use additional template areas with the Manor Theme using SMT or when modifying a page with an extension. For more information, see the help topic [SuiteCommerce Base Theme Templates and Areas](#).

The following image shows what the Manor Theme looks like before customization. For details on how to customize a theme, see the help topics [Theme Skin Manager](#) and [Site Management Tools Page Layout Selector](#).

Posh Theme

Applies to: SuiteCommerce | SuiteCommerce Advanced

Note: The Posh Theme requires SuiteCommerce or the Aconcagua release of SuiteCommerce Advanced or later.

The Posh Theme is a custom theme that lets you showcase your health and beauty web store's assorted products. It's only available if provisioned, installed, and activated for a selected domain in your account. For more information, see [Installing Theme and Extension SuiteApps](#).

You can configure the Posh Theme properties on your domain using the SuiteCommerce Configuration record. For more information, see [Configuring Themes](#).

Important: When activating the Posh Theme, you must also activate the Posh Theme extension that comes with the SuiteApp. For details, see [Activating Themes and Extensions](#).

Posh V4 Theme

Posh V4 is an upgraded version of the Posh custom theme that still gives you a framework for your interior design-focused web store, while also taking advantage of the latest SC Base Theme releases. This means that Posh V4 can get future updates, fixes, enhancements, and new features from the SC Base Theme by reactivating Posh V4 in the Extension Manager.

To activate Posh V4:

1. Go to Commerce > Extensions > Extension Manager and click **Edit** next to the website you want to update.
2. In the **Themes** tab, check the box for **Posh V4**.
3. Click **Activate**.

Considerations When Activating Posh V4

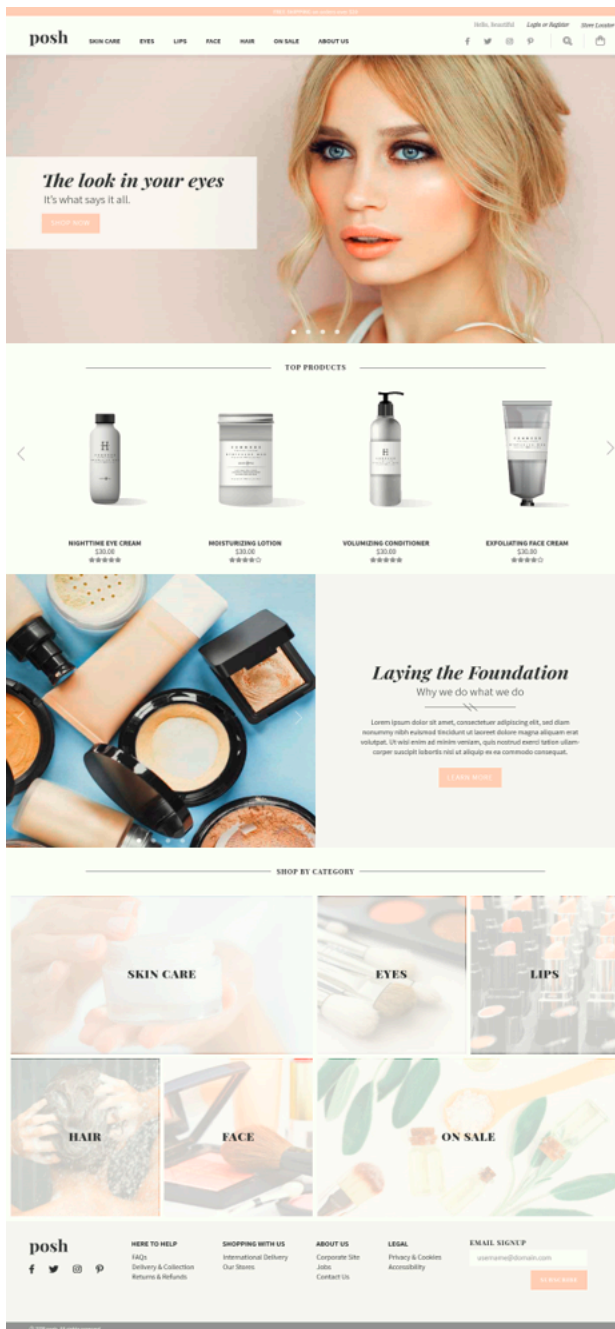

When switching from the Posh theme to Posh V4, consider the following:

- Activating Posh V4 doesn't replace or remove the standard Posh theme from your list of themes in the Extension manager.
- If you've made customizations to the Posh theme and then switch to Posh V4, those changes won't carry over.
- The Posh Theme Extension (found in the Extensions tab of the Extension Manager) can stay active without any changes.

Customizing the Posh Theme

You can use additional template areas with the Posh Theme using SMT or when modifying a page with an extension. For more information, see the help topic [SuiteCommerce Base Theme Templates and Areas](#).

The following image shows what the Posh Theme looks like before customization. For details on how to customize a theme, see the help topics [Theme Skin Manager](#) and [Site Management Tools Page Layout Selector](#).

Summit Theme

Applies to: SuiteCommerce | SuiteCommerce Advanced

Note: The Summit Theme requires SuiteCommerce or the Aconcagua release of SuiteCommerce Advanced or later.

The Summit Theme is a custom theme that lets you showcase products for your industry supply web store. It's only available if provisioned, installed, and activated for a selected domain in your account. For more information, see [Installing Theme and Extension SuiteApps](#).

You can configure the Summit Theme properties on your domain using the SuiteCommerce Configuration record. For more information, see [Configuring Themes](#).

Important: When activating the Summit Theme, you must also activate the Summit Theme extension that comes with the SuiteApp. For details, see [Activating Themes and Extensions](#).

Summit V4 Theme

Summit V4 is an upgraded version of the Summit custom theme that still gives you a framework for your industry supply web store, while also taking advantage of the latest SC Base Theme releases. This means that Summit V4 can get future updates, fixes, enhancements, and new features from the SC Base Theme by reactivating Summit V4 in the Extension Manager.

To activate Summit V4:

1. Go to Commerce > Extensions > Extension Manager and click **Edit** next to the website you want to update.
2. In the **Themes** tab, check the box for **Summit V4**.
3. Click **Activate**.

Considerations When Activating Summit V4

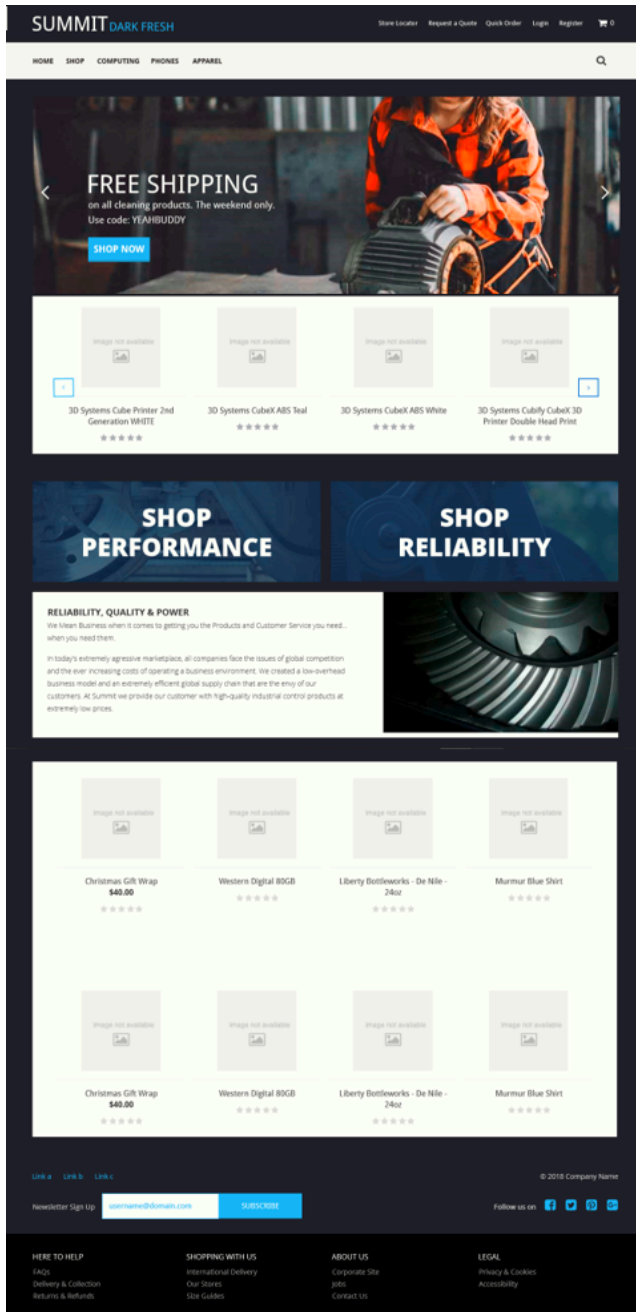

When switching from the Summit theme to Summit V4, consider the following:

- Activating Summit V4 doesn't replace or remove the standard Summit theme from your list of themes in the Extension manager.
- If you've made customizations to the Summit theme and then switch to Summit V4, those changes won't carry over.
- The Summit Theme Extension (found in the Extensions tab of the Extension Manager) can stay active without any changes.

Customizing the Summit Theme

You can use additional template areas with the Summit Theme using SMT or when modifying a page with an extension. For more information, see the help topic [SuiteCommerce Base Theme Templates and Areas](#).

The following image shows what the Summit Theme looks like before customization. For details on how to customize a theme, see the help topics [Theme Skin Manager](#) and [Site Management Tools Page Layout Selector](#).

Threads Theme

Applies to: SuiteCommerce | SuiteCommerce Advanced

Note: The Threads Theme requires SuiteCommerce or the Aconcagua release of SuiteCommerce Advanced or later.

The Threads Theme is a custom theme that lets you create an apparel web store. It's only available if provisioned, installed, and activated for a selected domain in your account. For more information, see [Installing Theme and Extension SuiteApps](#).

You can configure the Threads Theme properties on your domain using the SuiteCommerce Configuration record. For more information, see [Configuring Themes](#).

Important: When activating the Threads Theme, you must also activate the Threads Theme extension that comes with the SuiteApp. For details, see [Activating Themes and Extensions](#).

Threads V4 Theme

Threads V4 is an upgraded version of the Threads custom theme that still gives you a framework for your interior design-focused web store, while also taking advantage of the latest SC Base Theme releases. This means that Threads V4 can receive future updates, fixes, enhancements, and new features from the SC Base Theme by reactivating Threads V4 in the Extension Manager.

To activate Threads V4:

1. Go to Commerce > Extensions > Extension Manager and click **Edit** next to the website you want to update.
2. In the **Themes** tab, check the box for **Threads V4**.
3. Click **Activate**.

Considerations When Activating Threads V4

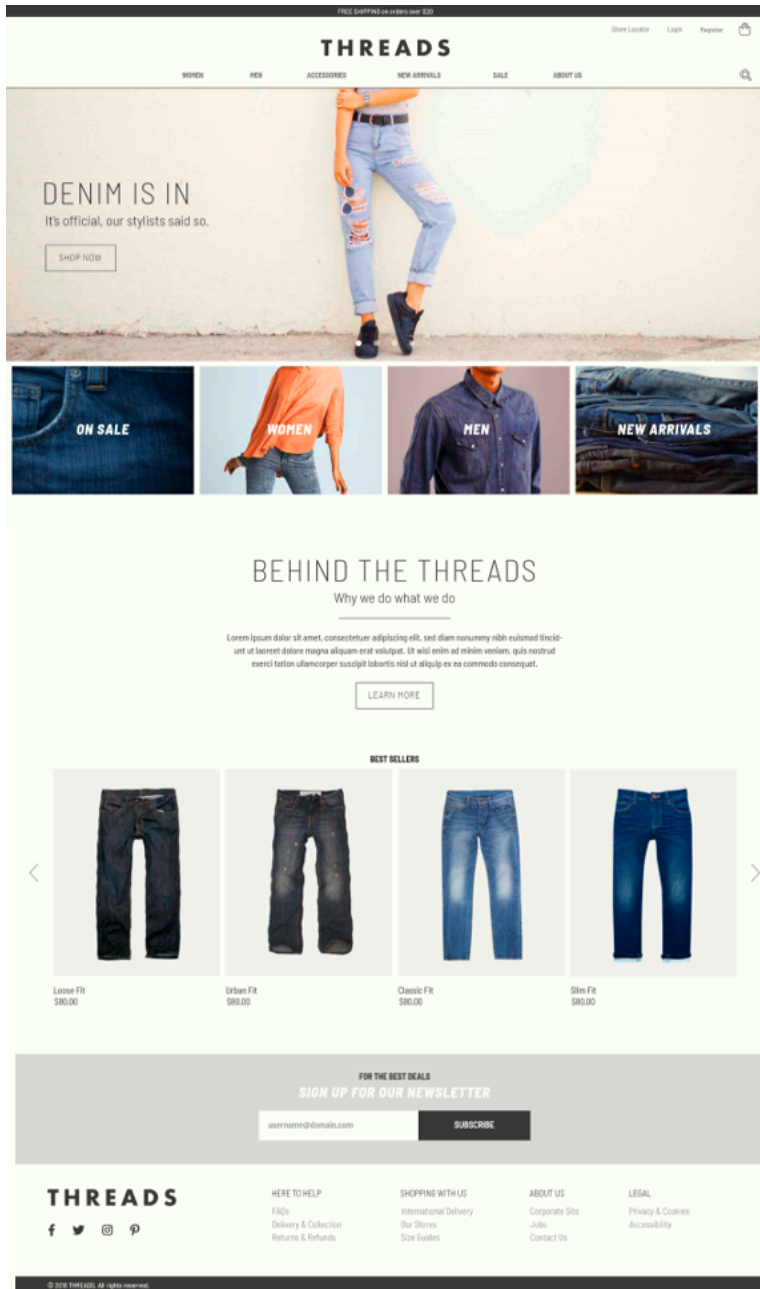

When switching from the Threads theme to Threads V4, consider the following:

- Activating Threads V4 doesn't replace or remove the standard Threads theme from your list of themes in the Extension manager.
- If you've made customizations to the Threads theme and then switch to Threads V4, those changes won't carry over.
- The Threads Theme Extension (found in the Extensions tab of the Extension Manager) can stay active without any changes.

Customizing the Threads Theme

You can use additional template areas with the Threads Theme using SMT or when modifying a page with an extension. For more information, see the help topic [SuiteCommerce Base Theme Templates and Areas](#).

The following image shows what the Threads Theme looks like before customization. For details on how to customize a theme, see the help topics [Theme Skin Manager](#) and [Site Management Tools Page Layout Selector](#).

Configuring Themes

Applies to: SuiteCommerce | SuiteCommerce Advanced

Important: To configure a theme, you must also have the companion theme extension activated. For details, see [Activating Themes and Extensions](#).

Note: Themes require SuiteCommerce or the Aconcagua release of SuiteCommerce Advanced or later.

To determine how theme properties show up on your website, you need to configure the properties on the SuiteCommerce Configuration record. This section covers how to configure global theme settings, as well as settings specific to each theme.

To learn more about how to configure themes, explore these topics:

- [Configuring Settings Specific to Individual Themes](#)
- [Configuring Global Theme Settings](#)

Configuring Settings Specific to Individual Themes

Applies to: SuiteCommerce | SuiteCommerce Advanced

This section covers how to configure settings that are specific to individual themes. For information about setting up global theme settings, see [Configuring Global Theme Settings](#).

See the following table for details on how to configure settings that apply to a specific theme.

Theme Settings	Applies To
Configuring the Top Promo	Bridge Theme
Configuring Free-Text Images	■ Bridge Theme ■ Summit Theme
Configuring the Hero Banner	■ Horizon Theme ■ Manor Theme
Configuring Facets	Horizon Theme
Configuring Commerce Categories	■ Horizon Theme ■ Manor Theme
Configuring the Promo Area	Posh Theme

Configuring the Top Promo

Applies only to the Bridge Theme.

You can configure the top promo to highlight a promotion for your web store.

To configure the top promo:

1. Go to Commerce > Websites > Configuration.

2. Select the website and domain where the theme is activated and click **Configure**.
3. Go to the **Bridge Theme** subtab.
4. Go to the **Home** subtab.
5. In the **Top Promo** field group, click a line in the list.
6. Using the table below for reference, fill out the fields.

Field	Description	Applies To
Text	Enter the text you want to show in the promo area.	Bridge Theme
Background Image URL	Set the background image you want to use. All images should be uploaded to the NetSuite File Cabinet, and stored in an image folder you create under Website Hosting Files > Live Hosting Files. For details, see the help topic File Cabinet Overview . If you use Cascading Style Sheets (CSS) to add images, they're overridden by the images in the File Cabinet.	Bridge Theme
Background Color	Set the background color. The background color only appears if there is no background image. You can use HEX and HTML color values.	Bridge Theme
Link Location	Enter the link to the internal page you want users to go to when they click the top promo.	Bridge Theme

7. Click **Add**.
8. When you are finished making changes, click **Save**.

Configuring Free-Text Images

Applies only to the Bridge Theme and Summit Theme.

Free-text images are a collection of images that accompany the text entered in the **Free Text** field. For details, see [Configuring General Settings](#).

To configure free-text images:

1. Go to Commerce > Websites > Configuration.
2. Select the website and domain where the theme is activated and click **Configure**.
3. Go to the theme subtab.
4. Go to the **Home** subtab.
5. In the **Free Text Images** field group, click a line in the list.
6. Using the table below for reference, fill out the fields.

Field	Description	Applies To
Image	Enter the image to display. All images should be uploaded to the NetSuite File Cabinet, and stored in an image folder you create under Website Hosting Files > Live Hosting Files. For details, see the help topic File Cabinet Overview . If you use Cascading Style Sheets (CSS) to add images, they're overridden by the images in the File Cabinet.	Bridge Theme
URL	Enter the URL of the internal page you want users to go to when they click the image. This field is required if you select an image.	Bridge Theme
Image URL	Set the image you want to use. All images should be uploaded to the NetSuite File Cabinet, and stored in an image folder you create, under Website Hosting Files > Live Hosting Files. For details, see the help topic File Cabinet Overview .	Summit Theme

Field	Description	Applies To
	If you use Cascading Style Sheets (CSS) to add images, they're overridden by the images in the File Cabinet.	
Link Location	Enter the URL of the internal page you want users to go to when they click the image. This field is required if you select an image.	Summit Theme

7. Click **Add**.
8. For each free-text image you want to add, repeat steps 5 to 7.
9. When you are finished making changes, click **Save**.

Configuring the Hero Banner

Applies only to the Horizon Theme and Manor Theme.

You can highlight unique information with the Hero Banner. You can choose the images, customize the text, and add multiple banners.

To configure the hero banner:

1. Go to Commerce > Websites > Configuration.
2. Select the website and domain where the theme is activated and click **Configure**.
3. Go to the theme subtab.
4. Go to the **Home** subtab.
5. In the **Hero Banner** field group, select a line in the list.
6. Using the table below for reference, fill out the fields.

Field	Description	Applies To
Title	Enter the title to overlay on the image.	Horizon Theme
Text	Enter the text to overlay on the image.	Horizon Theme
Image URL	Enter the image to display in the hero banner. Images should be 1600 pixels wide to accommodate the largest screen width. All images should be uploaded to the NetSuite File Cabinet, and stored in an image folder you create under Website Hosting Files > Live Hosting Files. For details, see the help topic File Cabinet Overview . If you use Cascading Style Sheets (CSS) to add images, they're overridden by the images in the File Cabinet.	Horizon Theme
Link Text	Enter the text to display for the link.	Horizon Theme
Link Location	Enter the URL of the internal page that you want users to go to when they click the link.	Horizon Theme
HTML Content	Enter HTML code to display in the hero banner.	Manor Theme
Background Image URL	Set the image to display. All images should be uploaded to the NetSuite File Cabinet, and stored in an image folder you create under Website Hosting Files > Live Hosting Files. For details, see the help topic File Cabinet Overview . If you use Cascading Style Sheets (CSS) to add images, they're overridden by the images in the File Cabinet.	Manor Theme

Field	Description	Applies To
Button Text	Enter the text to display on the button. If this field is left blank, the button doesn't display.	Manor Theme
Button URL	Enter the URL that you want users to go to when they click the button.	Manor Theme

7. Click **Add**.
8. For each hero banner you want to add, repeat steps 5 to 7.
9. When you are finished making changes, click **Save**.

Configuring Facets

Applies only to the Horizon Theme.

To configure facets:

1. Go to Commerce > Websites > Configuration.
2. Select the website and domain where the theme is activated and click **Configure**.
3. Go to the **Horizon Theme** subtab.
4. Go to the **Facets** subtab.
5. From the **Display Facets Format** list, choose **Horizontally** or **Vertically**.
6. Go to the **Shopping Catalog** subtab.
7. Select **Facets**.
8. Edit any row in the list that uses the facets_faceted_navigation_item_range.tpl template and clear the **Show Heading** box.
9. Click **OK**.
This ensures the desktop view is aligned and that there is no overlap when showing a header.
10. Click **Save**.

For more information about facets, see [Select and Configure Facet Fields](#).

Configuring Commerce Categories

Applies only to the Manor Theme and Horizon Theme.

To configure commerce categories:

1. Go to Commerce > Content Management > Catalog & Categories > Commerce Categories.
2. Click **Edit** beside the commerce category you want to configure.
3. From the **Thumbnail Image** drop down, select the image you want to use for the category.
4. Click **Save**.
5. For each category image you want to add, repeat Steps 2 to 4.
6. Go to Commerce > Websites > Configuration.
7. Select the website and domain where the theme is activated and click **Configure**.
8. Go to the **Integrations** subtab.
9. Select the **Categories** subtab.
10. From the **Menu Fields** list, select **thumbnailurl**.
11. Click **Save**.

For more information, see [Commerce Categories](#).

Configuring the Promo Area

Applies only to the Posh Theme.

You can configure the promo area to highlight a promotion for your web store.

To configure the promo area:

1. Go to Commerce > Websites > Configuration.
2. Select the website and domain where the theme is activated and click **Configure**.
3. Go to the **Posh Theme** subtab.
4. Go to the **Home** subtab.
5. In the **Promo Area** field group, click a line in the list.
6. Using the table below for reference, fill out the fields.

Field	Description	Applies To
Title	Enter the title to show in the promo area.	Posh Theme
Subtitle	Enter the subtitle to show in the promo area.	Posh Theme
HTML Content	Enter HTML code in the promo area.	Posh Theme
Image URL	Set the image to show in the promo area. All images should be uploaded to the NetSuite File Cabinet, and stored in an image folder you create under Website Hosting Files > Live Hosting Files. For details, see the help topic File Cabinet Overview . If you use Cascading Style Sheets (CSS) to add images, they're overridden by the images in the File Cabinet.	Posh Theme
Button Text	Enter the button text. If this field is left blank, the button doesn't display.	Posh Theme
Button URL	Enter the URL that you want users to go to when they click the button.	Posh Theme

7. Click **Add**.
8. When you are finished making changes, click **Save**.

Configuring Global Theme Settings

Applies to: SuiteCommerce | SuiteCommerce Advanced

This section covers how to configure global theme settings. Some themes have configurations that are specific to the theme. For more information, see [Configuring Settings Specific to Individual Themes](#).

For details on how to configure global theme settings, explore these topics:

- [Configuring the Home Page](#)
- [Configuring the Header](#)
- [Configuring the Footer](#)
- [Configuring the 404 Page](#)
- [Configuring Web Fonts](#)
- [Configuring the Login Page](#)

Configuring the Home Page

Applies to: SuiteCommerce | SuiteCommerce Advanced

Note: Themes require SuiteCommerce or the Aconcagua release of SuiteCommerce Advanced or later.

Important: Commerce themes are only available if provisioned, installed, and activated for a selected domain in your account. For details, see [Installing Theme and Extension SuiteApps](#).

Important: To configure a theme, you must also have the companion theme extension activated. For details, see [Available Commerce Themes and Supported Features](#) and [Activating Themes and Extensions](#).

You can configure properties to customize a Commerce theme's home page. For more information about how to configure the home page, explore these topics:

- [Configuring General Settings](#)
- [Configuring Carousel Images](#)
- [Configuring Infoblocks](#)

Configuring General Settings

This section explains how to configure the general settings on a Commerce theme's home page. Most of these settings apply to all six themes, unless otherwise noted.

To configure general settings:

1. Go to Commerce > Websites > Configuration.
2. Select the website and domain where the theme is activated and click **Configure**.
3. Go to the theme name subtab.
4. Go to the **Home** subtab.
5. Use the table below to fill out the fields.

Field	Description	Applies To
Autoplay Carousel	Check this box to make the carousel automatically scroll to the next image. For more information, see Configuring Carousel Images .	All themes
Carousel Speed (milliseconds)	Enter the duration in millisecond before the carousel scrolls to the next image. The default is 5000 milliseconds. For more information, see Configuring Carousel Images .	All themes
Announcement	Enter the text to show in the announcement area on the Home page.	Horizon Theme
Free Text Title	Enter the title to display in the carousel.	■ Bridge Theme ■ Summit Theme ■ Threads Theme
Free Text Subtitle	Enter the subtitle to display in the carousel.	Threads Theme
Free Text	Enter the text to display in the carousel.	■ Bridge Theme ■ Summit Theme

Field	Description	Applies To
		Threads Theme
Button Text	Enter the button text that appears on the image in the carousel. If this field is left blank, the button doesn't display.	Threads Theme
HREF	Enter the URL that you want users to go to when they click the button.	Threads Theme

- When you're finished making changes, click **Save**.

Configuring Carousel Images

Carousel images are a collection of pictures that appear on a Commerce theme's home page. You can upload several images, adjust how they display, and set overlay text. Each image can link to an external or internal URL, and you can add a call-to-action button. You can also make the images slide automatically and pick how long each one shows. For details, see [Configuring General Settings](#). Most of these settings apply to all six themes, unless otherwise noted.

To configure carousel images:

- Go to Commerce > Websites > Configuration.
- Select the website and domain where the theme is activated and click **Configure**.
- Go to the theme name subtab.
- Go to the **Home** subtab.
- In the **Enhanced Carousel** field group, click a line in the list.
- Use the table below to fill out the fields.

Field	Description	Applies To
Title	Enter the title to overlay on the carousel image.	All themes
Text	Enter the text to overlay on the carousel image.	All themes
Image URL	Select the image to display in the carousel when viewed on a desktop. The image should be 1600 pixels wide, and all images should have the same height to avoid display issues. All images should be uploaded to the NetSuite File Cabinet, and stored in an image folder you create under Website Hosting Files > Live Hosting Files. For details, see the help topic File Cabinet Overview . If you use Cascading Style Sheets (CSS) to add images, they're overridden by the images in the File Cabinet.	All themes
Image URL Mobile	Specify the image to display in the carousel when viewed on mobile devices. All images should be uploaded to the NetSuite File Cabinet, and stored in an image folder you create under Website Hosting Files > Live Hosting Files. For details, see the help topic File Cabinet Overview . If you use Cascading Style Sheets (CSS) to insert images, they are overridden by the images stored in the File Cabinet.	- Bridge Theme - Manor Theme - Posh Theme - Summit Theme - Threads Theme
Link Text	Enter the link text.	All themes
Link Location	Enter the URL of the internal page that you want users to go to when they click the link.	All themes
Class Name	Select how you want the carousel aligned on the home page: left, center, or right.	Manor Theme

Field	Description	Applies To
		- Posh Theme - Threads Theme
Image as Background	When this field is enabled, you can set which side of the image to crop on smaller devices. This field is enabled by default.	- Bridge Theme - Manor Theme - Posh Theme - Summit Theme - Threads Theme
Background Crop Side	If Image as Background is enabled, use this field to choose which side of the image to crop: left, center, or right.	- Bridge Theme - Manor Theme - Posh Theme - Summit Theme - Threads Theme
Caption Position	Select where to position the caption on the carousel image. Choose from the following: - Left — Select this option to left-align the caption on the carousel image. - Right — Select this option to right-align the caption on the carousel image. - Centered — Select this option to center the caption on the carousel image. - Left-box — Select this option to apply a background to the caption that is left aligned. This applies only to the Summit Theme. - Right-box — Select this option to apply a background to the caption that is right aligned. This applies only to the Summit Theme. - Centered-box — Select this option to apply a background to the caption that is centered. This applies only to the Summit Theme.	- Bridge Theme - Summit Theme
Caption Text Align	Select how you want the caption text aligned: left, right, or centered.	- Bridge Theme - Manor Theme - Posh Theme - Summit Theme - Threads Theme
Text Color	Enter a HEX or HTML color value for the text. This color overrides the one set on the CMS page in Site Management Tools. For more information about CMS page types, see the help topic Pages .	- Bridge Theme - Manor Theme - Posh Theme - Summit Theme - Threads Theme

7. Click **Add**.

8. For each image you want to add to the carousel, repeat steps 5 to 7.
9. When you're finished making changes, click **Save**.

Configuring Infoblocks

Infoblocks are a collection of image banners on the theme's home page that link to internal or external pages. Most of these settings apply to all six themes, unless otherwise noted.

To configure infoblocks:

1. Go to Commerce > Websites > Configuration.
2. Select the website and domain where the theme is activated and click **Configure**.
3. Go to the theme name subtab.
4. Go to the **Home** subtab.
5. In the **Infoblocks** field group, click a line in the list.
6. Use the following table to fill out the fields.

Field	Description	Applies To
Title	Enter the title to overlay on the infoblock.	All themes
Link Location	Enter the URL of the internal or external page that you want users to go to when they click the infoblock.	All themes
Text	Enter the text to overlay on the infoblock.	■ Bridge Theme ■ Horizon Theme ■ Summit Theme ■ Threads Theme
Background Color	Set the background color. The background color only appears if there is no background image. You can use HEX and HTML color values.	■ Bridge Theme ■ Horizon Theme ■ Summit Theme ■ Threads Theme
Background Image URL	Set the background image to display. The image should be 1600 pixels wide, and all images should have the same height to avoid display issues. All images should be uploaded to the NetSuite File Cabinet, and stored in an image folder you create under Website Hosting Files > Live Hosting Files. For details, see the help topic File Cabinet Overview. If you use Cascading Style Sheets (CSS) to add images, they're overridden by the images in the File Cabinet.	■ Bridge Theme ■ Summit Theme ■ Threads Theme
Image URL	Set the image. The image should be 1600 pixels wide, and all images should have the same height to avoid display issues. All images should be uploaded to the NetSuite File Cabinet, and stored in an image folder you create under Website Hosting Files > Live Hosting Files. For details, see the help topic File Cabinet Overview. If you use Cascading Style Sheets (CSS) to add images, they're overridden by the images in the File Cabinet.	■ Horizon Theme ■ Manor Theme ■ Posh Theme
Link Text	Enter the link text.	Horizon Theme
Span Columns	Check this box to span the infoblock across all columns.	Posh Theme

7. Click **Add**.
8. Repeat steps 5 to 7 for each infoblock you want to add.
9. When you're finished making changes, click **Save**.

Configuring the Header

Applies to: SuiteCommerce | SuiteCommerce Advanced

Note: Themes require SuiteCommerce or the Aconcagua release of SuiteCommerce Advanced or later.

Important: Commerce themes are only available if provisioned, installed, and activated for a selected domain in your account. For details, see [Installing Theme and Extension SuiteApps](#).

Important: To configure a theme, you must also have the companion theme extension activated. For details, see [Available Commerce Themes and Supported Features](#) and [Activating Themes and Extensions](#).

You can configure properties to customize a Commerce theme's header. Depending on which theme's active on your site, you can choose whether your header stays fixed, and enter the text to display in the welcome area or banner.

To configure the header:

1. Go to Commerce > Websites > Configuration.
2. Select the website and domain where the theme is activated and click **Configure**.
3. Go to the theme name subtab.
4. Go to the **Header** subtab.
5. Use the following table to fill out the fields.

Field	Description	Applies To
Fixed Header	Check this box if you want the header to stay visible at the top of the page while scrolling.	■ Bridge Theme ■ Horizon Theme ■ Summit Theme
Banner Text	Enter the text you want to show in the banner. It appears in the top-left corner. For example, Two Days Only – Free Shipping on Orders Over \$50.	■ Manor Theme ■ Posh Theme ■ Threads Theme
Welcome Text	Enter the text for the welcome area. It appears in the top-right corner.	Posh Theme

6. When you're finished making changes, click **Save**.

Configuring the Footer

Applies to: SuiteCommerce | SuiteCommerce Advanced

Note: Themes require SuiteCommerce or the Aconcagua release of SuiteCommerce Advanced or later.

Important: Commerce themes are only available if provisioned, installed, and activated for a selected domain in your account. For details, see [Installing Theme and Extension SuiteApps](#).

Important: To configure a theme, you must also have the companion theme extension activated. For details, see [Available Commerce Themes and Supported Features](#) and [Activating Themes and Extensions](#).

This section gives an overview of the properties you can configure for a Commerce theme's footer. For more information about how to configure the footer, explore these topics:

- [Configuring General Footer Settings](#)
- [Configuring Multi-Column Links](#)
- [Configuring Social Media Links](#)

Configuring General Footer Settings

This section explains how to configure the general settings that appear in a Commerce theme's footer. Most of these settings apply to all six themes, unless otherwise noted.

To configure general footer settings:

1. Go to Commerce > Websites > Configuration.
2. Select the website and domain where the theme is activated and click **Configure**.
3. Go to the theme name subtab.
4. Go to the **Footer** subtab.
5. Use the following table to fill out the fields.

Field	Description	Applies To
Show Legacy Newsletter	Clear this box to hide the legacy newsletter sign up in the footer. If you don't check this box, you can use the Newsletter Sign Up Extension in the footer or somewhere else on your website. For more information, see Newsletter Sign Up .	All themes
Hide	Check this box if you want to hide the copyright message in the footer.	All themes
Company Name	Enter the company name to display in the footer.	All themes
Initial Year	Enter the copyright dates to display in the footer. If left blank, the current year and company name are displayed.	All themes

Field	Description	Applies To
Newsletter Text	Enter the text that you want to display to encourage users to sign up to your newsletter. This text appears below the social media links.	Manor Theme
Copyright Text	Enter the copyright text to display in the footer.	- Manor Theme - Posh Theme
Upper Section Title	Enter the title to display in the upper section of the footer.	- Bridge Theme - Threads Theme
Upper Section Icon	Enter the icon name. This icon displays in the upper section along with the title and text. Only the icons available through Font Awesome version 4.7.0 are supported.	Bridge Theme
Upper Section Background URL	Set the background image. The image width should match the page's max width, and the height should match the footer's height. All images should be uploaded to the NetSuite File Cabinet, and stored in an image folder you create under Website Hosting Files > Live Hosting Files. For details, see the help topic File Cabinet Overview. If you use Cascading Style Sheets (CSS) to add images, they're overridden by the images in the File Cabinet.	- Bridge Theme - Horizon Theme
Upper Section Text Area 1	Enter the text to display in area 1 of the upper section.	Bridge Theme
Upper Section Text Area 2	Enter the text to display in area 2 of the upper section.	Bridge Theme
Lower Section Text Area	Enter the text to display in the lower-right side of the footer.	Horizon Theme
Social Media Links Title	Enter a title to introduce your social media links. For example, Follow Us On.	- Bridge Theme - Summit Theme - Threads Theme
Social Media Title	Enter the title to display above the social media icons.	- Horizon Theme - Manor Theme

- When you're finished making changes, click **Save**.

Configuring Multi-Column Links

You can configure multi-columns to organize your content into four columns in the Commerce theme's footer. The settings that you can configure are the same across all themes. The default columns are Here to Help, Shopping with Us, About Us, and Legal, but you can change these.

To configure multi-column links:

- Go to Commerce > Websites > Configuration.
- Select the website and domain where the theme is activated and click **Configure**.
- Go to the theme name subtab.
- Go to the **Footer** subtab.

5. In the **Multi-Column Links** field group, fill out the fields using the following table.

Field	Description
Text	Enter the text that you want to display for the link.
URL	Enter the URL that you want users to go to when they click the link.
Data-Touchpoint	Select a data-touchpoint. For example, shopping, my account or checkout. For more information about touch points, see the help topic Link a Website or Domain to an SSP Application .
Data-Hashtag	Select a data-hashtag. This value must match what is entered in the URL field and start with a hashtag.
Data-Target	Select a data-target.
Column	Select the column where you want the link to appear: Column 1, Column 2, Column 3, or Column 4.

6. When you're finished making changes, click **Save**.

Configuring Social Media Links

Social media links let you choose which social media icons you want to include in the Commerce theme's footer. The social media links settings are the same across all themes.

Note: By default, each Commerce theme includes the following social media icons: Facebook, Twitter, Instagram, and Pinterest.

To configure social media links:

1. Go to Commerce > Websites > Configuration.
2. Select the website and domain where the theme is activated and click **Configure**.
3. Go to the theme name subtab.
4. Go to the **Footer** subtab.
5. In the **Social Media Links** field group, fill out the fields using the following table.

Field	Description
Icon Name	Enter the name of the icon.
Text	Enter the text to display with the social media links.
URL	Enter the URL address you want to open when a user clicks the icon.
Data-Touchpoint	Select a data-touchpoint. For more information about touch points, see the help topic Link a Website or Domain to an SSP Application .
Data-Hashtag	Select a data-hashtag. This value must match what is entered in the URL field and include a hashtag at the beginning.
Data-Target	Select a data-target.

6. When you are finished making changes, click **Save**.

Configuring the 404 Page

Applies to: SuiteCommerce | SuiteCommerce Advanced

Note: Themes require SuiteCommerce or the Aconcagua release of SuiteCommerce Advanced or later.

Important: Commerce themes are only available if provisioned, installed, and activated for a selected domain in your account. For details, see [Installing Theme and Extension SuiteApps](#).

Important: To configure a theme, you must also have the companion theme extension activated. For details, see [Available Commerce Themes and Supported Features](#) and [Activating Themes and Extensions](#).

This section gives an overview of the Commerce theme settings you can configure for when someone enters an incorrect URL. The 404 page settings are the same across all themes.

To configure the 404 page:

1. Go to Commerce > Websites > Configuration.
2. Select the website and domain where the theme is activated and click **Configure**.
3. Go to the theme name subtab.
4. Go to the **404 Page** subtab.
5. Use the following table to fill out the fields.

Field	Description
Background Image	Enter the background image. Images should be 1170 pixels wide. All images should be uploaded to the NetSuite File Cabinet, and stored in an image folder you create under Website Hosting Files > Live Hosting Files. For details, see the help topic File Cabinet Overview . If you use Cascading Style Sheets (CSS) to insert images, they are overridden by the images stored in the File Cabinet.
Background Color	Set the background color. The background color only appears if there is no background image. You can use HEX and HTML color values.
Title	Enter the title for the 404 page. For example, 404 Page Not Found.
Text	Enter the text for the 404 page. For example, The page you are looking for does not exist.
Button Text	Enter the text to show on the button. If this field is left blank, the button doesn't appear.
HREF	Enter the URL of the internal page that you want users to go to when they click the button.

6. When you're finished making changes, click **Save**.

Configuring Web Fonts

Applies to: SuiteCommerce | SuiteCommerce Advanced

Note: Themes require SuiteCommerce or the Aconcagua release of SuiteCommerce Advanced or later.

Important: Commerce themes are only available if provisioned, installed, and activated for a selected domain in your account. For details, see [Installing Theme and Extension SuiteApps](#).

Important: To configure a theme, you must also have the companion theme extension activated. For details, see [Available Commerce Themes and Supported Features](#) and [Activating Themes and Extensions](#).

This section gives an overview of how to configure web fonts for each Commerce theme. You can use the web fonts that come with the theme or add a Google font family. Any font you add is available for you to use on your website. The settings are the same across all themes.

To configure web fonts:

1. Go to Commerce > Websites > Configuration.
2. Select the website and domain where the theme is activated and click **Configure**.
3. Go to the theme name subtab.
4. Go to the **Web Fonts** subtab.
5. To enable Google Web Fonts, check the **Enable Web Fonts** box.
6. To help pages load faster when using web fonts, check the **Load Web Font Scripts Asynchronously** box.
7. If needed, you can add a font style to the Google Families list. To do this:
 - a. Go to <http://fonts.google.com>.
 - b. Select the font style you want to use.
 - c. Click **select this style** for the font style you want to use.
 - d. From the pop up that appears, select the **Embed** subtab.
 - e. Copy and paste the bold text from the code sample into the Google Families list on the Configuration record.
 - f. Click **Add**.
 - g. Repeats steps b to f for each font style you want to add.

Note: Adding font styles to the Google Families list loads the font, but doesn't apply it. To apply a font, you must copy the font-family from the Google site and paste it into the specific font-family field under Theme Settings. For more information, see the help topic [Editing a Theme Skin](#).

8. When you're finished making changes, click **Save**.

Selected family

Review

Embed

To embed a font, copy the code into the <head> of your html

<link> @import

1

```
<link href="https://fonts.googleapis.com/css2?family=Roboto&display=swap" rel="stylesheet">
```

CSS rules to specify families

2

```
font-family: 'Roboto', sans-serif;
```

Item	Description
1	Copy and paste this code sample into the Configuration record.
2	Copy and paste this text into the specific font-family field under Theme Settings.

Configuring the Login Page

Applies to: SuiteCommerce | SuiteCommerce Advanced

Note: Themes require SuiteCommerce or the Aconcagua release of SuiteCommerce Advanced or later.

This section gives an overview of the properties you can configure on the Commerce theme's login page. The Login page settings that you can configure are the same for all themes.

Important: Commerce themes are only available if provisioned, installed, and activated for a selected domain in your account. For details, see [Installing Theme and Extension SuiteApps](#).

Important: To configure a theme, you must also have the companion theme extension activated. For details, see [Available Commerce Themes and Supported Features](#) and [Activating Themes and Extensions](#).

To configure the login page:

1. Go to Commerce > Websites > Configuration.
2. Select the website and domain where the theme is activated and click **Configure**.
3. Go to the theme name subtab.
4. Go to the **Login** subtab.
5. In the **Login Subtitle** field, enter the subtitle to display.
6. In the **Login Text** field, enter the text you want to show when someone is prompted to log in.
7. When you're finished making changes, click **Save**.

Commerce Themes and Skins

Applies to: SuiteCommerce | SuiteCommerce Advanced

A skin is a group of elements designed to compliment each other. Commerce themes include the following default skins:

- Amazon-Esque
- Aqua
- Light Fresh
- Dark Fresh
- Dark Mode: Green
- Deep Sea
- Earth
- Firehouse
- Pastel
- Young

You can preview and manage each skin associated with the active theme on your domain using the Theme Skin Manager. For more information, see the help topic [Theme Skin Manager](#).

Commerce Extensions

i Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced

Commerce Extensions offer a wide variety of features and functions you can use to enhance your Commerce website. This topic describes extensions distributed by NetSuite.

i Note: You must implement SuiteCommerce, SuiteCommerce MyAccount, or the Aconcagua release of SuiteCommerce Advanced and later to use Commerce Extensions.

These features include:

- Product feeds
- New predefined content layouts
- Integrations with third-party tools

To use these extensions, make sure you meet the following conditions:

- Your account must be **provisioned** with the corresponding extension bundle.
- Your account administrator must have **installed the bundle**. For more information about installing Commerce Extension SuiteApps, see [Installing Theme and Extension SuiteApps](#).
- Some Commerce extensions may be dependent on the **latest release of NetSuite**. Check that your account has been upgraded to the latest version.
- For extensions that need activation, your account administrator must have **activated the extension** for your website domain. For more information about how to activate a Commerce extension, see [Manage Themes and Extensions](#)

Additionally, you need to have the following SuiteApps installed in your account:

- SuiteCommerce, SuiteCommerce MyAccount, or SuiteCommerce Advanced (Aconcagua release or later)
- SuiteCommerce Extension Management
- SuiteCommerce Base Theme
- SuiteCommerce Configuration
- Reference Product Lists Records

Available Extensions

The following table lists Commerce extensions developed and supported by NetSuite. Some extensions won't work with all Commerce websites.

You can confirm whether you have the latest version of the extension in the Extension Manager. For more information, see [Manage Themes and Extensions](#).

Overview

i Applies to: SuiteCommerce | SuiteCommerce Advanced

Commerce web stores and SuiteCommerce InStore provide a comprehensive set of tools you can use to manage items on your site. Clear item descriptions, high-quality item images, and Commerce Categories (for sites with a large number of items) all contribute to the success of your website.

With Commerce web stores and SuiteCommerce InStore, you can:

- Configure items
- Group items in different ways
- Add product images
- Set up Commerce Categories
- Create item collections
- Set up personalized catalog views for different customer segments
- Add features to product pages
- Display item badges
- Set up side-by-side product comparison
- Enable the Infinite Scroll feature

i Note: The following item types are supported, but not visible in Commerce web stores:

- [Discount Items](#)
- [Subtotal Items](#)
- [Markup Items](#)
- [Payment Items](#)
- [Other Charge Items](#)

See the Supply Chain Management topic, [Item Types](#), for more information about tracking and managing item types.

The use of other item types in your Commerce web store will require customization. Be aware that these customizations can impact various areas of your web store and should only be made by someone with developer experience.

See the following topics for more information about web store items:

[Item Availability](#)

Set up item records and inventory for your website and prepare items for search engine optimization (SEO). Set up personalized catalog views that provide different customers with access to different items.

Item Grouping Methods

Group items using the method that best suits your purpose. For example, sales, web store navigation, etc. Group items into general purpose collections that can be used to create personalized catalog views for different customer segments. Create a hierarchy with product categories, subcategories, and products to help users to find what they're looking for.

Item Images

Add product images to your website to make your Product Details Pages and other site pages more effective.

Item Page Options

Enhance your web store's Product Details pages and Product Listings Pages by adding elements like Inventory Display, Product Lead Time, Stock Notifications, Item Badges, and more.

Item Availability

Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount

There are many settings in your Commerce account that determine what items are available on your site. These options control factors like what items are displayed, out-of-stock handling, which items to display in a multi-website setup, and more.

The steps below outline how to set up item records, manage inventory, configure search and SEO options, and organize products using categories. Following these steps will help you control which items appear on your site, how inventory is handled, and how customers interact with your product listings.

Step	Task	Description
Step 1	Set up Item records	Item Record Setup provides instructions for displaying an item on your website.
Step 2	Set up Item records for the search index	Search Index Settings details how to set up the search index for item records on your website.
Step 3	Set up item inventory	Item Inventory details how to set up the item inventory for your web store.
Step 4 (If necessary)	Define minimum/maximum order quantities	Order Quantity details how to set up order quantities for your web store.
Step 5 (If necessary)	Improve Search Engine Optimization (SEO) ranking	Search Engine Optimization (SEO) provides tips on optimizing search engine results for your web store.
Step 6 (If necessary)	Create commerce categories	Commerce Categories details how to use commerce categories.

Item Record Setup

Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount

This section explains how to make existing items available for viewing and purchase on your website. If your item hasn't been created yet, see the help topic [Creating Item Records](#). To ensure your item appears on your website, you'll need to complete the following tasks on the Item record—depending on your Commerce implementation:

- [Item Setup for SuiteCommerce MyAccount](#)
- [Item Setup for SuiteCommerce and SuiteCommerce Advanced](#)

Item Setup for SuiteCommerce MyAccount

Applies to: SuiteCommerce MyAccount

SuiteCommerce MyAccount (SCMA) displays item images in the following ways:

- Purchase History
- Returns
- Invoices

■ Quotes

 **Note:** If you don't enable an item to display on your SCMA site, it will show the message "This item is no longer available" in the Returns area of the Sales Order record.

To ensure the item image appears, you'll need to edit the item records for all items on your SCMA site. You can do this manually using the following procedure, or use the CSV Import feature to update multiple records.

To display an item on your SuiteCommerce MyAccount site:

1. Go to Lists > Accounting > Items.
2. Select **Edit** beside the item you want to add to your MyAccount site.
3. Select the **Web Store** subtab.
4. Check the **Display in Website** box.
5. In the **Web Store Display Name** field, enter the name you want to display for this item.
6. Select the **Web Site Categories** subtab.
7. In the **Site** field, select your SuiteCommerce MyAccount site.
8. In the **Site Category** field, select **Home**.
9. Click **Add**, then **Save**.
10. Attach and display images with the items in the web store. For details, see [Item Images](#).
11. Click **Save**.

 **Tip:** Alternatively, use the CSV export and import features to make these changes.

1. Search for your existing items using a custom search. For details, see the help topic [Search Overview](#).
2. Include the **Web Site** and **Category** filters in your search results.
These filters map to the **Site** and **Site Category** fields.
3. Export your results to a CSV file. For details, see the help topic [Exporting Selected Lists and Reports as CSV Files \(CSV Export\)](#).
4. Update the items in your CSV spreadsheet as needed.
Set **Site** to your SuiteCommerce MyAccount site and **Site Category** to **Home**.
5. Import your updated CSV file to NetSuite. For details, see the help topic [Importing CSV Files with the Import Assistant](#).

Item Setup for SuiteCommerce and SuiteCommerce Advanced

 **Applies to:** SuiteCommerce | SuiteCommerce Advanced

Perform the following steps to make an item available on your SuiteCommerce or SuiteCommerce Advanced (SCA) site.

To display an item on your Commerce website:

1. Go to Lists > Accounting > Items.
2. Select **Edit** beside the item you want to add to your Commerce site.
3. Set a price for the item in the **Sales/Pricing** subtab.
4. Select the **Web Store** subtab and check the **Display in Website** box.
5. Enter a title for the item page in the **Page Title** field. This title appears in the browser tab and can improve search engine ranking if it's descriptive.
6. Enter the item's display name in the **Web Store Display Name** field.
7. Enter a brief item description in the **Web Store Description** field.
8. Enter detailed item information in the **Detailed Description** field.
You can use letters, numbers, basic punctuation, and basic HTML code. The **Store Description** field allows 999 characters, while the **Detailed Description** field allows 1,300 characters.
9. If this item will be featured on your home page, enter a description in the **Featured Description** field.
This description appears below the item's name on the home page. You can enter up to 999 characters, including basic HTML code. Enter and format text using the formatting options, or click the **HTML Source Code** link.
10. Attach and display images with the items in the web store. For details, see [Item Images](#).
11. Enable Commerce Categories as required. For details, see [Commerce Categories](#).
12. Click **Save**.

Search Index Settings

i Applies to: SuiteCommerce | SuiteCommerce Advanced

Search Index plays a key role in displaying items in Commerce web stores and in SCIS. Items published to your web store are first indexed, and after the search index process is complete, data on the item records can be queried using the Item Search API.

When setting up item records for the Search Index, you might need to create custom fields beyond the standard ones. For example, price and brand are two common facets used on commerce sites. In NetSuite, price is a standard field on item records. Brand would be a custom field that you'll need to create. Include both fields in your field sets to display price and brand information in your Commerce web store and in SCIS. For more information, see the help topic [Custom Fields](#).

To set up item records for the search index:

1. Go to Lists > Website > Items.
2. Determine the standard fields you want to use as search fields, facet fields, and sort fields.

i Note: You can use a combination of standard and custom item record fields for search fields, facet fields, sort fields, and field sets on your website. Note that only certain field types are supported for these purposes. For more information, see [Field Set Reference](#).

3. Determine the fields on the item record that you need to create field sets for.

For example, for SEO, you can use descriptive URL components in an item template. To do this, enter a value in the **URL Component** field and include the **URL Component** field in a field set.

4. Make sure you have data in all the fields you'll be accessing through the Item Search API.

For information about supported API parameters, see the help topic [Item Search API Input Parameters](#).

Note: Ensure that data is also populated for Matrix Child items.

5. Create custom fields for use as search fields, facet fields, sort fields, and field sets.
For instance, create a custom field called Brand.
6. Enter data in the custom fields you created. For instance, if you created the custom field Brand, enter the value for brand on each item record for display on your site.
7. Check the **Display in Website** box on the item record.
8. Clear the **Inactive** box, as inactive items aren't included in the search index.
9. You can index all item records using the **Show Uncategorized Items** option, or you can individually select the item records you want indexed. For more information, see [Including Item Records in the Search Index](#).

Including Item Records in the Search Index

For an item to be included in the Search Index, the following conditions must be met:

- The **Display in Web Site** box must be checked on the item record.
- The item must be active, so the Inactive box should be cleared on the item record.
- Either check the **Show Uncategorized Items** box on the Web Site Setup page or assign the item to a Site Builder or Commerce Category.

Checking the **Show Uncategorized Items** box indexes all active items with the **Display in Website** box checked. This option allows items to appear in search results even if they're not in a category. However, this option might not be suitable for all scenarios. For instance, you might want to display only selected items when you have multiple sites with different item sets.

Alternately, you can clear the **Show Uncategorized Items** option, and configure the item records individually. In this case, only item records assigned to a Site Builder or Commerce Category are indexed. Add each item to a category on the site where you want it to appear. You can do this on the item record, or use the content manager.

Note: Changing the Show Uncategorized Items setting and saving the Web Site Setup record triggers the Search Index Rebuild process. You'll be redirected to the Job Status page, which displays the Search Index process.

To index all the item records:

1. Go to Commerce > Websites > Website List.
2. Click **Edit** next to your SuiteCommerce Advanced site.
3. On the **Setup** subtab, check the **Show Uncategorized Items** box.
4. Click **Save**.

To index individual item records:

- 1. Go to Commerce > Websites > Website List.
- 2. Click **Edit** next to your SuiteCommerce Advanced site.
- 3. On the **Setup** subtab, clear the **Show Uncategorized Items** box.
- 4. Click **Save**.
- 5. Go to Lists > Accounting > Items.
- 6. Click **Edit** next to an item record.
- 7. On the **Web Store** subtab, select a **Site** and **Site Category** for this item.
- 8. Click **Save**.
- 9. Repeat Steps 6 through 8 for each item record you want to index.

Item Inventory

i Applies to: SuiteCommerce | SuiteCommerce Advanced

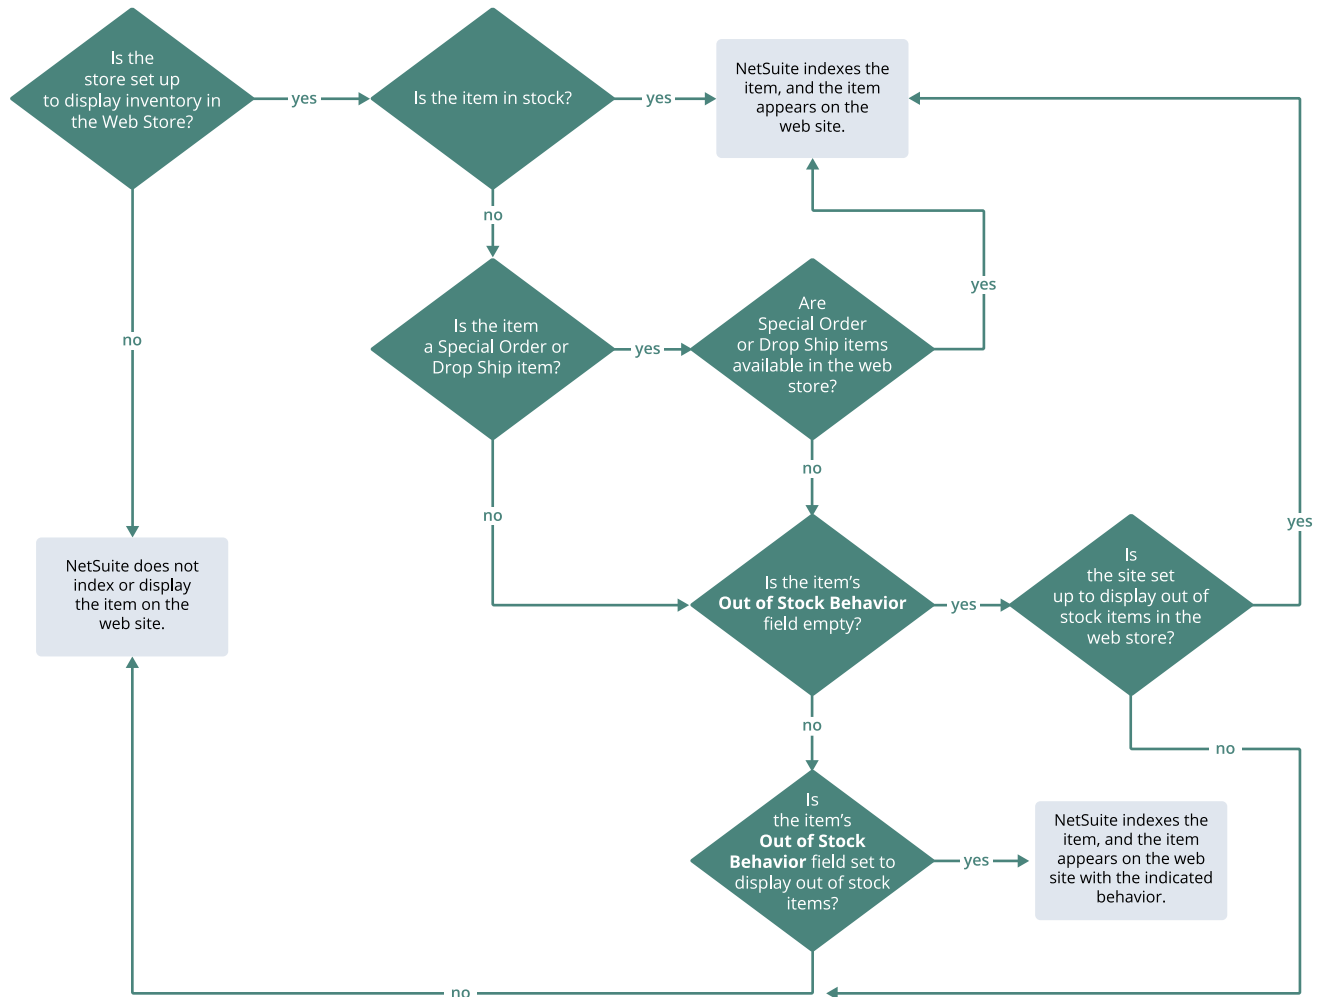

Commerce web stores, Site Builder web stores, and SuiteCommerce In Store (SCIS) rely on multiple fields to determine on-hand inventory visibility in your web store. The setup of these fields affects how items are displayed. Some fields have higher priority than others.

Field Precedence

The table below breaks down which fields take priority when it comes to showing inventory availability in your web store. Basically, if there’s any overlap or conflict between settings, some will take precedence over others. Knowing this order helps you understand exactly how your items will appear to customers—whether they’re in stock, out of stock, or always available.

Field	Precedence	Location
Make Inventory Available in Web Store	1	Store Record
Drop Ship Item	2	Inventory Item Record
Special Order Item		Inventory Item Record
Drop Ship/Special Order Items are Always in Stock		Web Site Setup Record
Out of Stock Behavior	3	Inventory Item Record
Include Out of Stock Items in Web Store	4	Web Site Setup Record

The following diagram shows how these field settings affect inventory visibility in NetSuite:

Make Inventory Available in Web Store

This setting has the highest priority among all inventory visibility settings. If a location's inventory isn't set to display in the web store, it won't appear, no matter what other settings are in place.

Drop Ship Item, Special Order Item, and Drop Ship/Special Order Items are Always in Stock

If a location's inventory is available in the web store, these settings take priority next. If an item is marked as Drop Ship or Special Order and the Drop Ship/Special Order Items are Always in Stock box is checked, it's considered in stock and will appear in the web store.

Out-of-Stock Behavior

When an item is out-of-stock, this setting determines how it's handled. This setting overrides the out-of-stock behavior set for your overall Commerce website.

Note: The **Out of Stock Behavior** setting determines how out-of-stock items are displayed on the Product Listing Page (PLP) and Product Detail Page (PDP). For information about out-of-stock behavior in the checkout flow, see [Out-of-Stock Messaging During Checkout](#).

To update this setting, go to Lists > Accounting > Items. Click **Edit** next to the item you want to update, go to the **Web Store** subtab, and then scroll to **Stock and Pricing Behavior**.

You have the following options for this setting:

- **Default** – Uses the setting for the **Include Out of Stock Items in Website** field on the Website Setup record. To update this field, go to **Commerce > Websites > Website List**. Click **Edit** next to your website, then go to the **Shopping** subtab, and then **Shopping Basics**.
- **Disallow back orders but display out-of-stock message** – NetSuite indexes the item for availability and ignores the Website Setup record's **Include Out of Stock Items in Website** setting if it's not checked.
- **Allow back orders but display out-of-stock message** – NetSuite indexes the item for availability and ignores the Website Setup record's **Include Out of Stock Items in Website** setting if it's not checked.
- **Remove items when out of stock** – NetSuite doesn't index the item for availability and ignores the Website Setup record's **Include Out of Stock Items in Website** setting if it's checked.
- **Allow back orders with no out-of-stock message** – NetSuite indexes the item availability and ignores the Website Setup record's **Include Out of Stock Items in Website** setting if it's not checked.

Include Out of Stock Items in Web Store

This field takes precedence only if the Inventory Item's Out of Stock Behavior field is set to Default.

Example:

You have two store locations with on-hand inventory, and you want your web store to function in the following ways:

- You want Store Location A's inventory to be available in your web store.
- You don't want Store Location B's inventory to be available in your web store.
- You don't want any out-of-stock items to appear in your web store.
- You want drop-ship items to always be listed as in stock.

Your NetSuite setup look like this:

Location in NetSuite	Field	Setting
Store Record for Location A	Make Inventory Available in Web Store	Checked
Store Record for Location B	Make Inventory Available in Web Store	Unchecked
Inventory Item Record (for any items to be listed as drop ship items)	Drop Ship Item	Checked
Web Site Setup Record	Drop Ship/Special Order Items are Always in Stock	Checked
Inventory Item Record	Out of Stock Behavior	Remove item when out-of-stock

Based on these settings, the Include Out of Stock Items in Web Store field in the Site Setup Record doesn't apply.

Personalized Catalog Views

Applies to: SuiteCommerce | SuiteCommerce Advanced

Warning: Be aware of the following:

- This information applies to SuiteCommerce or SuiteCommerce Advanced 2019.2 and later. Don't enable Personalized Catalog Views (PCV) if your site is using a SuiteCommerce Advanced release prior to 2019.2.
- PCV isn't compatible with SuiteCommerce InStore (SCIS), so don't enable PCV if you use SCIS.
- PCV isn't compatible with Intelligent Recommendations; if you use both, intelligent recommendations may display items that shouldn't be visible based on PCV settings.

The Personalized Catalog Views (PCV) feature enables you to provide different customers with access to different items. You can divide your customers into groups and provide each group with access to a tailored selection of catalog items. You can control what each customer group can do: view items, view prices, make purchases, or all three, which is especially useful for B2B sites.

For example:

- Businesses can grant VIP customers exclusive access to buy specific catalog items.
- Businesses can show products to non-members, but require signing up before displaying prices, and paid membership before permitting purchase.
- Retailers that are licensed to sell certain products in limited geographies can prevent customers in other geographic locations from seeing or buying those items.
- Manufacturers that require customers to be certified to buy certain items can ensure that all customers can see the items but only certified customers can buy them.

PCV uses NetSuite records like Customer Groups, Commerce Categories, and Item Collections, along with the Customer Segments Manager tool, to personalize catalogs.

For more information about PCV, see the following topics:

- [Setting Up Personalized Catalog Views](#) – Provides guidance on how to set up PCV including how to create customer and item segments, how to make item segments visible to customer segments, and how to check that the correct items are visible to the correct customers. The [Personalized Catalog Views Setup Checklist](#) lists the main steps you need to take to set up PCV.
- [Personalized Catalog View Examples](#) – Demonstrates how PCV is set up for the three use cases listed previously, namely, VIP customers, different catalogs based on customer location, and items restricted to certified customers.
- [Troubleshooting Item Availability](#) – Lists the settings that can prevent items from being displayed to the correct customers in the web store.

Watch the following help video for more information about Personalized Catalog Views.

 [Introducing Personalized Catalog Views](#)

Setting Up Personalized Catalog Views

i Applies to: SuiteCommerce | SuiteCommerce Advanced

The first step in setting up Personalized Catalog Views is to determine how to divide your customers and items and which items you want to make accessible to which customers.

Consider the following questions:

- What customer groups do you need? How do you decide to which group a customer belongs?
- Do you want anonymous visitors to see items and prices? Do you want them to buy items? If so, which ones?
- Do all your customers fit into one or more groups, or are there some leftover customers? What items, if any, should leftover customers see or buy? Do they need to be logged in or recognized to see or buy them?
- Can customers belong to more than one group?
- What item segments are needed, and how will items be assigned to them? Do the item segments correspond to the sections in my website navigation or are they different?
- Do you want all groups to be able to buy all items, or should some groups only see certain items without being able to buy them? Should customers who can see items also see prices?
- Who should see items not mapped to a customer segment? Should they also see prices or be able to buy them?

Setting up PCV is much easier after you've answered these questions.

Watch the following help video for information about setting up PCV.

 [Setting Up Personalized Catalog Views](#)

Personalized Catalog Views Setup Checklist

To set up Personalized Catalog Views, follow these steps:

1. Identify the customer and item segments you need for your web store.
2. Create customer segments. For details, see [Defining Customer Segments](#).
3. Create item segments. For details, see [Defining Item Segments](#).
4. Enable the Personalized Catalog Views feature. For details, see [Enabling Personalized Catalog Views](#)
5. Ensure PCV users have the correct permissions. For details, see [Personalized Catalog Views Roles and Permissions](#)
6. Define which item segments are visible and purchasable. For details, see [Managing which Customer Segments can Access Item Segments](#).
 - Define which item segments are visible to which customer segments
 - Define which customer segments can purchase which item segments.

- Decide if all users can view or buy items not included in any item segments that are mapped to customer segments
- 7. Verify that the correct items are displayed to the correct customers. For details, see [Verifying Personalized Catalog Views](#)

Defining Customer Segments

Applies to: SuiteCommerce | SuiteCommerce Advanced

A customer segment is a group of customers that can have a tailored catalog view. Personalized Catalog Views (PCV) offers the following customer segments:

- **Customer Groups** – Created using the entity groups feature. They can be:
 - Static – Create a personalized catalog view for a single customer or a group of unrelated customers. You can choose each customer to be included in the group.
 - Dynamic – Create a personalized catalog view for a group of customers with shared characteristics, such as location or order value. For example, West Coast customers or customers who have placed \$10,000 worth of orders. Define dynamic groups using saved searches.
- **Anonymous Users** – This segment consists of visitors who are not logged in and can't be recognized by the site, for example, through session data or browser cookies.
- **Recognized and Logged In Users** – This segment consists of visitors who are logged in or can be recognized by the site, for example, by using session data or browser cookies.
- **All Users** – This segment consists of all website visitors, regardless of whether they belong to another customer segment or not. By default, all items are visible to all users.

Create new customer groups by following the instructions in the help topic [Working with Groups](#).

Note: You can make item segments visible to the All Users, Anonymous Users, and Registered and Logged In Users customer segments but you can't control or view which customers are in these groups at any given time.

Defining Item Segments

Applies to: SuiteCommerce | SuiteCommerce Advanced

An item segment is a group of items that can be made visible to one or more customer segments. Personalized Catalog Views (PCV) offers the following item segments:

- **Item Collections** – Add specific items to an item collection record manually or by using a saved search. For more information, see [Item Collections](#).
- **Commerce Categories** – Create a hierarchical structure of product categories, subcategories, and products to display on your website. If you use commerce categories to organize and display products on your website, you can also use them in PCV to display specific commerce categories to selected customer segments. For more information, see [Commerce Categories](#).
- **Unmapped Items** – Not a true item segment, but a way NetSuite groups items not mapped to a customer segment. This happens when items aren't in any item segments, or because the item segments, in which they are included, are not mapped to any customer segments.

Commerce categories might not be the best choice for PCV since they aren't always tailored to specific customers or customer segments. For instance, on a clothing website, you might want visitors to see products grouped by Men's, Women's, and Accessories. However, you might want VIP customers to see a "VIP Items" item segment with products from all three categories. In this case, where the hierarchical item groupings are distinct from the customer-focused item groupings, it would be much better to create "VIP Items" as an item collection.

Your choice of item collections, commerce categories, or a combination depends on your desired outcome.

Personalized Catalog Views Roles and Permissions

📘 Applies to: SuiteCommerce | SuiteCommerce Advanced

To set up Personalized Catalog Views (PCV), users need a valid NetSuite account and a role with the necessary permissions. The following roles have the required permissions by default:

- Administrator (includes access to Site Management Tools)
- Store Manager (includes access to Site Management Tools)
- Marketing Manager
- Sales Manager
- Marketing Administrator
- Sales Administrator
- System Administrator

For more information, see the help topic [NetSuite Users & Roles](#).

Customer Segments Manager Permission for an Existing Role

Add permissions to a custom role to enable users to set up Personalized Catalog Views (PCV). Required permissions include:

- **Customer Segments Manager** – Required for setting up PCV. Without this permission, users can't access the Customer Segments Manager or set up PCV. However, they can view which item segments are mapped to different customer segments on Customer Groups and Item Collections records.
- **Commerce Categories** – Required only if commerce categories are used with PCV.
- **Site Management Tools (SMT) permissions** – Required if users want to preview PCV in the website. Required SMT permissions include:
 - Documents and Files
 - Website (External) Publisher
 - Website Management
- **SuiteAnalytics Workbook and Analytics Administrator** – Required to view the standard SuiteAnalytics Workbooks that display which items are visible to which customer and which customer can see which item. The access level for these permissions is Edit.

You can't edit standard NetSuite roles, but you can use them as a basis for custom roles. For detailed instructions and best practices for customizing a NetSuite role, see the help topic [NetSuite Roles Overview](#).

Enabling Personalized Catalog Views

i Applies to: SuiteCommerce | SuiteCommerce Advanced

To start using Personalized Catalog Views (PCV), enable the feature first. PCV is an account-specific feature, which means that the personalized catalog settings are used for all Commerce web stores associated with the account. When PCV is enabled, SuiteCommerce InStore (SCIS) websites only display items visible to all users.

To enable personalized catalog views:

1. Go to Setup > Company > Enable Features.
2. Click the **Items & Inventory** subtab.
3. Check the **Personalized Catalog Views** box.
4. On the **Web Presence** subtab, check:
 - **Commerce Categories** (only if using as item segments)
 - **Site Management Tools** (for verifying PCV with Site Management Tools)
5. On the **Analytics** subtab, check the **SuiteAnalytics Workbook** box (for verifying PCV with SuiteAnalytics Workbooks).
6. Click **Save**.

The Customer Segments Manager is now available to users who have the appropriate permission.

i Note: By default, enabling PCV allows all users to see and buy all items. This means that there is no change to the website when you enable the feature. Website changes occur when you make specific item segments visible to customer segments. For more information, see [Managing which Customer Segments can Access Item Segments](#).

Managing which Customer Segments can Access Item Segments

i Applies to: SuiteCommerce | SuiteCommerce Advanced

After defining item and customer segments, determine which item segments can be seen and purchased by which customer segments. This requires two settings:

- **Mapping** – Defines a relationship between an item segment and one or more customer segments
- **Website Visibility Level** – Defines the nature of the relationship between the item segment and the mapped customer segments. Options include:
 - **Display Fully** – Allows customers in the mapped customer segments to view and purchase all items in the item segment.
 - **Disable Purchase** – Hides the **Add to Cart** button for all items in the item segment. This prevents customers in the mapped customer segments from buying the items.
 - **Disable Purchase and Hide Price** – Hides the item price and **Add to Cart** button for all items in the item segment. This prevents customers in the mapped customer segments from viewing the item price and buying the items.

- **Hide Fully** – Hides unmapped items from all users. Unmapped items are items not mapped to any customer segments. For more information, see [Defining Visibility of Unmapped Items](#).

This visibility level is available only for the Unmapped Items item segment.

Note: For SuiteCommerce Advanced websites, these visibility options require the 2020.2 release or later:

- Disable Purchase
- Disable Purchase and Hide Price

Avoid using these options with SuiteCommerce Advanced releases prior to 2020.2.

You might not want to limit some item segments to specific customer segments. In such cases, you can allow all users to view and buy them.

You may also have items on your web store that aren't mapped to a customer segment. These items are grouped into the Unmapped Items segment. Determine which customer segments, if any, need to see and buy items in Unmapped Items segment.

Define which customers can see and buy which item segments in these NetSuite areas:

- **Customer Segments Manager (CSM)** – Define mappings and visibility levels between item segments and customer segments. The CSM provides an overview of all the mappings that have been defined and is the only place to define access to unmapped items for all users. For more information, see [Defining which Customer Segments can Access Items \(CSM\)](#) and [Defining Visibility of Unmapped Items](#).
- **Customer Group record** – Define which item segments a customer group can view, view prices, or purchase on the Customer Group record. For more information, see [Defining which Customer Segments can Access Items \(Customer Group\)](#).
- **Item Collection record** – Define which customer segments can view, view prices, or purchase items in an item collection on the Item Collections record. For more information, see [Defining which Customer Segments can Access Items \(Item Collection\)](#).
- **Commerce Categories record** – Define which customer segments can view items in a commerce category on the Commerce Category record. Note that you can't set **Disable Purchase** or **Disable Purchase and Hide Price** visibility options. For more information, see [Defining which Customer Segments can View Items \(Commerce Categories\)](#).

Note: Please be aware of the following:

- All item collection to customer segment mappings are visible and editable in the CSM, regardless of where the mapping was created.
- If a customer belongs to multiple customer segments with different visibility levels for the same item segment, they'll have the highest visibility level of the customer segments they belong to. For an example of this, see the Head Office Buyers group in [Different Product Lines Available to Different Customers](#).
- If an item is in multiple item segments with different visibility levels, and a customer has access to more than one of these segments, the highest visibility level will apply to the relationship between the customer and the item. For example, if tomatoes are in both the Fruits and the Vegetables item segment, a customer has the website visibility level of Display Fully for Fruits and Disable Purchase for Vegetables, the customer can buy tomatoes.
- If a customer in a customer group has contacts linked to it, the contacts are able to see the associated item segments only if the **Give Access** checkbox is checked for the customer and the **Access** checkbox is checked for the contact on the Customer record.
- When making a dynamic item collection visible to a customer segment, PCV uses a snapshot of the dynamic item collection members. This snapshot updates hourly. Similarly, if you use a dynamic customer group as a customer segment, PCV uses a snapshot of the customers in the customer group and updates the snapshot hourly.

Defining which Customer Segments can Access Items (CSM)

Applies to: SuiteCommerce | SuiteCommerce Advanced

The Customer Segments Manager provides an overview of all the item and customer segment mappings that have been defined. Regardless of where a mapping is defined, it's visible and editable in the Customer Segments Manager (CSM).

If no mappings are defined, by default, all users can view and purchase all items. For information about which customer segments can view unmapped items, see [Defining Visibility of Unmapped Items](#).

To define which customer segments can access item segments:

1. Go to Commerce > Marketing > Personalization > Customer Segments Manager.
2. Click **Add Item Segments**.
3. In the Available pane, depending on the type of item segment you want to map, select either **Item Collection** or **Commerce Category** from the list.

Note: When you use a Commerce Category as an item segment, note that it only includes items directly in that category. Any subcategories must be selected as separate item segments.

4. Select the item segments you want to define visibility for and click > to move them to the Selected pane. Use the Shift and Ctrl keys on your keyboard to select more than one value or to clear a value.

To search the list of item segments, use the filter at the top of the list of item segments.

5. Click **Add** to add the selected item segments to the Customer Segments Manager matrix. Remove an item segment from the matrix by clicking the icon in the Remove column.
6. If you want all members of a customer segment to be able to:
 - View and buy items in the item segment – Click in the Customer Segments selection area next to the Display Fully website visibility level, and select one or more customer segments
 - View item prices but not buy items in the item segment – Click in the Customer Segments selection area next to the Disable Purchase website visibility level, and select one or more customer segments
 - View items but not view prices or buy items in the item segment – Click in the Customer Segments selection area next to the Disable Purchase and Hide Price website visibility level, and select one or more customer segments

Note: If you have a SuiteCommerce Advanced website, you can use the following visibility options after upgrading to the 2020.2 release or later:

- Disable Purchase
- Disable Purchase and Hide Price

Don't use these options if your site is using a SuiteCommerce Advanced release prior to 2020.2.

To remove a customer segment from the selection area, click the cross icon next to it.

7. After mapping item segments to customer segments, click **Save**.

Verify your personalized catalog views by clicking **Save & View Site** or **Save & View Report**. For more information, see [Verifying Personalized Catalog Views](#).

Note: When you click any of the **Save** buttons, it triggers a search index rebuild. As soon as the rebuild is complete, the personalized catalog views become active and customers visiting the website are shown the personalized catalog view applicable to them. For information about how to check the status of the search index rebuild, see [Check the Search Index Job Status](#).

Defining which Customer Segments can Access Items (Customer Group)

Applies to: SuiteCommerce | SuiteCommerce Advanced

You can define the item segments visible and purchasable by a customer group from the customer group record.

To define which customer groups can access item segments:

1. Go to Commerce > Marketing > Personalization > Groups.
2. Click **Edit** next to the customer group.
3. On the **Personalization Rules** tab, select an item segment from the list in the Item Segment column and click **Add**. You'll need to do this for all the item segments you want to add.
4. Choose a **Website Visibility Level** for each item segment from the following options:
 - Display Fully – This enables customers in the customer group to view and purchase all items in the item segment
 - Disable Purchase – Prevents customers in the customer group from buying the items by hiding the Add to Cart button in the web store for all items in the item segment
 - Disable Purchase and Hide Price – Prevents customers in the customer group from viewing item prices or buying the items by hiding both item prices and the Add to Cart button in the web store for all items in the item segment

 **Note:** If you have a SuiteCommerce Advanced website, you can use the following visibility options after upgrading to the 2020.2 release or later:

- Disable Purchase
- Disable Purchase and Hide Price

Don't use these options if your site is using a SuiteCommerce Advanced release prior to 2020.2.

5. Click **Save** when you're finished. Clicking **Save** triggers a search index rebuild, when it's complete, personalized catalog views become active for customers visiting the website. For information about how to check the status of the search index rebuild, see [Check the Search Index Job Status](#).

Defining which Customer Segments can Access Items (Item Collection)

 **Applies to:** SuiteCommerce | SuiteCommerce Advanced

You can define the customer segments to which an item collection is visible and purchasable from the item collection record.

To define which customer groups can access items in an item collection:

1. Go to Commerce > Marketing > Personalization > Item Collections.
2. Click **Edit** next to the item collection.
3. On the **Customer Segments** tab, select a customer segment from the list in the Customer Segment column.
Add another customer segment by clicking **Add Row** and selecting one.
4. Choose a **Website Visibility Level** for each customer segment from the following options:
 - Display Fully – This enables customers in the selected customer segment to view and purchase all items in the item collection
 - Disable Purchase – Prevents customers in the selected customer segment from buying items in the item collection by hiding the Add to Cart button for all items in the item segment
 - Disable Purchase and Hide Price – Prevents customers in the selected customer segment from viewing item prices and buying items in the item collection by hiding both prices and the Add to Cart button for all items in the item segment

Note: If you have a SuiteCommerce Advanced website, you can use the following visibility options after upgrading to the 2020.2 release or later:

- Disable Purchase
- Disable Purchase and Hide Price

Don't use these options if your site is using a SuiteCommerce Advanced release prior to 2020.2.

5. Click **Save** when you're finished. Clicking **Save** triggers a search index rebuild, when it's complete, personalized catalog views become active for customers visiting the website. For information about how to check the status of the search index rebuild, see [Check the Search Index Job Status](#).

Defining which Customer Segments can View Items (Commerce Categories)

Applies to: SuiteCommerce | SuiteCommerce Advanced

You can define the customer segments to which a Commerce Category is visible from the Commerce Category record.

Note: By default the Website Visibility Level of the Commerce Category is set to Display Fully. To change the Website Visibility Level of a Commerce Category, use the Customer Segments Manager (CSM).

To define which customer groups can view items in a Commerce Category:

1. Go to Commerce > Content Management > Catalog & Categories > Commerce Categories.
2. Click **Edit** next to the Commerce Category.
3. On the **Customer Segments** tab, select a customer segment from the list in the **Customer Segments** column.
Add another customer segment by clicking **Add** and selecting one.
4. Click **Save** when you're finished. Clicking **Save** triggers a search index rebuild, when it's complete, personalized catalog views become active for customers visiting the website. For information about how to check the status of the search index rebuild, see [Check the Search Index Job Status](#).

Defining Visibility of Unmapped Items

Applies to: SuiteCommerce | SuiteCommerce Advanced

If an item is included in one or more item segments and at least one of the item segments is mapped to a customer segment, the item is visible to the customer segment. Such an item is called a mapped item.

An unmapped item, however, is one that is:

- Not included in any item segment
- Included in one or more item segments but none of the item segments are mapped to a customer segment

The Unmapped Items item segment is mapped by default to the All Users customer segment with Website Visibility Level set to Display Fully. Before you set up any mappings, all items are in the Unmapped Items segment, making them visible and purchasable by all users.

However, as you set up mappings between item segments and customer segments, consider whether the items left in Unmapped Items need to be visible, purchasable, or hidden from all users.

For instance, to show a subset of your inventory to VIP customers only, create an item collection called "VIP Items" and make it visible to the "VIP customers" customer segment.

What about the rest of your items that aren't mapped – what happens to them?

Let's say you've added many new items to your inventory but haven't assigned them to item segments yet. By default, these unmapped items are visible to all users, which may not be ideal.

In both these scenarios you'll need to set the Website Visibility Level of the Unmapped Items segment in the Customer Segments Manager.

To allow all users to buy unmapped items:

1. Go to Commerce > Marketing > Personalization > Customer Segments Manager.
2. Select **Display Fully** from the **Website Visibility Level** list next to the Unmapped Items item segment.

To prevent all users from buying unmapped items:

1. Go to Commerce > Marketing > Personalization > Customer Segments Manager.
2. Select one of the following from the **Website Visibility Level** list next to the Unmapped Items item segment:
 - To allow users to see item prices but prevent them from buying the items, select Disable Purchase.
 - To prevent users from seeing item prices and buying the items, select Disable Purchase and Hide Price.

Note: To allow all users to view but not buy unmapped items, ensure your website uses SuiteCommerce or SuiteCommerce Advanced 2020.2 or later. Don't use the following options if your site is using a SuiteCommerce Advanced release prior to 2020.2.

- Disable Purchase
- Disable Purchase and Hide Price

To hide unmapped items from all users:

1. Go to Commerce > Marketing > Personalization > Customer Segments Manager.
2. Select **Hide Fully** from the **Website Visibility Level** list next to the Unmapped Items item segment.

Note: An item can be included in multiple item segments. If any of these segments is mapped to a customer segment, the item is not included in the Unmapped Items segment.

Impact of Website Visibility Levels on Search Results

Applies to: SuiteCommerce | SuiteCommerce Advanced

When a customer searches for an item on your website, how the item appears in the search results depends on the website visibility level of the item segment containing that item. The following principles apply:

- If the item is set to be hidden from the customer, it won't appear in search results at all.
- If the item price is set to be hidden from the customer and:
 - no price filters are applied, the item appears in the search results but the price is not displayed.
 - price filters are applied (for example, Price < \$100), the item doesn't appear in the search results.
 - price sorting is applied, the item appears at the bottom of the search results, regardless of whether the sort order is low to high or high to low. This makes it impossible to guess the price from its position in the search results.

 **Note:** This behavior only applies to standard price fields. If pricing information for your website is stored in custom fields, prices are not hidden by the Disable Purchase and Hide Price website visibility level.

 **Important:** You need to run a full search index rebuild before the website visibility levels of item segments affect search results. For more information, see [Rebuild the Search Index Manually](#).

Verifying Personalized Catalog Views

 **Applies to:** SuiteCommerce | SuiteCommerce Advanced

In complex scenarios, particularly when there are multiple customer segments and items are included in more than one item segment, it's hard to know which items are visible and purchasable by which customers. To help you verify that the correct items are visible and purchasable by the correct customers, you have the following options:

- **Reports** – Personalized Catalog Views (PCV) includes two standard workbooks that show which customers can see, see prices for, or buy a particular item and which items, with or without prices, are visible to and purchasable by a particular customer. For more information, see [Using Workbooks to Verify Personalized Catalog Views](#).
- **Website preview** – Use Site Management Tools to see what items are visible to different customer segments and whether a customer segment is able to see item prices or buy the items. For more information, see [Using SMT Advanced Preview to Verify Personalized Catalog Views](#).

 **Note:** If you have a SuiteCommerce Advanced website, you can use website preview to see if different customer segments can view prices or buy items only if you are using the 20.2 or later release of SuiteCommerce Advanced.

Using Workbooks to Verify Personalized Catalog Views

 **Applies to:** SuiteCommerce | SuiteCommerce Advanced

SuiteAnalytics Workbook is a powerful tool for creating and customizing workbooks with NetSuite data. For Personalized Catalog Views, the following standard workbooks are available:

- **Items by Customer** – You can select specific customers and see which items they can see, and whether they can see prices or buy the items. This workbook displays which customer segments the selected customers are in, which item segments are mapped to those customer segments, which

items are included in the item segments, and the website visibility level of the item segment to the customer segment. For more information about the components of this workbook, see [Items by Customer Workbook](#).

- **Customers by Item** – You can select specific items and see which customers can see them and whether they can see prices or buy the items. This workbook shows you which item segments the selected items are in, which customer segments are mapped to those item segments, which customers are included in the customer segments, and the website visibility level of those items for those customers. For more information about the components of this workbook, see [Customers by Item Workbook](#).

Both workbooks update with the latest Personalized Catalog Views changes when you click any of the **Save** buttons on the Customer Segments Manager page. Note that you might need to clear the workbook cache to see the latest updates.

You can add other fields and filters to the standard workbooks or create your own. For more information, see the help topic [SuiteAnalytics Workbook Overview](#).

Items by Customer Workbook

i Applies to: SuiteCommerce | SuiteCommerce Advanced

SuiteAnalytics Workbook offers many workbook and dataset templates, each with predefined source data, criteria, pivot tables, and charts.

This section contains the information for the SuiteAnalytics Items by Customer workbook. For more information about SuiteAnalytics Workbook, see the help topic [Workbook and Dataset Templates](#).

- [Items by Customer Dataset](#)
- [Items by Customer Workbook](#)

Items by Customer Dataset

i Applies to: SuiteCommerce | SuiteCommerce Advanced

This dataset combines fields from the Customer, Customer Segments, Personalization Rules, Item Segments, and Items Item record types so that you can select specific customers and see which items are visible to them. This dataset forms the source data for the [Items by Customer Workbook](#).

Dataset Configuration

The Items by Customer Dataset combines data from five record types. To edit the dataset, see the help topic [Defining a Dataset](#).

Root Record Type	Joined Record Type	Custom Formula Fields	Data Grid	Criteria Filters
Customer	Customer Segments Personalization Rules Item Segments	(none)	The following records fields are included in the dataset. Customer: ■ Entity ID	The dataset is filtered using the following criteria: ■ Website Visibility Level is either Display Fully, Disable Purchase, or Disable Purchase and Hide Price

Root Record Type	Joined Record Type	Custom Formula Fields	Data Grid	Criteria Filters
	Items Item		Customer Segments: - Name Personalization Rules: - Website Visibility Level Item Segments: - Name Items Item: - Item Name/Number	

Items by Customer Workbook

 **Applies to:** SuiteCommerce | SuiteCommerce Advanced

The Items by Customer workbook lets you select specific customers and view the items they can see, and whether they can see the item prices and buy them. The workbook shows you:

- which customer segments the selected customers are in
- which item segments are mapped to those customer segments
- which items are included in the item segments
- the website visibility level of the item segment to the customer segment

To view which items are viewable or purchasable by specific customers:

1. Go to Commerce > Marketing > Personalization > Customer Segments Manager.
2. Click **Save & View Report** and select the Items by Customer workbook.

Alternatively, access the workbook by going to the Workbook Listing page and clicking the **Items by Customer** link in the Standard Workbooks list. For more information, see the help topic [Accessing and Sharing Workbooks and Datasets](#).

Note: If the **Save & View Report** button is not visible, check your permissions – you may not have access to workbooks. See [Personalized Catalog Views Roles and Permissions](#) for more information.

3. In the Items by Customer pivot table, click the Field Menu icon  next to Customers, then click **Filter Customers**.
4. Select the desired customers in the left pane and click > to add them to the right pane of the filter window.
5. Click **Apply**.
6. Click the Field Menu icon  next to Website Visibility Level, then click **Filter Website Visibility Level**.

To see the items that each selected customer:

- can view and buy, select **Display Fully** in the left pane of the filter window
- can view with prices but not buy, select **Disable Purchase** in the left pane of the filter window

- can view without prices and not buy, select **Disable Purchase and Hide Price**
 - cannot see on the web store, select **Hide Fully** in the left pane of the filter window
7. Click > to add the selected Website Visibility Level to the right pane.
 8. Click **Apply**.

The pivot table updates to show the items each selected customer can view and buy.

Customers by Item Workbook

Applies to: SuiteCommerce | SuiteCommerce Advanced

SuiteAnalytics Workbook offers many workbook and dataset templates, each with predefined source data, criteria, pivot tables, and charts.

This section contains the information for the SuiteAnalytics Customers by Item workbook. For more information about SuiteAnalytics Workbook, see the help topic [Workbook and Dataset Templates](#).

- [Customers by Item Dataset](#)
- [Customers by Item Workbook](#)

Customers by Item Dataset

Applies to: SuiteCommerce | SuiteCommerce Advanced

This dataset combines fields from the Item, Item Segments, Personalization Rules, Customer Segments, and Customers record types so that you can select specific items and see which customers can see the items, see their prices, and buy them. This dataset forms the source data for the [Customers by Item Workbook](#).

Dataset Configuration

The source data used in the Customers by Item dataset combines fields from five record types. To edit the dataset, see the help topic [Defining a Dataset](#).

Root Record Type	Joined Record Type	Custom Formula Fields	Data Grid	Criteria Filters
Item	Item Segments Personalization Rules Customer Segments Customers	(none)	The following records fields are included in the dataset. Item: ■ Item Name/Number Item Segments: ■ Name Personalization Rules: ■ Website Visibility Level Customer Segments: ■ Name	The dataset is filtered using the following criteria: ■ Website Visibility Level is either Display Fully, Disable Purchase and Hide Price, or Disable Purchase

Root Record Type	Joined Record Type	Custom Formula Fields	Data Grid	Criteria Filters
			Customers: Entity ID	

Customers by Item Workbook

Applies to: SuiteCommerce | SuiteCommerce Advanced

The Customers by Item workbook enables you to select specific items and see which customers can see them, see their prices, and buy them. The workbook shows you:

- which item segments the selected items are in
- which customer segments are mapped to those item segments
- which customers are included in the customer segments
- the website visibility level of those items for those customers

To view which customers can see and buy specific items:

- Go to Commerce > Marketing > Personalization > Customer Segments Manager.
- Click **Save & View Report** and select the Customers by Item workbook.

You can also access the workbook directly, by going to the Workbook Listing page and clicking the **Customers by Item** link in the Standard Workbooks list. For more information, see the help topic [Accessing and Sharing Workbooks and Datasets](#).

Note: If you can't see the **Save & View Report** button, you don't have the correct permissions to access workbooks. For more information, see [Personalized Catalog Views Roles and Permissions](#).

- In the Customers by Item pivot table, click the Field Menu icon  next to Item and click on Filter Item.
- In the left pane of the filter window, select the items you're interested in and click > to move them to the right pane.
- Click **Apply**.
- Click the Field Menu icon  next to Website Visibility Level and click **Filter Website Visibility Level**.

To see the customers who:

- can buy the selected item, select **Display Fully** in the left pane of the filter window
 - can view but not buy the selected item, select **Disable Purchase** in the left pane of the filter window
 - can view the selected item, but not see the item price or buy the item, select **Disable Purchase and Hide Price** in the left pane of the filter window
 - cannot view the selected item on the web store, select **Hide Fully** in the left pane of the filter window
- Click > to move the selected Website Visibility Level to the right pane.
 - Click **Apply**.

The pivot table refreshes to show which customers can see and buy each selected item.

Using SMT Advanced Preview to Verify Personalized Catalog Views

Applies to: SuiteCommerce | SuiteCommerce Advanced

This refers to SuiteCommerce or the 19.2 release of SuiteCommerce Advanced or later.

Site Management Tools Advanced Preview lets you see how your site appears to customers when Personalized Catalog Views (PCV) is enabled. You can select and apply customer segments to the preview to confirm that customers assigned to the segments can access the items they have permission to view or buy. You can also check that customers in those segments can't access items or prices that aren't available to them.

Note: If you have a SuiteCommerce Advanced site, you can use website preview to see if different customer segments can view prices or buy items, but only if you're using the 20.2 or later release. If you're using SuiteCommerce Advanced 19.2 or 20.1, you can only preview items customers can buy.

You can access Site Management Tools Advanced Preview in two ways:

- From the Customer Segments Manager in NetSuite, click **Save & View Site** and choose a domain from the dropdown list. This opens a new browser tab and logs you in to Site Management Tools on the site. By default, you're logged into the domain set as the primary URL. If there's no primary URL, you're logged into the first domain listed on the **Domains** tab in the website setup record.

Note: When you Save & View Site in the Customer Segments Manager, it triggers the site search index to be rebuilt. You won't see the changes in Site Management Tools until reindexing is done.

- From within Site Management Tools, select **Advanced Preview** on the Site Management toolbar.

Preview Customer Segments in SMT

When you select Advanced Preview in Site Management Tools, the Advanced Preview Settings are displayed in the side panel. By default, no customer segments are selected, and all items and categories show up in the preview.

When you select one or more customer segments in the side panel and click **Apply**, the items in the preview are filtered to only those items that are available to the selected customer segments. The site category navigation also updates to match the conditional category display structure.

The Commerce Category Hide Empty Categories feature hides any category branches with no items. For details, see [Exclude Empty Commerce Categories](#).

After you apply customer segments to the preview, you can use the site navigation to see which items are available to the selected customer segments.

To close Advanced Preview, click **Advanced Preview** in the Site Management toolbar.

Tips on Testing Personalized Catalog Views

Applies to: SuiteCommerce | SuiteCommerce Advanced

When you click **Save**, **Save & Preview**, or **Save & View** on the Customer Segments Manager page, the website's search index gets reindexed. When reindexing is done, the personalized catalog views go live

and your customers see the catalog that's meant for them. Making an item segment visible to a customer segment from a customer group record or an item collection record works the same way.

You can use SuiteAnalytics Workbooks and Site Management Tools Advanced Preview to check that Personalized Catalog Views is set up correctly, but only after you've saved the personalized catalog views. So, it's best to test personalized catalog views in a way that doesn't affect your live site.

There are two ways to test:

- **Use test customer segments** – To make certain items visible or purchasable only to specific customers, add test customers to your customer groups and set up Personalized Catalog Views like you would for real customers. Make sure the Unmapped Items segment is set to Display Fully. That way, all real customers can see everything except the items you've mapped to test customers. After you've logged in as a test customer and checked that the correct items show up, you can add real customers to the customer group.
- **Publish to a test website** – If your PCV setup is more complex, it's better to test everything in a sandbox account and publish to a test site to make sure the correct customers have access to the correct items.

Personalized Catalog View Examples

i Applies to: SuiteCommerce | SuiteCommerce Advanced

Personalized Catalog Views can be tricky to set up, especially if you have items in several item segments and customers in multiple customer segments. It's important to think about what each customer segment can and can't see or buy before you set up Personalized Catalog Views in NetSuite.

The following examples show how you can work through the layout and setup process:

- **Exclusive Items for VIP Customers** – This example covers a scenario where some inventory items are visible to everyone, but only a limited group can buy them. All other items are visible to all users, but only logged-in users can buy them.
- **Different Catalogs based on Customer Location** – This example limits which items are visible based on customer location. Some items are visible and can be bought by customers from more than one location.
- **Items Available only to Certified Customers** – This example lets only customers who've earned the right certification buy products from certain product lines. Some customers might be certified for more than one product line.
- **Different Product Lines Available to Different Customers** – This example limits certain product lines to specific customers, while letting other customers access more than one product line.

Exclusive Items for VIP Customers

i Applies to: SuiteCommerce | SuiteCommerce Advanced

Company A is a wholesale business that sells home decor like wall art, cushions, and glassware. Company A's website uses commerce categories to structure its navigation menu, so users can browse items in the Wall Art, Cushions, and Glassware categories. Company A wants to start a VIP program that gives some customers exclusive access to premium items. Customers who join the VIP program need to sign a contract with Company A first.

Layout

First, Company A needs to decide how to segment their items and customers. Let's see how their answers to some key questions help to layout Personalized Catalog Views.

Question	Answer	Layout Input
What are the customer groups I need?	VIP customers and All Users.	Customer groups to be created – VIP Customers.
On what basis will I assign a customer to one group or the other?	The Sales Operation Manager will add customers to the VIP group after they sign a contract.	VIP Customers customer group is a static customer group.
Do I want any of my customers to be in more than one customer group?	All Users includes VIP customers.	None
What item segments do I need?	VIP Items is a group that includes items from all commerce categories. Everyone can see these items, but only VIP Customers can buy them. We're also launching a new line of items called Designer Carpets, which will be available only to VIP Customers at first, though we might open it up to everyone later.	Item segments needed – VIP Items and Designer Carpets.
On what basis do I want to assign an item to one segment or another?	The Marketing Manager will add all VIP items to the VIP Items segment and the Designer Carpets segment.	None
Do the item segments correspond to the sections in my website navigation or are they different?	VIP Items is different because it includes items from every section of my navigation menu. Designer Carpets is meant to be a top-level section in the navigation menu.	VIP Items isn't a Commerce Category—it's an item collection. Designer Carpets is a Commerce Category because it shows up in the navigation menu.
Which item segments should be visible and purchasable to my customer segments? Which item segments should be visible but not purchasable? Can all customer segments view item prices?	VIP customers can see and buy all items. Recognized and logged-in users can't see Designer Carpets. They can see VIP items, but they can't see prices or buy them. They can see and buy everything else. Anonymous users can't see Designer Carpets or VIP Items, but they can see and buy everything else.	The Website Visibility Level for VIP Items is: ■ Display Fully for VIP Customers ■ Disable Purchase and Hide Price for Recognized and Logged In Customers The Website Visibility Level for Designer Carpets is: ■ Display Fully for VIP Customers
Who should be able to view any items that are not in item segments mapped to a customer segment? Should they be able to view the prices?	All users can see items that aren't mapped to VIP Customers.	The Website Visibility Level for Unmapped Items is: ■ Display Fully

Implementation

From the layout inputs, Company A creates the following in NetSuite:

- Customer Group (static): VIP Customers
- Item Collection: VIP Items

- Commerce Category: Designer Carpets
- Personalized Catalog View Setup:
 - VIP Items set to Display Fully for VIP Customers
 - VIP Items set to Disable Purchase and Hide Price for Recognized and Logged In Customers
 - Designer Carpets set to Display Fully for VIP Customers
 - Unmapped Items set to Display Fully for All Users

Note: In this example, Designer Carpets doesn't have any subcategories. If it did, you'd select the subcategories separately. Only items included directly to the category are part of the item segment.

Right now, the Designer Carpets Commerce Category is exclusive to VIP users, so other users don't see it in the navigation menu at all. For more information, see [Exclude Empty Commerce Categories](#).

Later, if Company A wants to make Designer Carpets visible and buyable for everyone, they can remove the mapping in the Customer Segments Manager. That makes all the items in it "unmapped" and visible to all users, and the Designer Carpets category will show up in the navigation menu for everyone.

Different Catalogs based on Customer Location

Applies to: SuiteCommerce | SuiteCommerce Advanced

Company B sells washing machines and dishwashers from different manufacturers to retailers around the world. They're licensed to sell:

- Washing machines and dishwashers made by manufacturer M in the USA, Canada and the United Kingdom
- Washing machines and dishwashers made by manufacturer S in the USA
- Washing machines made by manufacturer D in Canada
- Dishwashers made by manufacturer D in Canada and the United Kingdom
- Dishwashers made by manufacturer Y in the USA and Canada

Company B's website menu has sections for washing machines and dishwashers, with filters for manufacturer, capacity, energy rating, and more. They don't use commerce categories.

Layout

First, Company B needs to figure out how to segment their items and customers. Let's see how their answers to some key questions help to layout Personalized Catalog Views.

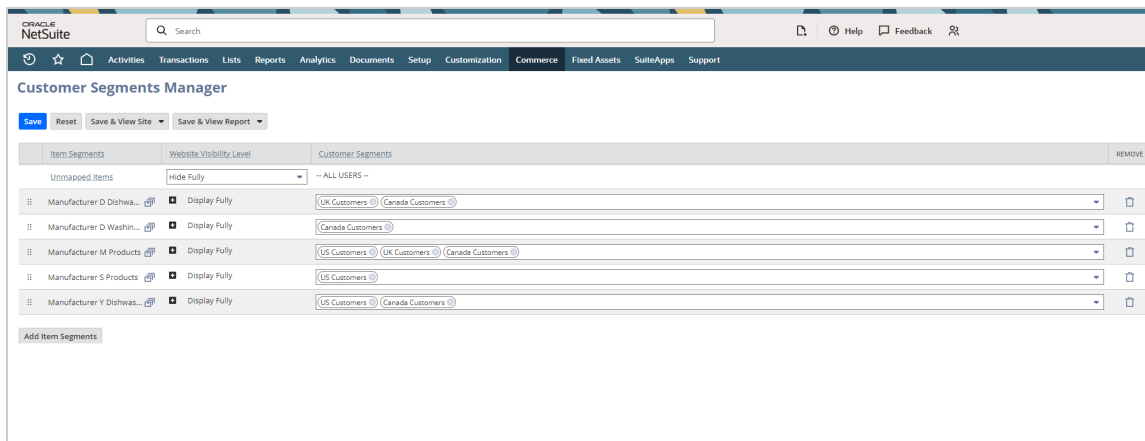

Question	Answer	Layout Input
What are the customer groups I need?	US Customers, Canadian Customers, UK Customers.	Customer groups to be created – US Customers, Canadian Customers, UK Customers.
On what basis will I assign a customer to one group or the other?	Customers will automatically be placed in the group that matches their registered address.	US Customers, Canadian Customers, and UK Customer customer groups are dynamic customer groups that use saved searches based on customer registered address.
Do I want any of my customers to be in more than one customer group?	No	You don't need to worry about what a customer should see if they're in more than one group.
What item segments do I need?	Manufacturer M Products, Manufacturer S Products, Manufacturer D washing machines, Manufacturer D dishwashers, Manufacturer Y dishwashers.	Item segment to be created- Manufacturer M Products, Manufacturer S Products, Manufacturer D washing machines, Manufacturer D dishwashers, Manufacturer Y dishwashers
On what basis do I want to assign an item to one segment or another?	First sort by manufacturer, then by item type.	Use mass updates to assign items to item collections.
Do the item segments correspond to the sections in my website navigation or are they different?	They're similar, but not the same.	Since Company B doesn't use commerce categories and the navigation isn't the same as the item segments, it's best to use item collections for the segments.
Which item segments should be visible and purchasable to my customer segments? Which item segments should be visible but not purchasable? Can all customer segments view item prices?	■ US Customers – Should see and buy washing machines and dishwashers made by manufacturer M and manufacturer S, dishwashers made by manufacturer Y. ■ Canadian Customers – Should see and buy washing machines and dishwashers made by manufacturer M and manufacturer D, dishwashers made by manufacturer Y. ■ UK Customers – Should see and buy washing machines and dishwashers made by manufacturer M and dishwashers made by manufacturer D. If a customer segment can see an item, they should also be able to see the price and buy it.	■ US Customers customer group mapped to Manufacturer M Products, Manufacturer S Products, Manufacturer Y dishwashers ■ Canadian Customers group mapped to Manufacturer M Products, Manufacturer D washing machines, Manufacturer D dishwashers, Manufacturer Y dishwashers ■ UK Customers group mapped to Manufacturer M Products, Manufacturer D dishwashers
Who should be able to view any items that are not in item segments mapped to a customer segment?	All item segments should be mapped to customer segments. If any items aren't in item segments, it's because	Unmapped Items website visibility level should be set to Hide Fully.

Should they be able to view the prices?	they haven't been classified yet, so they shouldn't be visible to anyone.	
Do all my customers fall into one or more customer groups or do I have some 'leftover' customers? What items, if any, do I want the leftover customers to see?	We're not licensed to sell to customers outside the USA, UK, or Canada. Any visitors to the website from anywhere else shouldn't see any products.	Don't map any item segments to customer segments other than US Customers, Canadian Customers, and UK Customers.

Implementation

From the layout inputs, Company B creates the following in NetSuite:

- Three saved searches that return US Customers, Canadian Customers, and UK Customers respectively
- Customer Groups (dynamic based on the saved searches): US Customers, Canadian Customers, UK Customers
- Item Collections: Manufacturer M Products, Manufacturer S Products, Manufacturer D washing machines, Manufacturer D dishwashers, Manufacturer Y dishwashers
- Personalized Catalog View Setup:
 - Manufacturer M Products item collection set to Display Fully for US Customers, Canadian Customers, and UK Customers customer groups
 - Manufacturer S Products item collection set to Display Fully for US Customers customer group
 - Manufacturer D washing machines set to Display Fully for Canadian Customers customer group
 - Manufacturer D dishwashers set to Display Fully for Canadian Customers and UK Customer customer groups
 - Manufacturer Y dishwashers set to Display Fully for US Customers and Canadian Customers customer groups
 - Unmapped Items set to Hide Fully

Items Available only to Certified Customers

Applies to: SuiteCommerce | SuiteCommerce Advanced

Company C supplies equipment and chemicals to labs. They only sell to customers who've been trained and certified to use their products. They also offer online training courses for people who want to get certified. The training is manufacturer-specific. Certification for Manufacturer A covers all their equipment and chemicals, but Manufacturer B needs separate certifications for its equipment and chemicals.

Layout

First, Company C needs to figure out how to segment their items and customers. Let's see how their answers to some key questions help to layout Personalized Catalog Views.

Question	Answer	Layout Input
What are the customer groups I need?	Certified Customers (Manufacturer A), Certified Customers (Manufacturer B equipment), Certified Customers (Manufacturer B chemicals), Non-Certified Customers, and the general public.	Certified Customers (Manufacturer A), Certified Customers (Manufacturer B equipment), and Certified Customers (Manufacturer B chemicals). Non-Certified Customers might be All Users, but that depends on other answers.
On what basis will I assign a customer to one group or the other?	We're the only supplier of training for Manufacturer B. If a customer buys and completes the classroom-based equipment training, the instructor fills out a form that automatically updates their customer record to show they're certified. If they finish the online chemicals course, their customer record updates automatically too. The customer should be automatically added to the correct certified group based on the information in their customer record. Manufacturer A uses different suppliers for certifications, so customers who want to buy Manufacturer A products from us need to email Customer Support with proof of certification. If they buy the training from us, their customer record updates automatically when they finish the course. Certified Customers (Manufacturer B equipment) and Certified Customers (Manufacturer B chemicals) should be dynamic groups that use saved searches based on custom Certification fields in the customer record.	Certified Customers (Manufacturer A) should be a static customer group so Customer Support can manually add customers when they get proof of certification. But it makes more sense to have a dynamic group for customers who buy training from Company C, so they don't have to send in proof of completing a course. So, we'll have two groups: a static one for external certification and a dynamic one for internal certification.
Do I want any of my customers to be in more than one customer group?	Yes. We support three certifications—Manufacturer A, Manufacturer B (equipment), and Manufacturer B (chemicals). Customers can have one or more of these, so they should be in the group for whichever certifications they have.	We need to think about what items customers in more than one group can see.
What item segments do I need?	Manufacturer A Products, Manufacturer B Equipment, Manufacturer B Chemicals, Certification Courses.	Item segment to be created – Manufacturer A Products, Manufacturer B Equipment, Manufacturer B Chemicals, and Certification Courses
On what basis do I want to assign an item to one segment or another?	For equipment and chemicals, sort first by manufacturer, then by item type. For certification courses, go by item type.	Use mass updates to add items to item collections. For certification courses, there are only three courses, so you can add them manually.
Do the item segments correspond to the sections in my website	They're different. The website is organized by product type, like microscopes, graduated cylinders, and so on.	Since Company C doesn't use commerce categories and the navigation structure isn't the same as the item segments needed, it's best

navigation or are they different?		to use item collections for the item segments.
Which item segments should be visible and purchasable to my customer segments? Which item segments should be visible but not purchasable? Can all customer segments view item prices?	■ Certified Customers (Manufacturer A external) – can buy Manufacturer A Products, Certification Courses. Can view all products. ■ Certified Customers (Manufacturer A internal) – can buy Manufacturer A Products, Certification Courses. Can view all products. ■ Certified Customers (Manufacturer B equipment) – can buy Manufacturer B Equipment, Certification Courses. Can view all products. ■ Certified Customers (Manufacturer B chemicals) – can buy Manufacturer B Chemicals, Certification Courses. Can view all products. ■ Non-Certified Customers – can buy Certification Courses and view all products. Let's dig deeper into what this group needs. Here are some more questions: □ Can customers with one certification see other certification courses? – Yes, they can. □ Can customers with a certification see the course they've already finished? – Yes, they can. □ Can anyone visiting the site see the certification courses? – We only sell to schools, universities, and similar organizations. Only their members can buy from us. They can buy products they're certified for and view all other products and certification courses. Other visitors can see our product catalog, including certification courses, but they can't see prices or buy anything. If they want to buy, they need to contact our Sales team to get their institution added to our customer list.	■ Certified Customers (Manufacturer A external) and Certified Customers (Manufacturer A internal) customer groups permitted to buy to Manufacturer A Products and Certification Courses. Permitted to view all products. ■ Certified Customers (Manufacturer B equipment) group permitted to buy Manufacturer B Equipment and Certification Courses. Permitted to view all products. ■ Certified Customers (Manufacturer B chemicals) permitted to buy Manufacturer B Chemicals and Certification Courses. Permitted to view all products. ■ Recognized and Logged In Customers permitted to buy Certification Courses. Permitted to view all products. ■ Anonymous Users permitted to view but not buy products. Also, they cannot see product prices.
Who should be able to view any items that are not in item segments mapped to a customer segment? Should they be able to view the prices?	All item segments should be mapped to customer segments. If any items aren't in an item segment, it's because they haven't been classified yet, so they shouldn't be visible to anyone.	Unmapped items should be set to Hide Fully
Do all my customers fall into one or more customer groups or do I have some 'leftover' customers? What items, if any, do I want the leftover customers to see?	We don't sell to the general public. If someone who's not a registered customer visits our site, they shouldn't see any products for sale.	All certified customers will be in one or more groups. Non-certified customers who are recognized and logged in can see all products and buy certification courses. Anyone who's not logged in or recognized shouldn't see any products at all.

Implementation

From the layout inputs, Company C creates the following in NetSuite:

- Three saved searches that return customers certified by Company C on Manufacturer A products, customers certified on Manufacturer B equipment, and customers certified on Manufacturer B chemicals respectively
- Customer Groups (dynamic based on the saved searches): Certified Customers (Manufacturer A internal), Certified Customers (Manufacturer B equipment), Certified Customers (Manufacturer B chemicals)
- Customer Group (static, to be updated by Customer Support): Certified Customers (Manufacturer A external)
- Item Collections: Manufacturer A Products, Manufacturer B Equipment, Manufacturer B Chemicals, Certification Courses
- Personalized Catalog View Setup:
 - Manufacturer A Products item collection set to Display Fully for Certified Customers (Manufacturer A internal) and Certified Customers (Manufacturer A external) customer groups
Set to Disable Purchase for Recognized and Logged in Users
Set to Disable Purchase and Hide Price for Anonymous Users
 - Manufacturer B Equipment item collection set to Display Fully for Certified Customers (Manufacturer B equipment) customer group
Set to Disable Purchase for Recognized and Logged in Users
Set to Disable Purchase and Hide Price for Anonymous Users
 - Manufacturer B Chemicals item collection set to Display Fully for Certified Customers (Manufacturer B chemicals) customer group
Set to Disable Purchase for Recognized and Logged in Users
Set to Disable Purchase and Hide Price for Anonymous Users
 - Certified Course item collection set to Display Fully for Recognized and Logged In Customers
Set to Disable Purchase and Hide Price for Anonymous Users
 - Sets Unmapped Items segment to Hide Fully

The screenshot displays the NetSuite Customer Segments Manager interface. The top navigation bar includes the NetSuite logo, a search bar, and various menu items like Activities, Transactions, Lists, Reports, Analytics, Documents, Setup, Customization, Commerce, Fixed Assets, SuiteApps, and Support. The main header is 'Customer Segments Manager' with buttons for Save, Reset, Save & View Site, and Save & View Report.

Item Segments	Website Visibility Level	Customer Segments	REMOVE
Unmapped Items	Hide Fully	~ ALL USERS ~	
Manufacturer A Products	☒ Display Fully ☐ Disable Purchase ☐ Disable Purchase and Hide Price	Certified Customers (Manufacturer A External) Certified Customers (Manufacturer A Internal) ~ RECOGNIZED AND LOGGED-IN CUSTOMERS ~ ~ ANONYMOUS USERS ~	
Manufacturer B Chemicals	☒ Display Fully ☐ Disable Purchase ☐ Disable Purchase and Hide Price	Certified Customers (Manufacturer B Chemicals) ~ RECOGNIZED AND LOGGED-IN CUSTOMERS ~ ~ ANONYMOUS USERS ~	
Manufacturer B Equipment	☒ Display Fully ☐ Disable Purchase ☐ Disable Purchase and Hide Price	Certified Customers (Manufacturer B Equipment) ~ RECOGNIZED AND LOGGED-IN CUSTOMERS ~ ~ ANONYMOUS USERS ~	
Certification Courses	☒ Display Fully ☐ Disable Purchase ☐ Disable Purchase and Hide Price	~ RECOGNIZED AND LOGGED-IN CUSTOMERS ~ Type to search... ~ ANONYMOUS USERS ~	

At the bottom, there is an 'Add Item Segments' button.

Different Product Lines Available to Different Customers

i Applies to: SuiteCommerce | SuiteCommerce Advanced

Company D supplies uniforms to fast food companies, and each one usually runs restaurants under several brand names. Company D gives each client their own website, but they all work the same way: head office buyers order uniforms in bulk, and outlet managers can buy top-up supplies for their outlet. Head office buyers can buy uniforms for any brand, but outlet managers can only buy for their own brand. In this example, we'll look at how Personalized Catalog Views is set up for the Fast Food Inc website. Fast Food Inc. runs 100 restaurants under the names Fast Pizza and Fast Burgers.

Layout

First, Company D needs to figure out how to segment their items and customers. Let's see how their answers to some key questions help to layout Personalized Catalog Views.

Question	Answer	Layout Input
What are the customer groups I need?	Head office buyers need access to buy all products. Outlet managers should only be able to buy items for their outlet brand. For example, the head office buyer at Fast Food Inc. should be able to buy uniforms for Fast Pizza and Fast Burgers staff but a Fast Burgers outlet manager should only be able to see and buy Fast Burger Uniforms. Outlet staff can't buy anything, but they should be able to see product details for their brand so they can tell the manager what item and size they need. We don't think they'll use the website much. All other Fast Food Inc head office employees should be able to see product details and prices, but they shouldn't be able to buy anything. The general public can't see any products on the site.	■ Head office buyers ■ Fast Pizza Outlet managers ■ Fast Burger Outlet managers ■ Fast Pizza Outlet staff ■ Fast Burger Outlet staff ■ Fast Food Head Office ■ General public — Anonymous Users
On what basis will I assign a customer to one group or the other?	There are three named head office buyers. When one of them is replaced, we receive an email from Fast Food Inc. – but this rarely happens. Outlet managers and staff change often. Managers have their own work email addresses, but staff share a common email, like staff@fastburger.com.	Head Office Buyers should be a static customer group so the Account Manager can add or remove people as needed. Outlet Managers should be dynamic customer groups that use saved searches based on brand code and the job title field on the customer record. Outlet Staff can be static or dynamic customer groups, since each group only has one user that's shared by all staff for that brand. Fast Food Head Office should be a dynamic customer group based on @fastfoodinc.com email addresses.

Do I want any of my customers to be in more than one customer group?	No. Each job role has its own function and different permissions.	Head Office buyers will be in the Head Office Buyers group, and they'll also be in the Fast Food Head Office group, which is based on a search using email addresses. The Head Office Buyers group can buy all products, but the Fast Food Head Office group can only view items and prices. Customers in more than one customer segment get access to items based on the customer segment with the highest permissions. So, head office buyers can buy all items because they're in the Head Office Buyers group.
What item segments do I need?	We have separate uniforms for each brand. Outlet managers and staff shouldn't be able to see or order uniforms from another brand. The Fast Pizza uniform includes tops and pants. The Fast Burger uniform includes tops, pants, and accessories.	Item segments to be created: ■ Fast Pizza Uniforms, which has subcategories: □ Fast Pizza Tops □ Fast Pizza Pants ■ Fast Burger Uniform, which has subcategories: □ Fast Burger Tops □ Fast Burger Pants □ Fast Burger Accessories
On what basis do I want to assign an item to one segment or another?	Based on brand.	Both commerce categories and item collections work for this.
Do the item segments correspond to the sections in my website navigation or are they different?	They're the same. The website navigation has the brand name at the top and sub-levels for each brand.	Commerce categories are a good fit here because you can use them for both navigation and Personalized Catalog Views.
Which item segments should be visible and purchasable to my customer segments? Which item segments should be visible but not purchasable? Can all customer segments view item prices?	■ Head office buyers should be able to see and buy everything. ■ Outlet managers should be able to see and buy everything for their brand, but not for other brands. ■ Outlet staff should be able to see product details for their brands. ■ The general public shouldn't be able to see any products.	■ Head office buyers permitted to view, view prices, and buy items from all item segments ■ Fast Pizza Outlet managers permitted to view, view prices, and buy items from Fast Pizza Uniforms ■ Fast Burger Outlet managers permitted to view, view prices, and buy items from Fast Burger Uniforms ■ Fast Pizza Outlet staff permitted to view items from Fast Pizza Uniforms ■ Fast Burger Outlet staff permitted to view items from Fast Burger Uniforms

		- Fast Food Head Office employees permitted to view and view prices of all items - General public not permitted to view any products
Who should be able to view any items that are not in item segments mapped to a customer segment? Should they be able to view the prices?	All item segments should be mapped to customer segments. If any items aren't in an item segment, it's because they haven't been classified yet, so they shouldn't be visible to anyone.	Unmapped items should be set to Hide Fully
Do all my customers fall into one or more customer groups or do I have some 'leftover' customers? What items, if any, do I want the leftover customers to see?	All Fast Food Inc. employees are in a customer group.	Anyone who can log in is in a customer group. Anonymous visitors shouldn't be able to see any product details.

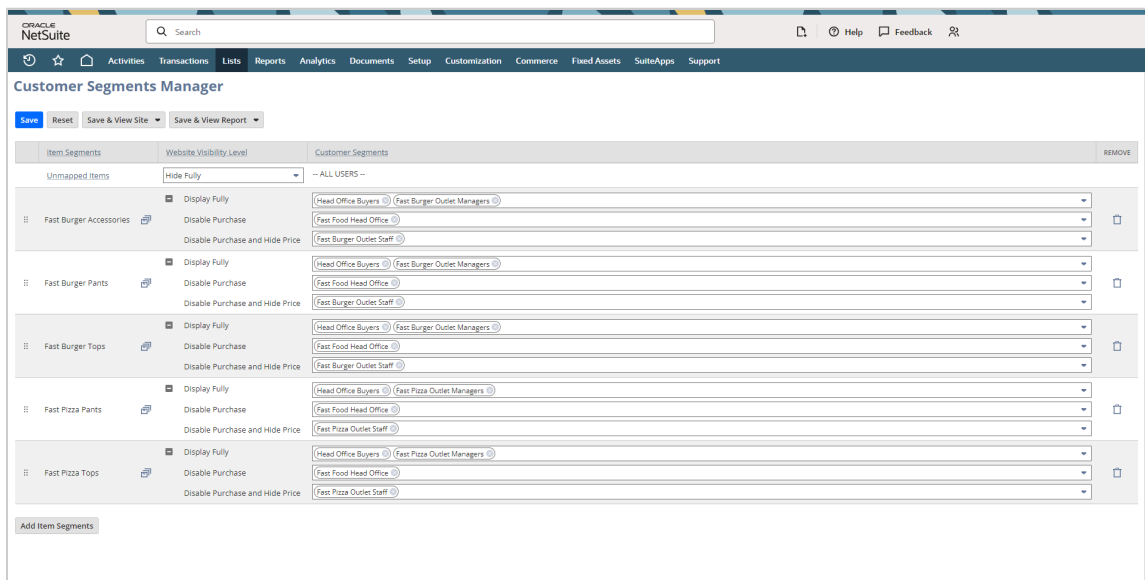

Implementation

From the layout inputs, Company D creates the following in NetSuite:

- Three saved searches:
 - Fast Burgers Outlet Managers (based on Job Title and @fastburgers.com email address)
 - Fast Pizza Outlet Managers (based on Job Title and @fastpizza.com email address)
 - Fast Food Head Office (based on @fastfoodinc.com email address)
- Dynamic Customer Groups (based on the saved searches):
 - Fast Burgers Outlet Managers
 - Fast Pizza Outlet Managers
 - Fast Food Head Office
- Static Customer Groups:
 - Head Office Buyers
 - Fast Pizza Outlet Staff
 - Fast Burger Outlet Staff
- Commerce Categories:
 - Fast Pizza Uniforms, with subcategories
 - Fast Pizza Tops
 - Fast Pizza Pants
 - Fast Burger Uniform, with subcategories
 - Fast Burger Tops
 - Fast Burger Pants
 - Fast Burger Accessories
- Personalized Catalog View Setup:
 - Fast Pizza Uniforms subcategories (Fast Pizza Tops and Fast Pizza Pants) set to Display Fully for Head Office Buyers and Fast Pizza Outlet Managers customer groups
 - Set to Disable Purchase for Fast Food Head Office
 - Set to Disable Purchase and Hide Price for Fast Pizza Outlet staff

- Fast Burger Uniforms subcategories (Fast Burger Tops, Fast Burger Pants, and Fast Burger Accessories) set to Display Fully for Head Office Buyers and Fast Burger Outlet Managers customer groups
Set to Disable Purchase for Fast Food Head Office
Set to Disable Purchase and Hide Price for Fast Burger Outlet staff
- Set Unmapped Items segment to Hide Fully

Note: In this case, the subcategories hold the items, so you need to map those to customer segments. The empty parent categories are required for navigation—they aren't needed for Personalized Catalog Views.

Troubleshooting Item Availability

Applies to: SuiteCommerce | SuiteCommerce Advanced

If a customer can't see an item on your website that they should, check the settings in the flowcharts below to troubleshoot the issue.

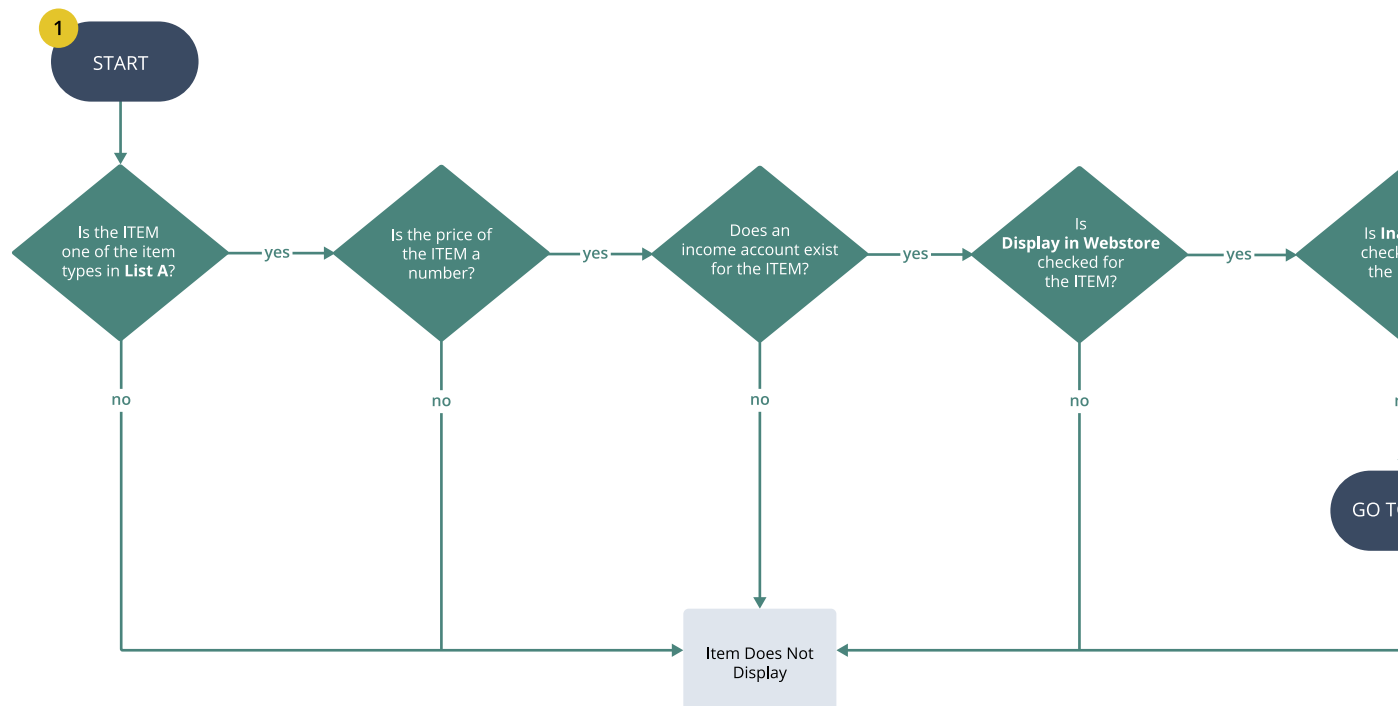

- Item Settings
- Commerce and Site Category Settings
- Out of Stock Behavior Settings
- Multi-Subsidiary Settings
- Personalized Catalog View Settings

Note: Some of these settings are role-specific. If you can't access any of them, contact your administrator.

Flowchart Definitions

CUSTOMER	The customer to whom the item is not available
ITEM	The item that is not visible on the website
WEBSITE	The website on which the customer cannot see the item
DATE	The date on which the customer cannot see the item on the website

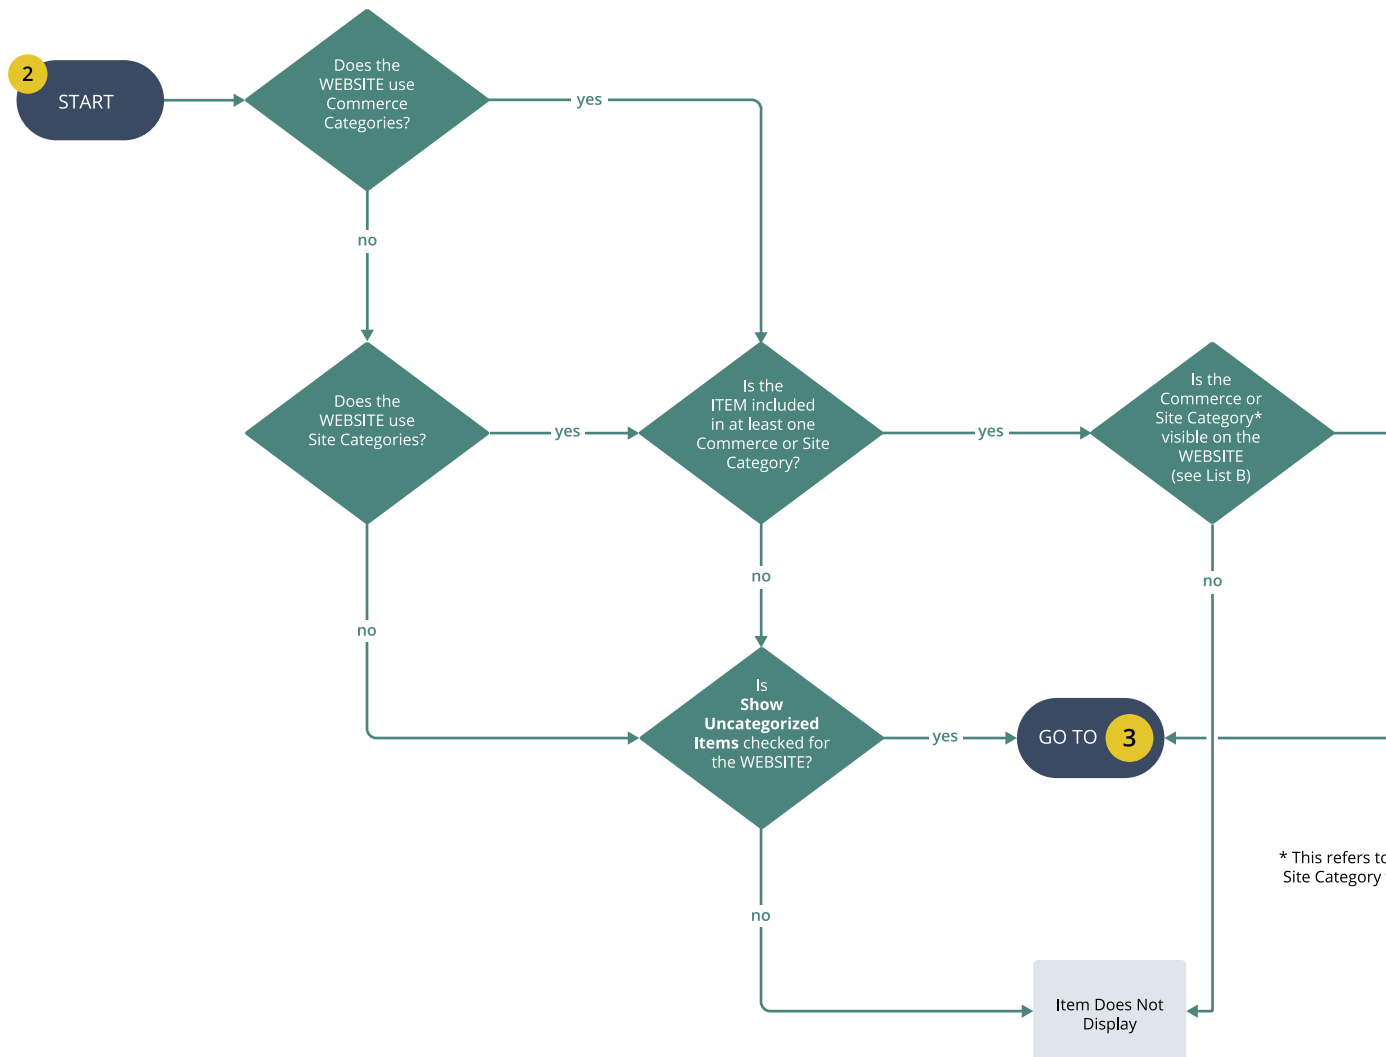

Item Settings

List A: Item Types

- Assembly Items
- Download Items
- Gift Certificates
- Inventory Items
- Kit
- Non Inventory Items
- Service Items

Commerce and Site Category Settings

List B: Category Visibility

If you answer YES to all these questions, the Commerce or Site Category will show up on the website.

For Commerce Categories only:

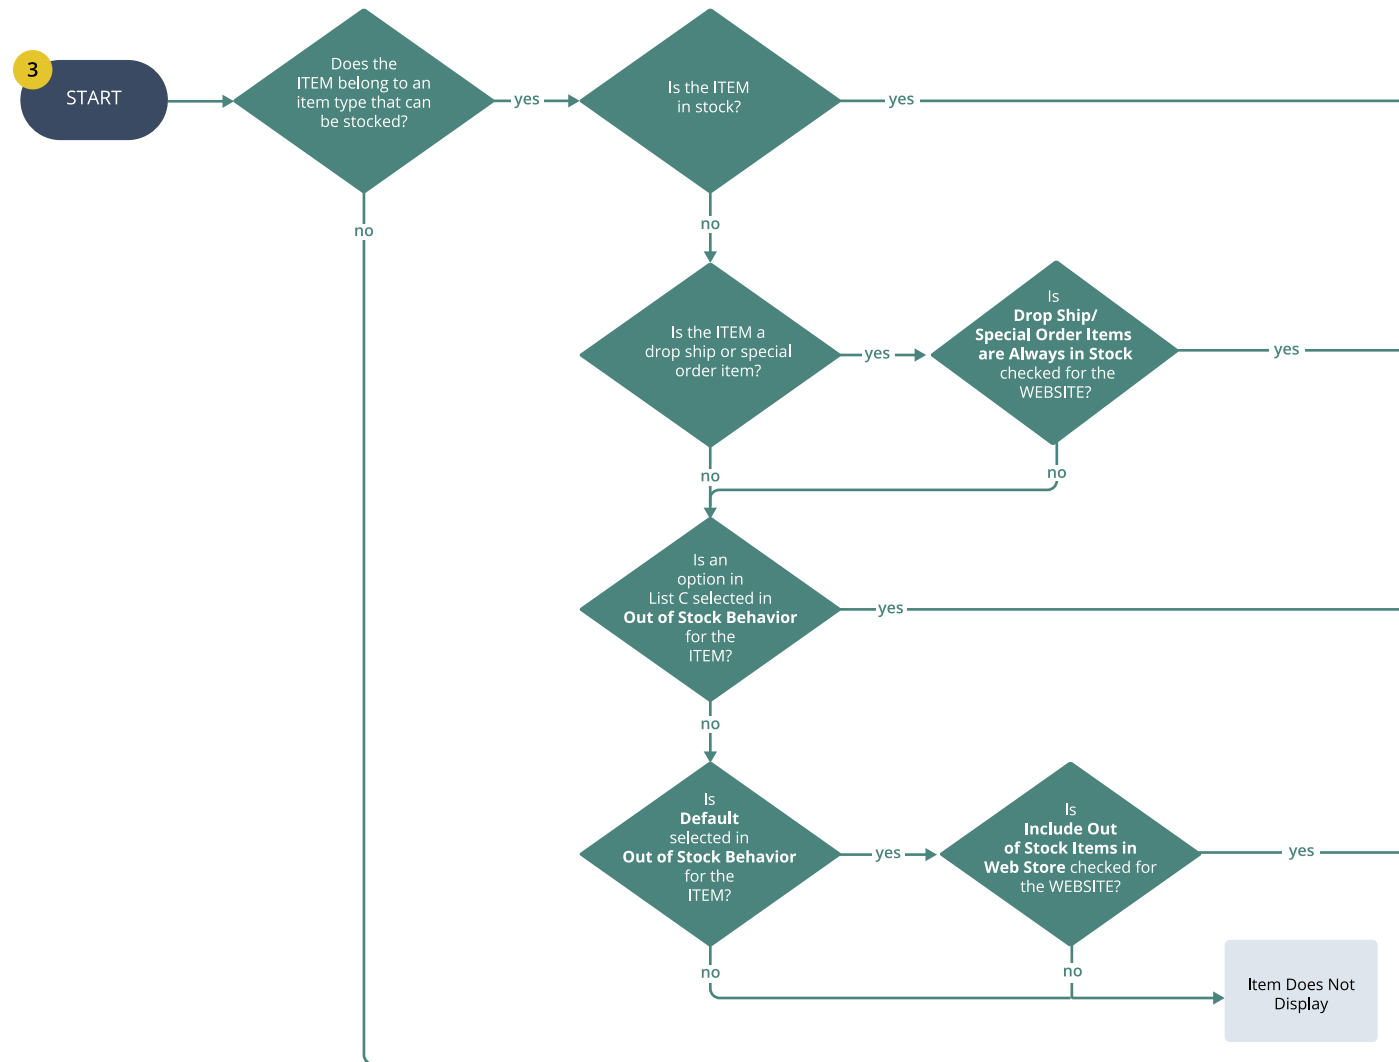

- Is the website selected for the Commerce Catalog?
- Is the **Inactive** box cleared for the Commerce Catalog?
- Is the Commerce Category included in the Commerce Catalog?
- Is the **Inactive** box cleared for the Commerce Category?
- Is **Display in Web Site** checked for the Commerce Category?
- Is Date within the period defined by the start and end date of the Commerce Category?

For Site Categories only:

- Is the website selected for a Presentation tab?

- Is the Site Category included on the Presentation tab?
- Is the **Inactive** box cleared for the Presentation tab and the Site Category?
- Is **Display in Web Site** checked for both the Presentation tab and the Site Category?
- Is the Customer included on the Audience subtab of the Presentation tab and the Site Category?

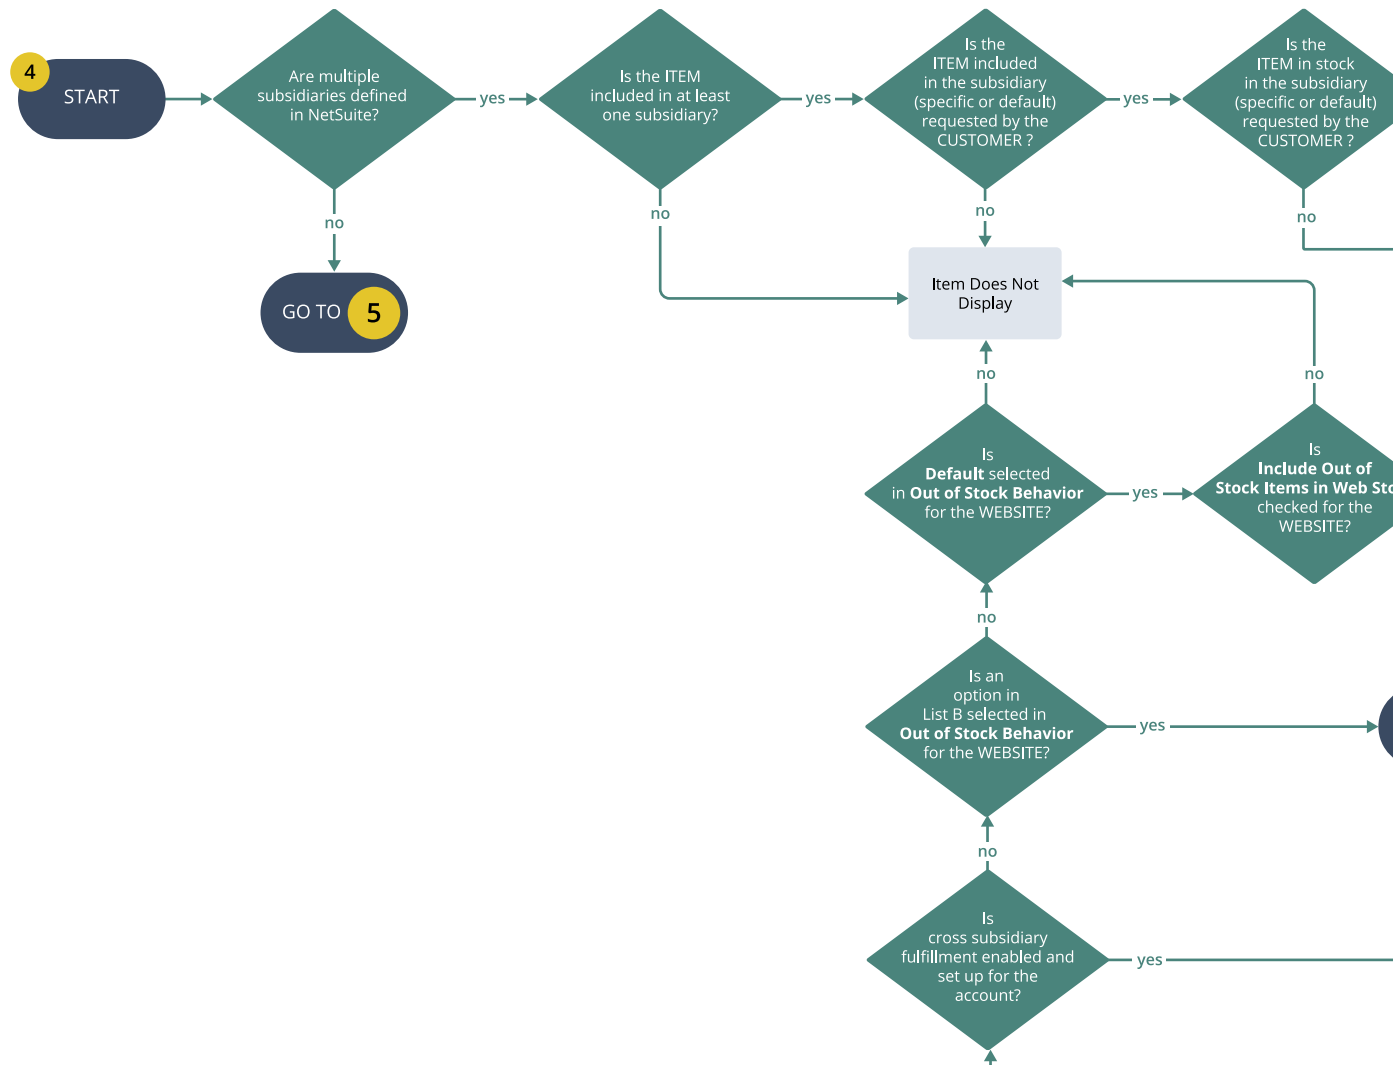

Out of Stock Behavior Settings

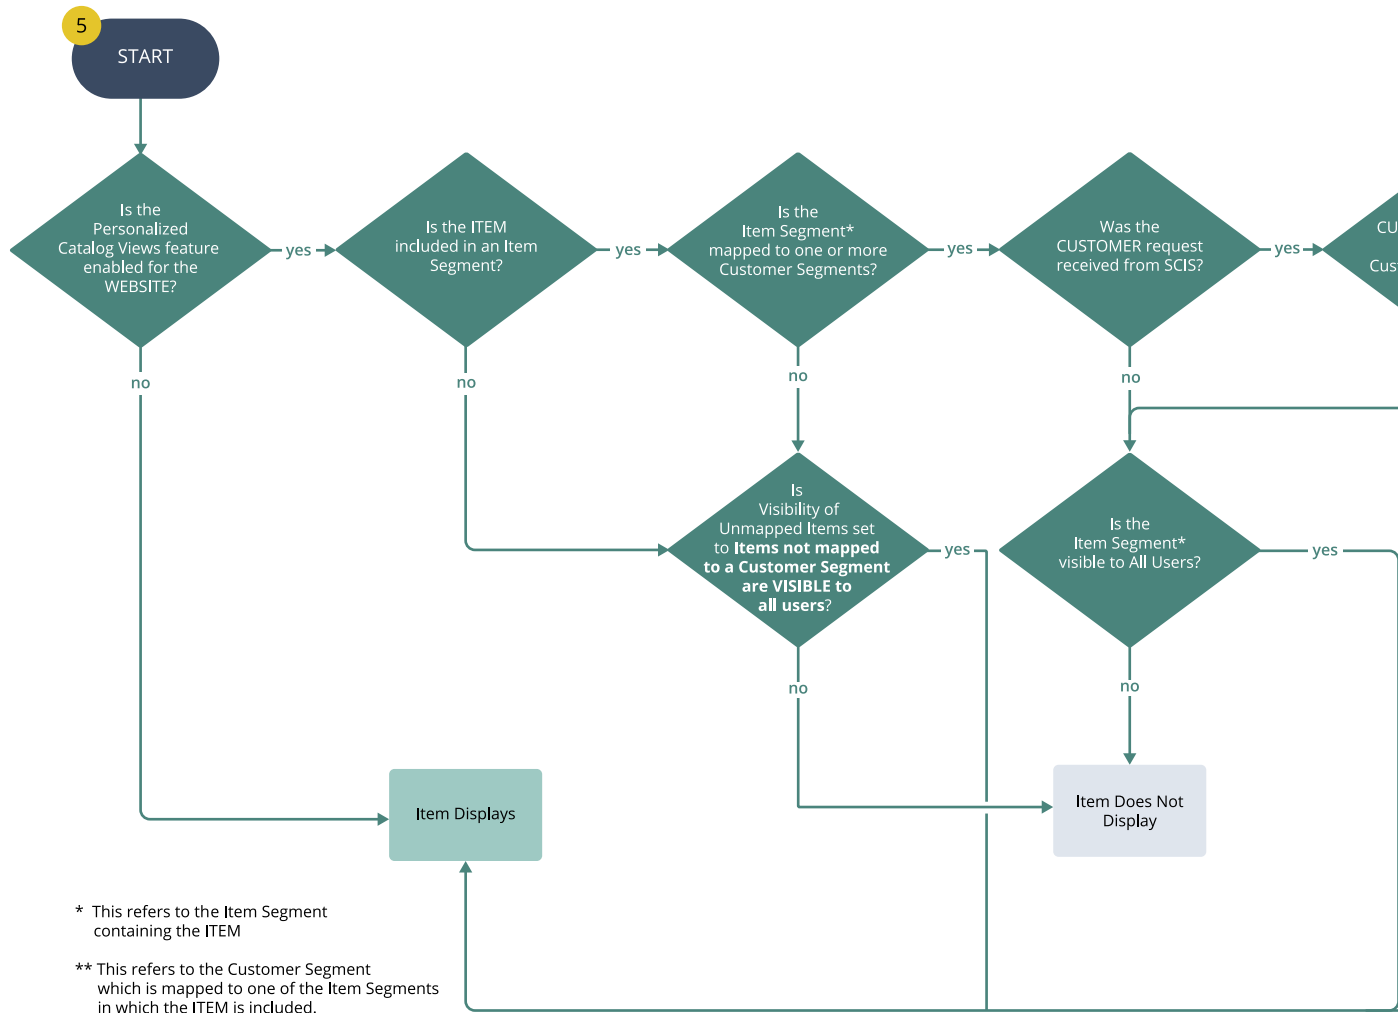

List C: Out of Stock Behavior

- Don't allow back orders, but show an out-of-stock message
- Allow back orders, but show an out-of-stock message
- Allow back orders without showing an out-of-stock message

Multi-Subsidiary Settings

Personalized Catalog View Settings

Item Images

Applies to: SuiteCommerce | SuiteCommerce Advanced

Item images can improve your website's quality and encourage customers to make a purchase. Item images appear on the Product Details page, as thumbnails, and in search results.

Note: This section covers item images, which follow a different procedure than other website images. For information about other image types, such as banners and logos, see [Site Management Tools Image Content Type](#).

Uploading item images involves renaming image files according to the file name format, then uploading them to the File Cabinet. From there, the images are associated with the item record that corresponds with the item identifier in the image file name.

Set up item images on your website by following these procedures:

1. [Website Setup](#)
 - a. [Set the Image Domain and Image Folder](#)
 - b. [Define the File Name Format](#)
 - c. [Add Item Image Field to Field Sets](#)
 - d. [\(Optional\) Configure Multi-Image Options](#)
2. [Rename Image Files with the Item Identifier](#)
 - a. [Image File Naming Guidelines](#)
 - b. [Example](#)
3. [Upload Images to the File Cabinet](#)
4. [Image Resizing and Compression](#)
 - a. [Guidelines](#)
 - b. [View Image Size IDs](#)
5. [Review Images After Upload](#)
 - a. [Add Alternate Text](#)
 - b. [Make Images Available Without Login](#)

Website Setup

Applies to: SuiteCommerce | SuiteCommerce Advanced

The following procedures define prerequisite settings for using item images. Complete each step before you upload the item image files.

Tip: You'll only need to set these up one time. Follow the steps to verify they are completed.

Set the Image Domain and Image Folder

Item image files are stored in the File Cabinet at Web Site Hosting Files > Live Hosting Files > images. Images in this folder are mapped to a corresponding item record. Only store item images in this folder. Avoid creating subfolders, as images in them won't map to item records.

 **Note:** Other images, such as banners and logos, are stored elsewhere. See [Site Management Tools Image Content Type](#) for more details.

To set the image domain and image folder:

1. Go to Commerce > Websites > Website List.
2. Click **Edit** next to your website name.
3. Click the **Images** subtab.
4. In the **Image Domain** field, select the domain you're going to use.
5. In the **Image Folder** field, select the path to the images folder (Web Site Hosting Files : Live Hosting Files : images).
6. Click **Save**.

Define the File Name Format

The file name format determines the structure of image file names. The file name is made up of components used to associate the file with its corresponding item record.

For more information about the parameters for renaming image files, see [Rename Image Files with the Item Identifier](#).

Definitions:

- **Item Identifier** – The file name component that matches an item record field. It can be the Display Name/Code, UPC Code, URL Component, Item Name/Number, or a custom field. Images associated with a given record must begin with the item identifier.
 - You can select the item identifier from the dropdown menu or create a custom field to use as the item identifier. Custom fields must be **stored** to be used as an item identifier.
- **Item ID Delimiter** – The component used to parse the item identifier from the other file name components.
 - Can be any combination of up to 5 supported characters. Supported characters: \$ - _ . + ! * ' () ,
 - The default value is an _ (underscore).
- **Structure Delimiter** – the component used to parse subsequent elements of the file name structure.
 - It can be any combination of up to 5 supported characters. Supported characters: \$ - _ . + ! * ' () ,
 - It can be the same value as the Item ID Delimiter.
 - The default value is a - (hyphen).

To define the file name format:

1. Go to Commerce > Websites > Website List.
2. Click **Edit** next to your website name.
3. Click the **Images** subtab.
4. Select an option from the **Item Identifier** dropdown list.
5. Enter a character in the **Item ID Delimiter** field.
6. Enter a character in the **Structure Delimiter** field.

7. Click **Save**.

Add Item Image Field to Field Sets

You need to add the item image field to the **details** and **search** field sets to display images on your website. If you skip this step, images associated with item records won't appear in search results or on product details pages. For more information, see [Define Field Sets](#).

To add an item image field to field sets:

1. Go to Commerce > Websites > Website List.
2. Click **Edit** next to your website name.
3. Go to the **Field Sets** subtab.
4. Click on the **details** field set and edit the **Fields Included in Field Set** column.
5. In the Field Set popup window, add a new row, and select **Item Images (Detail)** from the dropdown list.
6. Click **Add**.
7. Click **Submit**.
8. Click **OK**.
9. Repeat Steps 4 through 8 for the **search** field set.
10. Click **Save**.

(Optional) Configure Multi-Image Options

With multi-image options, you can link an image to a specific item matrix option and display it when users choose that option. For example, if an item comes in different colors, you can use the color choice to switch to the corresponding image. When a user chooses blue, they'll see the blue image.

See the next step, [Rename Image Files with the Item Identifier](#), for an explanation of how to rename your files to use this capability.

The multi-image options feature only works with matrix items. See the help topic [Matrix Items](#) for instructions on how to set up matrix items. You can set up multi-image for each transaction item option you created during [Setting Up Custom Transaction Item Options](#).

To configure multi-image options:

1. Go to **Commerce > Websites > Configuration**.
2. Select the website and domain you want to configure.
3. Click the **Shopping Catalog** subtab and **Multi-Image Option** sublist.
4. In the **Multi-Image Option** field, enter the ID of the custom transaction item option to trigger the multi-image option. You can add one or more options to make them available on your website.

Note: You can find the ID on the record for the custom transaction item option. See step 2 of [Setting Up Custom Transaction Item Options](#) for more details.

5. Click **Add** after entering each ID.

- 6. Click **Save**.

After you configure multi-image options, they are ready for use. To use multi-image, connect images to their corresponding options by adding the option value to the file name. See [Rename Image Files with the Item Identifier](#) for more details.

Rename Image Files with the Item Identifier

Applies to: SuiteCommerce | SuiteCommerce Advanced

The image file name components associate the file to an item record and determine how the images are presented on the product details page. Before renaming your image files, see [Rename Image Files with the Item Identifier](#) to define the naming conventions.

Use the renaming parameters to organize how images display on your website.

- Add multiple images for a single product or option
- Trigger specific images when options are selected using multi-image options. This requires you to set up [\(Optional\) Configure Multi-Image Options](#).
- Set a default image

See [Bulk Rename Product Images](#) for a way to rename multiple item images at one time.

Image File Naming Guidelines

The following image shows an example file name with labeled components:

Item	Component	Parameters
1	Item Identifier	The item identifier must match the item record. Use the item identifier as defined in Rename Image Files with the Item Identifier. Start your file names with the item identifier. The item identifier used in the example is the UPC Code.
2	Item ID Delimiter	The item ID delimiter separates the identifier from the rest of the file name. Use the delimiter defined in Rename Image Files with the Item Identifier. The example uses an underscore (_).
3	Keyword	This optional component helps when adding multiple images to an item record. Use the same keyword for all images associated to the same item record.
4	Structure Delimiter	This delimiter separates file name components like keywords, item options, and numbers. Defined in Rename Image Files with the Item Identifier.

Item	Component	Parameters
		The example uses a hyphen (-).
5	Item Option	This component triggers a specific image when an option like color is chosen. Requires setup of (Optional) Configure Multi-Image Options .
6	Number	Used to differentiate identical file names and add multiple images to the same item option, like front and back views.
7	File Extension	File names must end with a file extension. Always use a period (.) before the file extension regardless of the structure delimiter used. Supported file types include: JPG, GIF, PNG, PJPG, SVG, TIFF.

Additional parameters:

- Make sure each image file name is unique.
- Not all components are required, but all file names must have an item identifier, file extension, and one additional component.
- To set a default image, add .default before the file extension. This default image appears in search results and is the first image shown on the product details page.
 - Example: OM5447_media-blue-01.default.jpg
- The file name can contain additional descriptive components which do not affect the display or association of the image.
 - Example: OM5447_media-blue-01-mens-jacket.jpg
 - Always place descriptive components after the functional components in the file name.

Example

The following screenshots represent the relationship between file names and your website.

Associated Images	URL Component Alias	Commerce Categories
Name ^		
OM5447.media.black.01.jpg		
OM5447.media.black.02.jpg		
OM5447.media.green.02.jpg		
OM5447.media.blue.02.jpg		
OM5447.media.green.01.jpg		
OM5447.media.orange.01.jpg		
OM5447.media.orange.02.jpg		
OM5447.media.blue.01.jpg		

This example shows the image files represented on the product details page. No item option is selected, so all the image files are visible.

Upload Images to the File Cabinet

Applies to: SuiteCommerce | SuiteCommerce Advanced

Upload your image files to the File Cabinet in the image folder as set during the step [Set the Image Domain and Image Folder](#).

After images are uploaded they're automatically linked to their corresponding item records based on the item identifier. You can add or remove files from this folder whenever you need to. Images stored in a subfolder won't be recognized and won't link to item records.

To confirm your images uploaded correctly, check the Associated Images sublist on the item record's **Web Store** subtab.

To upload multiple images to the File Cabinet:

1. Create a ZIP file on your computer with the images you want to upload.

Tip: To unzip directly into the images folder, don't place images in a subfolder within the ZIP file.

2. Go to Documents > Files > File Cabinet.
3. Go to and open the images folder (Web Site Hosting Files : Live Hosting Files : images).
4. Click **Advanced Add**.

5. From the **Zip Archive to Add** field, select the ZIP file you created on your computer and click **Open**.
6. Check the **Unzip Files** box to extract your files directly into the images folder.
7. Check the **Make All Files Available Without Login** box to let all visitors view your images.
8. Click **Add**.

To upload a single image to the File Cabinet:

1. Go to Documents > Files > File Cabinet.
2. Go to and open the images folder (Web Site Hosting Files : Live Hosting Files : images).
3. Click **Add File**.
4. Find the image on your computer and click **Open**.

Image Resizing and Compression

i Applies to: SuiteCommerce | SuiteCommerce Advanced

Image resizing lets you use one image on the product details page, in search results, and for thumbnails. By resizing images to an appropriate size, the resizing tool speeds up page load times and improves SEO.

The image resizing tool generates a resized image when it's requested from the website and stores the image in the cache. The original image in the File Cabinet remains unchanged.

Resized images are compressed to the optimal level, regardless of other settings. For more on compressing other image types, see [Site Management Tools Image Compression](#).

Guidelines

- Resizing works with JPG and PNG files, but compression only applies to JPGs.
- Resizing only works for images in the images folder (Web Site Hosting Files : Live Hosting Files : images).
- The resizing tool works best when reducing large images. Small images may become pixelated when enlarged. Make sure your images are as large as the largest resizing ID dimension they'll be displayed at. Usually, that's 1200×1200 pixels. If your images are too big, resize them before uploading to save space.
- The resizing tool maintains the original aspect ratio. For example, a 1200×1000 image resized to 600×600 is rendered at 600×500. If you want to change the aspect ratio, use an image editor before you upload the image.

Automatic CDN File Size Compression

The CDN may automatically convert PNG and JPG images to AVIF or WEBP for better performance. If the converted image is smaller and supported by the browser, the CDN serves it instead.

You don't need to do anything to enable this feature other than enable CDN caching. For more information about CDN caching, see the help topic [CDN Caching](#).

Note: The File Cabinet doesn't support AVIF and WEBP for item images. Since conversion is automatic, stick with PNG and JPG for item images.

View Image Size IDs

Find image resizing settings on the **Images** subtab of the website setup record at Commerce > Websites > Website List. If the image size IDs are already set up, the IDs and dimensions appear. You can adjust the maximum width and height of your image size IDs here.

Adjust the dimensions as needed. Don't change the IDs, as they match the configuration record.

The following screenshot displays standard image size IDs and their default dimensions.

Image Resizing				
Image Size ID *	Description	Enabled	Maximum Width	Maximum Height
thumbnail		Yes	175	175
main		Yes	600	600
tinythumbnail		Yes	50	50
zoom		Yes	1,200	1,200
fullscreen		Yes	1,600	1,600
homeslider		Yes	200	220
homecell		Yes	125	125
categorybanner		Yes	1,000	50
Add Cancel + Insert Remove				

Review Images After Upload

Applies to: SuiteCommerce | SuiteCommerce Advanced

Check the Associated Images sublist on the Web Store subtab to verify that images are associated with the correct item record. If the images don't appear on the item record, verify that you completed all the steps in [Website Setup](#).

Add Alternate Text

Alternative text is crucial for your website. Alt text appears when an image can't be loaded. Alt text also helps with page readers and SEO. The alt text you enter is used in the HTML image element. For example ``.

You must add alt text to each image on the item record. Write a brief description of what's in the image. On the item record, alt text is limited to 35 characters. Alternatively, you can add alt text to the file record, which has a 199-character limit.

Here's an example of good alt text:

Associated Images	URL Component Alias	Commerce Categories •	Web Site Categories •	Related Items •
Name	Alt Image Tag			
OM5447.media.black.01.jpg	black waterproof Apparition jacket (front view)			
OM5447.media.black.02.jpg	black waterproof Apparition jacket (back view)			
OM5447.media.green.01.jpg	green waterproof Apparition jacket (front view)			
OM5447.media.green.02.jpg	green waterproof Apparition jacket (back view)			
OM5447.media.blue.01.jpg	blue waterproof Apparition jacket (front view)			
OM5447.media.blue.02.jpg	blue waterproof Apparition jacket (back view)			
OM5447.media.orange.01.jpg	orange waterproof Apparition jacket (front view)			
OM5447.media.orange.02.jpg	orange waterproof Apparition jacket (back view)			

 **Note:** You can update alt text manually for each image or use customization. To learn more about customization, see the help topic [Develop SCA Customizations](#).

To add alt text to an image on the item record:

1. Go to Lists > Accounting > Items.
2. Click **Edit** next to the item record you want to update.
3. Go to the **Web Store** subtab and find the **Associated Images** sublist.
4. In the **Alt Image Tag** field, provide alt text for each image (up to 35 characters).
5. Click **Update Matrix** (or **Save**).
6. Click **Submit**.

To add alt text to an image using the file record:

1. Go to Documents > Files > File Cabinet.
2. Go to Web Site Hosting Files > Live Hosting Files > images.
3. Click **Edit** on the image file you want to update.
4. In the **Alt Image Tag** field, enter your alt text (up to 199 characters).
5. Click **Save**.

Make Images Available Without Login

The ability to view images is controlled in the folder settings. This procedure shows you how to perform a mass update to ensure images are viewable to all website visitors.

If you've already done this during upload, you can skip this. This procedure ensures everything in the images folder is available without a login, regardless of how the files were uploaded.

 **Note:** By default, SuiteScript-uploaded files require a login, regardless of which folders the files are saved in. To make SuiteScript-uploaded files accessible without a login, set the parameter on the upload script or check the **Available Without Login** box. As of 2020.2, files uploaded using Web Services use the same Available Without Login rules as files uploaded using SuiteScript.

To perform a mass update of files to be available without login:

1. Go to Lists > Mass Update > Mass Updates.
2. Click **Files** to expand the options for files.
3. Click **Make Files Available Online**.
4. On the **Criteria** subtab, define which files to include in the update.
 - a. In the **Filter** column, select **Folder** from the dropdown menu.
 - b. In the popup window, select **any of** from the dropdown menu.
 - c. In the text box, search for the image folder by entering its location (Web Site Hosting Files : Live Hosting Files : images).
 - d. Click **Set**.
5. Click **Add**.
6. Click **Save**.

Item Grouping Methods

There are several ways to group items in Commerce web stores—some methods have specific purposes, while others are more general. The table below explains all the available item grouping methods and shows how they're different.

	Grouping Methods		
	Item Collections	Commerce Categories	Merchandise Hierarchy Nodes
Main Purpose	General purpose	Web store navigation	Reporting
Description	Item collections are a general way to group items. Used by Personalized Catalog Views. For more information, see Personalized Catalog Views .	Commerce Categories let you create a hierarchy of product categories, subcategories, and products for your web store's navigation.	Merchandise Hierarchy Nodes help you organize your merchandise so you can run reports to spot market trends and analyze shopper behavior.
Web Store Availability?	Available for use with: - NetSuite - NetSuite web stores	Available only for NetSuite web stores.	Available for use with: - NetSuite - NetSuite web stores
Cardinality	Many to many	Many to many	One to many A Merchandise Hierarchy node can have multiple items, but each item can only be in one node.
Member Definition	- Static (manual selection) - Dynamic (based on saved searches)	Static (manual selection)	Static (manual selection)
Date Effectivity	Does not support date effectivity.	Supports date effectivity, that is, Start Date and End Date.	Supports date effectivity, that is, Start Date and End Date.
More Information	Item Collections	Commerce Categories	Merchandise Hierarchy

Note: There are other ways to group items in NetSuite, like item groups, kits and assemblies, and Site Builder-specific methods like Site Categories. For more information, see the help topics [Groups, Assemblies, and Kit/Packages](#) and [Site Builder Tabs & Categories](#).

Item Collections

Item collections let you group catalog items together. The items you add to a collection might not be related, or you can group them by things like vendor or location. What you add to each item collection depends on your business needs.

You can:

- Add an item to multiple item collections
- Add a group of items to a collection by picking them one by one

- Automatically add items to a collection using a saved search

To see existing item collections, go to Commerce > Marketing > Item Collections.

Item collections can contain all item types supported by NetSuite. For matrix items, you can only add the parent item to the collection, but it represents all the child items. For more information about item types, see the help topic [Item Types](#).

One key use for item collections is in personalized catalog views. You can create an item collection and show it to one or more specific customer groups. For more information, see [Personalized Catalog Views](#).

You can also get data about item collections through SuiteAnalytics Connect. The records exposed in SuiteAnalytics Connect are available in the Connect Browser. You can get data for item collections using the Item Collection Map and Item Collections tables listed in [Connect Schema](#). For more information, see the help topics [Working with the Connect Browser](#) and [SuiteAnalytics Connect](#).

Note: To access the Connect schema, you need to have SuiteAnalytics Connect purchased and enabled in your NetSuite account.

Item Collections Roles and Permissions

Any user who creates item collections needs a valid NetSuite user account and a role with the right permissions. These roles give you those permissions by default:

- Administrator
- Store Manager
- Marketing Manager
- Sales Manager
- Marketing Administrator

You can also add the Item Collection permission to a custom NetSuite role so users can manage item collections. For more information about NetSuite users and roles, see the help topic [NetSuite Users & Roles](#). You can't edit a standard NetSuite role, but you can use it as a starting point for a new custom role. For detailed instructions and best practice for customizing a NetSuite role, see the help topic [NetSuite Roles Overview](#).

Creating Item Collections

You can create two types of item collections:

- **Static item collections** - Lets you add and remove items manually. They're great when your items can't be grouped by specific properties.
- **Dynamic item collections** - Lets you add and remove items automatically based on a saved search. Whenever an item matches the saved search, it's added to the collection.

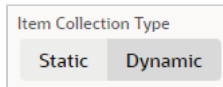

To create a dynamic item collection:

1. Go to Commerce > Marketing > Personalization > Item Collections > New.
2. In the **Name** field, enter a name for the item collection (up to 200 characters).

3. Enter a description for the item collection.

If you want, you can get writing help for the **Description** field from our generative AI service, NetSuite Text Enhance. Click the **Enhance Text** button to see your options. For more details, see the help topic [Text Enhance](#).

4. Select the **Dynamic** option on the toggle.

Note: You can't switch an item collection from Dynamic to Static or the other way around after you've saved it.

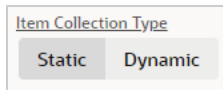

5. Select the existing item saved search you want to use from the **Saved Search** list.
For information about how to create a saved search, see the help topic [Defining a Saved Search](#).
6. Click **Save**.

To create a static item collection:

1. Go to Commerce > Marketing > Personalization > Item Collections > New.
2. In the **Name** field, enter a name for the item collection (up to 200 characters).
3. Enter a description for the item collection.

If you want, you can get writing help for the **Description** field from our generative AI service, NetSuite Text Enhance. Click the **Enhance Text** button to see your options. For more details, see the help topic [Text Enhance](#).

4. Select the **Static** option on the toggle.

Note: You can't switch an item collection from Dynamic to Static or the other way around after you've saved it.

5. On the **Items** subtab of the item collection, do one of the following:
 - To add multiple items together:
 1. Click **Add Multiple**.
 2. Check the boxes for the items you want to include and click > to move them to the Current Selections pane. You can use Shift and Ctrl on your keyboard to select or clear multiple values.
 3. To find specific items, use the search box at the top of the Add Items window. You can also filter the list using the filter above the items.
 - To add items one by one, pick them from the list in the Name field. You can search for specific items by typing in at least three characters from the item name.
6. Click **Save**.

You can also use CSV Import to create static item collections. The Item Collection and Item Collection Item Map records need to be imported separately. For more information, see the help topics [Item Collection Import](#) and [Item Collection Item Map Import](#).

Commerce Categories

Applies to: SuiteCommerce | SuiteCommerce Advanced

This information refers to SuiteCommerce or the Vinson release of SuiteCommerce Advanced or later.

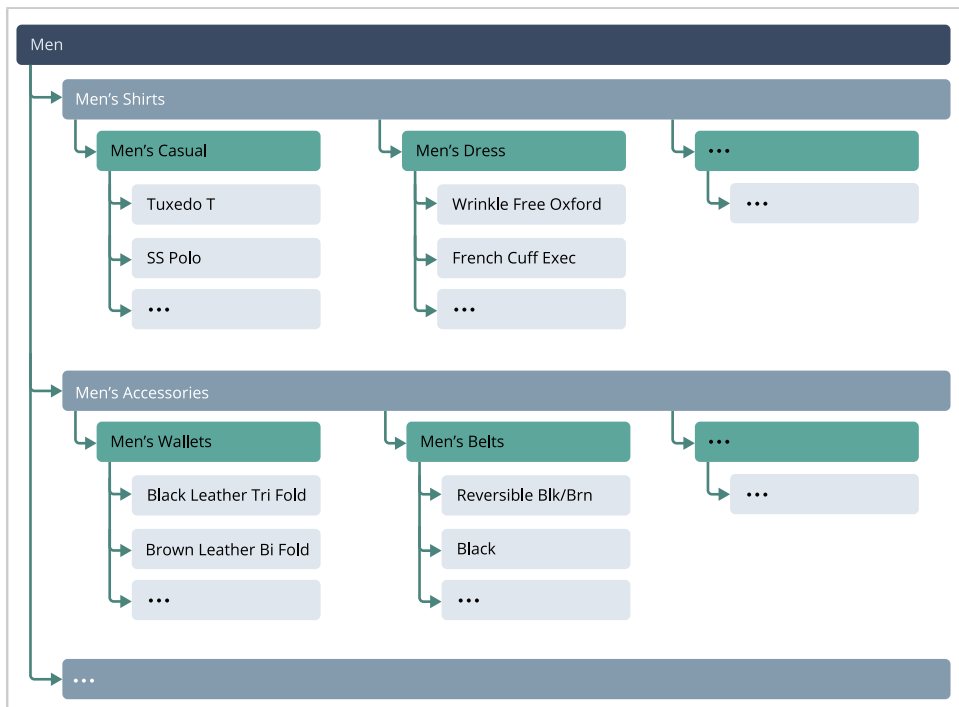

Commerce Categories let you build a hierarchy of product categories, subcategories, and products. At the top level of this hierarchy is the catalog. Each site can have one catalog, and all categories go into that catalog. A well-organized catalog helps you show items to your shoppers in a clear, structured way.

The catalog's category hierarchy can be general and show everything you sell, or it can be based on occasions like seasons. For example, you might have a spring theme that highlights spring apparel and accessories, or a back-to-school setup that features those specials.

Since you can assign the same item in multiple categories, your structure can be a mix of both types. For example, you could have a large, multi-purpose category with subcategories for spring fashions and accessories, along with standard categories like Men's, Women's, or Children's—each with their own subcategories.

Category organization can be simple with one level of categories and products assigned to those categories. More likely, the category organization and structure is sophisticated with multiple category levels that result in a well-organized, intuitive grouping of products. Here's an example of a category hierarchy for an apparel site.

Note: To manage Commerce Category records pages, you must have the appropriate permission.

This structure has four levels. The top category is Men, which is split into two more levels of subcategories. Items go in the lowest subcategory. Keep in mind, you don't have to assign items only to the lowest level. You may have some levels that have both categories and items assigned to it.

Note: SuiteCommerce supports up to 9,999 categories and subcategories combined. In this example, there are 7 total. It also supports up to 10,000 items per category.

Note: Don't mix up Commerce Categories and Merchandise Hierarchy. Commerce Categories help you organize items in your web store, while Merchandise Hierarchy is for grouping and managing products or inventory across your business. It's useful for planning, purchasing, and tracking inventory. For more information, see the help topic [Merchandise Hierarchy](#).

Category URLs

When you create a category you specify the URL fragment for that category. The URL fragment is used for accessing that category page. The system combines category and subcategory URL fragments, adds them to your domain, and creates the full URL for each category page. For example, the URL fragment for the category Camping is camping and the URL fragment for the category Camping Equipment is equipment. Camping Equipment is a subcategory of Camping. So, the full URL is <http://mysite.com/camping/equipment>.

For a subcategory, you can set a URL fragment override, which replaces the default fragment when someone accesses it through that parent category. This lets you use one URL fragment for a subcategory under one parent, and a different one under another parent. For more information about subcategories see [Create Subcategories for a Commerce Category](#).

Categories in Site Management Tools

In addition to creating and managing categories in NetSuite, you can also manage them in Site Management Tools. When you update categories in Site Management Tools, those changes show up in NetSuite too. The same goes for any category changes you make in NetSuite—they appear in Site Management Tools as well. When you manage categories in Site Management Tools, those changes are always live on your site. For more information, see the help topic [Commerce Categories in Site Management Tools](#).

Set Up NetSuite

Applies to: SuiteCommerce | SuiteCommerce Advanced

Here are the setup tasks you need to complete to use Commerce Categories:

Enable Commerce Categories Feature

Applies to: SuiteCommerce | SuiteCommerce Advanced

To enable the Commerce Categories feature:

1. Go to Setup > Company > Enable Features.
2. Click the **Web Presence** subtab.
3. In the Web Site field group, select the **Commerce Categories** box.

Note: If you use Commerce Categories to implement Personalized Catalog Views, you'll need to remove all mappings between Commerce Categories and Customer Segments before you can disable the Commerce Categories feature. For more information about using Commerce Categories to implement Personalized Catalog Views, see [Defining Item Segments](#).

Add Commerce Categories to Website Field Sets

Applies to: SuiteCommerce | SuiteCommerce Advanced

Field sets control what data your site templates can use. If you're adding Commerce Categories to an existing SuiteCommerce Advanced site, you'll need to add them to the site's field sets. For more information about field sets, see [Define Field Sets](#).

To add Commerce Categories to website field sets:

1. Go to Commerce > Websites > Website List.
2. Click **Edit** next to the website where you're adding the Commerce Categories field.
3. Click the **Field Sets** subtab.
4. Locate the **Details** field set and click the **Fields Included in Field Set** column. This is the last column in the row.
5. Click the **Set** button to the right of the field.

This opens the Field Set window, where you can see the assigned fields and add more if you need to.

6. Click the **Field Name** dropdown list at the bottom of the field list and choose **Commerce Categories**.
7. Click **Add**.
8. Click **Submit** to close the Field Set window.
9. Click **OK** on the search field set row.
10. Click **Save**.

Add Commerce Categories to Website Search Index

Applies to: SuiteCommerce | SuiteCommerce Advanced

SuiteCommerce provides enhanced item search capabilities for SuiteCommerce sites. When you're setting up Commerce Categories, you'll need to add them to the facet fields search index. See [Search Settings Overview](#) for more information about search settings.

To add Commerce Categories to the website search index:

1. Go to Commerce > Websites > Website List.
2. Click **Edit** next to the website where you're adding the Commerce Categories field.
3. Click the **Search Index** subtab.
4. Click the **Facet Fields** subtab.
5. Click the **Facet Field Name** dropdown list in the last row, and choose **Commerce Categories**.

Facet Field Name *	Field ID
Commerce Categories	commercecategory

6. Click **Add**.
7. Click the **Sort Fields** subtab.
8. Click the **Field Name** dropdown list in the last row and choose **Commerce Categories**.

Field Name *	Field ID	Sort Order
Commerce Categories	commercecategory	Ascending

9. Click **Add**.
10. Click **Save**.

Set Image Resizing Options For Commerce Category Banners

Applies to: SuiteCommerce | SuiteCommerce Advanced

SuiteCommerce Advanced lets you set image resizing options for your site's images. When you're setting up Commerce Categories, you'll want to set the image resizing option for the commerce category banner images. For more information, see [Image Resizing and Compression](#).

To set up image resizing options for Commerce Categories:

1. Go to Commerce > Websites > Website List.
2. Click **Edit** next to the website where you want to set up image resizing.
3. Click the **Images** subtab.
4. Locate the **Image Resizing** group and make the following entries.

Image Size ID *	Description	Enabled	Maximum Width	Maximum Height
categorybanner		Yes	150	150

- a. **Image Size ID** — Enter **categorybanner**.
- b. **Description** — The description is optional.
- c. **Enabled** — Check the box.
- d. **Maximum Width** and **Maximum Height** — Enter the maximum width and height for the category banner image. If you enter only the width or height, the other value is filled in automatically.
5. Click **OK**.
6. Click **Save**.

Set Up Commerce Catalog

Applies to: SuiteCommerce | SuiteCommerce Advanced

The catalog is the top-level group for Commerce Categories. Before you can create Commerce Categories, you'll need a catalog to assign them to. Each website can have only one catalog.

To create a Commerce Catalog:

1. Go to Commerce > Content Management > Catalog & Categories > Commerce Catalogs > New.
2. From the **Site** dropdown list, select the website for this catalog. Remember, each website can have only one catalog.
3. In the **Name** field, enter a name for the catalog. This name won't show up on your website—it's used for identifying the catalog in NetSuite.
4. In the Description field, add more details about the catalog. This information isn't shown on your site—it's used only to provide extra details in NetSuite, like the catalog's purpose.
5. Click **Save**.

Set Up Commerce Categories

 **Applies to:** SuiteCommerce | SuiteCommerce Advanced

Go to the Commerce Categories page to complete the related setup tasks. See [Commerce Categories](#).

Define Commerce Categories Basic Settings

 **Applies to:** SuiteCommerce | SuiteCommerce Advanced

You define commerce categories on the Commerce Categories page at Commerce > Content Management > Commerce Categories. You'll find the basic settings for a commerce category in the category header.

To add a Commerce Category:

1. Go to Commerce > Content Management > Catalog & Categories > Commerce Categories > New.
2. Enter the following information in the header:

 **Note:** Required fields are marked with an *.

Field Name	Field ID — SuiteCommerce Configuration	Description
Name*	name	Enter a name for the category. This name identifies the category in NetSuite and can be used publicly on your site in category navigation.
Description	description	Add a description for the category. This lets you give more details about it.
Catalog*	–	Select the catalog for this category. Remember the catalog determines which website the category is available on, and each website can only have one catalog.
Primary Parent	–	If you're creating a subcategory, select the main parent category you want to assign it to. The new category will show up as a subcategory under the parent you specify here. All subcategory override values start out blank, but you can change them on the Subcategory subtab for the parent category record. For more information, see Create Subcategories for a Commerce Category. Leave this field empty if you don't want to assign a primary parent category. If a subcategory has more than one parent, the same content can be accessed through different URLs. For SEO best practice, the primary parent flag is used to build the canonical link tag

		which tells web crawlers that this is the preferred URL for accessing the content.
Page Title	pagetitle	Enter a title for the page. This fills in the <title> element for an SuiteCommerce Advanced category page. You can also use this value to populate the <title> element in a custom SSP application.
Heading	pageheading	This field lets you set a heading that shows at the top of the categories page. The page template needs to be set up to show the heading. You can also use this field to display a heading for the category in your custom SSP application.
Sequence Number	sequencenumber	The sequence number you enter here sets the order of categories in the Site Management Tools category list. If you use the Move option in Site Management Tools to reorder the category list, the sequence number on the Commerce Category record updates automatically to reflect the new order.
URL Fragment*	urlfragment	The URL Fragment lets you set the part of the URL used to get to the category page. If it's a subcategory, the URL includes fragments from all parent categories in the hierarchy. Enter the URL without slashes. For example, for a category called shoes, enter shoes. If shoes is a subcategory of mens, and mens has a URL fragment of mens, the full URL to the shoes page is /mens/shoes. URLs are case sensitive, so be consistent with your fragments. It's best to always use lowercase. For more information about category URLs, see Category URLs.
Page Banner	pagebannerurl	The page banner field lets you pick an image file from the file cabinet to show as the banner on a category page on a SuiteCommerce Advanced site. The page template needs to be set up to display the banner. You can also use this for banners in your custom SSP app. To show a page banner, go to the SC Configuration record and select the pagebannerurl field ID for Category Fields.
Thumbnail Image	thumbnailurl	The thumbnail image field lets you pick a file from the file cabinet to use as the thumbnail for this category. To show a thumbnail image, go to the SC Configuration record and select the thumbnailurl field ID for Category Fields.
Addition to <HEAD>	addtohead	The addition to head field lets you add code like HTML, CSS, or JavaScript between the <head></head> tags on this category page.
Meta Keywords	metakeywords	This field lets you add meta keywords for the page.
Meta Description	metadescription	The description you enter here is important for SEO. It's usually what shows up on search results pages. For best practices about writing meta descriptions, see the help topic SEO and Meta Descriptions .
Sitemap Priority	sitemappriority	The value you enter here fills in the <priority></priority> element in your XML sitemap. You can use values from 0.0 to 1.0. If you don't set a priority, the default is 0.5. These priorities help you rank your pages. Search results pages may consider this ranking when presenting multiple pages from your site and order the pages based on the priority.
Display in Web Site	displayinsite	The Display in Web Site box lets you choose if a category should be visible to visitors. If you don't check it, the category won't show up on your SuiteCommerce Advanced site.

Inactive	isinactive	Mark a category as inactive if you want to hide it from your website and stop any other actions with it. For example, an inactive category can't be assigned as a subcategory. You can't mark a category as inactive if it already has subcategories assigned to it.  Note: When a category is inactive, it won't show up in the Commerce Categories list. To see inactive categories, check the Show Inactives box on the categories list page.
----------	------------	---

3. Add any subcategories you need. For more information, see [Create Subcategories for a Commerce Category](#).
4. Assign any items to the category. For more information, see [Assign Items to a Commerce Category](#).
5. Click **Save**.

Create Subcategories for a Commerce Category

 **Applies to:** SuiteCommerce | SuiteCommerce Advanced

You can use any category as a subcategory, and you can assign the same category as a subcategory to more than one category. You assign subcategories on the Subcategory subtab of the Commerce Category page at Commerce > Content Management > Catalog & Categories > Commerce Categories.

When you create a category, you enter basic information like its name, title, and meta description. For more information, see [Define Commerce Categories Basic Settings](#).

When you assign a category as a subcategory, you can override its basic settings with different values to use when the category is functioning as a subcategory. You can override all, some, or none of the category's primary values. For example, say you have categories called Outdoors, Camping, and Equipment. You assign Equipment as a subcategory for both Camping and Outdoors. For the Outdoors category assignment, you want a different banner image than for the Equipment category assignment, so you set up an override for the banner image.

 **Note:** When you assign a category as a subcategory, it won't be accessible as a root-level category anymore—you'll only be able to get to it through its subcategory assignments.

Canonical Tags for Commerce Categories

When you use URL overrides for subcategories, you end up with category pages that have different URLs but the same content. To help with SEO, SuiteCommerce Advanced adds an HTML canonical link tag to these pages.

The page with the primary path URL has a self-canonical tag, and pages with overridden URLs have a canonical tag that points to the primary parent path as well. Going back to the example above, the canonical link tags might look like this:

Primary Parent URL	http://mysite.com/camping/equipment	<link rel="canonical" href="http://mysite.com/camping/equipment" />
URL With Override	http://mysite.com/outdoor/campingequipment	<link rel="canonical" href="http://mysite.com/camping/equipment" />

Note: The Vinson release of SuiteCommerce Advanced uses relative paths in canonical URLs. Since search engines don't index canonical URLs with relative paths, you should extend the Facets.Browse.View.js in the **Facets** module to use absolute paths instead. For details, see the help topic [Canonical Tags Populated With Relative Paths](#). You only need to do this for the Vinson release of SuiteCommerce Advanced.

Order of Subcategories

The order of the subcategories on the **Subcategories** subtab, can reflect the order of how categories will be listed on the site. You can use Site Management Tools to change the order of the categories. When you change the order of categories in Site Management Tools, those changes also show up on the **Subcategories** subtab. For more information, see the help topic [Moving a Category or Subcategory](#).

The order in which categories are displayed on the site can be specified in the SCA Categories Configuration. See the help topic [Categories Subtab](#) for more information about configuring Commerce Categories in SCA.

Before you can assign a category as a subcategory, you'll need to create a category record for it. See [Set Up Commerce Categories](#).

To assign a subcategory to a category:

1. Create a new category record or edit an existing category record.
2. Select the **Subcategories** subtab.
3. Pick the category you want to assign as a subcategory from the categories dropdown list. Enter override values for any of the fields below, or leave them blank to use the default from the category record for the subcategory.
 - Name Override
 - Description Override
 - URL Fragment Override
 - Title Override
 - Heading Override
 - Page Banner Override
 - Thumbnail Image Override
 - Addition to <head> Override
 - Meta Keywords Override
 - Meta Description Override
 - Sitemap Priority Override
 - Display in Web Site Override
4. Click the **Add** to add the subcategory.
5. Keep repeating the last two steps for each subcategory you'd like to add.

View Category URL's

The **URL** subtab in the Commerce Categories record gives you a list of all URLs you can use to access a subcategory page. This is especially helpful if a subcategory is assigned to more than one parent category, since its page can be reached through different URLs.

To see the URLs for a subcategory page:

1. Go to Commerce > Content Management > Catalog & Categories > Commerce Categories.
2. Select the category record you want to view URLs for.
3. Select the **URL** subtab.

Assign Items to a Commerce Category

Applies to: SuiteCommerce | SuiteCommerce Advanced

You assign items to a category on the Items subtab of the Commerce Categories page. When you assign items to a category, those items show up under that category on your website. An item can be assigned to more than one category. You can also assign items at different levels in the category hierarchy. For example, you may have a level in your hierarchy that includes both subcategories and items.

Note: After you assign items to a category and save the record, it might take up to 5 minutes or more for them to show up in the Site Management Tools category preview and also in the category item list on the site. This delay is normal because the search index gets rebuilt when you add or change an item's category.

To assign an item to a category

1. Go to Commerce > Content Management > Catalog & Categories > Commerce Categories.
2. Click the category to display the category record.
3. Click **Edit**.
4. Click the **Items** subtab.
5. Select the item from the item dropdown list. Only items set up to show in your web store will appear here.
6. If this is the item's primary category, check the **Primary Category** box. The primary category is used on the item detail page of SuiteCommerce Advanced sites to provide a link for visitors to quickly access the primary category for an item.
7. Click **Add** to add the item to the list.
8. Repeat steps 5 through 7 for each item you'd like to assign to the category.
9. Click **Save**.

Commerce Category Customer Segment Assignment

Applies to: SuiteCommerce | SuiteCommerce Advanced

Customer Segment Assignment for commerce categories lets you assign a category to an existing customer segment. You can assign a customer segment right from the commerce category record instead of using the customer segment manager. You can edit, add, or delete customer segment assignments as needed.

To use customer segment assignment, you'll need to have Personalized Catalog Views enabled. For more information, see [Enabling Personalized Catalog Views](#).

To assign a commerce category to a customer segment:

1. Go to Commerce > Content Management > Catalog & Categories > Commerce Categories.
2. Click **Edit** on the category record you want to update.

3. Click **Customer Segments**.
4. Click the **Customer Segments** dropdown list and choose one or more customer segments to associate with the category. Only previously defined customer segments are available.
5. Enter your translations in the fields on the line of the selected language.
6. Click **Add**.
7. Click **Save**.

View Commerce Category Assignments for Items

 **Applies to:** SuiteCommerce | SuiteCommerce Advanced

When you use Commerce Categories to organize items on your site, you can assign an item to more than one category. This is an important feature, but it can make it challenging to remember every category you assigned an item to. Luckily, you don't have to remember all your category item assignments. There are two ways you can check which categories an item is assigned to.

- [View Commerce Category Assignments on the Item Record](#)
- [View Commerce Category Assignments with a Custom or Saved Search](#)

View Commerce Category Assignments on the Item Record

You can see a list of all the categories an item's assigned to on the Item Record in your NetSuite account. Use this method when you want to see the category assignment for one item.

To view Commerce Category assignments:

1. View the item record in NetSuite.

Tip: You can use the **Global Search** field to quickly view or edit an item record. Enter **i: [item name]** in the global search field and click the item in the displayed results.

2. Click the **Web Store** subtab.
3. Click the **Commerce Categories** subtab.

The following information is listed for each Commerce Category the item is assigned to:

- Site
- Commerce Catalog
- Commerce Category
- Primary Category Assignment Yes/No
- Inactive Category Yes/No
- Category Start Date and Time
- Category End Date and Time

View Commerce Category Assignments with a Custom or Saved Search

If you need a more detailed report of an item's category assignments, you can create a custom view for the item list or set up a custom or saved search. You can include the following:

- Commerce Catalog

- Commerce Category
- Commerce Category End Date
- Commerce Category Is Inactive Yes/No
- Commerce Category is Primary Yes/No
- Commerce Category Name
- Commerce Category Start Date

You can use the following procedure to customize the view on the item record list to include the category. After you create a custom list view, you can quickly access it by selecting it from the **View** dropdown list.

To create a custom item view for Commerce Category assignments:

1. Go to Lists > Website > Items. This displays the item list.
2. Click **Customize View**.
3. In the **Search Title** field enter a name for this view.
4. Click **Remove All**. This clears all fields from the view.
5. Select **Commerce Category Name** from the **Field** dropdown list.
6. Click **Add**. This adds the first row to the table.
7. Select **Name** from the **Field** dropdown list.
8. Click **Add**.
9. Select **Display Name** from the **Fields** dropdown list.
10. Click the **Add** button.
11. Select the **Available Filters** subtab.
12. Click the **Remove All** button.
13. Select **Commerce Categories** from the **Fields** dropdown list.
14. Click **Add**.
15. Click **Save**.

You can add more criteria and results fields to this custom view to fit your needs.

To create a saved search for item Commerce Category assignments:

1. Go to Lists > Website > Items.
2. Click **Search**.
3. Click **Create Saved Search**.
4. Click **Remove All**. This clears all fields from the view.
5. Select **Commerce Category Name** from the **Field** dropdown list.
6. Click **Add**. This adds the first row to the table.
7. Select **Name** from the **Field** dropdown list.
8. Click **Add**.
9. Select **Display Name** from the **Fields** dropdown list.
10. Click the **Add** button.
11. Select the **Available Filters** subtab.
12. Click the **Remove All** button.

13. Select **Commerce Categories** from the **Fields** dropdown list.
14. Click **Add**.
15. Click **Save**.

Exclude Empty Commerce Categories

i Applies to: SuiteCommerce | SuiteCommerce Advanced

This information refers to SuiteCommerce or the 19.2 release of SuiteCommerce Advanced or later.

The Exclude Empty Commerce Categories feature lets you leave out empty categories from your site when a category branch has no visible items. This makes sure empty categories don't show up on your site. An empty category is one with no available items and no subcategories with available items. Item availability depends on several factors. For more information, see [Item Availability](#).

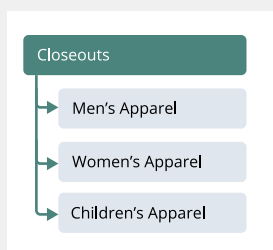

Excluding empty categories has a couple of key benefits:

- If you have a complex category structure with changing item availability, category navigation updates automatically based on what's available. This saves you time by updating categories and navigation for you, so you don't have to manage them manually.
- If you're using Personalized Catalog Views, the Commerce Category navigation is built based on the logged-in user and the items available to that customer's segment assignment. If a customer can't buy items in certain categories, those categories won't show up on the site. For details, see [Personalized Catalog Views](#).

Here are three examples of how category navigation is adjusted based on item availability.

Example 1: No Items Assigned to Category

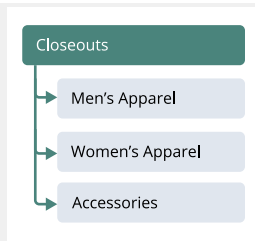

You have a **Closeouts** category with subcategories of **Men's Apparel**, **Women's Apparel**, **Children's Apparel**, and **Accessories**. You have assigned items to the three apparel categories but you have not assigned items to the Accessories category. Consequently, the category navigation on the site appears as follows:

In this example, **Accessories** doesn't show up in the navigation because it's empty and has no items assigned.

Example 2: Out of Stock Behavior

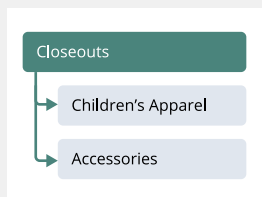

You have a **Closeouts** category with subcategories of **Men's Apparel**, **Women's Apparel**, **Children's Apparel**, and **Accessories**. Sales depleted your inventory of all items assigned to the Children's Apparel Category. Because of the nature of your out of stock behavior, items with no stock are not listed on the site. Consequently, no items are available in the Children's Apparel category and the resulting category navigation looks like this:

The **Children's Apparel** category doesn't show up in the navigation because it has no available items.

Example 3: Category Structure with PCV

You have implemented Personalized Catalog Views, and you have a **VIP Items** item segment that has items from your **Children's Apparel** and **Accessories** categories assigned to it. ABC Wholesaler is assigned to a customer group that can purchase items from VIP Items. Consequently, when the customer logs in to the site, the category navigation for the **Closeouts** category reflects this structure:

In this example, **Men's Apparel** and **Women's Apparel** don't show up in the navigation because ABC Wholesaler's customer segment can't buy anything from those categories.

To exclude empty categories:

1. Go to Commerce > Websites > Configuration.
2. Select the Website from the dropdown list.
3. Select the Domain from the dropdown list.
4. Click **Configure**.
5. Click the **Integrations** subtab.
6. Click the **Categories** subtab.
7. Check the **Exclude Empty Categories** box.
8. Click **Save**.

Configure Commerce Categories Properties

i Applies to: SuiteCommerce | SuiteCommerce Advanced

To configure Commerce Categories, use the SuiteCommerce Configuration record. For details, see the help topic [Categories Subtab](#).

To configure properties for Commerce Categories:

1. Select the domain to configure at Commerce > Websites > Configuration.

2. In the SuiteCommerce Configuration record, go to the **Integrations** tab, then the **Categories** subtab.
3. Set feature properties as required.
4. Save the Configuration record.

Item Page Options

i Applies to: SuiteCommerce | SuiteCommerce Advanced

This section provides information about elements featured on your web store's Product Details and Product Listings pages.

The following topics offer helpful information about item page options.

- [Grid Order](#)
- [Size Charts](#)
- [Item Badges](#)
- [Inventory Display](#)
- [Stock Notifications](#)
- [Product Lead Time](#)
- [Infinite Scroll](#)
- [Product Page Printer](#)

Grid Order

i Applies to: SuiteCommerce | SuiteCommerce Advanced

The Grid Order extension lets you set up matrix items to display purchasing options in a table on the Product Details page (PDP). These items display purchasing options in a table, replacing the standard experience. This view is ideal for customers who need to buy multiple variations of an item.

For example, a user can add the following items to their cart at one time:

- 10 small red gloves
- 10 medium black gloves
- 15 large white gloves

Gloves
 ★★★★★ No Reviews yet
 SKU: Onix

Order Grid

	Color 1	Color 2	Color 3	Color 4	Color 5
Small	\$145.00 10 Stock 56	\$145.00 Out of stock	\$145.00 Out of stock	\$145.00 Out of stock	\$145.00 Out of stock
Medium	N/A	N/A	\$145.00 10 Stock 56	\$145.00 Out of stock	\$145.00 Out of stock
Large	\$145.00 Out of stock	\$145.00 15 Stock 100	\$145.00 Out of stock	N/A	\$145.00 Out of stock
Summary	10	15	10	0	0
Subtotal					\$4,900.00

Add 25 items to Cart

You can set up Grid Order for any matrix items with one or two item options. When enabled and set up, users can quickly add quantities for multiple buying options in a table.

This topic explains how to do the following:

- [Add Field Sets](#)
- [Configure Grid Order](#)
- [Set Up Matrix Items for Grid Order](#)

Important: Commerce extensions are only available if provisioned, installed, and activated for a selected domain in your account. For more information, see [Commerce Extensions](#).

Note: You need SuiteCommerce or the Aconcagua release of SCA or later to use extensions.

Limitations

Note the following limitations when using the Grid Order extension:

- The grid won't appear on your site if a matrix item has three or more item options. With Grid Order, limit matrix item options to one or two.
- Grid Order won't display items with a parent matrix item that includes a required item option.

See the help topic [Matrix Items](#) for details on how to create item records using an item matrix.

Add Field Sets

Applies to: SuiteCommerce | SuiteCommerce Advanced

Field sets control the data that's visible to site templates. To use the Grid Order feature, you must add several fields to the site's **details** field sets. For more information about field sets, see [Define Field Sets](#).

To add Grid Order fields to the Web Site Setup Record:

1. Go to Commerce > Websites > Website List.
2. Click **Edit** next to the website to which you are adding Grid Order.
3. Go to the **Field Sets** subtab.
4. Add the **Grid Order Behavior**, **Show Stock Quantities**, and **Activate Stock Notifications** fields to the **details** field set. For each field, follow these steps:
 - a. Find the **Fields Included in Field Set** column of the **details** field set and click the **Set** button.
 - b. Select the fields from the **Field Name** list and click **Add**.
 - c. Click **Submit** in the Field Set window
 - d. Click **OK** in the Field Set row.
5. After adding all of the fields to the field set, click **Save**.

Configure Grid Order

Applies to: SuiteCommerce | SuiteCommerce Advanced

Enable the Grid Order extension for a domain using the SuiteCommerce Configuration record. This makes Grid Order available for all matrix items. However, you must set up each item individually to use Grid Order.

To configure Grid Order:

1. Go to Commerce > Websites > Configuration.
2. Select the website and domain with the activated Grid Order extension, then click **Configure**.
3. Go to the **Extensions** subtab.
4. In the **Grid Order** subtab, fill out the fields for each category, referencing the tables below.
5. Click **Save**.

Grid Order Configuration Fields:

Field	Description
Activate for All Matrix Items	Enables Grid Order for all matrix items that have the Grid Order Behavior field on the Item Configuration record set to Default Site Behavior . For more information, see Set Up Matrix Items for Grid Order .
Activate for Mobile	Enables Grid Order for mobile sites.

Grid Order Options Fields:

Field	Description
Order Grid Title	Sets the order grid title.
Quantity Pricing Label – Order Grid	Sets the label for the Quantity Pricing link. For more information about using Grid Order in conjunction with Quantity Pricing, see Integration with Other SuiteCommerce Features .
Quantity Summary Level – Order Grid	Sets the label for the Quantity Summary row, which gives the total number of items selected.

Field	Description
Subtotal Price Label – Order Grid	Sets the label for the Subtotal Price row, which gives the subtotal amount owed.
Combination Not Available – Order Grid	Sets the text to display when an item's unavailable.
Inventory Label – Order Grid	Sets the label for current inventory quantity. The <code>[[units]]</code> placeholder is automatically replaced with the available quantity.
Stock Notifications Label – Order Grid	Sets the label for the Stock Notifications link in the order grid. For more information about using Grid Order in conjunction with Stock Notifications, see Integration with Other SuiteCommerce Features .
Add to Cart Button Label – Order Grid	Sets the label for the Add to Cart button. The <code>[[items]]</code> placeholder is automatically replaced with the number of items to be added to the cart.
Quantity Warning Message – Order Grid	Sets the message to display for quantity errors.
Minimum Quantity Hint – Order Grid	Sets the message to display for a highlighted field when the required minimum quantity is not met. The <code>[[min]]</code> placeholder is automatically replaced with the minimum quantity for the item.
Maximum Quantity Hint – Order Grid	Sets the message to display for a highlighted field when the maximum quantity is exceeded. The <code>[[max]]</code> placeholder is automatically replaced with the maximum quantity for the item.
Confirmation Text	Sets the confirmation message after adding items to the cart. The <code>[[items]]</code> placeholder is automatically replaced with the number of items added.
View Cart Button Label	Sets the label for the View Cart & Checkout button that appears with the confirmation text.
Continue Shopping Button Label	Sets the label for the Continue Shopping button that appears with the confirmation text.
Grid Order Table Combinations	Determines how matrix item options appear in the order grid. Display two matrix item options by listing one as the Order Grid Row and the other as the Order Grid Column . If you list a matrix item options pair twice using both row/column alignments, the combination listed first takes precedence. Display items with one matrix item option by listing it in either the Order Grid Row or the Order Grid Column .
Item Color Palette Mapping	Determines the color palette for custom fields with color swatches. In the Item Field ID column, enter the custom field ID for the the item color field. In the Palette ID column, enter the ID for the color palette you want to use. If you haven't set up additional palettes, use default as the Palette ID . To view or create additional color palettes, see the help topic Color Palettes Subtab .

Set Up Matrix Items for Grid Order

Applies to: SuiteCommerce | SuiteCommerce Advanced

Set up matrix items to display options as a grid after enabling Grid Order for your domain. Grid Order works with matrix items that have one or two matrix item options. For example, a shirt with size and color options is a good example of an item that can use Grid Order.

To set up a matrix item to display item options as a grid:

1. Access the matrix item in NetSuite where you want to apply Grid Order.

Search NetSuite for the matrix item or go to **Lists > Accounting > Items**.

Important: Set Grid Order for the Matrix Item record (parent), not the Matrix Subitem.

2. Click **Edit** next to the matrix item you want to change.
3. Go to the **SuiteCommerce Extensions** subtab.
4. In the **Grid Order** area:
 - a. Set the **Grid Order Behavior** field to control how the item displays information in the Product Detail page.
Choose from these options::
 - **Default Site Behavior:** Choose this option to turn Grid Order on or off for as many matrix items as you want at one time, using the **Activate for All Matrix Items** field on the SC Configuration record. If **Activate for All Matrix Items** is checked, an order grid displays for items with **Default Site Behavior** selected.
For more information, see [Configure Grid Order](#).
 - **Always Activate for This Item:** Choose this option to display the matrix dimensions of this item as a grid, ignoring the default website configuration.
 - **Deactivate for This Item** – Choose this option to deactivate the purchasing grid for this item, ignoring the default website configuration.
 - b. Check the **Show Stock Quantities** option to display the in-stock quantity in the grid. Clear this option to hide quantities in stock.
For out-of-stock items, this option follows the Out of Stock Behavior on the Item record. For more information, see the help topic [Setting Web Store Back Order and Out-of-Stock Preferences](#).
 - c. Check the **Activate Stock Notifications** option to display a **Notify Me** link for out-of-stock items not available on backorder.

Note: The SC Stock Notifications extension must be installed and activated on the same domain to be used in conjunction with this extension.

5. Click **Save**.

Integration with Other SuiteCommerce Features

This extension integrates with the following SuiteCommerce features:

- **Quantity Pricing** – If enabled, options with quantity pricing options display an expandable price chart. For details, see [Quantity Pricing](#).

- **Stock Notifications** – If your domain uses the Stock Notifications extension, each item includes an option to sign up for stock notification emails. For details, see [Stock Notifications](#).
- **Require Login for Pricing** – If enabled and the user isn't logged in when viewing the Product Details page, the Grid Order extension won't appear. A message will ask users to log in to see the price. Clear the **Require Login for Pricing** box on the Web Site Configuration record to let users use Grid Order without logging in. For more information, see the help topic [Shopping Preferences](#).

Size Charts

 **Applies to:** SuiteCommerce | SuiteCommerce Advanced

Add size charts to your web store with the Size Chart extension, letting shoppers view sizing options without leaving the Product Details page (PDP). In addition to a pop-up feature on the PDP, Size Chart also creates a specific landing page where shoppers can view several size charts.

Using this extension, you can provide size information in shoppers' preferred units and offer measurement and fit tips.

Important: Commerce extensions are available if you provision, install, and activate them for a selected domain in your account. For more information, see [Commerce Extensions](#).

Note: You need SuiteCommerce or the Aconcagua release of SCA or later to use extensions.

This topic explains how to:

- [Update the Field Sets](#)
- [Assign a Size Chart to an Item](#)
- [Customize the Size Charts](#)

Size Chart Page

The Size Chart extension creates a size chart landing page with all the size charts for your website at [example.com/size-charts](#).

You access individual size charts by using the size chart record's internal ID and name in the URL. Any spaces in the size chart name are replaced by underscores. For example, to display a size chart named Women's Tops, the URL is [example.com/size-charts/1-Womens_Tops](#).

Update the Field Sets

The field sets for a website determine the data that is exposed to site templates. To use the Size Chart feature, add the Size Chart (Custom) and Size Chart ID (Custom) fields to your site's field sets. For more information, see [Define Field Sets](#).

To add Size Chart fields to the Web Site Setup Record:

1. Go to Commerce > Websites > Website List.
2. Click **Edit** next to the website to which you are adding Size Charts.
3. Go to the **Field Sets** subtab.
4. Add the **Size Chart (Custom)** and **Size Chart ID (Custom)** fields to the **details** and **matrixchilditems** field sets. To add each field to each field set, perform the following steps:

- a. Locate the **Fields Included in Field Set** column and click the **Set** button.
 - b. Select the fields from the **Field Name** list and click **Add**.
 - c. In the Field Set window, click **Submit**.
 - d. In the Field Set row, click **OK**.
5. After adding all the fields to the field sets, click **Save**.

Assign a Size Chart to an Item

You determine the size chart to display when shoppers click the size chart link on the Product Detail page (PDP). The size chart link only appears if you've selected a size chart on the Item record.

You can update item records individually or use mass update to add Size Charts to entire commerce categories. For more information about using the mass update functionality, see the help topic [Mass Updates](#).

To assign a size chart to an item:

1. Go to Lists > Accounting > Items.
2. Click **Edit** next to the item to which you want to add a size chart.
3. Go to the **SuiteCommerce Extensions** subtab, then the **Size Charts** subtab.
4. In the **Size Chart** field, select the size chart you want to assign to the item.

 **Note:** You can only assign one size chart to an item.

5. Click **Save**.
 - If it's a Matrix Item, click **Update Matrix**.
 - If not, click **Save**.

Customize the Size Charts

The Size Chart extension comes with 19 default size charts for your web store. These size charts include standard measurements in imperial and metric units for women's, men's, kid's, and baby's apparel. You can use the existing size charts or create new ones.

To add a new size chart:

1. Go to Lists > Web Site > Size Charts > New.

 **Note:** Making changes to the default size charts overwrites the existing values. To create a new chart using another size chart as a template, view the chart and click **Make Copy**.

2. Set the following fields:

Field	Description
Inactive	If checked, makes the size chart inactive.
Name	Sets the name for the size chart. This name appears in the Size Chart field of the Item record.
Title	Sets the title to display at the top of the size chart on your site.
Description	Determines additional details to display with the size chart on your site, such as fit of the clothing and tips on taking measurements.

Field	Description
Chart	Determines the size chart to display. You can use the basic formatting tools in Formatted Text editing mode or enter HTML tags using the Source editing mode.

3. Click **Save**.

Item Badges

Applies to: SuiteCommerce | SuiteCommerce Advanced

The Item Badges extension lets you display promotional badges on a product, so you can promote certain items to users. Item Badges appear on the Product Details and Product Listings pages, as well as in image carousels. You can use these to promote certain products to users by choosing the label, shape, and size of the badge.

Important: Commerce extensions are only available if provisioned, installed, and activated for a selected domain in your account. For more information, see [Commerce Extensions](#).

Note: You need SuiteCommerce or the Aconcagua release of SCA or later to use extensions.

Note: This extension only supports inventory items, not assembly or kit items.

This topic explains how to:

- [Set Up the Extension](#)
- [Enable Item Badges for an Item](#)
- [Configure Properties](#)
- [Create or Edit an Item Badge](#)
- [Create or Edit a Badge Shape](#)
- [Add Facet Fields](#)

Set Up the Extension

To set up the Item Badges extension, you'll need to add fields to your site's field sets. Field sets control the data that's exposed to site templates. Add the Badges (Custom) and Show Item Badges (Custom) fields to the site's field sets to use Item Badges. For more information, see [Define Field Sets](#).

To add Item Badges fields to the Web Site Setup Record:

1. Go to Commerce > Websites > Website List.
2. Click **Edit** next to the website you're adding Item Badges to.
3. Go to the **Field Sets** subtab.
4. Add the **Badges (Custom)** and **Show Item Badges (Custom)** fields to the **details, search, related items**, and **correlated items** field sets. Follow these steps to add each field to each field set:
 - a. Locate the **Fields Included in Field Set** column and click the **Set** button.
 - b. Select the fields from the **Field Name** list and click **Add**.
 - c. In the Field Set window, click **Submit**.
 - d. In the Field Set row, click **OK**.
5. After adding the fields to all of the field sets, click **Save**.

Enable Item Badges for an Item

For Item Badges to display on your products, you'll need to enable them at the item level. Update item records one by one or use Mass Update for a whole category of items. Find Mass Updates for Item Badges in NetSuite under Lists > Mass Update > Mass Updates > General Updates > Custom Records > Item Badges and Shapes. For more information, see the help topic [Mass Updates](#).

To enable Item Badges for an item:

1. Go to Lists > Accounting > Items.
2. Click **Edit** next to the item you want to add a badge to.
3. Go to the **SuiteCommerce Extensions** subtab and the **Item Badges and Shapes** subtab.
4. Check the **Show Item Badges** box.
5. In the **Badges to Display** field, select the badges you want to add to this item.
You can select up to three badges to display per item.
6. Click **Save**.

Configure Properties

To determine how Item Badges display on your website, you'll need to configure the properties on the SuiteCommerce Configuration record. To determine how Item Badges display on your website, configure the properties on the SuiteCommerce Configuration record. You can choose where to display the badge on the product image.

To configure properties:

1. Go to Commerce > Websites > Configuration.
2. Select the website and domain where the Item Badges extension is activated and click **Configure**.
3. Go to the **Extensions** subtab, then the **Item Badges** subtab.
4. In the **Badge Position** field, select where to position the badge on the product image.
5. Click **Save**.

Create or Edit an Item Badge

You can customize the badge text, color, and shape by editing an existing badge or creating a new one. Edit or create an item badge by modifying the Item Badges and Shapes record.

To create or edit an item badge:

1. Go to Customization > List, Records, & Fields > Record Types > Item Badges and Shapes.
The Item Badges and Shapes record is created when you install the extension.
2. Click **List**.
3. Click **Edit** next to the badge you want to edit, or click **New** to create a new one.
4. Set the following general fields:

Field	Description
Badge Name	This sets the name that'll display at the item level. This name displays in the Badges to Display field of the Item record.
Badge Text	This sets the text to display on the badge. Basic HTML formatting tags are supported.
Alt Text	This sets the description for the badge.

5. In the **Style** subtab, set the following fields:

Field	Description
Text Color	This sets the color of the badge text.
Background Color	This sets the background color of the badge or fill color of SVG images. This field supports text, HEX, or RGB.
Shape	This sets the shape of the badge from a list of pre-defined shapes. You can choose a default badge or upload a new image. If the Shape field is set to Bookmark , the Badge Text will display next to the badge instead of on the badge. To customize badge shape options, see Create or Edit a Badge Shape .
Text Weight	This sets the weight of the badge text. The text display depends on your web store's theme.
Inactive	This determines if the item badge is inactive. An inactive badge does not render on your web store but can be made active again at any time.

6. Click **Save**.
 - If the item is a Matrix Item, click **Update Matrix**.
 - If not, click **Save**.

Create or Edit a Badge Shape

To add or change the Shape field options in the Item Badges and Shapes record, you'll need to edit the Item Badge Shape record. You can customize item badge shapes by choosing a name, shape, or image. You select a shape from the options found in the Item Badge Shapes list.

To create or edit a badge shape:

1. Go to Customization > List, Records, & Fields > Record Types > Item Badge Shapes.
The Item Badge Shapes record is created when you install the extension.
2. Click **List**.
3. Click **Edit** next to the badge shape you want to edit, or click **New** to create a new record.
4. Set the following fields:

Field	Description
Name	This sets the name for the shape that appears in the Shape field of the Item Badges and Shapes record.
Shape	This sets the badge shape from a list of pre-defined options. If the Shape field is set to Bookmark , the Badge Text will display next to the badge instead of on the badge.
Image	This allows you to select an image from the file cabinet or upload an image to serve as a badge shape. Note that selecting a shape in the Shape field will override any uploaded image.

5. Click **Save**.

Add Facet Fields

Item badges can be configured as facets, so users can search for products with badges on your web store.

To use faceted navigation with item badges:

- Select facet fields in the Web Site Setup record.
- Configure facet fields in the SuiteCommerce Configuration record.

Follow the instructions for setting up facets in [Select and Configure Facet Fields](#), using these guidelines:

- When selecting facets in the Web Site Setup record, add the **Badges (Custom)** facet field.
- When configuring facets in the SuiteCommerce Configuration record, add the **custitem_ns_ib_badges** facet field.

This internal ID corresponds to the **Badges (Custom)** facet field listed on the Web Site Setup record.

After setting up this extension, you'll be able to display item badges on both the Product Listings and Product Details pages. Customize badges to highlight products and enable faceted navigation using badges for users.

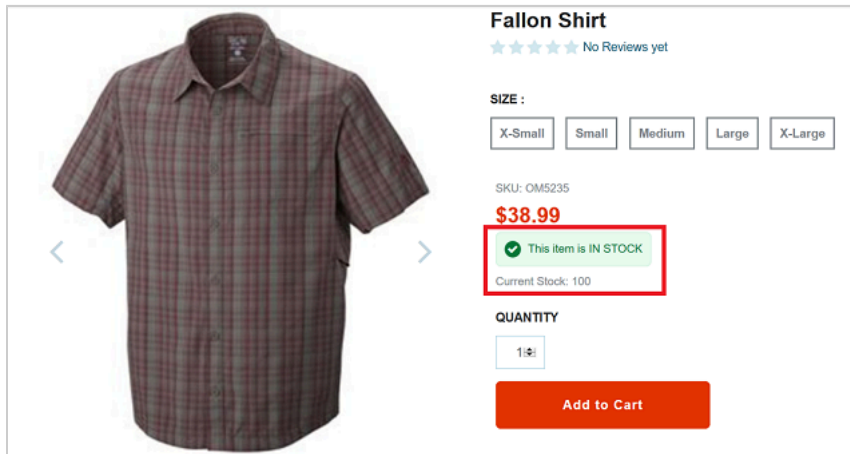

Inventory Display

Applies to: SuiteCommerce | SuiteCommerce Advanced

The Inventory Display extension lets you show stock status and available quantity on an item's Product Details page (PDP). You can customize the behavior for different types of inventory, such as special order or drop ship items. You can also add a message to show when an item is running low.

The extension shows different notifications based on how you set up your web store. For more information about what determines inventory visibility with different types of items, see [Item Inventory](#).

For assembly items, the extension shows how many finished products are available. For matrix items, the extension adjusts to show the inventory level for each option.

Important: Commerce extensions are available only if they're provisioned, installed, and activated for a specific domain in your account. For more information, see [Commerce Extensions](#).

Note: Extensions require SuiteCommerce or the Aconcagua release of SuiteCommerce Advanced or later.

To enable Inventory Display for a product, follow these steps:

- [Configure Properties](#)
- [Update Field Sets](#)

Configure Properties

You can control how Inventory Display looks on your website by configuring properties at the extension or item level. Configuring properties at the extension level determines the settings for all items, but you can override these settings for specific items by configuring properties at the item level.

You can pick different status messages to display for regular, special order, and drop ship items, and create messages for when an item is low in stock. You can also turn off Inventory Display messages for certain items or for all items.

You can update item records one at a time or use Mass Update to configure Inventory Display for entire commerce categories. For more information about Mass Update, see the help topic [Mass Updates](#).

To configure properties at the extension level:

1. After you've activated the Inventory Display extension in your NetSuite account, go to Commerce > Websites > Configuration.
For more information about activating an extension, see [Manage Themes and Extensions](#).
2. Select the website and domain where you've activated the Inventory Display extension, then click **Configure**.
3. Go to the **Extensions** tab.
4. In the **Inventory Display** subtab, fill out the fields for each category using the tables below as a guide.
5. Click **Save** to finish.

Regular Items:

Field	Description
In Stock Message – Regular Items	Sets the message that shows when a regular item is in stock.
Back Order Message – Regular Items	Sets the message that shows when a regular item is available on back order. To avoid conflicting messages, set Out of Stock Behavior to Allow back orders without an out-of-stock message . For more information, see the help topic Setting Web Store Back Order and Out-of-Stock Preferences .
Quantity Available – Regular Items	Sets the message that shows the quantity available for a regular item. The [[quantity]] placeholder is automatically replaced with the current available quantity.

Special Order Items:

Field	Description
In Stock Message – Special Order Items	Sets the message that shows when a special order item is in stock.
Back Order Message – Special Order Items	Sets the message that shows when a special order item is available on back order.
Always in Stock Message – Special Order Items	Sets the message that shows when special order items are set to Always in Stock .

Drop Ship Items:

Field	Description
In Stock Message – Drop Ship Items	Sets the message that shows when a drop ship item is in stock.
Back Order Message – Drop Ship Items	Sets the message that shows when a drop ship item is available on back order.
Always in Stock Message – Drop Ship Items	Sets the message that shows when drop ship items are set to Always in Stock .

Low Stock Fields:

Field	Description
Low Stock Threshold	Sets the stock amount that triggers a low stock message for regular items. If you set it to 0, low stock messages won't show.
Low Stock Message	Sets the message that shows when a regular item reaches the low stock threshold. The [[quantity]] placeholder is automatically replaced with the current available quantity.
Hide Quantity Available for Low Stock	If checked, hides the quantity available for a regular item that's reached the low stock threshold.

To configure properties at the item level:

1. Go to Lists > Accounting > Items.
2. Click **Edit** next to the item you want to set up Inventory Display for.
3. Go to the **SuiteCommerce Extensions** tab, then click the **Inventory Display** subtab.

4. Fill out the fields for each category using the table below as a guide.
5. Click **Save**.
 - If it's a Matrix Item, click **Update Matrix**.
 - If not, click **Save**.

Inventory Display Fields:

Field	Description
In Stock Message	Sets the message that shows when the item is in stock. This message overrides the In Stock Message or Always in Stock Message on the SC Configuration record, depending on the item type.
Back Order Message	Sets the message that shows when the item isn't in stock but is available on back order. To avoid conflicting messages and show only this one, set the Out of Stock Behavior field to Allow back orders with no out of stock message (Item record > Web Store subtab > Stock and Pricing Behavior section).
Quantity Available Message	Sets the message that shows the quantity available. The <code>[[quantity]]</code> placeholder is automatically replaced with the current available quantity, and this number updates dynamically for matrix and child items.
Low Stock Message	Sets the message that shows when a regular item hits the low stock threshold. The <code>[[quantity]]</code> placeholder is automatically replaced with the current available quantity.
Low Stock Threshold	Sets the stock amount that triggers a low stock message for regular items. If you set it to 0, low stock messages won't show.
Hide Quantity Available	If checked, hides the quantity available for this item.
Hide Quantity Available for Low Stock	If checked, hides the quantity available for a regular item that's reached the low stock threshold.
Hide Inventory Messages	If checked, hides the quantity and inventory messages for this item.

Update Field Sets

Field sets decide what data shows up in your site templates. To use the Inventory Display feature, you need to add several fields to the site's details and matrixchilditems field sets. For more information about field sets, see [Define Field Sets](#).

To add fields to the Web Site Setup Record:

1. Go to Commerce > Websites > Website List.
2. Click **Edit** next to the website where you want to add Inventory Display.
3. Go to the **Field Sets** subtab.
4. Add these fields to the **details** and **matrixchilditems** field sets:
 - Drop Ship Item
 - Special Order Item
 - In Stock Message
 - Back Order Message
 - Quantity Available Message

- Low Stock Message
- Low Stock Threshold
- Hide Quantity Available
- Hide Quantity Available for Low Stock
- Hide Inventory Messages

To add each field to each field set, follow these steps:

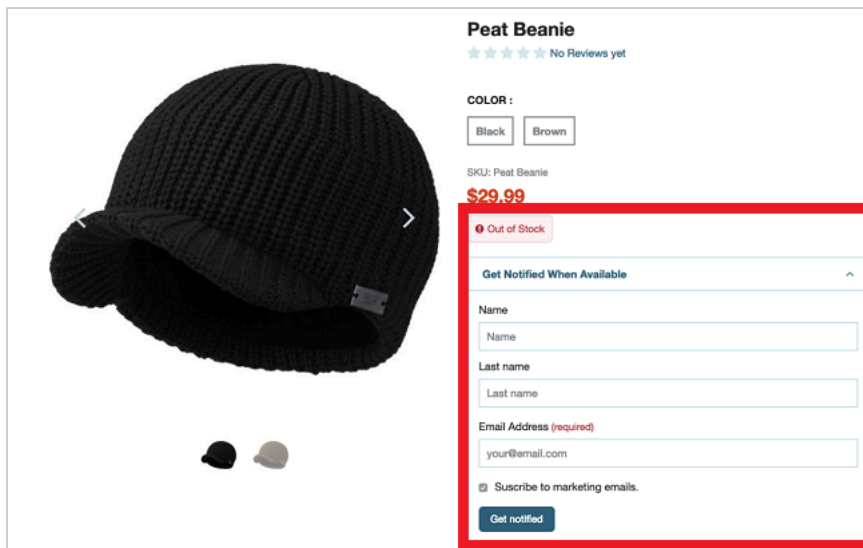

- a. Find the **Fields Included in Field Set** column and click **Set**.
 - b. Select the fields from the **Field Name** list and click **Add**.
 - c. In the Field Set window, click **Submit**.
 - d. In the Field Set row, click **OK**.
5. After adding the fields to both field sets, click **Save**.

When you're done, you can show stock status and inventory quantity on product detail pages.

Stock Notifications

Applies to: SuiteCommerce | SuiteCommerce Advanced

The Stock Notifications extension lets users sign up for an email alert when an out-of-stock item is available again. If enabled, users see a stock notification option on the Product Details pages. Logged-in users can go to the Stock Notifications tab in their My Account page to see the items they're subscribed to, check notification statuses, and cancel notifications if they want.

Important: Commerce extensions are available only if provisioned, installed, and activated for a specific domain in your account. For more information, see [Commerce Extensions](#).

Note: Extensions require SuiteCommerce or the Aconcagua release of SuiteCommerce Advanced or later.

This topic explains how to:

- [Set Up the Stock Notifications Email Template](#)
- [Configure Properties](#)
- [View Saved Searches for Stock Notifications](#)

Before You Begin

To use the Stock Notifications extension, set the Out of Stock Behavior field to whatever works best for you. You can choose this setting for each item, so Stock Notifications doesn't have to work the same way for every item. You'll find the Out of Stock Behavior field on the Web Store tab of the Item record.

Check the table below for Out of Stock Behavior field options and how they affect Stock Notifications.

Out of Stock Behavior	Does Stock Notifications Appear on the PDP?
Default	No
Disallow back orders but display out-of-stock message	Yes
Allow back orders but display out-of-stock message	Yes
Remove item when out-of-stock	No The item is removed from the web store.
Allow back orders with no out-of-stock message	No If you switch to this option after using one where Stock Notifications showed on the product detail page, subscribers get an email letting them know the item is ready to order.

For more information, see [Item Inventory](#).

Set Up the Stock Notifications Email Template

After you install the Stock Notifications bundle, create the email template that notifies users when their item is back in stock. You need to create an email template for the extension to work. To set up the notification email, create a new email template in NetSuite using the file included in the Stock Notifications bundle. For more information about modifying an email template, see the help topic [Customizing Templates for System-Automated Email](#).

Note: If you know HTML and FreeMarker, you can use the variables in the header of the included file to customize the email template even more. For more information about modifying a template with FreeMarker, see the help topic [Scriptable Templates](#).

To set up the email template:

1. Go to File Cabinet > SuiteBundles > [BUNDLE ID] > com.netsuite.backinstocknotification100 > Email Templates.
In the path above, [BUNDLE ID] is the Stock Notifications bundle ID. For the bundle ID, see [Commerce Extensions](#).
2. Click **Download** next to the **stock_notifications_email.template.ftl** file.
3. Use this file to create a new email template:
 - a. Go to **Documents > Templates > Email Templates > New**.

- b. In the **Name** field, enter a name for your new template.
This name shows up as an option in the **Email Template** field of the SC Configuration Record, where you pick it to set up the extension's email template.
- c. In the **Record Type** field, select **Custom Record**.
- d. In the **Template** tab, perform the following steps:
 - i. In the **Subject** field, enter the subject for the stock notification email.
For example:
`${customRecord.custrecord_ns_sc_ext_sn_s_item?split(":")?last}` is back in stock!
If you know HTML and FreeMarker, you can change this subject to fit your needs.
 - ii. In the **Create Template From:** field, select **File**.
 - iii. Click the **New** icon to add a file.
 - iv. In the **Select File** field, choose the **stock_notifications_email.template.ftl** file you downloaded from the File Cabinet.
 - v. Click **Save**.
- e. Click **Save** to finish creating the email template.

Configure Properties

To control how Stock Notifications show up on your website, configure the properties in the SuiteCommerce Configuration record. You can choose section titles, placeholder texts, feedback messages, and more.

To configure properties:

1. After you've activated the Stock Notifications extension in your NetSuite account, go to Commerce > Websites > Configuration.
For more information about activating an extension, see [Manage Themes and Extensions](#).
2. Select the website and domain where you've activated the Stock Notifications extension, then click **Configure**.
3. Go to the **Extensions** tab.
4. In the **Stock Notifications** subtab, fill out the fields for each category using the tables below as a guide.
5. Click **Save**.

General Fields:

Field	Description
Section Title – Items	Sets the title for the Stock Notifications option on the Product Details page (PDP).
Section Text – Items	Sets the description for the Stock Notifications section.
Subscribe to Matrix Options – Items	If checked, shows the option for users to subscribe to Stock Notifications for each matrix item variation.
Subscribe to Matrix Options Label – Items	Sets the label for the Subscribe To Matrix Options – Items box on the PDP.

User Information Fields:

Field	Description
Email Address Label	Sets the label for the Email field. Users are asked to enter an email address when signing up for a stock notification.
Email Address Placeholder	Sets the placeholder text for the Email field.
Mandatory First Name	Determines if the First Name field is required.
First Name Label	Sets the label for the First Name field. Users are asked to enter a first name when signing up for a stock notification.
First Name Placeholder	Sets the placeholder text for the First Name field.
Default Lead First Name	Sets the default text for the First Name field in the Lead record if the user doesn't enter a first name.
Mandatory Last Name	Sets whether the Last Name field is required.
Last Name Label	Sets the label for the Last Name field. Users are asked to enter a last name when signing up for a stock notification.
Last Name Placeholder	Sets the placeholder text for the Last Name field.
Default Lead Last Name	Sets the default text for the Last Name field in the Lead record if the user doesn't enter a last name.

Submission Fields:

Field	Description
Subscription Agreement Label	Sets the label for the Subscription Agreement field that asks users to subscribe to marketing emails.
Submit Button Label	Sets the label for the signup submit button.
Success Message	Sets the message that shows when the form is submitted successfully.
Error Message	Sets the message that shows if there's an error during form submission.

My Account Fields:

Field	Description
Subscriptions Page Title – My Account	Sets the title for the Subscriptions page and menu item associated with My Account.
Subscriptions Empty State – My Account	Sets the message that shows on the Subscriptions page when there are no current Stock Notifications subscriptions.
Item Column Label – Subscriptions Table	Sets the label for the Item column in the Subscriptions table, showing the name of the item the user subscribed to.
Show Item SKU	Sets whether the item SKU is shown.
Price Column Label – Subscriptions Table	Sets the label for the Price column in the Subscriptions table, showing the price of the item the user subscribed to.

Field	Description
Status Column Label – Subscriptions Table	Sets the label for the Status column in the Subscriptions table, showing the notification status of the item the user subscribed to.
Active Subscription Label – Subscriptions Table	Sets the label to show in the Status column of the Subscriptions table if the stock notification is active for the item.
Subscription Date Label – Subscriptions Table	Sets the label for the subscription date to show in the Status column of the Subscriptions table if the stock notification is active.
Cancel Subscription Button Label – Subscriptions Table	Sets the label for the Cancel Subscription button to display for each active item in the Subscriptions table.
Subscription Canceled Message – Subscriptions Table	Determines the message to display when stock notifications are canceled for an item.
Undo Cancel Subscription Label – Subscriptions Table	Sets the label for the button to undo canceled stock notifications for an item.
Cancel All Subscriptions Button Label – Subscriptions Table	Sets the label for the Cancel All Subscriptions button to display for each active matrix item in the Subscriptions table.
Undo Cancel All Subscriptions Button Label – Subscriptions Table	Sets the label for the button to undo all canceled Stock Notifications for a matrix item.
Date Format – Subscriptions Table	Determines the format in which the date appears.

Email Fields:

Field	Description
Email Template (Required)	Sets the email template used for stock notification emails. Select the email template you created in the Set Up the Stock Notifications Email Template section.
Email Employee Sender	Determines from which employee the stock notification email originates.

View Saved Searches for Stock Notifications

After you set up the extension, you can view the saved searches for Stock Notifications. These saved searches are created automatically when you install the extension:

- **Stock Notifications Customers Waitlist** – Check which customers are waiting on an item.
- **Stock Notifications TOP 10 Requested items** – Find out which products have been requested the most.
- **Stock Notifications Sent Mails** – Check which stock notification emails have been sent.
- **Stock Subscriptions Newsletter** – See which customers elected to subscribe to the newsletter when signing up for a stock notification.

These saved searches help you learn more about your customers and give you information you can use for marketing and inventory.

To view a saved search:

1. Go to Reports > Saved Searches > All Saved Searches.

2. Click **View** next to the saved search you want to see.

For more information about how to view or use a saved search, see the help topic [Accessing a Saved Search](#).

Product Lead Time

Applies to: SuiteCommerce | SuiteCommerce Advanced | Site Management Tools

The Product Lead Time extension lets you show the estimated wait time for an out-of-stock item to be available again. This extension uses NetSuite's Lead Time feature to calculate the wait time.

Important: Commerce extensions are available only if provisioned, installed, and activated for a selected domain in your account. For more information, see [Commerce Extensions](#).

Note: Extensions require SuiteCommerce or the Aconcagua release of SuiteCommerce Advanced or later.

To show Product Lead Time for a product, perform the following steps:

1. [Configure Properties](#)
2. [Add Field Sets](#)
3. [Enable Product Lead Time for an Item](#)

Before You Begin

To use the Product Lead Time extension, you need to enable the Advanced Inventory Management feature in NetSuite. Go to Setup > Company > Enable Features > Items & Inventory > Inventory and check the Advanced Inventory Management box.

Configure Properties

To control how Product Lead Time shows up on your website, set the properties in the SuiteCommerce Configuration record. You can choose the message to display on the product page and whether to show lead time as a daily countdown or date.

To configure properties:

1. After you've activated the Product Lead Time extension for a domain, go to Commerce > Websites > Configuration.
For more information about activating an extension, see [Manage Themes and Extensions](#).
2. Select the website and domain where you've activated the Product Lead Time extension, then click **Configure**.
3. Go to the **Extensions** tab.
4. In the **Product Lead Time** subtab, set the following fields:

Field	Description
Message Text	Sets the message to display on the product page of your webstore. The calculated time automatically replaces the <code>[[leadtime]]</code> placeholder. You can use basic HTML tags in this field.
Show Lead Time As	Determines how the wait time displays on your website. Selecting Day Countdown displays the number of days until the item is back in stock. Selecting Date displays the date when the product will be back, using the format you set in the Date Format field. If the lead time is less than a day, the wait time shows as one day or the current date.
Date Format	Sets the date format for when the Show Lead Time As field is set to Date .
Maximum Number of Days	Sets the maximum number of days to display. If the number of days until the product is back is more than the maximum, the maximum number shows in the Message Text . You can set the Maximum Number of Days at the extension and item level. To override it for a specific item, set the Maximum Number of Days field on the Item record (SuiteCommerce Extensions tab > Product Lead Time subtab).

5. Click **Save**.

Add Field Sets

The field sets for a website determine the data that is exposed to site templates. To use the Product Lead Time feature, you need to add the Show Lead Time Message field to your site's field sets. For more information about field sets, see [Define Field Sets](#).

To add a Product Lead Time field to the Web Site Setup Record:

1. Go to Commerce > Websites > Website List.
2. Click **Edit** next to the website where you want to add Product Lead Time.
3. Go to the **Field Sets** subtab.
4. Add the **Show Lead Time Message (Custom)** field to both the **details** and **matrixchilditems** field sets. For each field set, follow these steps:
 - a. Find the **Fields Included in Field Set** column and click **Set**.
 - b. Select **Show Lead Time Message (Custom)** from the **Field Name** list and click **Add**.
 - c. In the Field Set window, click **Submit**.
 - d. In the Field Set row, click **OK**.
5. After you add the field to both field sets, click **Save**.

Enable Product Lead Time for an Item

To show Product Lead Time on your product pages, you need to enable the extension at the item level. You can update item records one at a time or use Mass Update to add Product Lead Time to entire commerce categories. For more information about using Mass Update, see the help topic [Mass Updates](#).

To enable Product Lead Time for an item:

1. Go to Lists > Accounting > Items.
2. Click **Edit** next to the item you want to add Product Lead Time to.
3. Go to the **SuiteCommerce Extensions** tab.
4. In the **Product Lead Time** subtab, set these fields:

Field	Description
Show Lead Time Message	If checked, enables the Product Lead Time feature for this item.
Maximum Number of Days	Sets the maximum number of days to display. If the number of days until the product is back is more than the maximum, the maximum number shows in the Message Text. You can set the Maximum Number of Days at the extension and item level. This field overrides the Maximum Number of Days field on the SuiteCommerce Configuration record (Extensions tab > Product Lead Time subtab).

5. Click **Save**.
 - If it's a Matrix Item, click **Update Matrix**.
 - If not, click **Save**.

Infinite Scroll

Applies to: SuiteCommerce | SuiteCommerce Advanced

The Infinite Scroll extension loads content continuously as users scroll down the page, eliminating the need for pagination. This extension lets users easily browse items on the Product Listings page (PLP), which can help boost sales.

With the optional auto scroll feature, you can decide if users need to click a button to see more content or keep scrolling as new products load automatically.

Important: Commerce extensions are available only if provisioned, installed, and activated for a selected domain in your account. For more information, see [Commerce Extensions](#).

Note: Extensions require SuiteCommerce or the Aconcagua release of SuiteCommerce Advanced or later.

Configure Infinite Scroll

Use the SuiteCommerce Configuration record to set the loading button labels and decide if you want to turn on the auto scroll feature.

To configure Infinite Scroll:

1. Go to Commerce > Websites > Configuration.
2. Select the website and domain where the Infinite Scroll extension is activated and click **Configure**.
3. Go to the **Extensions** tab.
4. In the **Infinite Scroll** subtab, set the following fields:

Field	Description
Load More Content Label	Sets the label for the Load More Content button.
Load Previous Content Label	Sets the label for the Load Previous Content button.
Enable Auto Scroll	If you check this, pages automatically load when users reach the bottom, instead of showing a Load More Content button. This feature keeps users from reaching the site footer until they've scrolled through every page.

5. Click **Save**.

After configuring this extension, users can browse your PLP with Infinite Scroll.

Product Page Printer

 **Applies to:** SuiteCommerce | SuiteCommerce Advanced

The Product Page Printer extension lets you add a print option to the social media section of Product Details Pages (PDPs), so customers can easily print a PDP from your web store. The extension provides a template where you can choose which fields to show on the printable page. When users view the printable page, they can also pick which product details to include before printing.

Important: Commerce extensions are available only if provisioned, installed, and activated for a selected domain in your account. For more information, see [Commerce Extensions](#).

Note: Extensions require SuiteCommerce or the 19.1 release of SuiteCommerce Advanced or later.

This topic explains how to:

- [Configure the Product Page Printer Extension](#)
- [Update Field Sets](#)
- [Enable Product Page Printer for an Item](#)

Configure the Product Page Printer Extension

Use the SuiteCommerce Configuration record to set up the printable page, choose which product details to include, and decide how to show the selected fields.

To configure the Product Page Printer Extension:

1. Go to Commerce > Websites > Configuration.

2. Select the website and domain where the Product Page Printer extension is activated and click **Configure**.
3. Go to the **Extensions** tab.
4. In the **Product Page Printer** subtab, set the listed fields for each category, using the tables below as a guide.
5. For each field added to the Additional Fields table, make sure it's available on your web store with a corresponding field set.

For more information about how to add the fields to your site's field sets, see [Update Field Sets](#).

6. Click **Save**.

Printable Page — Item Details Fields:

Field	Description
Show Print Button – Product Details Page	If checked, includes the Page Printer button on Product Details Pages (PDPs).
Print Button Label – Product Details Page	Sets the label for the Page Printer button on PDPs.
Company Logo URL	Sets the URL location of the logo image file to display at the top of the printable page. You can find the URL field on the image file record.
Company Contact Info	Sets what company info shows in the header of the printable page. Basic HTML format tags are supported.
Show Price	If checked, includes the item price on the printable page. If the Require Login for Pricing field is checked on the Web Site Setup record, the Requires Login for Pricing Message displays.
Price Label	Sets the label for the price on the printable page.
Display Item URL As	Sets how the Item URL shows up on the printable page.
Requires Login for Pricing Message	Sets the label for the link to your web store login page. This field appears if the Require Login for Pricing field is checked on the Web Site Setup record.
Show SKU	If checked, includes the item SKU on the printable page.
SKU Label	Sets the label for the SKU on the printable page.
Note from the Supplier	Sets the message for shoppers to see on the printable page. For example, you can include Terms and Conditions or additional company information. Basic HTML format tags are supported.
Show Rating	If checked, includes the item rating on the printable page.
Rating Label	Sets the label for the item rating on the printable page.
Matrix Subitems Section Label	Sets the label for the Matrix Subitems section of the printable page.
Item Not Found Message – Not Found Page	Sets the message that appears on the Not Found Page when someone tries to open a printable page with an invalid Item ID.

Field	Description
Continue Shopping Button Label – Not Found Page	Sets the label for the link to the Product Listing Page that shows up on the Not Found Page if a shopper tries to open a printable page with an invalid Item ID.

Additional Fields:

To add more fields, insert a row in the Additional Fields table and complete the following fields as needed.

Field	Description																		
Field ID	Sets the internal field ID for the field you want to show on the printable page.																		
Label	Sets the label for the field on the printable page.																		
Show As	Determines how the field displays on the printable page. Possible options include: ■ Text — determines that the value is in a text format. ■ Date — displays the value as a date. You can determine the format of the date in the Placeholder field. ■ Check/Cross — displays a check for items that meet the field criteria and an X for items that do not. ■ QR Code — displays the value as a QR code.																		
Placeholder	Provides additional information about how the value displays on the printable page. The following fields allow for placeholders: <table> <tr> <th>Placeholder Value</th><th>Example Date Display</th></tr> <tr> <td>d mmm</td><td>7 Oct</td></tr> <tr> <td>d mmmm</td><td>7 October</td></tr> <tr> <td>d/m</td><td>7/10</td></tr> <tr> <td>dd/mm/yy</td><td>07/10/19</td></tr> <tr> <td>dd/mm/yyyy</td><td>07/10/2019</td></tr> <tr> <td>mmm d</td><td>Oct 7</td></tr> <tr> <td>mmm d</td><td>October 7</td></tr> <tr> <td>m/d</td><td>10/7</td></tr> </table>	Placeholder Value	Example Date Display	d mmm	7 Oct	d mmmm	7 October	d/m	7/10	dd/mm/yy	07/10/19	dd/mm/yyyy	07/10/2019	mmm d	Oct 7	mmm d	October 7	m/d	10/7
Placeholder Value	Example Date Display																		
d mmm	7 Oct																		
d mmmm	7 October																		
d/m	7/10																		
dd/mm/yy	07/10/19																		
dd/mm/yyyy	07/10/2019																		
mmm d	Oct 7																		
mmm d	October 7																		
m/d	10/7																		

Update Field Sets

To use the Product Page Printer feature, you need to add the Print Button Behavior — Product Details Page field to your site's details field set.

You also need to make sure the fields in the Additional Fields table on the SuiteCommerce Configuration record are included in your site's details field set. Most standard fields are already in the field sets before you activate the Product Page Printer extension, but you should double-check that they're included. For more information about field sets, see [Define Field Sets](#).

To add a Product Page Printer field to the Web Site Setup Record:

1. Go to Commerce > Websites > Website List.
2. Click **Edit** next to the website you want to add the Product Page Printer field to.
3. Go to the **Field Sets** subtab.
4. Make sure the necessary fields are listed in the **Fields Included in Field Set** column of the **details** field set.
5. Add the **Print Button Behavior — Product Details Page** field and any other missing fields to the **details** field set by following these steps:
 - a. Locate the **Fields Included in Field Set** column and click the **Set** button.
 - b. Select the fields from the **Field Name** list and click **Add**.
 - c. In the Field Set window, click **Submit**.
 - d. In the Field Set row, click **OK**.
6. After you add the fields to all the field sets, click **Save**.

Enable Product Page Printer for an Item

You can use an Item record to choose the Page Printer button behavior for a specific item, instead of using the site-wide setting.

To enable Product Page Printer for an item:

1. Go to Lists > Accounting > Items.
2. Click **Edit** next to the item you want to update the Product Page Printer behavior for.
3. Go to the **SuiteCommerce Extensions** tab.
4. In the **Product Page Printer** subtab, set the following field:

Field	Description
Print Button Behavior – Product Details Page	Choose the Page Printer button behavior from the options below: ■ Default Site Behavior – Follows the website configuration. If the Show Print Button – Product Details Page field is checked on the SuiteCommerce Configuration record, the Page Printer button shows up on the Product Details Page (PDP). ■ Always Activate for This Item – No matter what the website configuration is, the Page Printer button appears on the PDP. ■ Deactivate for This Item – No matter what the website configuration is, the Page Printer button doesn't appear on the PDP.

5. Click **Save**.
 - If it's a Matrix Item, click **Update Matrix**.
 - If not, click **Save**.

Overview

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced

The Web Store Transactions chapter ties together the checkout, payment, and shipping options for your site. We'll walk you through all the choices, like setting up your checkout steps, Paypal accounts, taxes for different countries, and shipping options.

Explore the following topics to learn more about the transaction features available for your Commerce site:

Checkout

Applies to: SuiteCommerce | SuiteCommerce Advanced

SuiteCommerce web stores include a checkout application you can customize or set up to give your users a unique checkout experience.

You can customize your experience by changing:

- [Checkout Flows](#) – Use one of several predefined checkout flows. Each flow has steps that guide shoppers through checkout until they place an order. You can also set different properties for the checkout flow in the configuration record.
- [Minimum Web Store Order Amount](#) – Define minimum order amounts before someone can check out.
- [Checkout Preferences](#) – Choose whether your site creates cash sales or invoice forms at checkout.
- [Shopping Cart Options for Business Customers](#) – Choose whether all contacts for your business customers share the same shopping cart.
- [Out-of-Stock Messaging During Checkout](#) – Show how many items are in stock in the out-of-stock error message on the review page. This message appears if a customer orders more than you have available.

For more advanced customization, you can:

- [Create Custom Fields Using an Extension](#) – You can add fields to ask for extra information, like shipping instructions, special requests, or delivery time slots, using an extension.
- Create new [Overview](#) – You can create a new extension using the CheckoutComponent or CartComponent APIs. For more on the extensibility API, see the help topics [Overview](#) and [Frontend Extensibility API](#).
- [Customize the Checkout Application](#) – If you're using SuiteCommerce Advanced, you can fully customize your checkout experience using standard best practices.

Note: Whenever possible, create new extensions for advanced customization. This makes maintenance, portability, and releases easier.

Whenever possible, advanced customization should be accomplished by creating new extensions. This allows for easier maintenance, portability, and release independence. Only implement advanced customizations by customizing the checkout application when the exposed extensibility APIs are not sufficient for your business use case.

Checkout Flows

Applies to: SuiteCommerce | SuiteCommerce Advanced

SuiteCommerce has three checkout flows that guide users through the same tasks in different orders. The checkout flow is defined at the domain, so you can configure different flows for each domain associated with a website.

Standard checkout (default) directs the user through these pages:

1. Shipping Address page – enter shipping address and delivery method
2. Payment page – enter payment method and billing address

3. Review page – review your checkout information and the contents of your cart before submitting the order

One Page checkout consolidates the information in the Standard checkout onto a single page:

1. Checkout Information page – enter shipping address, delivery method, payment method, and billing address
2. Review page – review your checkout information and the contents of your cart before submitting the order

Billing First checkout shows the billing address first:

1. Billing Address page – enter billing address
2. Shipping Address page – enter shipping address and delivery method
3. Payment page – enter payment method and review billing address
4. Review page – review your checkout information and the contents of your cart before submitting the order

Note: If enabled, the Multiple Ship To feature changes the checkout flow. Users select an address and delivery method for each shipment and then proceed to the payment methods page. See [Multiple Ship To](#) for more information.

To configure the checkout flow:

1. Go to Commerce > Websites > Configuration.
2. Select the website and domain you want to configure.
3. On the **Checkout** tab, select a checkout flow from the **Checkout Steps** field.
4. Click **Save**.

Note: For pre-Vinson implementations, you'll need to do advanced customization of your application if you want to use a different checkout flow. See the help topic [Customize the Checkout Application](#).

Minimum Web Store Order Amount

Applies to: SuiteCommerce | SuiteCommerce Advanced

You can restrict customers from checking out of your web store until they've reached a minimum total sales amount. If you have multiple subsidiaries and use different currencies, you can set a minimum order amount for each currency that's available online.

To set a minimum order amount for web store sales:

1. Go to Commerce > Websites > Web Site List.
2. Click **Edit** next to the website you want to update.
3. On the **Shopping** subtab, enter the minimum amount a customer must spend in the **Minimum Order Amount** field. If someone tries to check out with less than this, they'll get a warning and can't finish the order until they add more items.

Note: If you use the Multiple Currencies feature, set the minimum order amount for each currency in the **Currency** list at the bottom of the **Shopping** subtab.

4. Click **Save**.

To set a minimum or maximum quantity limit for an item, see [Order Quantity](#).

Checkout Preferences

Applies to: SuiteCommerce | SuiteCommerce Advanced

You can set preferences for sales orders and how you bill web orders.

To set checkout preferences:

1. Go to Commerce > Websites > Web Site List.
2. Click **Edit** next to the website you want to update.
3. On the **Shopping** subtab, in the **Checkout Preferences** section, set your preferences using the table below.

Preference	Description
Sales Order Type	Select whether NetSuite should generate cash sales or invoice forms when you approve sales orders from your store. ■ To let your customers decide how they want to pay, select Per Customer Basis. Note: You must choose this option to retrieve payment terms for customers who pay when invoiced. ■ If you use a payment method with a payment processing profile that supports the sales request and doesn't support the authorization request, you must select the Standard Sales Order form. ■ To only accept credit cards, select a Cash Sale form.
Credit Card Form	If you selected Per Customer Basis in the Sales Order Type field, select the form that should be generated when customers pay by credit card.
Invoice Form	If you selected Per Customer Basis in the Sales Order Type field, select the form that should be generated when customers choose to be invoiced. Set this field to a sales order or invoice form. Customers must have terms set on the customer record and register in your site to be able to pay by invoice.

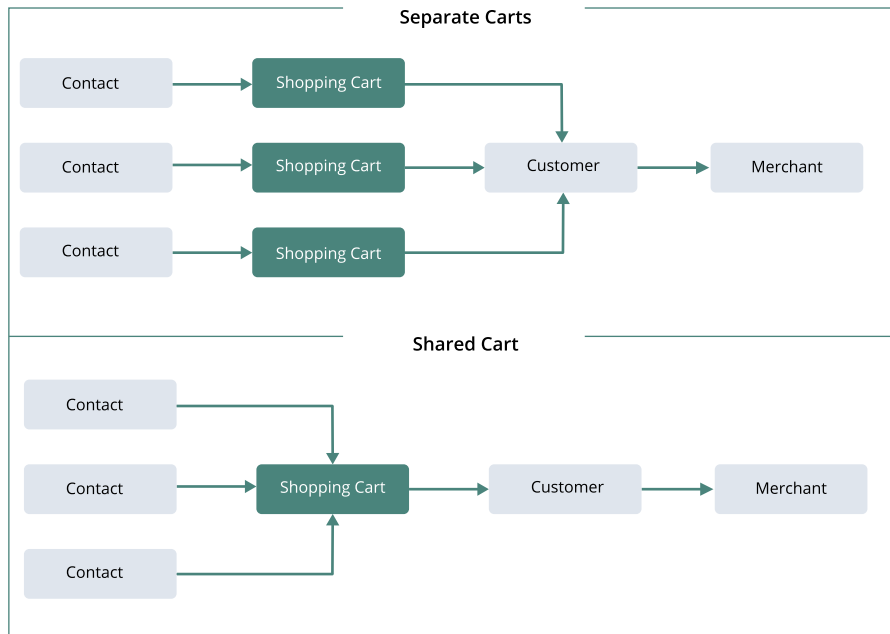

4. Click **Save**.

Shopping Cart Options for Business Customers

Applies to: SuiteCommerce | SuiteCommerce Advanced

Your business customers can place orders on your Commerce site in a few different ways. For example, in big companies, several contacts might place orders for their own departments using separate carts. In small businesses, one person might handle all the ordering. Sometimes, two or three contacts work together and place orders in the same cart. For more information about contacts, see the Record Management topic [Contacts](#).

Depending on what works best for your business customers, administrators can pick one of two shopping cart sharing modes:

- **Separate carts for each customer contact** – Each contact has their own cart, and it's not visible to others. This helps prevent:
 - One contact removing items another contact added.
 - One contact checking out before others have added everything they need.

Note: Even though carts are separate, contacts can see all orders placed by anyone in the My Account section of your web store. If you want My Account to show only orders placed by the logged-in contact, you need SuiteCommerce or SuiteCommerce Advanced 2019.1 or later.

- **Single cart shared by all customer contacts** – All contacts for a business use the same shopping cart.

For both options, only one set of payment details is defined for the business customer.

Shopping Cart Behavior and Limitations

Before you set shopping cart options for business customers, keep in mind:

- To keep your site running smoothly, there's a soft limit of 100 unique items that can be added to the shopping cart for SuiteCommerce and SuiteCommerce Advanced sites.
- There's no hard limit on how many items a contact can add, but the more items in the cart, the longer it will take to continue to add items.
- If contacts add more than 100 items, there's no guarantee the order will go through.

Shopping Cart Sharing Mode

On the Web Site Setup record, choose the shopping cart sharing mode for your site. You can set a different mode for each site.

To set the shopping cart sharing mode:

1. Go to Commerce > Websites > Web Site List.
2. Click **Edit** next to the website you want to update.
3. Go to the **Shopping** subtab.
4. In the Shopping Basics section, one of these options from the **Shopping Cart Sharing Mode** list:
 - Single cart shared by all customer contacts (default)
 - Individual carts for each customer contact
5. Click **Save**.

If you switch from a single shared cart to individual carts for contacts, the existing shopping cart is retained and can still be accessed by anyone logging in using the main customer login details. Individual contacts receive new, empty carts when they log in.

If you switch from individual carts to a shared cart, contacts lose access to their individual carts. The individual carts are retained until they expire in about 30 days, but aren't accessible unless you revert to individual carts.

Identify Order Creator

Business customers can see which contact placed a sales order by:

- Checking the Sales Order form.
Go to **Transactions > Sales > Enter Sales Orders > List**, and click **View** next to the order you want to check. On the **Relationships** subtab, you'll see the contact listed as the **Order Creator**.
- Checking the order email, which by default only goes to the contact who placed the order.
If the **CC Customer on All Emails Related to Orders Placed by Contacts** email preference is checked, business customers receive email for all orders placed by their contacts.

To send copies of order email to the business customer:

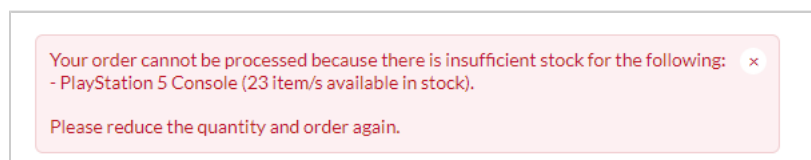

1. Go to Setup > Company > Email Preferences.
2. Go to the **Transactions** subtab and check the **CC Customer on All Emails Related to Orders Placed by Contacts** box.
3. Click **Save**.

Out-of-Stock Messaging During Checkout

i Applies to: SuiteCommerce | SuiteCommerce Advanced

An out-of-stock error message shows up on the review page if your customer orders more of an item than you have in stock. Your customer can go back and change their order to ask for a smaller quantity.

The following example shows an out-of-stock error message:

The message lists the items that don't have enough stock and shows how many are left. You can choose whether to show the quantity.

To display the quantity of items available in stock:

1. Go to Commerce > Websites > Configuration.
2. Select your website and domain, and click **Configure**.
3. Go to the **Checkout** subtab and then the **Quantity Stock Message** subtab.
4. Check the **Show Quantity Available on the Out-of-Stock Error Message** box to include the quantity of items that are available in the message.
Clear this box if you don't want to show the quantity in the out-of-stock message.
5. Click **Save**.

 **Note:** The out-of-stock error message only shows up if there's at least one item left. If there's no stock, your customers can't add the item to their cart, so they won't get to checkout with it.

To learn about out-of-stock behavior and settings outside the checkout flow, see [Out-of-Stock Behavior](#).

Payment Options for Commerce Web Stores

i Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced

Check out the topics below to learn how to set up credit card payments, PayPal options, and payment authentication for your Commerce website.

- [Setting Up Customer Credit Card Processing](#)
- [Web Store Transactions](#)
- [Set Up Credit Card Payments for Web Stores](#)
- [Credit Card Payer Authentication for Commerce Web Stores](#)
- [3D Secure Payment Authentication for Commerce Web Stores](#)
- [Require Authorization for Web Store Credit Card Transactions](#)
- [Alternative Payment Methods for Commerce Web Stores](#)
- [ACH Payments on Commerce Web Stores](#)
- [PayPal Integration and Express Checkout for Commerce Web Stores](#)
- [Alternative Payment Methods for Commerce Web Stores](#)
- [SuiteCommerce Payment Instruments Integration](#)

Set Up Credit Card Payments for Web Stores

i Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced

To start taking credit card payments for web orders, you'll need to set up accounting preferences in your NetSuite account, configure payment methods, and add at least one credit card processing profile.

Check out the following help topics to learn how to set up credit card payments for your Commerce web store:

- [Set up Accounting Preferences for Web Stores](#)
- [Create Payment Methods for Web Stores](#)
- [Assign Payment Processing Profiles to Your Website](#)

i Note: You'll need a merchant account that lets you process credit card payments. NetSuite offers merchant services, or you can use your own. See the Order Management help topic, [Setting Up Customer Credit Card Processing](#), for information about setting up a merchant account.

Set up Accounting Preferences for Web Stores

i Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced

Set your accounting preferences so your NetSuite account can process orders from your Commerce web store. The following steps show you how to set up preferences for online payments, credit card transactions, and web order taxes.

To set up accounting preferences for your Commerce web store:

1. Go to Setup > Accounting > Preferences > Accounting Preferences.
2. On the **Items/Transactions** subtab, in the Payment Processing section, check **Customers Can Pay Online** to allow customers to pay for the orders they place online using credit or debit cards.
3. Check **Use Card Security Code for Credit Card Transactions** to ask customers for the 3 or 4 digit card security code (CSC), usually found on the back of their card. This also adds an image to help customers find their CSC.

Note: To verify CSCs on your website, enable the **Process an Online Payment with Sales Order Creation** option on the Website Setup record. See [Require Authorization for Web Store Credit Card Transactions](#) for information about enabling this option.

4. Click **Save**.
5. Go to Setup > Accounting > Taxes > Set Up Taxes.

Note: Tax estimates displayed in your web store for guest shoppers reflect the default tax configurations you set on the Set Up Taxes page in NetSuite. This tax information is sent to your web store by the Commerce API, but the Commerce API doesn't calculate taxes. If you don't use SuiteTax, you should contact your tax provider to ensure tax calculations are accurate.

6. Check **Per-Line Taxes on Transactions**.

Note: In some cases, the Per-Line Taxes on Transactions feature conflicts with the feature, Multiple Shipping Routes. If you can't see the **Per-Line Taxes on Transactions** checkbox, go to **Setup > Company > Enable Features**, then the Transactions subtab, and clear the **Multiple Shipping Routes** box. Click **Save**. Then, return to Setup > Accounting > Taxes > Set Up Taxes and check the **Per-Line Taxes on Transactions** box. Afterward, re-enable the Multiple Shipping Routes feature.

7. In the **Charge Sales Tax on Store Orders** field, select one of the following:
 - **Always** – Charge sales tax on every order.
 - **Never** – Leave sales tax off orders in the web store.
 - **Per Customer Basis** – Charge sales tax based on the Taxable checkbox on customer records.

Note: If you select **Always** or **Per Customer Basis**, you must either set up tax groups or select **Tax Codes Only** in the **Tax Code Lists Include** field at Setup > Accounting > Taxes > Set Up Taxes.

8. Click **Save**.

Create Payment Methods for Web Stores

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced

Before you can assign credit card payment processing profiles to your website, you'll need to create one or more payment methods. Create a payment method for each credit card and payment type that customers can use on your website. For more information, see the Order Management help topic, [Creating a Payment Method](#).

Assign Payment Processing Profiles to Your Website

i Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced

If you've got multiple websites, you can assign a different credit card payment processing profile to each one. Before you set up a credit card processing profile in NetSuite, make sure you've set up a merchant account for each payment card gateway you want to use. For more information, see the Order Management help topic, [Setting Up Payment Processing Profiles in NetSuite](#).

To assign a credit card payment processing profile to your Commerce web store:

1. Go to Setup > Accounting > Financial Statement > Payment Processing Profiles.
2. Click **Edit** next to the payment processing profile you'd like to use.
3. In the **Web Site** field, select one or more websites.
4. Click **Save**.

i Note: If you assign a credit card processing profile that supports the sales request, but not authorization, you'll need to use standard sales orders as the sales order type.

Go to **Commerce > Websites > Website Lists** and click **Edit** next to your website. Go to the **Shopping** subtab, then the **Checkout** subtab, and make sure you've selected Standard Sales Order in the **Sales Order Type** field. For more information, see the help topic [Checkout Preferences](#).

Credit Card Payer Authentication for Commerce Web Stores

i Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced

Credit card payer authentication is available for credit cards used in your Commerce website checkout. With payer authentication, customers can set up a password linked to their credit card. This password helps verify the card's owner and protects you from chargebacks.

When you enable payer authentication, you can add the Verified by Visa, MasterCard SecureCode, and Maestro SecureCode logos to your site. After placing an order, customers are taken to a payer authentication site. They can enter or create a password, or choose to skip this step. They're then sent back to your website's confirmation page, and the order is created in your NetSuite account.

In addition, a Payer Authentication Status field is added to sales orders. For credit card orders on your website, this field shows if authentication was successful, failed, or skipped. For other sales orders, it'll be blank.

Payer authentication is currently offered through these credit card gateways:

- MerchantE
- CyberSource
- eWAY Rapid

- Payflow Pro
- WorldPay

Note: If you use CyberSource or MerchantE, you'll need to contact them to add payer authentication feature to your account before enabling it in NetSuite. If you use Payflow Pro, you'll need to enroll in PayPal's Buyer Authentication Service through your PayPal Manager account.

Payflow Pro, owned by PayPal, is used for credit card processing. PayPal is the checkout method that enables you to enter or accept payment information.

For information about regional payment gateways, see the Order Management help topic, [Setting Up Regional Payment Gateways](#).

For information about payer authentication for eWAY Rapid, see the Order Management help topic, [Payer Authentication for eWay Rapid](#).

For information about integration with third-party checkout providers, like PayPal Express, see the help topic [Integration with Third-Party Checkout Providers](#).

To enable credit card payer authentication:

1. Go to Setup > Accounting > Financial Statements > Payment Processing Profiles.
2. Click **Edit** next to the credit card gateway you'd like to use for payer authentication.
3. In the Primary area, check **Payer Authentication**.
4. Click **Save**.

Now, customers will be redirected to a payer authentication site after submitting a credit card order.

3D Secure Payment Authentication for Commerce Web Stores

Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount | Site Builder

3D Secure payment authentication provides additional fraud protection by challenging a user's identity when they make a credit or debit card payment. Typically, the user is required to enter a 2FA code sent to or generated by their mobile device. We verify the code when your customer processes a transaction in your web store.

Support for 3D Secure 1 ended on October 15, 2022. See [End of Support for 3D Secure 1](#) to learn more, including information about migrating your website from 3D Secure 1 to 3D Secure 2.

3D Secure 2 is supported on the following flows of your Commerce website:

- Make a payment, quotes, and reorder items: SuiteCommerce MyAccount (SCMA), SuiteCommerce, and SuiteCommerce Advanced (SCA) versions 2023.1.1 and later.
- Checkout, make a payment, and quote to sales order: SuiteCommerce and SCA versions 2022.2 and later.
- Checkout flow only: SuiteCommerce and SCA versions 2020.1, 2020.2, 2021.1, 2021.2, and 2022.1.

See [3D Secure Authentication Process](#) for details on how your Commerce website supports the use of 3D Secure payment authentication.

Note: You only need to follow these steps if you're using native 3D Secure. See [3D Secure Authentication Process](#) for information about native 3D Secure and external checkout.

To enable 3D Secure payments for your website:

1. Go to Commerce > Websites > Configuration.
2. Select your website and domain and click **Configure**.
3. Go to the **Advanced** tab.
4. Check the **Enable 3D Secure Payments** box.
5. Click **Save**.

3D Secure Authentication Process

Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount | Site Builder

There are two typical ways to adopt 3D Secure 2 technology as part of your customers' shopping experience: natively or by using an external checkout.

Not all SuitePayments solutions that integrate with NetSuite support 3D Secure 2. See [Payment Gateway Support for 3D Secure 2](#) for a list of payment gateway partners who support 3D Secure 2.

Native 3D Secure 2

With native 3D Secure 2, an identity challenge displays to cardholders when they use your web store checkout. The challenge usually pops up right on the page as an iframe or as a separate step during checkout.

Your website needs specific 3D Secure 2 code and support for payment instruments to use native 3D Secure 2.

If you're using SuiteCommerce or SCA versions 2020.1 or later, your web store checkout already includes native 3D Secure 2 support.

If you're using SuiteCommerce, SCMA, or SCA versions 2022.2 or later, native 3D Secure 2 is included for making a payment, reordering items, and converting quotes to sales orders.

SCA sites running 2019.2 or earlier, and all Site Builder versions, don't support native 3D Secure 2. See [Migrating from 3D Secure 1 to 3D Secure 2](#).

To confirm that your web store already processes payments with native 3D Secure 2:

1. Go to Lists > Search > Saved Searches > New.
2. Click **Cardholder Authentication**.
3. Click **Preview** without setting filters.
4. If cardholder authentication search results are returned, your web store is using native 3D Secure 2.

External Checkout

External checkout (also called hosted payment pages) means you use an external payment page from your payment gateway partner.

External checkout occurs when a user is redirected to an external web page that accepts and processes the their payment details. After they finish, they're sent back to your web store to complete the order.

If your web store uses Site Builder or SCA 2019.2 or earlier, you need a payment gateway partner that supports 3D Secure 2. See [Payment Gateway Support for 3D Secure 2](#).

Your website must be able to support external checkout. Support for external checkout is as follows:

- All SCA versions support external checkout, but you might need to patch or customize your code if you're on SCA Kilimanjaro or earlier. See [Migrating from 3D Secure 1 to 3D Secure 2](#).
- Site Builder sites with SiteBuilder Extensions for checkout provide varying support for 3D Secure 2, depending on your extension version. See [Migrating from 3D Secure 1 to 3D Secure 2](#).
- Site Builder sites using Reference Checkout or the classic built-in checkout don't support 3D Secure 2. See [Migrating from 3D Secure 1 to 3D Secure 2](#).

After 3D Secure authentication is enabled for your Commerce website, the following logic is applied to each payment card transaction using external checkout:

1. A user selects their payment method as a credit or debit card.
2. The user attempts to submit their order.
3. The web store redirects the user to the third-party payment processor's external checkout or hosted payment page.
4. The user enters their card details and submits them.
5. The payment processor decides if a 3D Secure challenge is needed and shows it if required.
6. If everything works, the payment goes through and the user comes back to your web store to finish the order.

End of Support for 3D Secure 1

i Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount | Site Builder

Online payment card processing requirements have changed in the European Economic Area (EEA) and the UK. Now, these regions enforce Strong Customer Authentication requirements under the [Payment Services Directive \(PSD2\)](#).

To meet Strong Customer Authentication requirements, first-generation 3D Secure (3D Secure 1 or 3DS 1.x) is being replaced by newer 3D Secure 2 (also called 3DS 2.x, EMV 3-D Secure, or EMV 3DS).

Support for 3D Secure 1 ended on October 15, 2022. If you keep using 3D Secure 1 for your Site Builder or SuiteCommerce web store, your card payments may fail or get declined. To avoid this, switch to 3D Secure 2. See [Migrating from 3D Secure 1 to 3D Secure 2](#).

To reduce declined transactions and comply with Strong Customer Authentication rules, make sure:

- Your web store's checkout or payment forms support 3D Secure 2 challenges.
- Your payment gateways and NetSuite integrations handle the 3D Secure 2 cardholder challenge for you.
 - If your payment gateway partner doesn't support 3D Secure 2, select a new partner. For a list of partners that do, see [Payment Gateway Support for 3D Secure 2](#).

To set up a new payment processing profile for your new payment gateway, see the Order Management topic [Creating Payment Processing Profiles](#).

- The issuer of the payment card and the payment gateway both support 3D Secure 2.

Migrating from 3D Secure 1 to 3D Secure 2

i Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount | Site Builder

Migrate your website to SuiteCommerce or the latest version of SuiteCommerce Advanced (SCA) and use a gateway that provides native 3D Secure 2 support. However, if you can't migrate your website to SuiteCommerce or the latest SCA version, take these actions:

Product	Version	Native Support for 3D Secure 2	External Checkout Supported	External Support for 3D Secure 2	Action You Should Take
Site Builder	All	No	No	No	Install SiteBuilder Extensions Kilimanjaro (bundle 194218) or SiteBuilder Extensions Premium Kilimanjaro (bundle 194219) and use the external checkout feature. See the help topic Installing a Bundle. The following patches are required for external checkout to work with SiteBuilder Extensions Kilimanjaro and SiteBuilder Extensions Premium Kilimanjaro: - Customer not Directed to the Payment Review Page after Checkout using the Checkout Flow - Customer not Directed to the Payment Review Page after Checkout after using the Make A Payment Flow - Customer Redirected to My Account Overview Instead of Successful Payment Page Change your Proceed to Checkout touchpoint on your website setup record to point to the SiteBuilder Extensions SSP. See the help topic Select Supported Touch Points. Since this SSP replaces your website's existing checkout, you'll need to set up your new checkout to fit your business needs, and you might need a developer to transfer any code-level customizations from your old checkout.
Site Builder with Reference Checkout	All	No	No	No	Install SiteBuilder Extensions Kilimanjaro (bundle 194218) or SiteBuilder Extensions Premium Kilimanjaro (bundle

Product	Version	Native Support for 3D Secure 2	External Checkout Supported	External Support for 3D Secure 2	Action You Should Take
					194219) and use the external checkout feature. See the help topic Installing a Bundle. The following patches are required for external checkout to work with SiteBuilder Extensions Kilimanjaro and SiteBuilder Extensions Premium Kilimanjaro: ■ Customer not Directed to the Payment Review Page after Checkout using the Checkout Flow ■ Customer not Directed to the Payment Review Page after Checkout after using the Make A Payment Flow ■ Customer Redirected to My Account Overview Instead of Successful Payment Page Change the Proceed to Checkout touchpoint on your website setup record to point to the SiteBuilder Extensions SSP. See the help topic Select Supported Touch Points. Because this SSP replaces your website's existing checkout, you need to follow procedures to set up your new checkout to meet your business's requirements. You may also need a developer to transfer any code-level customizations that are being used in your old checkout.
Site Builder with SiteBuilder Extensions	All	No	Partial	No	Use the external checkout feature. 3D Secure 2 support depends on your checkout version. Install SiteBuilder Extensions Kilimanjaro (bundle 194218) or SiteBuilder Extensions Premium Kilimanjaro (bundle 194219). The following patches are required for external checkout to work with SiteBuilder Extensions Kilimanjaro

Product	Version	Native Support for 3D Secure 2	External Checkout Supported	External Support for 3D Secure 2	Action You Should Take
					and SiteBuilder Extensions Premium Kilimanjaro: - Customer not Directed to the Payment Review Page after Checkout using the Checkout Flow - Customer not Directed to the Payment Review Page after Checkout after using the Make A Payment Flow - Customer Redirected to My Account Overview Instead of Successful Payment Page If you haven't already, change your Proceed to Checkout touchpoint on your website setup record to point to the SiteBuilder Extensions SSP. See the help topic Select Supported Touch Points. Since this SSP replaces your website's existing checkout, you'll need to set up your new checkout to fit your business needs, and you might need a developer to transfer any code-level customizations from your old checkout.
SuiteCommerce	—	Yes	Yes	Yes	Use native 3D Secure or external checkout.
SuiteCommerce MyAccount	—	Yes	Yes, except for Windcave	Yes	Use native 3D Secure or external checkout.
SCA— Includes My Account checkout	Denali Mont Blanc	No	Partial	Partial	Use external checkout. Support for external checkout was introduced in the Mont Blanc release of SCA and a patch was developed to backport it to the Denali release. See the help topic Mont Blanc Release of SuiteCommerce Advanced.
	Vinson Elbrus	No	Yes	Yes	Use external checkout. The following patches are required for external checkout to work: Domain Bridging Update (Elbrus and Vinson)

Product	Version	Native Support for 3D Secure 2	External Checkout Supported	External Support for 3D Secure 2	Action You Should Take
					- Order Confirmation Page Not Displayed When Using Single Page Checkout and External Payment (Elbrus and Vinson) - Users Not Redirected to External Payment System (Vinson) - Incorrect Redirect URL for External Payments (Vinson)
	Kilimanjaro Aconcagua 2018.2	No	Yes	Yes	Use external checkout. You'll need the Domain Bridging Update patch for external checkout to work on Kilimanjaro implementations. The following patches are required for external checkout to work with SCA Kilimanjaro and SCA 2018.2: - Customer not Directed to the Payment Review Page after Checkout using the Checkout Flow - Customer not Directed to the Payment Review Page after Checkout after using the Make A Payment Flow - Customer Redirected to My Account Overview Instead of Successful Payment Page
	2019.1 2019.2	No	Yes	Yes	Use external checkout.
	2020.1 and later	Yes	Yes	Yes	Use native 3D Secure or external checkout. You might need patches to use native 3D Secure 2 with pre-2021.2 SCA releases. SCA 2020.1.8 and 2020.1.12 included minor fixes for 3D Secure 2. The following patches are required for external checkout to work with SCA 2020.1, SCA 2020.1.12, 2021.2, and SCA 2021.2.3: Customer not Directed to the Payment Review Page

Product	Version	Native Support for 3D Secure 2	External Checkout Supported	External Support for 3D Secure 2	Action You Should Take
					after Checkout using the Checkout Flow - Customer not Directed to the Payment Review Page after Checkout after using the Make A Payment Flow - Customer Redirected to My Account Overview Instead of Successful Payment Page

Payment Gateway Support for 3D Secure 2

i Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount | Site Builder

The following payment gateway partners integrate with NetSuite and support 3D Secure 2. Each partner requires sign up and installation of the SuiteApp.

See the help topic [Installing from the SuiteApp Marketplace](#) to find out how to add SuiteApps to your NetSuite account.

Partner Name	Geographies	Native Support for 3D Secure 2	External Support for 3D Secure 2
Adyen Payments for NetSuite	Australia Canada Europe US	No	Yes
AltaPay for NetSuite	Europe US	No	Yes
Cybersource for NetSuite	Global	No	Yes
MerchantE for SuitePayments	US	Yes	No
Windcave Integration for NetSuite	Australia Canada New Zealand UK US	No	Yes
Worldpay Payments for NetSuite	Global	Yes	No

Note: Worldpay Payment Gateway (Worldpay UK) doesn't support EMV 3DS.

Require Authorization for Web Store Credit Card Transactions

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced

You can require automatic authorization for your customers' credit card payments on sales orders by enabling the Process an Online Payment with Sales Order Creation option on the Website Setup record.

The Process an Online Payment with Sales Order Creation option:

- Applies to sales orders placed by customers logged into your Commerce website.
- Doesn't apply to invoice payments. Requiring authorization for invoice payments is not supported.

Note: If the Payment Instruments feature is enabled and the customer selects a payment processing profile that is set up to tokenize credit cards, the card is automatically tokenized.

Note: The **Process an Online Payment with Sales Order Creation** option is distinct from the **Process an Online Payment with Sales Order Creation at Customer Center** option on the Accounting Preferences page, which applies to sales orders from Customer Center users in NetSuite. To learn more, see the Accounting help topic, [Items/Transactions Accounting Preferences](#).

To require authorization for credit card transactions of sales orders:

1. Go to Commerce > Websites > Web Site List.
2. Click **Edit** next to the website you're updating.
3. Go to the **Shopping** tab.
4. In the Shopping Basics area, check **Process an Online Payment with Sales Order Creation**.
5. Click **Save**.

Alternative Payment Methods for Commerce Web Stores

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced

This information refers to SuiteCommerce, SuiteCommerce MyAccount, and the Mont Blanc release of SuiteCommerce Advanced and later.

If you want your customers to use payment methods other than credit cards, you can create custom payment options that show up in your store and are accepted as valid payment methods for orders.

After you enable alternative payment methods, your customers can choose a payment option that communicates with an external payment gateway that is provided by a third-party company offering payment processing services.

Alternative payment methods are available to your customers in the following situations:

- When choosing a payment method during checkout.
- When paying for sales orders converted from a quote.
- When paying an invoice.

After a user picks an alternative payment method, they're prompted to leave your website and go to a third-party payment site for authentication.

If approved, the customer comes back to your website at the Order Confirmation page. If rejected, they're sent to your Payment Method page to pick a different method. If the customer cancels payment on the third-party site, the payment event is canceled in NetSuite and they're sent to the My Account home page.

See [Checkout](#) for information about customizing checkout experiences on your Commerce website.

Perform the following actions to set up alternative payment methods using external payment processing on your website:

- [Set Up an External Payment Gateway for Web Stores](#)
- [Create a New Payment Method for Web Stores](#)
- [Create a Payment Processing Profile for Web Stores](#)
- [Edit Website Settings for Payment Processing Profiles](#)
- [Set Up NetSuite to Process Alternative Payment Methods on Web Stores](#)
- [Restrict Web Store Payments Based on Customer's Currency](#)

Set Up an External Payment Gateway for Web Stores

i Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced

You can pick an external payment gateway partner from [SuiteApp.com](#).

Follow the steps provided in [Installing from the SuiteApp Marketplace](#) to install a SuiteApp to your NetSuite account.

Before choosing a payment gateway partner, note that a direct commercial relationship must first exist between the merchant and the payment gateway. This also requires an acquiring relationship. Some NetSuite's partners are acquirer agnostic, so you can keep your current acquiring relationship. Others require a new acquiring agreement.

If your current payment partner relationships don't work for you, reach out to the SuiteCloud Developer Network for help.

i Note: Only NetSuite-approved payment partners can offer external payment gateway services. To get a payment gateway, vendors must follow the official Built for NetSuite process.

Create a New Payment Method for Web Stores

i Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced

After installation, some SuiteApps automatically create a new Payment Method record in NetSuite, but others don't. To let your customers use alternative payments with third-party providers, link a payment method to the payment gateway that came with the SuiteApp.

To create a new payment method for external payment processing:

1. Follow the steps provided in the Order Management help topic, [Creating a Payment Method](#).
2. Give the payment method a name that makes it clear it's for an external payment method.
3. Select External Checkout from the **Type** list.
4. Check **Display in Website**.
5. Click **Save**.

Create a Payment Processing Profile for Web Stores

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced

A payment processing profile is a NetSuite record that stores the external payment gateway connection information that is delivered with the associated SuiteApp. You'll need to create at least one payment processing profile to direct NetSuite to use the payment gateway when processing a payment for a transaction that uses that profile.

To create a payment processing profile:

1. Follow the steps provided in the Order Management help topic, [Alternative Non-Credit Card Payment Methods for Web Store Orders](#).
2. In the payment processing profile record's **Web Site** field, pick the website that'll use this profile.
3. In the **Supported Payment Methods** field, choose the external payment method you created using the steps provided in [Create a New Payment Method for Web Stores](#). NetSuite will automatically update the Payment Method record to associate with this profile.
4. Make any other changes you need and click **Save**.

Edit Website Settings for Payment Processing Profiles

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced

After you create a payment processing profile, follow these setup steps:

- Allow payment processing in your Commerce web store.
- Allow non-credit card purchases during checkout.

To allow payment processing in your Commerce web store:

1. Go to Commerce > Websites > Website List.
2. Click **Edit** next to the website your updating.
3. Go to the **Shopping** subtab.
4. In the **Shopping Basics** area, check **Process an Online Payment with Sales Order Creation**.
5. Click **Save**.

To allow non-credit card purchases during checkout:

1. Go to Commerce > Websites > Website List.
2. Click **Edit** next to the website your updating.
3. Go to the **Shopping** subtab.

4. In the **Payments Page** area, check **Allow Non-Credit Card Payment Methods During Checkout**.
5. Click **Save**.

Set Up NetSuite to Process Alternative Payment Methods on Web Stores

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced

Set up your NetSuite account to use payment processing profiles that connect to third-party payment providers.

To allow NetSuite to process alternative payment methods:

1. Go to Setup > Accounting > Preferences > Accounting Preferences.
2. Go to the **Items/Transactions** subtab.
3. In the **Payment Processing** area, check **Enable the Sale Payment Operation on a Sales Order by Automatically Creating a Customer Deposit**.
4. Click **Save**.

Restrict Web Store Payments Based on Customer's Currency

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced

You can restrict payment methods to match the currency set in the payment processing profile. With this preference set, only profiles that support the selected payment method and your customer's currency will show up. If you use NetSuite OneWorld, the payment processing profile must also support the customer's subsidiary.

Important: This setting takes precedence over the **Restrict Payment Methods by Customer Currency** preference which is found on the **Shopping** tab of your Website record at Commerce > Websites > Website List. This means even if **Restrict Payment Methods by Customer Currency** is unchecked, only payment methods that support your customer's currency are shown. If nothing matches, your Payment Information page won't show any payment methods.

To restrict a payment method based on the customer's currency:

1. Enable your account for multiple currencies. See the help topic [Customers and Multiple Currencies](#) for detailed information.
2. Go to Setup > Accounting > Preferences > Accounting Preferences.
3. Go to the **Items/Transactions** subtab.
4. In the **Payment Processing** area, check **Use Strict Rules for the Selection of Payment Processing Profiles**.
5. Click **Save** to finish.
6. Go to the payment processing profile at **Setup > Accounting > Financial Statements > Payment Processing Profiles**.

7. Click **Edit** next to the payment processing profile you're updating.
8. Go to the **Payment Information** area.
9. In the **Charge Currencies** field, select the currencies you want to use.
10. Click **Save**.

ACH Payments on Commerce Web Stores

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced

The ACH Payments feature offers Automated Clearing House (ACH) payments for the My Account and Checkout flows in SuiteCommerce, SuiteCommerce MyAccount, and the 2023.1 release of SuiteCommerce Advanced (SCA) and later versions.

By enabling ACH Payments for Checkout and My Account, you'll lower the risk of lost or stolen checks, reduce administrative work, and boost customer security.

Important: This topic discusses the benefits and the process of enabling ACH Payments on your website for your customers and is unrelated to ACH Processing. To learn about ACH Processing, see the help topic [ACH Processing](#).

Important: The Payment Instrument feature must be enabled to create ACH payment methods and for ACH payments to work on your Commerce website. See the Order Management topic [Enabling the Payment Instruments Feature](#).

To set up ACH Payments for your Commerce website, complete payment setup tasks in NetSuite. See [Prerequisites for ACH Payments on Web Stores](#) for more information.

The ACH Payments feature lets users on your Commerce website do the following:

- Pay an invoice using an ACH transaction
- Pay a sales order during the checkout flow
- Add, edit, or remove an ACH payment instrument

The following topics provide helpful information about ACH:

- [Prerequisites for ACH Payments on Web Stores](#)
- [Set Up ACH Payments for Commerce Web Stores](#)
- [Web Store User Experience for ACH Payments](#)
- [Limitations of ACH Payments on Web Stores](#)

Limitations of ACH Payments on Web Stores

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced

The following limitations apply to the ACH Payments feature for Commerce websites:

- Processing financial transactions through the ACH network is available only for accounts in the United States. For information about electronic payment options for other countries, see the help topics [Supported Payment Formats](#) and [Electronic Bank Payments](#).

- The ACH Payments feature for the checkout flow is not compatible with Site Builder or the 2022.2 release of SCA and earlier.
- The ACH Payments feature is not compatible with the 2022.2 release of the SuiteCommerce Base Theme and earlier.
- Under My Account, ACH Payments is only available for invoice payments. This feature is not available for standard checkout flows or sales orders initiated from quotes.
- Within the Checkout flow, ACH Payments is not available for any sales order that was initiated from a quote.
- The ACH Payments feature only works with the Base, Bridge, Horizon, Manor, Posh, Summit, and Threads themes.

Prerequisites for ACH Payments on Web Stores

i Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced

Complete these tasks to set up ACH Payments for your Commerce website:

1. [Install a Third-party SuiteApp that Supports ACH Payments](#)
2. [Create a Payment Method](#)
3. [Create a Payment Processing Profile](#)

Install a Third-party SuiteApp that Supports ACH Payments

To enable ACH, your NetSuite account administrator should install a third-party SuiteApp that supports ACH payments. See the help topic [SuiteApps Documentation Summary](#) for more information.

Create a Payment Method

Create a payment method by following the steps in the Order Management help topic, [Creating a Payment Method](#). However, to make ACH payments work on your Commerce website, you need to perform these extra steps:

1. Select **ACH** from the **Type** list.
2. Check the **Display in Web Site** box.
3. Save your ACH payment method, then create an ACH payment processing profile. See [Create a Payment Processing Profile](#).
4. After you've created your ACH payment processing profile, edit your ACH payment method.
5. Under **Associated Payment Processing Profiles**, select your ACH payment processing profile.

Create a Payment Processing Profile

Create an ACH payment processing profile so your website can support ACH payments.

To create an ACH payment processing profile:

1. Ensure you've installed a third-party SuiteApp that supports ACH payments. See [Install a Third-party SuiteApp that Supports ACH Payments](#).

2. Follow the steps in the Order Management help topic, [Setting Up an Alternative Payment Method Processing Profile](#) to create a payment processing profile. However, to make ACH payments work on your Commerce website, you need to perform these extra steps:
 - In the **Payment Information** area, under **Supported Payment Methods**, select your ACH payment method.
 - In the **Payment Information** area, under **Gateway Request Types**, select **Authorization** and **Capture Authorization**.

Set Up ACH Payments for Commerce Web Stores

i Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced

To set up ACH payments on your Commerce website, complete the following tasks:

- [Create a Payment Instrument for ACH Payments on Web Stores](#)
- [Enable ACH Payments for Web Stores](#)

i Note: If you want to use ACH Payments during checkout, you'll also need to enable the **Allow non-credit card payment methods during checkout** feature (Commerce > Websites > Website List > [your website] > Shopping tab > Payments Page).

Create a Payment Instrument for ACH Payments on Web Stores

i Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced

You can create payment instruments in two ways:

- You create a payment instrument using the Order Management feature in NetSuite.
- Your customer creates a payment instrument on your Commerce website. See [Web Store User Experience for ACH Payments](#).

i Note: To create a payment instrument, you'll first need to enable the Payment Instruments feature (Setup > Company > Enable Features > Transactions > Payment Processing).

Follow the steps in the Order Management help topic, [Payment Instruments](#), to set up a payment instrument in NetSuite.

To create an ACH account for a customer:

1. Go to Lists > Relationships > Customers, and select the customer you want to create an ACH account for.
2. Go to the **Financial** subtab and the **Payment Instruments** subtab.
3. Click **New ACH**.
4. Fill out the following fields on the ACH payment instrument page:
 - **Type** – Select **ACH**.
 - **Payment Method** – Select your ACH payment method.
 - **Limit** – Enter the limit per transaction for this account.

- **Bank Account Number** – Enter the bank account number, up to 20 digits.
- **Account Type** – Select Checking, Corporate Checking, or Saving.
- **Routing Number** – Enter the nine-digit routing number.
- **Bank Name** – Enter the name of the bank. **Bank Name** is not displayed as a required field in NetSuite but is required for your Commerce website.
- **Account Owner Name** – Enter the name of the account owner.
- **Customer Consent** – Enter a customer consent message to be included with all ACH transmissions using this account.

5. Click **Save**.

Enable ACH Payments for Web Stores

i Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced

Configure ACH Payments for Make a Payment and Checkout flows in the SuiteCommerce Configuration record.

In the Make a Payment flow, you can offer the ACH payment method to customers paying invoices in the My Account area of your site. In the Checkout flow, you can offer the ACH payment method for customers who have their customer profile set to Company or Individual.

See the help topic [Payment Instrument ACH Subtab](#) for information about configuring ACH payment instruments.

To enable ACH payments for Make a Payment:

1. Go to Commerce > Websites > Configuration.
2. Select your website and domain, and click **Configure**.
3. Go to the **Payment Instruments & Methods** subtab and the **Payment Instrument ACH** subtab.
4. Check the **Enable ACH Payments for Make a Payment** box.
5. Click **Save**.

To enable ACH payments from Companies in the Checkout flow

1. Go to Commerce > Websites > Configuration.
2. Select your website and domain, and click **Configure**.
3. Go to the **Payment Instruments & Methods** tab and the **Payment Instrument ACH** subtab.
4. Check the **Enable ACH Payments from Companies Using Checkout** box.
5. Click **Save**.

To enable ACH payments from Individuals in the Checkout flow

1. Go to Commerce > Websites > Configuration.
2. Select your website and domain, and click **Configure**.
3. Go to the **Payment Instruments & Methods** tab and the **Payment Instrument ACH** subtab.
4. Check the **>Enable ACH Payments from Individuals Using Checkout** box.
5. Click **Save**.

Web Store User Experience for ACH Payments

i Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced

With ACH Payments enabled, Commerce website users can:

- Select an invoice and make a payment using an ACH transaction
- Add, edit, or remove an ACH payment instrument

Users can access ACH payments from these areas on your Commerce website:

- User area > Settings
- My Account > Settings
- User area > Billing > Invoices > Make a Payment
- My Account > Billing > Invoices > Make a Payment

Users can add, edit, or remove ACH payment instruments in these on your Commerce website:

- User area > Settings > ACH Payments
- My Account > Settings > ACH Payments
- User area > Billing > Invoices > Make a Payment
- My Account > Billing > Invoices > Make a Payment

i Note: Users can only edit the **Limit** field when editing ACH payment instruments. To edit other fields, users need to remove and re-add the payment instrument.

ACH Payments Page

Users can add, edit, or remove ACH payment instruments. Click **Add Bank Account** to add a new ACH payment instrument. See the following sample ACH Payments page:

PayPal Integration and Express Checkout for Commerce Web Stores

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced

Enable the PayPal Integration feature in your account to accept PayPal as a payment method in your Commerce web store. An Administrator, or someone with Setup permission, can go to Setup > Company > Enable Features. Go to the Transactions subtab and the Payment Processing area, then check the PayPal Integration box.

Setting up a successful integration includes entering the API provided by NetSuite into your PayPal merchant account.

Note: PayPal requires Transport Security Layer (TLS) 1.2 for all HTTPS connections. If a user attempts to access PayPal payment systems using a browser without TLS 1.2 enabled, the PayPal page won't load. To fix this issue, users should use a browser that supports TLS 1.2 and has it enabled in browser settings.

Setting Up PayPal Express Checkout for Web Stores

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced

PayPal Express Checkout lets your customers check out using information saved in their PayPal accounts without having to re-enter details on your website. You can take advantage of PayPal and partner offers using Express Checkout. After integrating PayPal Express Checkout with NetSuite, you can issue returns through PayPal.

After you set up PayPal Express Checkout, customers click the PayPal button in your shopping cart, get redirected to PayPal to confirm or change their details, then return to your site to enter any gift certificates or coupon codes and to submit the order.

Note: Customers need a PayPal account to complete payment with PayPal Express Checkout.

Complete the following tasks to set up PayPal Express Checkout in NetSuite:

- Set up your PayPal merchant account with API access to NetSuite transactions.
- Set up PayPal Express Checkout in NetSuite.

To set up your PayPal account with API access to NetSuite transactions:

1. If you don't have a PayPal merchant account, go to [PayPal](#) to set one up.

In NetSuite, you can go to Setup > Accounting > PayPal Accounts > New and click the link near the top of the page. This link redirects you to the PayPal Business website.

Important: Your PayPal account needs to be Premier or Business to set up the required API access for PayPal Express Checkout.

2. Log in to your PayPal merchant account and, depending on your environment, use one of the following API usernames for granting API Access to NetSuite:
 - For production accounts – **ppexpresscheckout_api1.netsuite.com**
 - For sandbox or demo accounts – **dwilli_1183500510_biz_api1.netsuite.com**
3. Check the following options in the list of APIs:
 - Use Express Checkout to process payments.
 - Issue a refund for a specific transaction.
 - Obtain information about a single transaction.
 - Search your transactions for items that match specific criteria and display the results.
 - Authorize and capture your PayPal transactions.

To set up PayPal Express Checkout in NetSuite:

1. Confirm the PayPal Integration feature is enabled in NetSuite.

Go to Setup > Company > Enable Features.

2. Click the **Transactions** subtab.
3. In the Payment Processing area, check the **PayPal Integration** box to enable PayPal as a payment method on your Commerce website.
4. Click **Save**.
5. Create a PayPal account record in NetSuite that corresponds with your PayPal account.
Go to Setup > Accounting > PayPal Accounts > New.
6. Enter the following information in the Account Basics area:

- **Account Name** Enter a name for the PayPal payment method.
- **Primary PayPal Email Address** – Enter the email address you use to log in to your PayPal merchant account.

Important: To receive customer payments, your primary email address must match your merchant account email (it's case sensitive). Log in to PayPal and check your profile if needed.

- Check **Test Mode** if you're using PayPal sandbox environment for testing.
- Check **Inactive** if you don't want this PayPal account available on your website.
- Check **Use Express Checkout** to use PayPal Express Checkout in your Commerce website. Follow the instructions in [Setting Up PayPal Express Checkout for Web Stores](#) if you want to use PayPal Express Checkout

Important: You'll need to set up API access in your PayPal Express merchant account to enable integration with NetSuite.

- Check **Use Express Checkout With Bill Me Later** to let customers pay with PayPal Credit.
7. In the Payment Method area, complete the following steps to select an account for PayPal transactions:
 - Select your subsidiary from the **Subsidiary** list.

Note: The subsidiary must be the same as the one you select in Step 12.

- Check **Deposit To**.
 - Select PayPal from the **Account** list.
8. Click **Submit**.

Note: PayPal integration is validated when you click Save on the PayPal Accounts page. If PayPal Express Checkout is set up correctly, the page saves successfully.

9. Go to Commerce > Websites > Website List to associate your PayPal account with your subsidiary.
10. Click **Edit** next to the name of your website.
11. Go to the **Setup** tab.
12. At the bottom of the **Setup** tab, in the Subsidiaries area, go to the row for your subsidiary and select your PayPal account from the PayPal Account list.

Note: The subsidiary must be the same as the one you selected in Step 7.

13. Click **Save**.

To associate multiple PayPal accounts with your NetSuite account, see [Using Multiple PayPal Accounts on Web Stores](#).

When a customer completes checkout, NetSuite creates a sales order with payment authorized by PayPal. Depending on your accounting settings, the sales order status in NetSuite is either Pending Fulfillment or Pending Approval. After the order is billed, payment is received from PayPal.

Note: NetSuite doesn't send an email if the order can't be processed. If there's a funding issue in PayPal, the customer goes back to PayPal, sees the error, and can pick a new funding source to resubmit the order.

If you don't want to use Express Checkout, don't check the **Use Express Checkout** box unchecked when you enable the PayPal Integration feature in NetSuite. Customers can still choose PayPal as a payment option at checkout. For details, see [Web Store PayPal Integration Without Express Checkout](#).

Using Multiple PayPal Accounts on Web Stores

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced

You can use a separate PayPal account for each website you operate. If you use NetSuite OneWorld, you can use a separate PayPal account for each of your subsidiaries.

To set up multiple PayPal accounts:

1. If you don't already have a PayPal merchant account, go to [PayPal](#) to set one up.
In NetSuite, you can go to Setup > Accounting > PayPal Accounts > New and click the link near the top of the page. This link redirects you to the PayPal Business website.
2. Enter the following information in the Account Basics area:
 - **Account Name** - Enter a name for the PayPal payment method.
 - **Primary PayPal Email Address** - Enter the email address you use to log in to your PayPal merchant account.

Important: To receive customer payments, your primary email address must match your merchant account email (it's case sensitive). Log in to PayPal and check your profile if needed.

- Check **Test Mode** if you're using PayPal sandbox environment for testing.
 - Check **Inactive** if you don't want this PayPal account available on your website.
 - Check **Use Express Checkout** to use PayPal Express Checkout in your Commerce website. Follow the instructions in [Setting Up PayPal Express Checkout for Web Stores](#) if you want to use PayPal Express Checkout.
 - Check **Use Express Checkout With Bill Me Later** to let customers pay with PayPal Credit. Follow the instructions in [Setting Up PayPal Express Checkout for Web Stores](#) if you want to use PayPal Express Checkout.
3. In the Payment Method area, complete the following steps to select an account for PayPal transactions:
 - Select your subsidiary from the **Subsidiary** list.

Note: The subsidiary must be the same as the one you selected in Step 11.

- Check **Deposit To**.

- Select PayPal from the **Account** list.
4. Click **Submit**.

Note: PayPal integration is validated when you click **Save** on the PayPal Accounts page.

5. Repeat Steps 2 through 5 for each of your PayPal accounts.
6. Go to Commerce > Websites > Website List to associate your PayPal accounts with multiple websites or multiple subsidiaries in a OneWorld account. Follow these steps:
 - **For multiple websites** – Go to the **Setup** subtab and select the appropriate PayPal account in the Preferences section.

The screenshot shows the NetSuite Setup subtab with various configuration options. In the Preferences section, the 'PayPal Account' dropdown menu is highlighted with a red box and set to 'PayPal'. Other visible options include 'Scriptable Cart and Checkout', 'Scripting Template (Credit Card)', 'Online Order - Cas...le with cart scrip', 'Scripting Template (Invoice)', 'Sales Order - Invoice with cart script', 'Show Uncategorized Items', 'Credit Sales Reps for Website Orders', and 'Default Customer Category'.

- **For OneWorld** – Go to the **Setup** subtab and associate a PayPal account record with each subsidiary.

Move To Top		Move To Bottom				
Online	Default	Subsidiary	Display Name	PayPal Account	Payment Processing Profiles	
☒	☒	Parent Company	International Store	Paypal	VeriSign	
☒	☐	Italy	Italian Store	Paypal International		
☒	☐	Germany	German Store	Paypal International		

7. Click **Save**.

After you set up multiple PayPal accounts in NetSuite, you can track sales orders from multiple websites or subsidiaries.

Authorization and Capture with PayPal Express Checkout on Web Stores

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced

After an order is created, NetSuite initiates an authorization request to PayPal for the full order amount. When the shopper approves the authorization, a three-day honor period starts. PayPal holds the order amount on the shopper's account to make sure funds are available for capture.

During this three-day honor period, you're guaranteed to capture funds if the authorization is valid. Contact PayPal for more information about their validation process.

You've got three days from when the order's created to fulfill it and capture the funds. If you try to capture funds after the three-day period, NetSuite voids the original authorization, starts a new one, and tries to capture the funds again. By default your PayPal account is restricted to a single authorization. NetSuite can initiate only as many authorizations as your PayPal account allows within a 29-day period.

Important: Your PayPal account manager can tell you how many authorizations are allowed in your account and increase the limit if needed.

Managing Customer Records with PayPal Express Checkout on Web Stores

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced

When you enable PayPal Express Checkout in NetSuite, a new customer record is created each time a shopper uses this payment method, regardless of whether they are a new or returning customer. This means that even if a shopper already has a customer record in your NetSuite account, checking out with PayPal Express will still generate an additional customer record.

Duplicate customer records show up in the list of customers with a number after the name. For example, Jane Smith and Jane Smith1.

To manage duplicates, turn on the Merge Duplicates feature (Setup > Enable Features > CRM). After you enable it, you can periodically run the duplicate merge operation from the Search menu.

Note: If customers use PayPal Express Checkout before logging in or registering, a customer record is created. However, they don't get login or password information and can't access the Customer Center or My Account page.

Refunding Web Store Orders Paid by PayPal Express Checkout

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced

You can refund PayPal Express Checkout orders in NetSuite without logging in to PayPal. After PayPal Express Checkout is enabled and set up, you can refund orders made with either the Express Checkout button or PayPal payment option.

You can issue full, partial, or multiple refunds on PayPal orders if the total refund doesn't exceed the original amount. You can't refund transactions if the funds haven't been captured yet.

See the Order Management topic, [Refunding an Open Balance](#), for information about the process to refund a customer in NetSuite.

Note: If PayPal Express Checkout isn't enabled, then transactions processed using the PayPal payment option can't be refunded in NetSuite. You need to issue the refund using the same payment method the customer used for the original transaction.

Web Store PayPal Integration Without Express Checkout

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced

PayPal integration without Express Checkout is supported only on Standard Site Builder sites.

For implementations of SuiteCommerce Advanced, SuiteCommerce, and SiteBuilder Extensions Denali to Aconcagua, you must enable Express Checkout to use PayPal as a payment method. If Express Checkout is disabled for these implementations, and you use PayPal, checkout will fail.

If you have a standard implementation of Site Builder and you enable PayPal Integration but don't check the Use Express Checkout box, customers can still choose PayPal as a payment option at checkout. When customers choose PayPal, they click the Pay With PayPal button at the end of checkout and payments are deposited in your PayPal merchant account.

If Express Checkout is not enabled for your Site Builder implementation, then transactions processed using the PayPal payment option can't be refunded in NetSuite. You'll need to log in to the PayPal website to issue refunds.

Web Store Checkout Process with PayPal Express Checkout

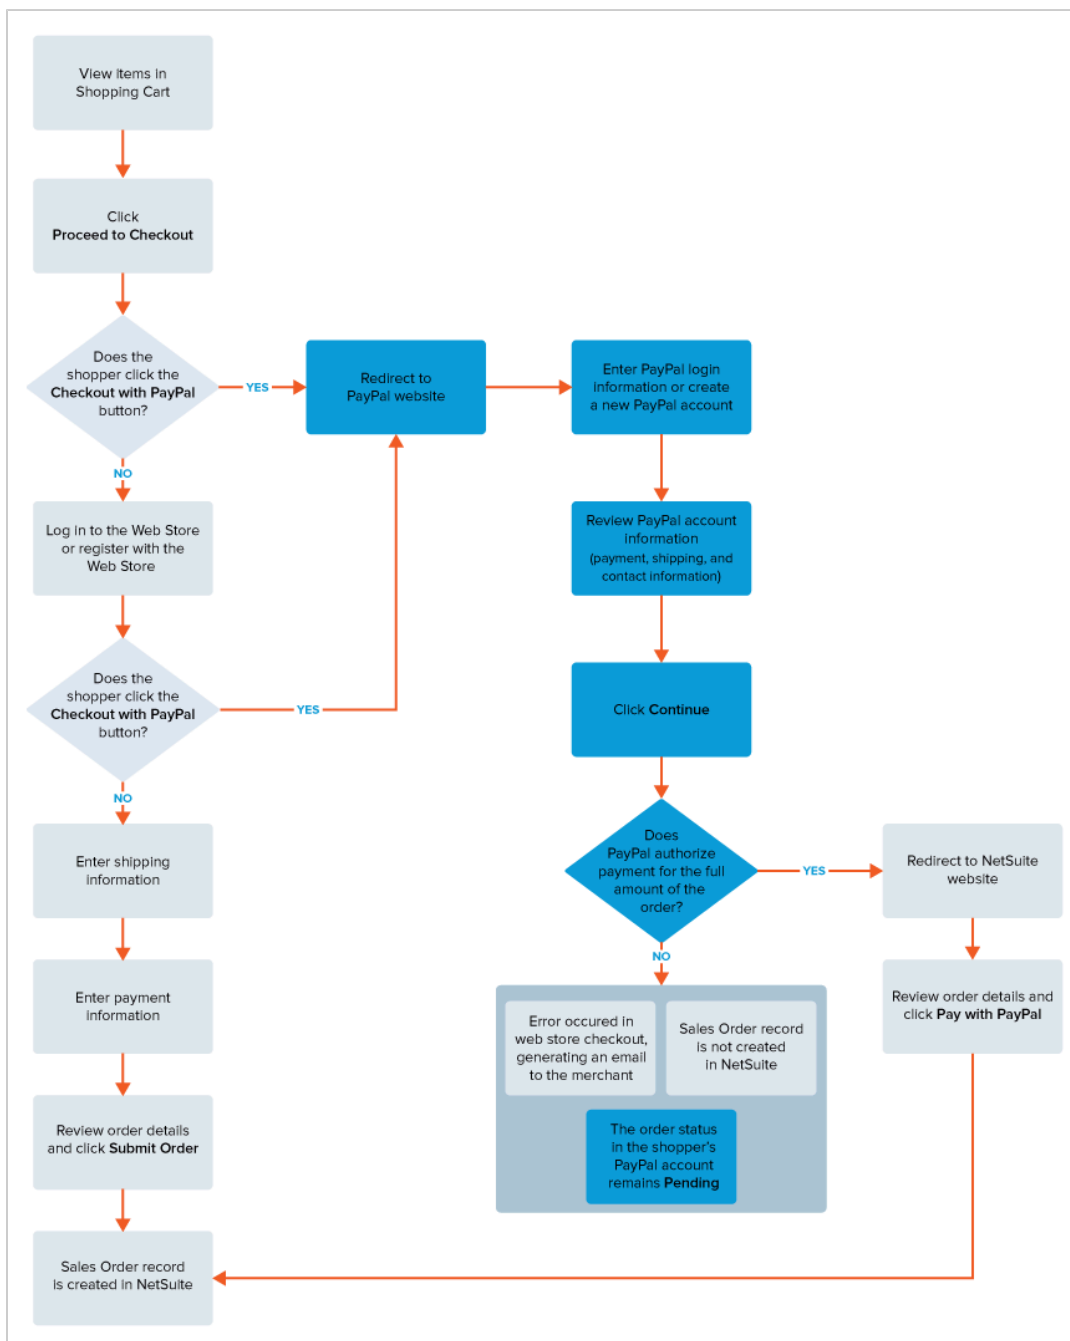

i Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced

PayPal Express Checkout lets your web store customers pick their payment method at various points in the checkout process, helping lower cart abandonment.

The PayPal Express Checkout button appears in the shopping cart and address information page. If customers pick PayPal on the payment methods page, they'll see the Pay with PayPal button, with Express Checkout functionality, on the last checkout page of checkout.

Customers click the PayPal Express Checkout button and are temporarily redirected to the PayPal site to confirm their payment and address details.

The following diagram shows the PayPal Express Checkout process for Commerce websites:

After the sales order record is created in NetSuite, the following PayPal fields are displayed on the sales order form:

Field Name	Field ID	Field Type	Description
PayPal Status	paypalstatus	Text	Shows the payment status from PayPal. Possible values are: - None – No status. - Canceled-Reversal – The reversal was canceled, so the funds from the reversed transaction were returned to you. For example, you won a dispute with the customer and the

Field Name	Field ID	Field Type	Description
			funds for the reversed transaction have been returned to you. - Completed – Payment's complete and the funds are in your account. This is the only status for point-of-sale transactions. - Denied – You denied the payment. - Expired – The authorization period for this payment expired. - Failed – The payment has failed. This happens only if the payment was made from your customer's bank account. - Pending – The payment's pending. - Refunded – You refunded the payment. - Reversed – A payment was reversed due to a chargeback or other type of reversal. The funds have been removed from your account balance and returned to the buyer. - Processed – The payment's been accepted. - Voided – The authorization for this transaction was voided.
PayPal Order ID	paypalorderid	Text	The ID of the order submitted through PayPal Express Checkout. Populated from the PayPal response.
PayPal Tran. ID	paypaltranid	Text	Unique transaction identification number of the payment. Populated from the PayPal response.
Authorization ID	paypalauthid	Text	Authorization identification number. Populated from the PayPal response.
Process PayPal Payment	paypalprocess	Checkbox	If checked, PayPal processes the payment or refund. If not checked, the info is saved in NetSuite but the data entered in the other PayPal fields will be stored in NetSuite but not sent to PayPal. This is checked by default for PayPal Express Checkout orders.
Override PayPal Settings	paypaloverride	Checkbox	If checked, the user can override the PayPal Tran. ID and PayPal Status fields. If not checked, these field IDs are disabled and populated with the PayPal response.

SuiteCommerce Payment Instruments Integration

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced

SuiteCommerce lets you use the Payment Instruments feature for tokenized payment methods and additional payment gateways. For details, see [Tokenized Payment Instruments for Web Stores](#).

Requirements:

- SuiteCommerce or SuiteCommerce Advanced version 2019.1 or later
- A domain with an active theme built using the SuiteCommerce Base Theme 2019.1 or later. See the help topic [SuiteCommerce Base Theme](#).

Note: The 2019.1 and later versions of the SuiteCommerce Base Theme include the templates required to use tokenized payment instruments.

Note: Tokenized payment instruments are not supported on SiteBuilder Extensions.

After the Payment Instruments feature is enabled:

- Registered website users can manage their debit and credit card payment instruments. See [Payment Card Management for Commerce Web Stores](#).
- Site administrators can add tokenized payment instruments as payment methods. See [Tokenized Payment Instruments for Web Stores](#).

Payment Card Management for Commerce Web Stores

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced

With the Payment Instruments feature enabled, logged-in Commerce website customers can:

- Add new debit and credit cards to their account.
- View saved tokenized and non-tokenized debit and credit cards during checkout.
- Enter payment information for a single transaction that is not saved for future purchases.
- Enter additional card payment instrument security information when required by the card issuer or payment gateway.

To let your customers use payment instruments in the My Account area of your Commerce website, give the Customer Center role full permission to use the Payment Instruments feature.

Note: First you'll need to enable the Payment Instruments feature in NetSuite. See the help topic [Payment Instruments](#).

To give the Customer Center role access to the Payment Instruments feature:

1. Go to Setup > Users/Roles > User Management > Manage Roles (Administrator).
2. Click **Customize** next to the Customer Center role.
3. Go to the **Permissions** subtab and the **Lists** subtab.
4. From the **Record** list, select **Payment Instruments**.
5. From the **Level** list, select **Full**.
6. Click **Add**.
7. Click **Save**.

Tokenized Payment Instruments for Web Stores

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced

Tokenized payment instruments increase payment security by substituting sensitive payment card data with a payment card token that doesn't include sensitive data.

After you set up tokenized payment instruments for your website, NetSuite creates a token the first time a customer uses their payment card to complete a transaction. SuiteCommerce uses the token for all future transactions using that payment card.

Important: Enabling the NetSuite Payment Instruments feature changes your payment record structure and can't be undone. Tokens created before enabling the feature are inaccessible and can't be used. Contact your NetSuite account manager to determine if you are eligible for this feature.

After the Payment Instruments feature is enabled in your NetSuite account, you can set up tokenized payment instruments.

See the help topic [Tokenization](#) for additional information about tokenization.

Setting up tokenized payment instruments for SuiteCommerce

1. Set up accounting preferences to allow credit card payments on your website. See [Set up Accounting Preferences for Web Stores](#).
2. Enable the Payment Instruments record. See the help topic [Payment Instruments](#).

Note: The Payment Instrument feature checkbox is available on the Enable Features page when your NetSuite account manager adds this feature to your NetSuite account.

3. Create one or more payment methods for tokenized payment cards. See the help topic [Creating a Payment Method](#).
 - From the **Type** list, select **Payment Card Token**.
 - Check the **Display in Website** box.
 - Go to the **Payment Visuals** subtab to choose which images are used on your website's checkout page for this payment method.
4. Set up an alternative payment method processing profile for tokenized payments. See the help topic [Setting Up an Alternative Payment Method Processing Profile](#).
5. Assign the new payment processing profile to your website. See [Assign Payment Processing Profiles to Your Website](#).
6. Go to Commerce > Websites > Website List.
7. Click **Edit** next to the website for which you want to set up tokenized payment instruments.
8. Go to the **Shopping** subtab and the **Shopping Basics** tabs area.
9. Check the **Require Authorization for Credit Card Transactions** box.
10. Click **Save**.

Your customers now get extra security from tokenized card transactions when they use debit or credit cards in checkout.

Commerce Web Store Taxes

Applies to: SuiteCommerce | SuiteCommerce Advanced

This topic explains the following:

- [SuiteCommerce VAT, GST, PST Tax Support](#)
- [SuiteCommerce SuiteTax Support](#)

Note: Tax estimates displayed in your web store for guest shoppers reflect the default tax configurations you set on the Set Up Taxes page in NetSuite. This tax information is sent to your web store by the Commerce API, but the Commerce API doesn't calculate taxes. If you don't use SuiteTax, you should contact your tax provider to ensure tax calculations are accurate.

For developer information about tax-related values returned by the Commerce API, see the help topic [Commerce API](#).

SuiteCommerce VAT, GST, PST Tax Support

Applies to: SuiteCommerce | SuiteCommerce Advanced

Note: If you're a SuiteCommerce Advanced customer, you need to be on the Kilimanjaro release or later to use this feature.

SuiteCommerce supports the display of VAT, GST, and PST tax amounts for Canadian, UK, Australian, and New Zealand editions of NetSuite.

Before you enable VAT/GST/PST display in your Commerce web store, make sure your NetSuite account has the right tax types and codes set up. For detailed information about setting up taxes for your NetSuite account, see the help topic [Taxation](#).

Note: You can only show VAT/GST/PST tax breakdowns in single Australian, New Zealand, UK, or Canadian editions, or in OneWorld editions with only one subsidiary set up.

To enable the display of VAT/GST/HST in your Commerce web store:

1. Go to Commerce > Websites > Configuration and pick the website and domain you want to set up.
2. On the **Shopping Catalog** subtab, enable the option **If the Information is Available to your Country, shows detailed taxes in the cart**.
3. Make sure the right tax codes are entered on the **Accounting** subtab of your Item records.
4. For Australian and New Zealand accounts, set the **Prices Include Tax** option on the **Sales/Pricing** subtab of the Item record. Here's what happens depending on your selection:
 - If **Prices Include Tax** is enabled, the product page shows the total cost including tax. At checkout, you'll see the item cost and tax broken out separately.
 - If **Prices Include Tax** isn't enabled, the product page shows the cost without tax. At checkout, you'll still see the item cost and tax broken out separately.

After you've set up VAT/GST/HST display, users see the breakdown of VAT/GST/PST tax amounts during checkout.

Note: For Canadian accounts, a user must be logged in and have a default address selected. If not, a tax code error is returned.

SuiteCommerce SuiteTax Support

Applies to: SuiteCommerce | SuiteCommerce Advanced

If you're a SuiteCommerce Advanced customer, you need to be on the 2019.1 release or later to use this feature.

Note: You need to deploy SuiteScript 2.0 (SSP2) on the same site and domain as SuiteScript 1.0 (SSP1). Deploy the SSPv2 application to your Shopping and Checkout domain. In SuiteCommerce Advanced 2019.1, only one SSPv2 application is included. In SuiteCommerce Advanced 2019.2, there are two—use the DEV SSPv2 application for deployment. For details, see the help topic [Deploy and Undeploy SSP Applications](#).

SuiteCommerce supports the NetSuite SuiteTax feature for customers in the US and Canada. SuiteTax helps you meet local tax rules by letting you pick internal or third-party tax engines to calculate taxes. You can choose a different tax engine for each tax registration (nexus) on subsidiary records to stay compliant with each tax area. For more information, see the help topic [SuiteTax](#).

You can't use SuiteTax with the Multiple Ship To feature. See the help topic [Known Limitations of SuiteTax](#) for more limitations and considerations.

After you've set up SuiteTax on your Commerce web store, users see the total tax for their order as soon as they add shipping details at checkout. The total tax updates when the user:

- Adds or removes items
- Changes the item quantity
- Changes the shipping address
- Changes the shipping method
- Applies a promotion

SuiteCommerce Capabilities with SuiteTax Enabled	Business-to-Consumer (B2C)	Business-to-Business (B2B)
View a summary of the taxes grouped by tax type at checkout.	X	X
See every tax applied in the returned order summary (in My Account Returns).	X	X
See every tax applied in the order, summarized by type (in My Account History).	X	X
View the total taxes for previous orders (user must be logged in to their registered account).	X	X
See the total tax amount when creating a sales quote.		X
View the total tax amount when paying an invoice.		X

Setting up SuiteTax for your Commerce Web Store

1. Add payment visuals for all payment methods your web store uses. See the help topic [Creating a Payment Method](#).

Important: To use SuiteTax, you need to add payment visuals for all payment methods.

2. Enable the SuiteTax feature. See the help topic [Enabling the SuiteTax Feature](#).

Important: After enabling SuiteTax, you can't switch back to the legacy tax engine.

3. Go to Customization > Plug-ins > Manage Plug-ins and enable the SuiteTax Engine plug-in.
4. Install these SuiteTax SuiteApps:
 - SuiteTax Engine. See the help topic [Installing the SuiteTax Engine](#).
 - Tax Reporting Framework. See the help topic [Installing Tax Reporting Framework](#).
5. Set up the tax engine for your subsidiary tax registrations. See the help topic [Selecting a Tax Engine for Tax Registrations on Subsidiary Records](#).
6. Set up accounting preferences for your Commerce web store. See [Set up Accounting Preferences for Web Stores](#).
7. Make sure your SuiteTax setup is complete and check the migration status. See the help topic [Viewing the SuiteTax Data Migration Status](#).

Device Fingerprinting

Applies to: SuiteCommerce | SuiteCommerce Advanced

SuiteCommerce Advanced supports device fingerprinting for online orders as part of the advanced fraud management features available with CyberSource Decision Manager. Device fingerprinting collects information about the computer someone uses to place an order in your web store to see if the device is trustworthy. Decision Manager analyzes the data gathered at checkout in real time. Based on rules you define in Decision Manager, an order can be accepted, rejected, or placed on payment hold for review as part of your order management process in NetSuite.

Before you use device fingerprinting in your Commerce web stores, make sure you meet these prerequisites:

- You need to use CyberSource Decision Manager to authorize credit card transactions. Check the **Enable Device Fingerprinting** box in your CyberSource gateway profile. For details, see the help topic [Using CyberSource Decision Manager for Fraud Management](#).
- Check the **Require Authorization for Credit Card Transactions** box for the site you want on the **Shopping** subtab of the Web Site Setup record at Commerce > Websites > Website List.

After these prerequisites are met, when a user opens the final submit page in Checkout, their device information and a unique session ID are sent to the device fingerprinting server.

Note: Any calls to the device finger printer are excluded from the SEO page generator.

If you're using a release prior Vinson, you can customize your setup to support device fingerprinting. Add this code snippet right before the closing `</body>` tag in the checkout.ssp file at `/CheckoutApplication@x.x.x/SuiteScript/checkout.ssp`.

```
1 | <%= order.getDeviceFingerprintingHtml() %>
```

For customization best practices, see the help topic [Develop Your SCA Customization](#).

Shipping Setup

i Applies to: SuiteCommerce | SuiteCommerce Advanced

When you're setting up your Commerce website, you can choose how shipping works and which shipping methods shoppers can use.

On the **Shipping** subtab of the Website Setup page, you can:

- Require shoppers to enter shipping information before checking out.
- Require shoppers to enter shipping address before billing address.
- Select a default shipping method for a website.
- Enable shipping to all countries or limit to specific countries.
- Choose a default country to show in the **Country** field during checkout.

For more information, read the following topics:

- [Setting a Preferred Shipping Method for Your Site](#)
- [Shipping Estimator](#)
- [Restricting Ship To Countries in Your Commerce Web Store](#)

For the complete listing of website shipping preferences, read the help topic [Shipping Page](#).

Before you can select a default shipping method for your site, you'll need to register your shipping accounts, set your preferences, and create shipping items in NetSuite. For more information, read the following topics:

- [Registering a FedEx Account, Registering a UPS Account, Registering a UPS Account \(UK\), Register a USPS Account with NetSuite](#)
- [Getting Started with Australia Post Integration](#)
- [Setting Shipping Preferences](#)
- [Creating Shipping Items](#)

The default shipping method you pick, along with the customer's previous choices, decides which carrier and shipping options shoppers see at checkout. In Checkout, the Shipping Method page displays a list of shipping items that are appropriate for the shipping address. If you select a Default Website Shipping Method, then a shipping method is preselected in Checkout based on the customer and your settings.

Important: If you use multiple locations, to calculate shipping correctly, the **Location** field must be displayed on the sales order form you use for your website. For more information about displaying fields on transaction forms, see the help topic [Configuring Fields or Screens](#).

With the SuiteCommerce Shipping Bar extension, you can tell shoppers about free or special shipping rates with messages that update to show how much more they need to spend to qualify. To learn more about setting up the shipping bar on your site, see [Shipping Bar](#).

Note: To set up shipping methods for use outside Commerce websites, see the Order Management topic, [Setting Up Shipping](#).

Setting a Preferred Shipping Method for Your Site

i Applies to: SuiteCommerce | SuiteCommerce Advanced

The preferred shipping method for an order is based on:

- [Default Shipping Carrier](#)
- [Default Website Shipping Method](#)
- [Customer Information](#)

Shoppers can always choose a different shipping method or carrier if one's available. You can show the [Shipping Estimator](#) on your site to help customers pick a carrier.

Default Shipping Carrier

If you use UPS, FedEx, USPS, or other carriers, you can pick a default carrier for your NetSuite account. NetSuite shows the default carrier to Commerce web store shoppers if other preferences or customer address information cannot be used to determine an appropriate shipping method. Set this preference if you'd like to preselect a carrier for shoppers when nothing else applies.

To learn more about setting a default carrier in NetSuite, see the help topic [Selecting a Default Shipping Carrier](#).

Default Website Shipping Method

The Default Website Shipping Method is the preferred shipping carrier displayed in Checkout. Set this preference if you want customers to see this option first at checkout. You can select a default shipping method for your website whether you use multiple carriers or not.

To select a default shipping method for a website:

1. Go to Commerce > Websites > Web Site List.
2. Click **Edit** next to the website you'd like to change.
3. On the **Shipping** subtab, in the Shipping Page section, select a shipping method in the **Default Website Shipping Method** field.
4. Click **Save**.

Note: To set up shipping methods that can be used outside Commerce websites, see the Order Management topic, [Setting Up Shipping](#).

Customer Information

If a shopper placed a previous order through your website, the customer record stores the shipping method selected for the last order. This information updates each time the customer picks a shipping method on the order form. The shopper's previous shipping method choice is preselected in Checkout.

Shipping Estimator

Applies to: SuiteCommerce | SuiteCommerce Advanced

The Shipping Estimator displays as a dropdown field in the order summary box in the cart section of your website after your customer adds items to their cart. It shows the estimated shipping cost based on the Shipping Estimator Preference set by the website administrator.

Note that the preference setting you select may not be applicable to all customers. For example, you might pick a default shipping method that's not available for a customer's address. In that case, a system of precedence determines the method by which the estimated shipping cost is calculated. For more information, see [Shipping Estimator Order of Precedence](#).

To estimate the shipping cost, the Shipping Estimator only requires customers to select a country and enter a postal code. Customers will enter a full shipping address later and can pick a different shipping method before placing their order.

Note: Shipping estimates for orders shipped by FedEx from a Canadian location do not include Canadian sales tax.

The following image is an example of how the Shipping Estimator looks in the Store Front:

Order Summary

This topic includes:

- [Enabling the Shipping Estimator](#)
- [Shipping Estimator Preference Options](#)
- [Shipping Estimator Order of Precedence](#)

Enabling the Shipping Estimator

In SuiteCommerce Advanced, you have full control over what's shown on your website. To show the Shipping Estimator feature, you'll need to layout your website to display it in the shopping cart.

To enable the shipping estimator:

1. Go to Commerce > Websites > Web Site List.
2. Click **Edit** next to the website you'd like to change.
3. Click the **Setup** subtab.
4. Check the **Enable Shipping Estimator in Cart** box.
5. Click the **Shipping** subtab.
6. Make a selection from the **Shipping Estimator Preference** list. For more information, see [Shipping Estimator Preference Options](#).
7. Click **Save**.

Shipping Estimator Preference Options

After you select a Shipping Estimator Preference, it'll use your choice to figure out the estimated shipping cost for your customer. You can select from these options:

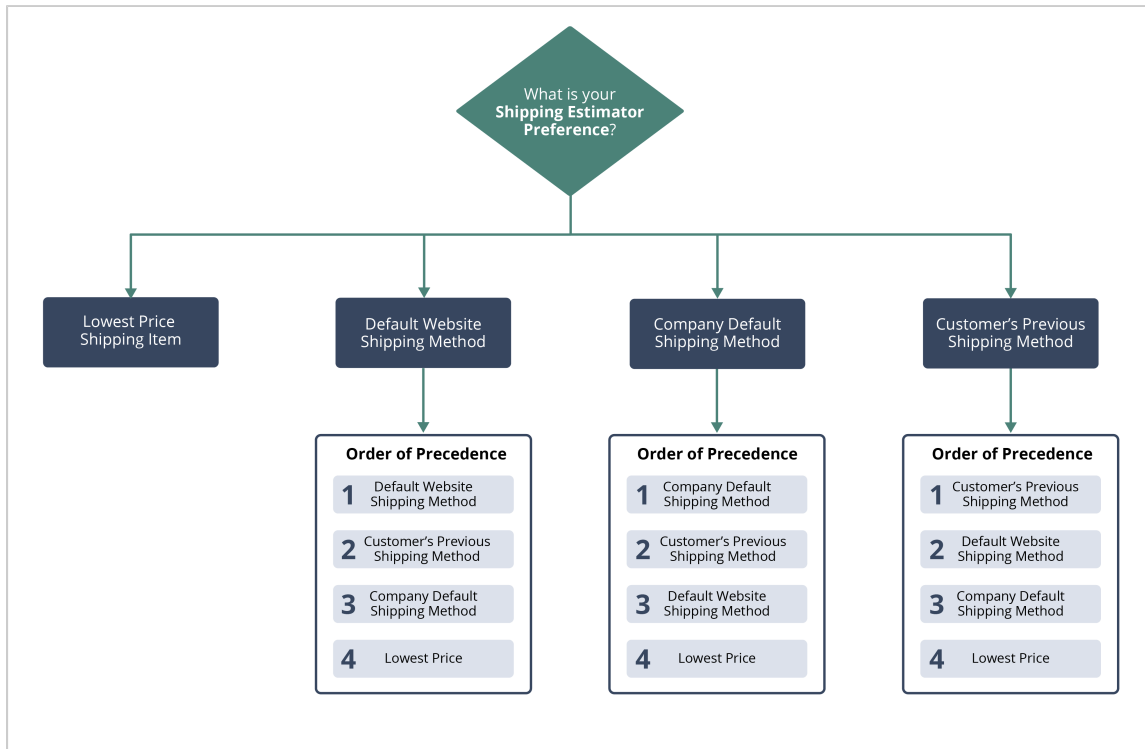

- **Lowest Price Shipping Item** – Shows the lowest-priced shipping method for the shopper's address.
- **Default Website Shipping Method** – Shows the website's default shipping method. You can select the default setting on the Website Setup page. For more information, see [Setting a Preferred Shipping Method for Your Site](#).
- **Company Default Shipping Method** – Shows the shipping method set as your company's default. You can select the default setting at Setup > Accounting > Shipping.
- **Customer's Previous Shipping Method Selection** – Shows the shipping method that the shopper used on the previous order.

Shipping Estimator Order of Precedence

The Shipping Estimator's order of precedence is based on the Shipping Estimator Preference you pick. If your chosen preference doesn't work for a website order, the next option in line is used.

For example, if you select the Default Website Shipping Method but it's not available for a customer's address, the shipping estimator will use the shipping method the customer picked on a previous order. If it's their first time ordering, the estimator uses the third item in the order of precedence, which is the company default method, and so on.

The following image shows the Shipping Estimator's order of precedence for calculating shipping costs on web orders:

Restricting Ship To Countries in Your Commerce Web Store

Applies to: SuiteCommerce | SuiteCommerce Advanced

If you only ship domestically or can't ship to some countries, you can choose which countries your customers can select in your Commerce web store.

Note: You can set up shipping and handling rules when you create a shipping item to specify the countries it can ship to or the websites it is available on. See: [Creating Shipping Items](#).

To designate countries you ship to:

1. Go to Commerce > Websites > Web Site List.
2. Click **Edit** next to the website you'd like to change.
3. On the **Shipping** subtab, in the Shipping Page section, clear the **Web Store Ships to all countries** box.
4. In the **Countries Web Store Ships To** field, pick the countries your customers can choose at checkout.
5. Click **Save**.

Your customers can only have orders shipped to the countries you've listed.

Shipping Items in Your OneWorld SuiteCommerce Website

Applies to: SuiteCommerce | SuiteCommerce Advanced

NetSuite lets you create a shipping item record for each shipping method you want to offer on your Commerce website. When customers order from a website associated with a OneWorld account, the only shipping items available are associated with the subsidiary displayed on the website. When you create a shipping item in NetSuite, you'll need to pick a subsidiary for it on the Shipping Item record.

Shoppers on your website only see shipping methods based on the following criteria:

- The subsidiary they choose in a Site Builder website or the default subsidiary set for a SuiteCommerce Advanced (SCA) website.
- The shipping items are available to the customer and are the ones that are tied to the subsidiary set on their customer record.
- The customer and shipping item are both assigned to the same subsidiary.
- The shipping preferences you define on the **Shipping** subtab of the Website Setup page.

If a shopper hasn't registered or logged in, the Shipping Estimator shows the lowest shipping rate from your list of shipping items. For instructions about how to display the Shipping Estimator on your Commerce website, see [Shipping Estimator](#).

Note: By default, new customers who register on your web store are assigned a customer role that you specify in NetSuite. In a OneWorld account, the corresponding subsidiary must be defined on the default customer role. If you don't set a subsidiary on the default customer role, your customer might not see shipping options or other information. For more information, see the help topics [Setting the Default Customer Role](#) and [OneWorld CRM](#).

Shipping Bar

Applies to: SuiteCommerce | SuiteCommerce Advanced | Site Management Tools

The Shipping Bar extension lets you add a shipping bar and banners to your site to show shoppers how much they need to spend to get free or special rate shipping.

Important: SuiteCommerce extensions are only available if provisioned, installed, and activated for a selected domain in your account. For more information, see [Commerce Extensions](#).

Note: If you are a SuiteCommerce Advanced customer, you must be implementing the Aconcagua release or later to take advantage of extensions.

Overview

The shipping bar and optional banners display various messages to customers based upon how much progress they have made toward free or special rate shipping. When the cart value meets the minimum for free or special shipping, a congratulations message appears. The Shipping Bar extension comes with default progress and congratulations messages, but you can customize them if you want. The Shipping

Bar also supports multiple currencies for customers in different countries. To use multiple currencies with this extension, you'll need to enable the Multiple Currency feature and add additional currencies on your Website Setup record. For more information, see the help topics [Enabling the Multiple Currencies Feature](#) and [Multi-Currency](#).

Integrate Shipping Bar with Shipping Promotions

To use the SuiteCommerce Shipping Bar extension with auto-applied free or discounted shipping, you'll need to complete these steps first:

1. Create a new shipping item to automatically apply free or special rate shipping. You'll use this shipping item as your default shipping method. For details, see the help topic [Creating Shipping Items](#).
2. Select the new shipping method as your preferred shipping method in the website setup. See [Setting a Preferred Shipping Method for Your Site](#).

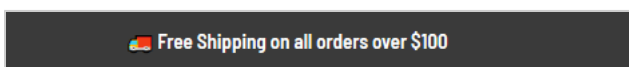

Important: The SuiteCommerce Shipping Bar extension considers cart values when making calculations. The extension does not take into account any shipping promotions that you may have set up in your account using SuitePromotions or advanced promotions that are not reflected in the cart through auto-apply.

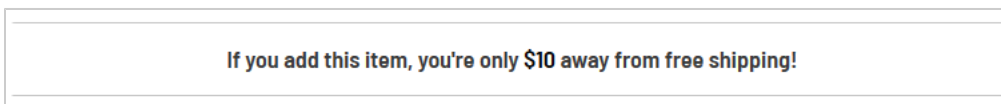

Shipping Bar Display Options

You can display the shipping bar in a few different ways:

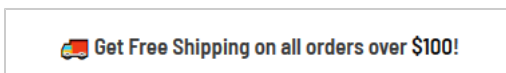

- **Header bar** – This bar displays in the header of your website. The bar displays an initial, progress, or congratulations message based on the cart's total. You can choose the position of the header bar and link to a specific page. For example, you can customize an alternate message to link to your shipping terms and conditions page. This image is an example of how the shipping bar looks in the header.

- **Product banner** – This banner appears on product detail pages (PDP). It shows users if they meet the minimum value to qualify for shipping if they add the item to their cart. If the cart total with that item doesn't meet the minimum, shoppers see how much more they need to spend to qualify. This image is an example of how the shipping bar looks on the PDP:

- **Cart banner** — This banner displays on the cart page. The banner displays an initial, progress, or congratulations message based on the cart's total. This image is an example of how the shipping bar looks on the cart page.

You can use the Shipping Bar fields in the Site Management Tools (SMT) Theme Customizer to change the style and display of the header bar, product banner, and cart banner. Pick the font, background and text colors, border size, and more to make each display fit your needs. For more information about using the Theme Customizer in SMT, see the help topic [Theme Skin Manager](#).

Configure Shipping Bar

Use the SuiteCommerce Configuration record to enable the header bar, product banner, and cart banner. You can also set the shipping bar's URLs and messages, and use multi-currency to set up the shipping bar for several countries.

To configure Shipping Bar:

1. Go to Commerce > Websites > Configuration.
2. Select the website and domain where the Shipping Bar extension is activated and click **Configure**.
3. Go to the **Extensions** subtab.
4. In the **Shipping Bar** subtab, fill out the listed fields for each category, using the tables below as references.
5. Click **Save**.

Shipping Bar Configuration Fields:

Field	Description
Shipping Goal Value	Sets the minimum order value a shopper needs for free or special rate shipping.
Currency Symbol	Determines the symbol or abbreviation for the currency.
Header Bar Position	Sets the position of the header bar. You can choose from the following options: ■ Above Header – Header bar displays above the website header ■ Fixed to Top – Header bar remains visible at the top of the page while scrolling ■ Below Header – Header bar displays below the website header
Initial Message URL	Sets the full URL for the header bar Initial Message link.
Alternate Message 1 URL	Sets the full URL for the header bar Alternate Message 1 link. For example, use this field to link to your Terms & Conditions or a sale landing page.
Alternate Message 2 URL	Sets the full URL for the header bar Alternate Message 2 link. For example, you can use this field to link to a Terms & Conditions page or a landing page promoting a sale.

Messaging Fields:

In the Messaging fields, you can use the following placeholders, which are replaced by their associated values automatically:

- `[[value]]` – shipping goal value
- `[[to-value]]` – remaining amount required to qualify for free or special rate shipping

Field	Description
Show Header Bar	If checked, displays the header bar at the top of all pages of your site.
Initial Message – Header Bar	Sets the message shown in the header bar.
Alternate Message 1 – Header Bar	Sets the alternate message for the header bar.

Field	Description
	The header bar displays a new message every five seconds or when a user clicks on the side arrows.
Alternate Message 2 – Header Bar	Sets the alternate message for the header bar. The header bar displays a new message every five seconds or when a user clicks on the side arrows.
Progress Message – Header Bar	Sets the message to display when the user adds an item to the cart but has not reached the shipping goal value required to qualify for free or special rate shipping.
Congratulations Message – Header Bar	Sets the message to display when the user meets the shipping goal and qualifies for free or special rate shipping.
Show Product Banner	If checked, displays the product banner on product detail pages (PDPs).
Progress Message – Product Banner	Sets the message to display on the PDP when a customer hasn't reached the shipping goal value required to qualify for free or special rate shipping. This message appears below the item selection options.
Item Qualifies Message – Product Banner	Sets the message to display on the PDP if the shopper qualifies for free or special rate shipping if they add the item to the cart. This message appears below the item selection options.
Show Cart Banner	If checked, displays the shipping banner on the cart page.
Initial Message – Cart Banner	Sets the message to display on the cart page.
Progress Message – Cart Banner	Sets the message to display on the cart page when the user hasn't reached the shipping goal value required to qualify for free or special rate shipping.
Congratulations Message – Cart Banner	Sets the message to display on the cart page when the user meets the shipping goal value to qualify for free or special rate shipping.

Multi-Currency Support Fields:

Field	Description
Currency	Determines an additional currency available for the shipping bar.
Shipping Goal Value	Sets the shipping goal value required to qualify for free or special rate shipping for this currency.
Currency Symbol	Sets the symbol or abbreviation for the currency.

Multiple Ship To

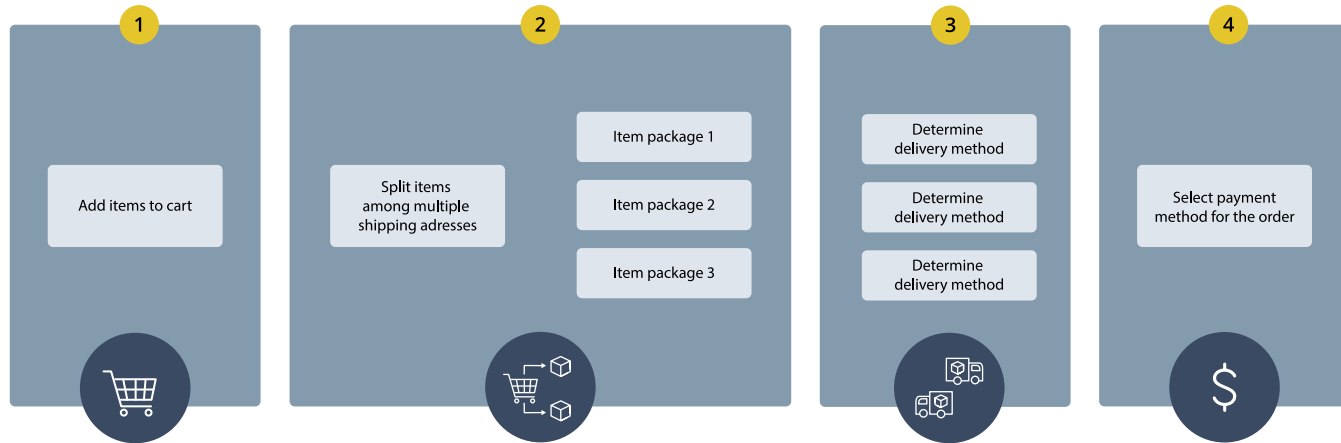

i Applies to: SuiteCommerce | SuiteCommerce Advanced

The Multiple Ship To (MST) feature lets shoppers send items from the same order to different shipping addresses. This feature works with all three checkout flows (Standard, One Page, or Billing First). For more information about configuring checkout, see [Checkout](#).

With MST enabled, shoppers can:

- Specify items for checkout and ship them to different addresses as needed.

- Define a different shipping method for each shipping address. (Note that users can only define one shipping method per address within the same order.)

When MST is enabled, shoppers typically proceed through the following steps:

1. A shopper adds items with specified quantities to the shopping cart and proceeds to checkout.
2. When setting the shipping address, the shopper selects **I want to ship to multiple addresses**. The shopper then selects a shipping address and the items to ship to that address, then clicks **Create Shipment**.

Note: If there are no shipping addresses, the site prompts the shopper to enter one. Shoppers also have the option to create additional shipping addresses by selecting **Add/Edit Addresses**.

3. The user creates additional shipments until all items have been allotted to a shipping address. If only a single address is selected, shoppers can continue, but the site returns to the configured checkout flow.
4. The shopper picks a delivery method for each shipment.
5. The shopper chooses a payment method and finishes the order.

See [Setup Tasks](#) for learn how to enable Multiple Ship To in your web store.

Setup Tasks

Applies to: SuiteCommerce | SuiteCommerce Advanced

Perform the following setup tasks in your NetSuite account to enable the Multiple Ship To feature:

To enable Multiple Shipping Routes:

1. Enable the Multiple Shipping Routes feature. For details, see the help topic [Multiple Shipping Routes](#).

To set the scripting template:

1. Go to Commerce > Websites > Web Site List.

2. Click **Edit** next to the website you'd like to change.
3. Go to the **Preferences** section of the **Setup** subtab.
4. Select the **Standard Sales Order** option in both the **Scripting Template (Credit Card)** field and **Scripting Template (Invoice)** field.
5. Click **Save**.

Configure Feature Properties

Follow the correct configuration procedures below, depending on the version of SuiteCommerce Advanced you are implementing. For information about configurable properties, regardless of your implementation, see the help topic [Checkout Tab](#).

To enable multiple shipping:

1. Go to Commerce > Websites > Configuration.
2. Select the website and domain you'd like to configure.
3. Go to the **Checkout** subtab.
4. To enable the Multiple Ship To feature, check the **Enable Multiple Shipping** checkbox.
5. Click **Save**.

To enable multiple shipping (pre-Vinson):

1. Create a custom module that includes the backend Configuration object as a dependency. See the help topic [Configure Properties](#) for details.

Note: Don't edit the original Configuration.js source file directly. See the help topic [Develop Your SCA Customization](#) for information and best practices on customizing JavaScript.

2. Redefine the `isMultiShippingEnabled` property in the custom module to true. This property is set to false by default.
3. Save and deploy to your site.

Known Limitations

i Applies to: SuiteCommerce | SuiteCommerce Advanced

Here are some known limitations with Multiple Ship To:

- Promo codes aren't supported in the Multiple Ship To flow. If someone tries to enter one, they'll see an error. If they enter a promo code with a single ship-to order and then switch to Multiple Ship To, the site also returns an error and removes the promo code automatically.
- Multiple Ship To is limited to defining one shipping method per shipping address. Shoppers can't create multiple shipping methods for the same address. For example, a user can't order one set of items to ship **Home** using the Standard shipping methods and another set of items shipping **Home** using a One Day shipping method.
- Checkout can be slower if you're using shipping methods with real-time rates, especially with Multiple Ship To orders. You should run performance tests before going live with real-time rates.

- Customized Online Forms aren't supported.
- Minimum quantity is set as a shipping minimum and not as an order minimum. You must comply with minimum quantity limitations on each of the lines/shipments of your order. Multiple Ship To doesn't take into account more items on another line.
- Multiple Ship To isn't compatible with Scriptable Cart, Pickup In Store, or SuiteTax.

Overview

Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce InStore

When shoppers visit your web store, you want them to quickly find the items that they are looking for with minimum navigation. The Item Search service speeds up this process by returning search results for the search query provided by the shopper. NetSuite gives you all the tools you need to boost item search in your Commerce web stores and SCIS. You can:

- Configure your item search settings, including Search Fields, Facet Fields, Sort Fields, and Field Sets
- Get to know the Search Index, which helps make search requests more targeted and faster
- Use the Item Search API to retrieve data from your indexed item records
- Use Search Synonyms to define variants of terms in your product catalog

Important: The procedures in this section assume you've already set up Item Records for Web Stores. For more information, see [Item Availability](#).

Search Settings Overview

Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce InStore

Configure Your Website Search

You can enhance the item search capabilities of your website by configuring the item search settings with your preferences. The following illustration shows how item search settings relate to your web store:

- **Search Fields** influence the default sort order of the search results, which is relevance. For more information, see [Select and Configure Search Fields](#).
- **Facet Fields** help a shopper narrow down the search results. For more information, see [Select and Configure Facet Fields](#).

- **Sort Fields** define how results can be sorted beyond relevance to a search query. For more information, see [Select and Configure Sort Fields](#).
- **Field Sets** are a grouping of item fields taken from item records, used to display information to your shoppers. For more information, see [Define Field Sets](#).

Prerequisites

Before you configure the item search settings, you should:

- Complete [Item Availability](#), which includes setting up item records for display on your web store, setting up item records for search index, and setting up item inventory in web stores.
- Review the [FieldSetsList](#) spreadsheet, which lists all the fields that are available for keyword search, faceting, sorting, and for use in field sets.

 **Note:** When the Multiple Vendor feature is enabled, do not use the Preferred Vendor field (Field ID: vendor) as a sort field, facet field, or search field as it will not return any values.

- Review the [Sample Search Field Configuration](#).
- Read the best practices to [Improve Relevance of your Search Results](#).
- Identify the item record fields that contain keywords, which shoppers might use to search for products on your website.

 **Important:** For every website, the total number of fields included in the Field Sets, Sort Fields, and Facet Fields and should not exceed the limit of 1200.

- Identify the item record fields shoppers might use to quickly narrow down search results.
- Identify the item record fields shoppers might use to sort the search results.
- Identify the item record fields you want to include in each field set.
- Create any custom fields you want to add to field sets or use as search, facet, or sort fields.

 **Important:** If you use a custom item field in a field set or as a search field, facet field, or sort field, the custom item field gets locked and cannot be edited until unlocked.
To unlock a custom item field, remove it from all field sets, search fields, facet fields, and sort fields on every Commerce website, then wait for the Search Index to rebuild.

Select and Configure Search Fields

 **Applies to:** SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce InStore

When a shopper initiates a search in your web store, the system uses the order and matching type of the fields you configure on the Search Fields subtab. This order controls how items are matched and returned in search results.

Before you [Configure Search Fields](#), refer to the following sections:

- [Understanding Match Types](#)
- [Sample Search Field Configuration](#)

Understanding Match Types

i Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce InStore

Before configuring search fields, review the types of matches available. The matching type determines how the system compares a field's contents to a search term. Also, check the definitions for each type of match as it would be applied to the item attribute text "wifi router":

Type of Match	Description	Usage
Exact	Matches the exact text of the item field contents. For example, if the shopper types "wifi router" in the search box, the search matches "wifi router." i Note: If the search query provided by the shopper includes a non-alphanumeric character, the word order is preserved as if it were a phrase search for Exact match type. For example, consider that Drywall Screw is an item in your catalog and the name specified in the Product Name field is 4*128mm Drywall Screws. If you do not want the non-alphanumeric character * to be ignored during search, you must configure the Product Name field as a search field with an Exact match type.	Exact match holds good in situations where a shopper might provide the exact search string when searching for a product. Ideal for the SKU and Online Name fields where there are chances that a shopper remembers the full name and provide the exact search string. i Note: If you select the same search field multiple times and use it with different types of match, define exact match at the top of the list for that search field.
Keyword	Appears anywhere in the text. For example, if the shopper types "router" in the search box, the search matches "wifi router."	Keyword holds good for fields with a lot of text. Ideal for fields with description such as Detailed Description or in case of the Online Name field where shoppers might search for only part of the full item name. i Note: To avoid false positives in your search results, ensure that the item descriptions do not repetitively use terms associated with other unrelated items in your catalog.
Starts with	Behaves the same as Keyword search but only for the first 20 characters of every word in a field. For example, if the shopper types "wifi" in the search box, the search matches "wifi router."	You should use Starts With only if your site uses Type Ahead search and only use it on fields such as Online Name.
Starts With Exact	Matches the exact text from the beginning of a field but only up to the first 20 characters. For example, if the shopper types "wifi" or "wifi rou" in the search box, the search matches "wifi router."	Starts With Exact holds good in situations where a shopper provides the exact first few characters (up to 20 characters) as the search string. Ideal for the SKU field where a shopper might provide only the first few characters of the SKU number.

Type of Match	Description	Usage
		 Note: If all your SKU numbers are less than 20 characters, it is possible to only use Starts With Exact for the SKU field instead of Exact.
Fuzzy	Matches similar text or misspellings depending on the length of the search term specified. Following rules are applicable when the type of match is Fuzzy: ■ Fuzzy matching is not applied for search term with three or fewer characters. ■ Search term with four or five characters will fuzzy match against one character being different. ■ Search term with six or more characters will fuzzy match against up to two characters being different. For example, if the shopper types “mifi” in the search box, the search matches “wifi router.”	Since fuzzy matches can return irrelevant items (skirt versus shirt) in the search results, use the Fuzzy type of match only if you have a valid use case. If you want to include the Fuzzy type of match in your Search Settings, place it at the bottom of the list. Since the list of search fields is ranked in order, top to bottom, fuzzy matches near the top of the list can return irrelevant items at the top of the search results list.

 **Note:** If the search query provided by the shopper includes a non-alphanumeric character, it is treated as white space for Keyword, Starts With, Starts With Exact, and Fuzzy match types.

Sample Search Field Configuration

 **Applies to:** SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce InStore

NetSuite provides default search field settings to get you started. However, you should reconfigure the Search Fields based on the data in your item records.

You can use the following search fields setup as a starting point for your website:

Search Field	Item Record Field Name	Field ID	Search Type
Name	ITEM NAME/NUMBER	itemid	Starts With Exact
Online Name	WEB STORE DISPLAY NAME	storedisplayname	Exact
Online Name	WEB STORE DISPLAY NAME	storedisplayname	Starts With
Online Name	WEB STORE DISPLAY NAME	storedisplayname	Keyword
Search Keywords	SEARCH KEYWORDS	searchkeywords	Keyword
Detailed Description	DETAILED DESCRIPTION	storedetaileddescription	Keyword

Configure Search Fields

 **Applies to:** SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce InStore

Now that you have reviewed the usage of each type of match, you can select and configure the Search Fields.

To configure the search fields:

1. Complete the prerequisite tasks as described in [Prerequisites](#).
2. Go to Commerce > Websites > Website List.
3. Click **Edit** next to your SuiteCommerce Advanced site.
4. Click the **Search Index** sub tab and then click **Search Fields**.
5. If the default setting is relevant to your website, go to Step 8 without making any changes.
6. (Optional) To rearrange the search fields, you can drag and drop rows.
7. (Optional) To delete a search field, select the field and click **Remove**.
8. (Optional) To add a new search field:
 1. Select the search field from the **Search** dropdown.
 2. Select the match type for the Search Field from the **Type of Match** dropdown.
 3. Click **Add**.
9. After you have finalized the Search Fields, click **Save**.

Select and Configure Facet Fields

i Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce InStore

Facets let you filter the search results by the values in item fields. When a shopper clicks a facet value, the results show only items with that value. Each extra click keeps narrowing down the search results. Commerce web stores and SCIS use modern faceted navigation for displaying item results.

Usually, you'll use different item attributes as facets. For example, popular facet fields for an apparel website are brand, gender, color, and size.

When you add a Facet Field under Search Index, you turn on faceting for that field. You can then use this facet field with the Item Search API.

i Note: Don't add too many Facets or Facet Values, since it can slow down search. Try to use 40 facets or fewer.

To select the facets:

1. Complete the prerequisite tasks as described in [Prerequisites](#).
2. Go to Commerce > Websites > Website List.
3. Click **Edit** next to your SuiteCommerce Advanced site.
4. Click the **Search Index** sub tab and then **Facet Fields**.
5. From the **Facet Field Name** dropdown, pick the fields you want to use as facets and click **Add**.
6. (Optional) To delete a Facet Field, select the field and click **Remove**.
7. After you have finalized the Facet Fields, click **Save**.

After you select the facet fields, you can configure the facet fields for your site using the SuiteCommerce Configuration record. For more details, see [Configure Facet Fields](#).

Configure Facet Fields

Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce InStore

After you select the facet fields, your website's navigational area will automatically show them. You don't have to set up facet field properties, but facets might not show up the way you want by default. For example, if you set up a custom field like `custom40` as a facet, add it under the Facets subtab in the SuiteCommerce Configuration record and set it up so it doesn't show as `custom40` in your web store.

Note the following when configuring facets:

- You need to set up facet fields in NetSuite for them to show up on your site.
- If you don't set the facet's URL Component in NetSuite, the site will display the default field ID.
- If you don't set a facet on the Facets subtab, it'll use the default look for that facet.
- If you don't set a property in the Facets subtab, it'll use the default look for that property.
- If your products have dashes (-) in their names, don't use dashes in the `id` property. The Facets Router sees these dashes as separators, and the website won't load.
- Starting with the Elbrus release of SuiteCommerce Advanced, you can set up facets as URL parameters or as part of the URL path. This choice can affect SEO. For more details, see [Facets as Parameters](#).
- You can't use free-form text custom item fields as facet fields.

Follow the correct configuration procedures for your version of SuiteCommerce Advanced. For information about configurable properties, see the following sections:

- [Facets Subtab](#)
- [Color Palettes Subtab](#)
- [Facets Delimiters Subtab](#)
- [Facets SEO Subtab](#)

To configure the facet fields:

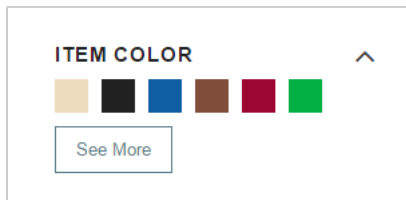

1. Go to Commerce > Websites > Configuration.
2. Select the site you want to configure from the **Select Website** list.
3. Select the specific domain you want to configure from the **Select Domain** list.
4. Click **Configure**.
5. On the SuiteCommerce Configuration record page, click the **Shopping Catalog** tab.
6. Click the **Facets** subtab and configure your facet options as required.
7. Click **Save** to save the Configuration record.

For example, let's say you want to set up the color facet field to display on your website like this:

- Display the facet title as **Item Color**
- Display in the URL as a parameter
- Appear expanded when loaded
- Be collapsible
- Appear first in the list of facets on your website

Your customized Facets entry might look like this:

Your resulting facet will display on your website like this:

Facets as Parameters

Applies to: SuiteCommerce | SuiteCommerce Advanced

This section applies to the **Elbrus** release of SuiteCommerce Advanced and later.

When you use Faceted Navigation, all your selections get combined into one URL as you narrow down your search. You can configure how each facet is included in the URL. This section covers your options and how they affect SEO. For details on each configurable property, see the help topic [Facets Subtab](#).

You can:

- Configure all facets as part of the URL path (default).
- Configure all facets to work as URL parameters.
- Configure each facet to be either a URL parameter or part of the URL path.

Note: If you change any facet fields, you'll need to re-index your site. It might take 30 to 60 minutes for the changes to show up because of caching.

Facets as URL Path

When a user filters their search by adding more facets, the number of facet combinations can become large. If you configure facets as part of the URL path, the URL gets longer as more facets are added. This means more unique pages get indexed by search engines, which can have a negative impact on your SEO.

Using facets in the URL path leads to the following:

- You'll need to manually update robots.txt to block these URLs from being indexed when you add new facets. See the help topic [SEO and Robots.txt](#) for details.
- The SEO Page Generator runs through every possible path when indexing your site. This can add multiple filtering combinations and overwhelm the SEO Page Generator with unnecessary information.
- Too many facet combinations can have an adverse effect on any sitemaps produced.
- Search engine web crawlers can reach your content through many different URLs.

When treating facets as part of the URL path, the SEO Page Generator considers the entire path in the index, as shown in the following example:

`www.site.com/facet1/value1/facet2/value2/`

Note: If you're using the Vinson release or earlier, all facets are part of the URL path and you can't change this.

Facets as URL Parameters

Using facets as URL parameters means fewer unique pages get indexed, which helps your search rankings and makes your web store easier to find. When facets are set as URL parameters, the SEO Page Generator ignores them when indexing your site.

Note: You don't need to edit robots.txt for SEO if your facets are set as URL parameters.

When configuring facets as URL parameters, the SEO Page Generator considers only the web store domain in the index as shown in the following example (`www.site.com`):

`www.site.com?facet1=value1&facet2=value2`

Select and Configure Sort Fields

Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce InStore

Using a sort field, shoppers can sort search results by that field instead of the default relevance field. It's not always clear which fields you should use for sorting, but make sure all your item records have data in the fields you pick—especially if those fields are optional. Items with empty fields show up last when you sort by that field. For example, if you sort by price, items with no price will be at the end.

Note: Relevance is always the default sort field, and you can't remove it. But you can add other item fields as sorting options for your site. By default, the `onlinecustomerprice` field is already set up as a sort option, so you don't need to do any configuration to let shoppers sort by price. Commerce web stores are pre-configured to display two price sorting options: low to high and high to low.

When you add a Sort Field under Search Index, you turn on sorting for that field. You can use it with the Item Search API, but it only shows up in your web store after you configure it.

To add the sort fields:

1. Complete the prerequisite tasks as described in [Prerequisites](#).
2. Go to Commerce > Websites > Website List.
3. Click **Edit** next to your SuiteCommerce Advanced site.
4. Click the **Search Index** subtab and then **Sort Fields**.
 - **Field Name** — (Required) Select an item record field. Choose the item attributes you want shoppers to use for sorting.
 - **Field ID** — (View only field) Displays the field's internal ID.
 - **Sort Order** — Choose ascending or descending order. This sets how products are sorted in the search results.

Configure Sort Fields

Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce InStore

After you select the sort fields, you can configure the sort fields for your Commerce web stores using the SuiteCommerce Configuration record. Configuring a Sort Field ensures that the sort field is available to the shoppers in the web store.

To configure the sort fields:

1. Select the domain to configure at Commerce > Websites > Configuration.
2. Select the site you want to configure from the **Select Website** list.
3. Select the specific domain you want to configure from the **Select Domain** list.
4. Click **Configure**.
5. On the SuiteCommerce Configuration record page, click the **Search** tab and then click the **Result Sorting** subtab.
6. Define and configure your sort options. For details, see the help topic [Result Sorting Subtab](#).
For example, if you've set up a custom field like `custitem41` as a sort field, you'll need to add it to the Desktop, Phone, and Tablet sections before shoppers can use it on those devices.
7. Click **Save**.

To configure sort fields for pre-Vinson SuiteCommerce Advanced implementations, add the new sort field to the `sortOptions` array in the `SC.Shopping.Configuration.js` configuration file. For guidance on extending your implementation, see the help topic [Develop Your SCA Customization](#).

For example, if you've set up `custitem41` as a sort field, add it to the `sortOptions` array before it shows up in your web store.

```
1 | sortOptions: [
2 |   {id: 'relevance:asc', name: _('Sort by relevance').translate(), isDefault: true}
3 | ,   {id: 'onlinecustomerprice:asc', name: _('Sort by price, low to high').translate()}
4 | ,   {id: 'onlinecustomerprice:desc', name: _('Sort by price, high to low ').translate()}
5 | ,   {id: 'custitem41:desc', name: _('Sort by best seller, low to high ').translate()}
6 | ]
```

For information about handling Matrix Item sorting and combining Sort Fields using the Item Search API, see [Sorting Best Practices](#).

Sorting Best Practices

Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce InStore

When you're working with Matrix items, make sure the sorting values match between child and parent records. For sortable fields, set the same values in the child items as you do in the parent items. If the values don't match, you'll get inconsistent sorting results.

For example, if you add a custom field called Best Seller to your item record, but only set the value on the parent and not the children, sorting by Best Seller might not show the parent records where you expect.

Note that parent items are assigned a sort value defined as the lowest sort field value from among their children. The parent items are then sorted according to those selected sort values.

Combine Sort Fields Using Item Search API

Even though the default sort order is by relevance, you can change it by using a custom item field along with relevance. This helps when two or more items have the same relevance score and you want to use another field as a tie breaker. For example, you could use Most Popular or Best Seller as the extra parameter.

Since API calls override NetSuite's default settings, you can use an Item Search API request to combine multiple sort fields and show the results you want.

For example, suppose you add a custom field, Rating (custitem_rating), to your item record to record the item review rating. Enter a value in the custom field on item records, assigning numbers 1 – 5, with 5 being the best rated item. Then, use an Item Search API request to sort by price and rating.

```
1 | /api/items?sort=pricelevel5:asc,custitem_rating:desc
```

For information about Item Search API, see the help topic [Item Search API](#). For the complete list of parameters supported by the Item Search API, see the help topic [Item Search API Input Parameters](#).

Define Field Sets

Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce InStore

You can show information from your NetSuite item records to your website by defining field sets. After you define the field sets, a web developer can use the Item Search API to access field values in the field sets.

For example, you might make a field set for the product details page with fields like product name, images, description, availability, and price. You could also create a different field set for the search results page, which includes fields that display an image thumbnail, product name, and price.

Note: Field Sets are made public on the internet. Since you can pick any field type, make sure you're careful about which fields you expose.

You can use the Field Set Setup Script to quickly add the required Field Sets to your site. To run a script to create the field sets, see the help topic [Set Up Initial Field Sets](#).

You can also define your own field sets on the Web Site Setup page. To define your own field sets, follow the inline procedure.

To define your own field sets:

1. Complete the prerequisite tasks as described in [Prerequisites](#).
2. Go to Commerce > Websites > Website List.
3. Click **Edit** next to your SuiteCommerce Advanced site.
4. Click the **Field Sets** subtab.
5. In the **Name** field, enter a name for the new Field Set. This name is only displayed internally on the Field Sets list page and in dropdown lists on the Web Site Setup page. Name each Field Set based on the product views you create for your site.

Important: The Field Set to return item details is typically named **details**. If you use a different name, you'll need to update the `searchApiMasterOptions` property. See the help topic [Search Results Subtab](#) for more details on configuring this property.

6. In the **Field Set ID** field, enter an ID you'll use later with the Item Search API as an input parameter to specify the field set. The ID has to be alphanumeric, lowercase, and can't have spaces or special characters. The Field Set ID is displayed internally, on the Field Sets list page and in dropdown lists on the Web Site Setup page.
7. The **Record Type** field is pre-populated with the value **Item** as only item records are supported.
8. The **Description** field is an optional. You can add a description if you want, and it'll only show on Field Set records, the Field Set list, and the Web Site Setup page.
9. To populate the **Fields Included in Field Set** field, click the Set icon next to this field. A Field Set window opens.

Important: When defining a field set for a merchandising zone, include the following fields in your field set to ensure it appears correctly on your web store.

- Internal ID
- Matrix Child Items (Detail)
- Store Display Name 2 or Display Name
- Price for Current Customer (Formatted)
- URL Component
- Item Images (Detail)

For more information about merchandising zones see, [Merchandising Zone Content](#).

10. In the Field Set window, select the item record field from the **Field Name** field and click **Add**.
11. Repeat Step 10 for each item record field you want to include in the field set.
12. After you have selected all the fields, click **Submit**. The values of the **Field ID** and **Field Type** fields are auto populated for the selected field. You can use the field ID to refer to specific fields when writing SuiteScript. This is also the field ID returned in the JSON response when using the Item Search API. The field type refers to the NetSuite field type. Field types provide information about the type of data web developers can expect in the JSON response to Item Search API queries.
13. Click **Add** on the Web Site Setup page to add the new field set.
14. Click **Save** to save your changes.

Defining field sets is the last step in configuring item search settings. When you click **Save** on the Web Site Setup page, the item search indexing process starts. For more information, see [Search Index Overview](#) and [Check the Search Index Job Status](#).

Field Set Reference

We've provided a Microsoft Excel worksheet with all the fields you can use in field sets. You can use this list to find field IDs, field types, and see which fields are available for faceting, sorting, and keyword search. The worksheet also shows additional fields with derived values, called Synthetic fields.

To access the worksheet, click this link: [FieldSetsList.xls](#)

Note: Depending on what features you have enabled, some fields in the spreadsheet might not show up in your account.

Derived Fields for Field Sets

Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce InStore

Besides the fields on item records, there are also fields with derived values—these are called derived or synthetic fields. You can use them in field sets to get additional information.

Derived Field Name	Field ID	Description
Available for Backorder	Isbackorderable	Displays a Boolean value, which indicates whether an item can be back ordered when it is out of stock. One of the following conditions must be met for an item to back orderable: - The item's out of stock behavior is set to Allow back orders with no out-of-stock message or Allow back orders but display out-of-stock message. - The item's out of stock behavior is set to Default and the site is configured to display out of stock items.
Available for Purchase	ispurchasable	Displays a Boolean value, which indicates whether an item is available for purchase. This field returns the Boolean value true if all the sub fields of the <code>ispurchasable_detail</code> field returns true.
Available for Purchase (Detail)	ispurchasable_detail	Returns a JSON object with all the available information about item purchasability. This field consists of the following subfields: <code>bystockavailability</code> - Displays a Boolean value, which indicates whether an item is in stock or back orderable. <code>inpersonalizedcatalog</code> - If the current user cannot purchase this item based on settings in Personalized Catalog Views (PCV), this field returns the Boolean value false. If the PCV feature is not enabled or if the current user can purchase this item based on settings in PCV, this field returns the Boolean value true. Following is an example JSON response: <pre> 1 "ispurchasable": true, 2 "ispurchasable_detail": { 3 "bystockavailability": true, 4 "inpersonalizedcatalog": true 5 } </pre>
Commerce Categories	commercecategory	Displays the Name, ID, URLs, and URL fragment aliases of each Commerce Category containing the item.

Derived Field Name	Field ID	Description
		 Note: The same details are also displayed for each category in the primary path to the item when navigating through the category hierarchy.
Correlated Items (Detail)	correlateditems_detail	Displays the details of all the correlated items associated with an item. The correlateditems fieldset defines the fields to be returned for each correlated item.  Note: Even if you have defined the default field set correlateditems as described in Set Up Initial Field Sets , you can overwrite the default field set with any other field set using the Item Search API parameter correlateditems_fieldset. For more information, see the help topic Item Search API Input Parameters .
Default Category (Detail)	defaultcategory_detail	Displays the path to the item's default Site Builder category on the current site with the help of label and URL component fields.
Default Item Ship Method	defaultitemshipmethod	Displays the default shipping method for the specified item.
Display Out-of-Stock Message	showoutofstockmessage	Displays a Boolean value, which indicates whether a message should be displayed to indicate that the item is out of stock. The item must be out of stock and one of the following conditions must be met for the out of stock message to be displayed: ■ The item's out of stock behavior is set to Allow back orders with no out-of-stock message or Allow back orders but display out-of-stock message. ■ The item's out of stock behavior is set to Default and the site is configured to display out of stock items.
In Stock	isinstock	Displays a Boolean value, which indicates whether an item should be considered to be in stock depending on the item type and item availability.
Item Carrier	itemcarrier	Displays the carrier used to ship an item. For example, UPS, FedEx, and so on.
Item Images (Detail)	itemimages_detail	Lists the URL and alt text of all the images associated with the item.  Note: The default URL for each image is displayed, not the URL of the resized image.
		For information about image file naming convention, see Rename Image Files with the Item Identifier .
Item Options (Detail)	itemoptions_detail	If an item has item options, this field returns all the item options, their values in case of list-type options, and their default values. For example, for gift certificate items, this field returns the sender name, recipient name, recipient email address, and message. For matrix items, this field indicates whether the

Derived Field Name	Field ID	Description
		item is a matrix parent or child. Also, for matrix child items, the field returns the internal ID of the matrix parent item.  Note: If an item field is set up as an item option for a matrix item, you must select that item option in the web store even if it is not marked as required in NetSuite. This is evident in the Item Search API response under the <code>itemoptions_detail</code> field, where the Boolean value of <code>ismandatory</code> and <code>ismatrixdimension</code> is returned as true for each item option set up for that matrix item. Consequently, the matrix child item cannot be added to the shopping cart until you select a value for each item option set up for that matrix item.
Matrix Child Items	matrixchilditems_detail	Displays the details of all the matrix child items that exist for the matrix parent item, including which item option values define each child item. The <code>matrixchilditems</code> fieldset defines the fields to be returned for each matrix child item.  Note: Even if you have defined the default field set <code>matrixchilditems</code> as described in Set Up Initial Field Sets, you can overwrite the default field set with any other field set using the Item Search API parameter <code>matrixchilditems_fieldset</code>. For more information, see the help topic Item Search API Input Parameters.
Price (Formatted) and Price Level (Formatted)	pricelevel*_formatted	Each price field has a formatted counterpart. For example, the field ID of the Base Price field is <code>pricelevel1</code>. The field ID of the derived field Base Price (Formatted) is <code>pricelevel1_formatted</code>. The regular price field returns a numeric value. The <code>*_formatted</code> variant of the price field returns the formatted price with a currency symbol along with appropriate number of decimal places based on regional rounding conventions.
Price for Current Customer (Detail)	onlinecustomerprice_detail	Returns a JSON object with all the available information about the item's current price. If a customer is logged in, the price displayed on the website applies to the logged-in customer, including special pricing and quantity pricing. If the item has quantity pricing, the price schedule is returned. If the item is a donation item, information defining the donation parameters such as minimum and default amount are included. This field consists of the following subfields: ■ <code>onlinecustomerprice</code> - Price for the current customer, or in case of matrix items, this is the lowest child item price. ■ <code>onlinecustomerprice_formatted</code> - Formatted version of <code>onlinecustomerprice</code> ■ <code>priceschedule</code> - Pricing for specified quantities of the item, which can be set up on the item record. ■ <code>Nopricemessage</code> - This message is displayed when the price is unavailable for an item.

Derived Field Name	Field ID	Description
		- Maximumvariableamount – This subfield is displayed if the item is a donation item and it displays the maximum donation amount. - Showdefaultvariableprice - This subfield is displayed if the item is a donation item and it displays the item's show default amount option.
Price visible	ispricevisible	Displays a Boolean value, which indicates whether the item price is visible to the current user. This field returns the Boolean value true if all the sub fields of the ispricevisible_detail field returns true.
Price visible (Detail)	ispricevisible_detail	Returns a JSON object with all the available information about item price visibility. This field consists of the following subfields: - bycurrentuserloginstatus – Displays a Boolean value, which indicates whether an item price is visible to the current user based on their login status. This is determined by the Require Login for Pricing option on the Web Site Configuration record. - inpersonalizedcatalog – If the current user cannot see the item price based on settings in PCV, this field returns the Boolean value false for this user. If the Personalized Catalog Views (PCV) feature is not enabled or if the current user can see the item price based on settings in PCV, this field returns the Boolean value true. Following is an example JSON response: <pre> 1 "ispricevisible": true, 2 "ispricevisible_detail": { 3 "bycurrentuserloginstatus": true, 4 "inpersonalizedcatalog": true 5 }, </pre>
Related Items (Detail)	relateditems_detail	Displays the details of all the related items associated with an item. The <i>relateditems</i> fieldset defines the fields to be returned for each related item.  Note: Even if you have defined the default field set relateditems as described in Set Up Initial Field Sets, you can overwrite the default field set with any other field set using the Item Search API parameter relateditems_fieldset. For more information, see the help topic Item Search API Input Parameters.

Improve Relevance of your Search Results

 **Applies to:** SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce InStore

Here are some best practices to help make your search results more relevant:

- Your search results mostly depend on the data in your item catalog. Better data means better search results.

So, make sure your item descriptions don't keep repeating terms from other unrelated items in your catalog.

- For items shown in your web store, make sure the item records are complete. At least specify values for all the fields you're using as search, facet, or sort fields.
- The Search Fields tab settings affect the default sort order (relevance) of your search results. So, pick item record fields with keywords your customers might use, and add those to the Search Fields subtab. For more information, see [Sample Search Field Configuration](#).
- The top row on the Search Fields list shows the field and match type that get the highest relevance ranking. So, place the field most likely to be searched—like Online Name (Field ID: storedisplayname) or Name (Field ID: itemid)—at the top.
- If you use the same search field multiple times with different match types, place the exact match at the top of the list.
- Use the Starts With type of match for the Online Name search field only if your site uses Type Ahead Search.
- Since fuzzy matches can return irrelevant items (like shirt versus skirt, or cat versus hat), only use the Fuzzy match type if you really need it. If you want accurate search results (like all items matching **Shirt** at the top), don't place fuzzy match fields at the top of your Search Fields list. Because the list is ranked from top to bottom, fuzzy matches near the top can bring up unrelated items first.
- Don't add too many search fields, since it can slow things down and make your results less relevant.
- Only some item record fields work for faceted navigation, depending on the field type. For more information, see [Field Set Reference](#).
- Don't add too many facets or facet values. For more information, see the help topic [SEO Page Generator Best Practices](#).
- Keep facet field values under 200 characters. If they're too long, the search index won't rebuild.
- If you have Google Analytics enabled, you can see what search terms your shoppers use. In Google Analytics, go to Behavior > Site Search > Search Terms to see them all. By checking these terms, you can spot areas in your Search Settings to tweak for even better results.

Important: Google Analytics 4 (GA4) has replaced Google Universal Analytics (GAU) as Google's cross-platform Analytics solution. All standard GUA properties stopped processing new hits on July 1, 2023. 360 Universal Analytics properties will stop processing new hits on July 1, 2024. See the help topic [Google Analytics 4](#) for information about GA4, including information about migrating from GUA to GA4.

Troubleshoot Unexpected Search Results

i Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce InStore

Your search results depend on your item catalog, item record data, search settings, and the search query. Because of these, you might see any of the following:

- Relevant items are returned at the top
- Irrelevant items are returned before relevant items
- Irrelevant items are returned intermittently
- Relevant items are not returned
- No items are returned

Relevant items at the top implies you've set up the right fields in your search settings for your published items. You don't need to do anything else right now.

But if you have Google Analytics enabled, you can check the search terms your shoppers use to help fine-tune your Search Settings as described in [Improve Relevance of your Search Results](#).

Irrelevant items might be returned before relevant items because of your Search Settings. Try tweaking your Search Settings to see if you get better results.

Sometimes, a search term might be used over and over in the description of an unrelated product, making that item show up in the results. Try rewording those descriptions to fix this.

Irrelevant items might be returned intermittently because of stemming, which can be sub-optimal in some situations. Stemming reduces words to their root form at both index and query time, so if two or more words share the same stem and the match type is set to Keyword, you might see some irrelevant items mixed in with the relevant ones.

For example, generator, generic, and general all get stemmed to gener in the Search Index, so searching for generator brings up all of them.

If **relevant items are not returned** even though they're published, you might have picked the wrong field under Search Fields or set the wrong match type.

For items to be searchable:

- The field on the item record and the one in your search fields sublist should match. For example, the Web Store Display Name field is called Online Name in the Search Fields dropdown. To make sure you've picked the right one, always check the Field ID of a field using the [FieldSetsList.xls](#) spreadsheet.
- Any item fields you add under Search Fields should have values filled in on the item record.
- The match type you pick for a Search Field should fit the data in your item record and the search query.

If **no items are returned** in the search results even though your settings are right and the item is published, the Item Search API might not be returning items. Try rebuilding the search index manually as described in [Rebuild the Search Index Manually](#).

Improve the Performance of the Search Results Page

i Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce InStore

You can boost the performance of search results pages in Commerce web stores and SCIS by tweaking your field sets.

Prerequisites

You have:

- Complete understanding of Item Search API, including the usage of [Item Search API Input Parameters](#).
- Complete understanding of Field Sets.

Background

Fields such as Matrix Child Items (Detail), Related Items (Detail), and Correlated Items (Detail) use the default field sets and retrieve a large number of item fields for each item. Consequently, the performance of pages that retrieve lot of matrix child items, related items, or correlated items degrade.

For example, the Matrix Child Items (Detail) field retrieves matrix child item fields from the matrixchilditems reserved field set. The matrixchilditems field set has the following fields configured as part of [Set Up Initial Field Sets](#):

onlinecustomerprice_detail, internalid, quantityavailable, outofstockbehavior, outofstockmessage, stockdescription, instock, isbackorderable, is purchasable, showoutofstockmessage, itemid, minimumquantity, itemtype, isfulfillable, isstorepickupallowed, quantityavailableforstorepickup_detail

Solution

When retrieving item fields for the search result pages, you can specify an alternate field set to be loaded instead of the default field set using the Item Search API input parameters.

Use the following Item Search API parameters to override the default field set with any other field set:

- For the Matrix Child Items (Detail) field, use the Item Search API parameter matrixchilditems_fieldset.
- For the Related Items (Detail) field, use the Item Search API parameter relateditems_fieldset.
- For the Correlated Items (Detail) field, use the Item Search API parameter correlateditems_fieldset.

Example

In this example, you'll see that for each matrix child item about 15 item fields are retrieved. Consequently, the performance of pages that retrieve lot of matrix child items degrades.

23                     "quantityavailable": 100,
24                     "outofstockmessage": "",
25                     "quantityavailableforstorepickup_detail": {
26                         "locations": []
27                     },
28                     "isstorepickupallowed": false
29                 },
30             ],
31             "instock": false,
32             "itemid": "H2201100-274",

```

```

33         "ispurchasable": true,
34         "stockdescription": "",
35         "isbackorderable": true,
36         "onlinecustomerprice_detail": {
37             "onlinecustomerprice_formatted": "$15.99",
38             "onlinecustomerprice": 15.99
39         },
40         "internalid": 7542,
41         "showoutofstockmessage": false,
42         "outofstockbehavior": "- Default -",
43         "itemtype": "InvPart",
44         "quantityavailable": 0,
45         "outofstockmessage": "",
46         "quantityavailableforstorepickup_detail": {
47             "locations": []
48         },
49         "isstorepickupallowed": false
50     },
51 ],
52 .
53 .
54 .
55 .

```

To improve the performance of search result pages, you can now overwrite the default field set with any other field set using the Item Search API parameter `matrixchilditems_fieldset`. Consider that we have created a new field set `matrixchilditems_mini`, which has only four item fields. For more information, see [To define your own field sets](#).

In this example, fewer matrix child item fields are returned as we have overwritten the default field set with a field set `matrixchilditems_mini` (using the Item Search API parameter `matrixchilditems_fieldset`):

```
1 | http://www.mywebstore_suite.com/api/items?fieldset=details&matrixchilditems_fieldset=matrixchilditems_mini
```

```

1  {
2      "total": 10,
3      "items": [
4          {
5              "isinstock": true,
6              "metataghtml": "",
7              "custitem_ns_pr_item_attributes": "&nbsp;",
8              "matrixchilditems_detail": [
9                  {
10                     "itemid": "H2201100-110",
11                     "onlinecustomerprice_detail": {
12                         "onlinecustomerprice_formatted": "$15.99",
13                         "onlinecustomerprice": 15.99
14                     },
15                     "internalid": 7541,
16                     "quantityavailable": 100,
17                 },
18                 {
19                     "itemid": "H2201100-274",
20                     "onlinecustomerprice_detail": {
21                         "onlinecustomerprice_formatted": "$15.99",
22                         "onlinecustomerprice": 15.99
23                     },
24                     "internalid": 7542,
25                     "quantityavailable": 0,
26                 }
27             ],
28         },
29     ],
30 },
31 .

```

If your search results page includes Related or Correlated items, you can further improve the performance by using the Item Search API parameters `relateditems_fieldset` and

`correlateditems_fieldset` to overwrite the default field sets of the Related Items (Detail) and Correlated Items (Detail) fields respectively.

Search Index Overview

Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce InStore

The Search Index powers item search by making searches faster and more targeted. For the items set up to be included in the Search Index, the Search Index retrieves the item attribute values of the defined search fields, sort fields, and facet fields and uses them to order the results. The search index gets built the first time you click Save on the Web Site Setup page after selecting the item search settings. Whenever you change your item record or search settings, the search index updates or rebuilds to include your changes.

Note: If you delete your Commerce website, its index gets deleted too.

To learn more about the Search Index, refer to the following sections:

- [Events that Trigger Search Index Rebuild](#)
- [Events that Trigger Search Index Update](#)
- [Check the Search Index Job Status](#)
- [Rebuild the Search Index Manually](#)

Events that Trigger Search Index Rebuild

Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce InStore

Any of the following changes in your NetSuite account trigger a search index rebuild:

- Changing facets, search, and sort options (on the Search Index subtab of the Web Site Setup page).

Note: When you remove a search field and save, the search index only rebuilds if you've removed all match types for that field.

- Adding or removing languages.
- Adding or removing Subsidiary accounts.
- Changing site currencies when you have currency-based fields set as facets or sort options, like price or cost.
- Changing the preference, **Include Out Of Stock Items in Web Store** on the Web Site Setup Page.
- Reactivating a website that was inactive. See the help topic [Making a Website Inactive](#) for more information.

Note: Saving an item record triggers an index **update**, not a rebuild. For information about what triggers an update, see [Events that Trigger Search Index Update](#).

Events that Trigger Search Index Update

Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce InStore

Any of the following changes in your NetSuite account trigger a search index update:

- Any change to an Item record

Note: This includes changes to item records from a CSV import.

- Item Availability
- Item Pricing
- URL Components for Facets
- Web Site Tabs
- Site Builder Categories
- Commerce Categories
- Customer Segment Manager
- Personalization Rules tab on Customer Group record
- Customer Segments tab on Item Collections record

For information about events that trigger the search index to rebuild, see [Events that Trigger Search Index Rebuild](#).

Check the Search Index Job Status

Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce InStore

You can check the status of the search index process on the Job Status page. Go to Commerce > Websites > Website List, and click View in the Search Index Status column.

The Job Status page shows how much time has passed while the search index is processing. Click **Refresh** to update the page.

Note: Changes to an item record trigger an index update. The Records Finished column on the Job Status page always shows the total number of records being processed.

The job names on the Job Status page tell you if the search index is being built, rebuilt, or updated, and why. Every item update gets an entry on the page, unless you're updating a lot of items at one time—then updates are batched, so you'll see fewer entries than the number of items updated.

The following table lists all possible job names; which ones you see depends on your NetSuite configuration.

Job Name	Description
Create	The full search index is being built for a brand new site.
Reindex for site config change	The full search index is being rebuilt because you changed the site configuration.
Index regeneration	The full search index is being rebuilt because you triggered a rebuild or turned a feature on or off that needs a new index.
Index is live	The new search index is now available for search queries.
Feature Change	The search index is being updated because you toggled a feature, like Commerce Categories.
Item Type Feature Change	The search index is being updated because you toggled an item type feature, like Download Items or Gift Certificates.

Job Name	Description
Item Update	The search index is being updated because you added or updated one or more items.
Item Removal	The search index is being updated because you removed one or more items from the web store.
Commerce Category Update	The search index is being updated because you added, updated, or deleted a Commerce Category.
Site Builder Category Update	The search index is being updated because you added, updated, or deleted a Site Builder Category.
Synonyms Updated	The full search index is being rebuilt because you added, changed, or removed Synonyms.

Rebuild the Search Index Manually

i Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce InStore

Even though some changes in your NetSuite account automatically trigger a search index rebuild, you can also rebuild the search index for your site manually. For information about events that trigger the search index to rebuild, see [Events that Trigger Search Index Rebuild](#).

You'll usually do a manual rebuild if you want to force a rebuild right away instead of waiting for NetSuite to do it automatically.

After you initiate the rebuild process, it can take up to 10 minutes to start rebuilding the search index. How long it takes to finish depends on how many items you're indexing.

i Note: You can only request a search index rebuild twice in a 24-hour period.

To manually rebuild the search index for your site:

1. Go to Commerce > Websites > Website List.
2. Click **Edit** next to your website.
3. On the Web Site Setup page, choose Actions > Rebuild Search Index.

A popup message will let you know there's a limit to how many times you can request a rebuild.

i Note: The **Rebuild Search Index** option is still there if your site is marked as Inactive, but clicking it won't start a rebuild.

4. In the popup message, click **OK** to rebuild the search index for this website.
5. (Optional) Open the Job Status page to check the status of the rebuild process. For more information, see [Check the Search Index Job Status](#).

Overview

Applies to: SuiteCommerce | SuiteCommerce Advanced

When customers visit your Commerce web store, you want to make online ordering and order tracking seamless and intuitive.

With SuiteCommerce, you can:

- Offer quantity discounts to your web store customers
- Speed up the ordering process with SKU/reference ordering
- Provide customers with the option to pick up in store
- Help customers find your physical stores

Payment Link

Lets your customers conveniently settle their invoices online, using a computer or mobile device. They can receive an email with the invoice and a link to the payment page, which allows them to choose their preferred payment method.

Direct Invoice Payment

Lets your customers access and pay their invoices securely within their My Account area, using a computer or mobile device. Your system sends them an email notification with a link to the invoice, and after logging in, they can pay the invoice using a stored payment method.

Order Status

Show customers their billing and shipping details on your website. Both guests and registered customers can view order fulfillment progress, tracking information, and payment details.

Quantity Pricing

Offer quantity-based discounts to encourage upselling.

Strike-Through Pricing

Show discounts on specific items with strike-through pricing.

Quick Order

Lets customers quickly add multiple items to their cart. Speed up ordering for your customers who know your catalog and prefer to shop by SKU or reference number.

Store Pickup for SuiteCommerce Websites

Lets customers pick up orders at physical stores. Set up store locations for pickup and limit pickup hours.

Store Locator

Helps customers find nearby stores or view a store address on a map. Use with the Pickup In Store feature to let customers pick up purchases instead of shipping them.

Web Store Orders Workbook

Track and retrieve data on items ordered through your web store. Workbook users can also analyze which items have been purchased in which site.

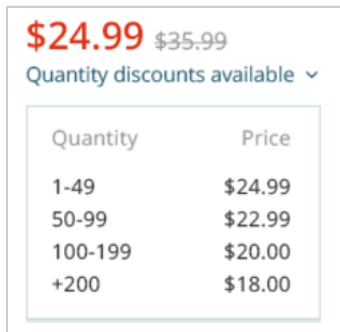

Quantity Pricing

Applies to: SuiteCommerce | SuiteCommerce Advanced

This information refers to SuiteCommerce and the Elbrus release of SuiteCommerce Advanced or later.

Note: Quantity Pricing relies on the Search API and is not available with Site Builder Extensions.

SuiteCommerce Advanced provides a Quantity Pricing feature for customers who offer quantity-based price breaks. This feature uses the Search API to return an item's quantity pricing details from NetSuite (in JSON format) and display results in a chart describing the pricing discounts available by quantity ordered. This information is collapsed by default and is available when the shopper clicks or taps a link.

Quantity	Price
1-49	\$24.99
50-99	\$22.99
100-199	\$20.00
+200	\$18.00

Quantity pricing information is available to shoppers in the following areas of your website:

- Product Details page
- Quick View modal window
- Quick Order page ([Quick Order](#) must be enabled)
- Request for Quote page ([Quotes for Commerce Websites](#) must be enabled)
- Product List Details page in My Account
- Re-Order List Page in My Account

To enable this feature, perform the tasks detailed in [Set Up Quantity Pricing in NetSuite](#).

To disable this feature, edit the `distro.json` file as described in [Disable Quantity Pricing](#).

Set Up Quantity Pricing in NetSuite

Applies to: SuiteCommerce | SuiteCommerce Advanced

By default, the JavaScript module for this feature is available with the Elbrus release bundle, but you must configure NetSuite to enable quantity pricing capabilities. For instructions on how to enable this feature, see the help topic [Using Quantity Pricing](#).

Disable Quantity Pricing

Applies to: SuiteCommerce | SuiteCommerce Advanced

You can configure SuiteCommerce or SuiteCommerce Advanced (SCA) to disable the Quantity Pricing feature. When you disable Quantity Pricing, quantity pricing data won't appear on your website.

Note: You should disable this feature by editing the `distro.json` file. This method enhances response time and customer experience in your Commerce web store.

To disable the Quantity Pricing feature in NetSuite:

1. Go to Setup > Company > Enable Features.
2. Go to the **Transactions** subtab.
3. In the Sales area, clear the **Quantity Pricing** box to disable the Quantity Pricing feature.
4. Click **Save**.

To disable the Quantity Pricing feature by editing the `distro.json` file:

1. Open the `distro.json` file in the root directory of the SCA source code.

Note: This task requires developer experience.

2. Delete (or disable within comment tags) the following line:

```
1 | "suitecommerce/QuantityPricing": "X.X.X",
```

3. Delete (or disable within comment tags) any lines that include **QuantityPricing**.
4. Save and redeploy the `distro.json` file to NetSuite. For more information, see the help topic [Deploy SCA Customizations to NetSuite](#).

Order Quantity

Applies to: SuiteCommerce | SuiteCommerce Advanced

You can configure item records to enforce a minimum or maximum quantity on web store orders. You can define a minimum quantity limit, a maximum quantity limit, or both. Customers can submit an order only if the quantity of the item in the shopping cart complies with the limit you defined.

To define maximum and minimum order quantities, you first need to enable quantity pricing and set quantity pricing preferences. See the help topic [Using Quantity Pricing](#).

Note: This topic explains how to configure maximum and minimum quantity for web store orders only. For information about purchase orders, see the Supply Chain Management help topic, [Purchase Order Management](#).

Note: Enforcing maximum quantities is not supported when using Site Builder extensions.

To set a minimum or maximum quantity limit for an item:

1. Go to Lists > Accounting > Items.
2. Click **Edit** next to the item you want to restrict the quantity for sale.
3. On the **Sales/Pricing** subtab, use the appropriate field to set minimum or maximum quantity for checkout:

The screenshot shows the 'Sales/Pricing' subtab of an item record. On the left, there are fields for 'Cost Estimate Type' (set to 'Average Cost'), 'Item Defined Cost', 'Billing Schedule' (set to 'Monthly -- 1 Year'), and 'Soft Descriptor'. On the right, there is a red-bordered box containing the 'Maximum Quantity' field (set to 12), the 'Minimum Quantity' field (set to 3), and a checked checkbox labeled 'Enforce Minimum Internally'.

- In the **Maximum Quantity** field, enter the greatest quantity of this item you want customers to be able to buy in the web store.
- In the **Minimum Quantity** field, enter the lowest quantity of this item you want customers to be able to buy in the web store. For example, if the lowest quantity you want to sell is three, enter 3. If the customer tries to change this quantity to a lower number, a warning message is displayed.

Note: You can edit the warning message at Commerce > Site Builder/SuiteCommerce Advanced > Customize Text.

4. (Optional) Check the **Enforce Minimum Internally** box to apply the minimum quantity limit to sales orders placed in NetSuite as well as orders placed in the web store.
5. Click **Save**.

Quick Order

Applies to: SuiteCommerce | SuiteCommerce Advanced

This information refers to the Elbrus release of SuiteCommerce Advanced or later.

Note: The Quick Order feature relies on the Search API and is not available with Site Builder Extensions.

Commerce web sites provide a Quick Order feature for shoppers who prefer to quickly search for and add multiple items to their cart. This feature is designed for merchants who allow catalog ordering or provide wholesale products on their website. Quick Order assists shoppers who are familiar with a merchant's catalog and want to shop for items by Stock Keeping Unit (SKU), Part Number, or other identifier.

Shoppers can access the feature by clicking a link in the header or by entering their cart and expanding the Quick Add accordion. Here, shoppers can quickly search for, add, and remove items. Shoppers can also adjust quantities in a list format, instead of browsing the web store.

Your Shopping Cart Is Empty

Continue Shopping on our [Home Page](#) or use the Quick Add below to add items to your cart.

Quick Add

Which item(s) would you like to add? Quantity

Miler Cold Weather Beanie Reflective-BE

Men's Miler Cold Weather Beanie Reflective
SKU: Miler Cold Weather Beanie Reflective-BE
\$25.00
Color: blue

Add Item

This feature is enabled by default with the Elbrus release bundle and later of SuiteCommerce Advanced, but you must complete the tasks detailed in [Set Up Quick Order in NetSuite](#) for it to work correctly.

To disable this feature, edit the `distro.json` file as described in [Disable Quick Order](#).

More Information

Before setting up the Quick Order feature, review the following information:

- This feature doesn't support subsidiaries.
- Handling costs aren't displayed in the summary total of the order, but they're added to the order total after the order becomes a purchase.
- Parent matrix items can't be added to a quick order, only specific child items.

- The **Item Name** can't include the following special characters:

Special Character	Name
()	Parentheses
[]	Brackets
{}	Braces
~	Tilde
!	Exclamation point
" "	Quotation marks
:	Colon
/	Slash mark

For more information, see the help topic [Creating Item Records](#).

Set Up Quick Order in NetSuite

i Applies to: SuiteCommerce | SuiteCommerce Advanced

Perform the following setup tasks in NetSuite:

- [Set Up Search Fields](#)
- [Ensure Field Sets are Defined](#)

Set Up Search Fields

To allow customers to search your site for items in a quick order, you're required to create specific Search Fields in NetSuite. This optimizes searches by Stock Keeping Unit (SKU).

To set up Search Fields for Quick Order:

1. Go to Commerce > Websites > Web Site List.
2. Select **Edit** next to the website you're setting up.
3. Click the **Search Index** subtab and **Search Fields** subtab.
4. Add the following Search Fields and search criteria in the order listed:

Search Field	Type of Match
Name	Starts With
Name	Exact
Name	Fuzzy

For more information, see [Select and Configure Search Fields](#).

Ensure Field Sets are Defined

Before the Quick Order feature can function properly on your site, you must expose specific field sets to your website.

To ensure Field Sets are defined:

1. Go to Commerce > Websites > Web Site List.
2. Click **Edit** next to the website you're setting up.
3. Click the **Field Sets** tab.
4. Ensure that the Items Searcher: itemssearcher Field Set is in place as defined below.

Name	Field Set ID	Fields Included in Field Set
Items Searcher	itemssearcher	■ itemimages_detail: Item Images (Detail) ■ displayname: Display Name ■ itemid: Name ■ storedisplayname2: Store Display Name 2 ■ urlcomponent: URL Component ■ custitem_ns_pr_count: Product Reviews Count (Custom) ■ custitem_ns_pr_rating: Product Reviews Rating (Custom) ■ minimumquantity: Minimum Quantity ■ itemoptions_detail: Item Options (Detail) ■ matrixchilditems_detail : Matrix Child Items (Detail) ■ instock: In Stock ■ showoutofstockmessage: Display Out-of-Stock Message ■ outofstockmessage: Out of Stock Message ■ onlinecustomerprice_detail: Price for Current Customer (Detail) ■ pricelevel1: Retail pricelevel1_ ■ formatted : Retail (Formatted) ■ itemtype: Type ■ ispurchasable: Available for Purchase

For more information, see [Define Field Sets](#).

Disable Quick Order

Applies to: SuiteCommerce | SuiteCommerce Advanced

You're able to configure SuiteCommerce or SuiteCommerce Advanced (SCA) to disable the Quick Order feature. After disabling **Quick Order**, the hyperlink won't appear on your site.

To disable the Quick Order feature:

1. Go to Commerce > Websites > Configuration.
2. Select your website and domain and click **Configure**.
3. Go to the **Shopping** tab and the **Quick Order** subtab.
4. Clear the **Show 'Quick Order' Hyperlink** box to hide the Quick Order link.
5. Click **Save**.

To disable the Quick Order feature (SCA 2018.2 and earlier):

1. Open the distro.json file in the root directory of the SuiteCommerce Advanced source code.

 **Note:** This task requires developer experience.

2. Delete (or disable within comment tags) the following lines:

```
1 | "suitecommerce/QuickOrder": "X.X.X",  
2 | "suitecommerce/QuickOrderAccessPoints": "X.X.X",
```

3. Delete (or disable within comment tags) any lines that include QuickOrder or QuickOrderAccessPoints.
4. Save and redeploy the distro.json file to NetSuite. For more information, see the help topic [Deploy SCA Customizations to NetSuite](#).

Store Pickup for SuiteCommerce Websites

Applies to: SuiteCommerce | SuiteCommerce Advanced

Store Pickup for Commerce websites gives your customers the option to collect their orders from one of your retail locations instead of having them shipped to a specific address. When you enable Store Pickup, you're offering your customers an additional, convenient way to receive their orders. Store pickup doesn't have customer shipping charges and it increases foot traffic and cross-selling opportunities at your retail locations.

The following topics provide helpful information about setting up Store Pickup on your Commerce website:

- [Prerequisites for Store Pickup](#)
These tasks require some configuration in NetSuite's Order Management feature.
- [Set Up Store Pickup for Commerce Websites](#)

Limitations

The Store Pickup feature has the following limitations:

- The Store Pickup feature is available in the following NetSuite accounts: U.S., Canada, U.K., Australia, and OneWorld.
- Store Pickup can't be used with the following features:
 - SuiteTax – For details, see the help topic [General SuiteTax Topics](#).
 - Scriptable Cart – For details, see the help topic [Scriptable Cart](#).
- Store Pickup for Commerce websites is compatible with SuiteCommerce and the SuiteCommerce Advanced Elbrus release or later.
- Customers can only choose one pickup location for their entire order with Store Pickup for Commerce websites.
- Customers can place combined orders with items for shipping and store pickup. If Store Pickup is enabled, the items can't be shipped to multiple locations.

Prerequisites for Store Pickup

Applies to: SuiteCommerce | SuiteCommerce Advanced

Before setting up Store Pickup on your Commerce website, complete these tasks:

- [Complete Order Management Tasks for Store Pickup](#)
- [Set Up Automation in Advanced Order Management](#)
- [Set Up Store Locator](#)

Complete Order Management Tasks for Store Pickup

SuiteCommerce and SuiteCommerce Advanced websites integrate with NetSuite's Order Management feature to provide the complete Store Pickup feature.

To complete the Order Management tasks required to set up Store Pickup, follow the steps outlined in the help topic [Setting Up Store Pickup](#).

Set Up Automation in Advanced Order Management

 **Important:** Set up Advanced Order Management in your NetSuite account before setting up Store Pickup on your Commerce website.

Advanced Order Management lets you set up automation to meet your company's needs. Enabling Run Automation is optional, but it's considered a best practice.

Enabling Run Automation automates a business event workflow in NetSuite. When business events occur on a sales order, NetSuite runs automation processes based on your Advanced Order Management settings. For more information, see the help topic [Order Fulfillment Automation](#).

 **Note:** You'll incur usage fees for order fulfillment automation if you create over 5,000 automated sales orders in a year. For more information, see the help topic [Automation Capacity and Usage Fees](#).

To set up automation in Advanced Order Management:

1. Go to Setup > Order Management > Setup Tasks > Advanced Order Management.
2. Select the **Automation** tab and then the **Pickup Orders** subtab.
3. Check the **Run Automation** box.
4. In the **Fulfillment Request Creation** area, select one or both of the following options to specify when to create fulfillment requests:
 - **Sales Order Approved** – Automatically creates a fulfillment request when a store pickup sales order is approved and there's no payment hold.
 - **Payment Hold Released** – Automatically creates a fulfillment request for store pickup sales orders when a payment hold is released on an approved store pickup sales order.
5. Click **Save**.

Set Up Store Locator

The Store Locator feature helps customers find your physical stores by searching location records in your NetSuite account and showing results near their location or a specified address.

To set up this feature, follow the steps outlined in [Store Locator](#).

Set Up Store Pickup for Commerce Websites

 **Applies to:** SuiteCommerce | SuiteCommerce Advanced

 **Important:** To use Store Pickup on your Commerce website, provision the Advanced Order Management module on your NetSuite account and enable specific features. See [Prerequisites for Store Pickup](#) for more information.

To use Store Pickup on your Commerce website, complete the following:

- [Define Store Pickup Field Sets](#)

■ Enable Store Pickup for Commerce Websites

Define Store Pickup Field Sets

You need to expose specific field sets to your Commerce website for the Store Pickup feature to function properly. For details, see the help topic [Set Up Initial Field Sets](#).

Important: Store pickup fields are specific to the Store Pickup feature and are added to field sets that are already established. Don't replace established field sets with the store pickup fields. For more information, see [Define Field Sets](#).

To confirm store pickup fields are exposed:

1. Go to Commerce > Websites > Website List.
2. Select **Edit** next to your website.
3. Click the **Field Sets** subtab.
4. Confirm store pickup fields are in place as defined in the following table.
5. Add any missing store pickup fields to each field set as defined in the following table.
6. Click **Save**.

Field	Field Set ID	Fields to be Added to Field Set
Details	details	- isfulfillable: Can be Fulfilled/Received - isstorepickupallowed: Store Pickup Allowed - quantityavailableforstorepickup_detail: Available For Store Pickup (Detail)
Matrix Child Items	matrixchilditems	- isfulfillable: Can be Fulfilled/Received - isstorepickupallowed: Store Pickup Allowed - quantityavailableforstorepickup_detail: Available For Store Pickup (Detail)
Matrix Child Items Search	matrixchilditems_search	- isfulfillable: Can be Fulfilled/Received - isstorepickupallowed: Store Pickup Allowed - quantityavailableforstorepickup_detail: Available For Store Pickup (Detail)
Order	order	- isfulfillable: Can be Fulfilled/Received - isstorepickupallowed: Store Pickup Allowed - quantityavailableforstorepickup_detail: Available For Store Pickup (Detail)
Search	search	- isfulfillable: Can be Fulfilled/Received - isstorepickupallowed: Store Pickup Allowed

Enable Store Pickup for Commerce Websites

After you complete the steps to set up Store Pickup as part of Order Management documented in [Complete Order Management Tasks for Store Pickup](#), you must enable Store Pickup for your Commerce website.

To enable Store Pickup:

1. Go to Commerce > Websites > Configuration.
2. Select your website and domain and click **Configure**.
3. Click the **Checkout** tab.
4. Check **Enable Pickup In Store**.
5. Enter the internal ID in the **Pickup In Store Sales Order Custom Form ID** field.
See the help topic [Customizing the Sales Order Form for Store Pickup](#) for detailed instructions on creating a sales order form for Store Pickup and obtaining the internal ID.
6. Click **Save**.

Disable Store Pickup for Commerce Websites

To disable Store Pickup on your Commerce website, complete the following:

- [Remove Store Pickup Field Sets](#)
- [Disable Store Pickup in SuiteCommerce or SuiteCommerce Advanced](#)

Remove Store Pickup Field Sets

Important: Store pickup fields are specific to the Store Pickup feature and are removed from field sets that are already established. Do not remove established fields when you remove the store pickup fields. See [Define Field Sets](#) for detailed information.

To remove store pickup fields:

1. Go to Commerce > Websites > Website List.
2. Select **Edit** next to the website you want to modify.
3. Click the **Field Sets** subtab.
4. Remove fields from each field set as defined in the following table.
5. Click **Save**.

Field	Field Set ID	Fields to be Removed from Field Set
Details	details	■ isfulfillable: Can be Fulfilled/Received ■ isstorepickupallowed: Store Pickup Allowed ■ quantityavailableforstorepickup_detail: Available For Store Pickup (Detail)
Matrix Child Items	matrixchilditems	■ isfulfillable: Can be Fulfilled/Received ■ isstorepickupallowed: Store Pickup Allowed ■ quantityavailableforstorepickup_detail: Available For Store Pickup (Detail)
Matrix Child Items Search	matrixchilditems_search	■ isfulfillable: Can be Fulfilled/Received ■ isstorepickupallowed: Store Pickup Allowed ■ quantityavailableforstorepickup_detail: Available For Store Pickup (Detail)

Field	Field Set ID	Fields to be Removed from Field Set
Order	order	- isfulfillable: Can be Fulfilled/Received - isstorepickupallowed: Store Pickup Allowed - quantityavailableforstorepickup_detail: Available For Store Pickup (Detail)
Search	search	- isfulfillable: Can be Fulfilled/Received - isstorepickupallowed: Store Pickup Allowed

Disable Store Pickup in SuiteCommerce or SuiteCommerce Advanced

You can configure SuiteCommerce or SuiteCommerce Advanced to disable the Store Pickup feature.

To disable the Store Pickup feature:

1. Go to Commerce > Websites > Configuration.
2. Select your website and domain and click **Configure**.
3. Click the **Checkout** subtab.
4. Clear the **Enable Pickup In Store** box.
5. Click **Save**.

Store Locator

 **Applies to:** SuiteCommerce | SuiteCommerce Advanced

The Store Locator feature lets customers use your Commerce website to find physical store locations. Store Locator searches your NetSuite account's location records and displays results near your customer's location or any specified address.

See the help topic [Locations Overview](#) for information about the Locations feature. To set up location records for your stores, including address and business hours, see the help topic [Creating Locations](#).

Store Locator also helps customers pick up orders from a store, instead of having them shipped.

Store Locator is available for SuiteCommerce and SuiteCommerce Advanced (SCA) implementations of Commerce websites.

Important: Store Locator uses the Google Maps API key. For this feature to work properly on your website, you're required to get an API key from Google. See [Use API Keys](#) on the Google Maps Platform for instructions.

The following topics provide helpful information about the Store Locator feature:

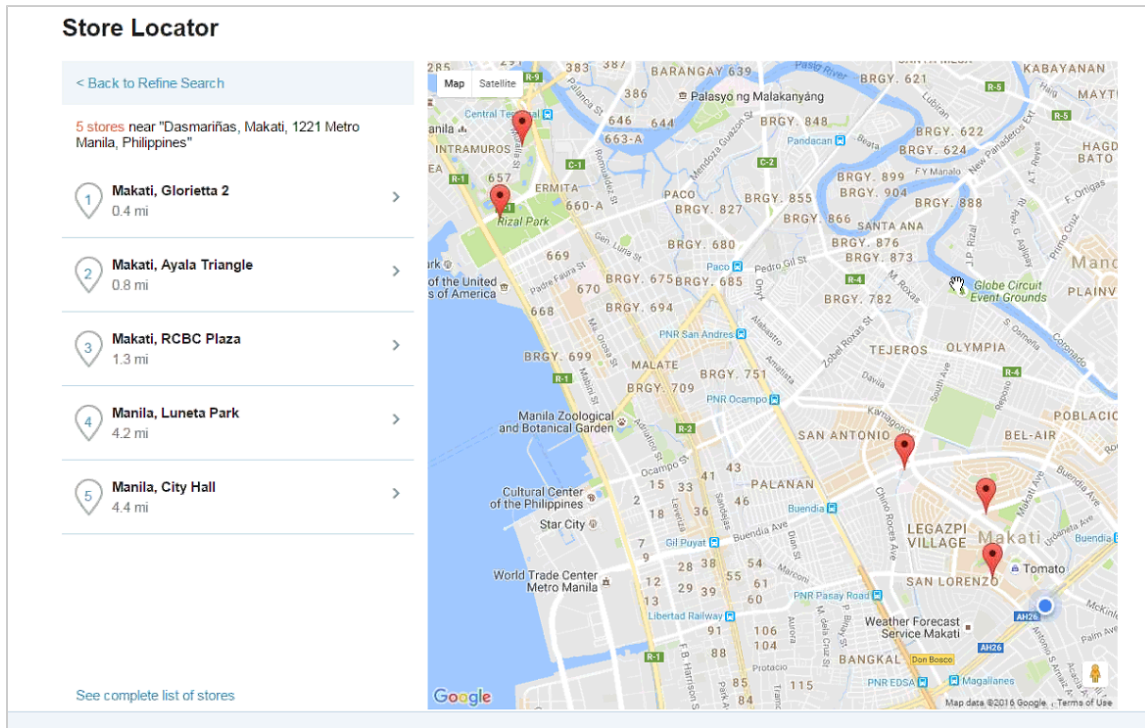

- [Set up Store Locator in NetSuite](#)
- [Configure Store Locator Properties](#)
- [Map Engine Implementation](#)

User Experience

After you enable the Store Locator feature, your customers can:

- See store locations in a list and an interactive map.
- View stores near their current location.
- Find stores by address, city, or postal code.
- Select a store to view its address, hours, and more.
- View a list of all stores.
- Get directions to a store.

See the following sample Store Locator page:

Customers access the Store Locator feature by clicking the Store Locator link in your website header. When the Store Locator page loads, customers can enable geolocation. With geolocation enabled, Store Locator uses the customer's current location to find nearby stores. Customers can also search by entering a specific address.

Store Locator only displays specific locations based on settings you configure.

Example

You set your website to show stores within 60 miles of the search origin point. The origin point is either the customer's location or an address they enter. If no stores are within the radius, you also set up your website to show the three nearest stores.

A customer searches for stores on your website using their current location as the search origin point. Store Locator displays store locations based on your settings (stores located within 60 miles of the customer's location). If no stores are within the radius, Store Locator shows the three closest stores, listed from nearest to farthest.

Note: Store Locator is displayed using the secure domain associated with the Checkout application in SuiteCommerce and SCA. This is largely transparent to the customer, but the URL will reflect this. See the help topic [Link a Checkout Domain with Your Web Store](#).

Set up Store Locator in NetSuite

Applies to: SuiteCommerce | SuiteCommerce Advanced

Important: To use Store Locator, set up location records in your NetSuite account. For details, see the help topic [Locations Overview](#). To set up location records for your stores, including address and business hours, see the help topic [Creating Locations](#).

The following topics provide helpful information about enabling and disabling the Store Locator feature:

- [Verify that Store Locator is Enabled](#)
- [Set Elevated Permissions for the Service File Record](#)
- [Disable Store Locator](#)

Verify that Store Locator is Enabled

Store Locator is enabled by default in SuiteCommerce and SuiteCommerce Advanced. However, you can verify that the feature is enabled with the following processes.

To verify that Store Locator is enabled:

1. Go to Commerce > Websites > Configuration.
2. Select your website and domain, then click **Configure**.
3. Click the **Store Locator** tab and the **Store Locator** subtab.
4. Verify that the **Is Enabled** box is checked. If it's not checked, select the box.
5. Click **Save**.

To verify that Store Locator is enabled (SuiteCommerce Advanced pre-Vinson):

1. Open the `distro.json` file in the SCA source code's root directory using a code editor.
2. Search for lines of code that include `StoreLocator`.

For example:

```

1  "suitecommerce/StoreLocatorReferenceMapImplementation": "X.X.X",
2  "suitecommerce/Location.SCA": "X.X.X",
3  "suitecommerce/StoreLocatorAccessPoints": "X.X.X",
4  "suitecommerce/StoreLocator": "X.X.X",
5  "suitecommerce/StoreLocatorGoogleMapsImplementation": "X.X.X",
6
7  "StoreLocatorAccessPoints",
8  "StoreLocator"
9
10   "StoreLocator.Model"
11
12  "StoreLocator.ServiceController"
```

3. Verify that the lines of code are not disabled within comment tags.
4. Search for the following line and confirm that it is not disabled within comment tags:

```
1 | Location.sca
```

5. Close the file.

Set Elevated Permissions for the Service File Record

To use Store Locator, set elevated permissions for the service file record in NetSuite. NetSuite creates a custom Advanced Customer Center role after you install SuiteCommerce or SuiteCommerce Advanced (SCA). Use this role for Store Locator setup.

To set elevated permissions for the service file record:

1. Go to Documents > Files > File Cabinet.
2. Go to Web Site Hosting Files > Live Hosting Files > SSP Applications > [Applicable Bundle Folder] > Development > services.
3. Select **Edit** next to the StoreLocator.Service.ss file.
4. In the File record, check the **Available Without Login** box.
5. Click the **Permission** subtab.
6. Check the **Enabled** box.
7. In the **Execute as Role** list, select the custom Advanced Customer Center role.
8. Check the **Run Script Without Login** box.
9. Click **Save**.

Disable Store Locator

You can disable the Store Locator feature in the SuiteCommerce Configuration record. When Store Locator is disabled, customers can't:

- See store locations in a list or on an interactive map.
- Find stores near their current location.
- Search for stores by address, city, or postal code.
- View location details, including address and hours, from the search results.
- See a list of all stores.
- Get directions to a store.

To disable Store Locator:

1. Go to Commerce > Websites > Configuration.
2. Select your website and domain and click **Configure**.
3. Click the **Store Locator** tab and the **Store Locator** subtab.
4. Clear the **Is Enabled** box to disable Store Locator.
5. Click **Save**.

To disable Store Locator (SuiteCommerce Advanced pre-Vinson):

1. Open the `distro.json` file in the SCA source code's root directory using a code editor.
For more information about the distribution file and its location, see the help topic [The `distro.json` and `ns.package.json` Files](#).

Note: In pre-Vinson SCA versions, Store Locator is enabled by default. To disable it, edit the `distro.json` file. You'll need developer experience to complete this task.

2. Delete (or disable within comment tags) any lines of code that include `StoreLocator`.

For example:

```
1  "suitecommerce/StoreLocatorReferenceMapImplementation": "X.X.X",
2  "suitecommerce/Location.SCA": "X.X.X",
3  "suitecommerce/StoreLocatorAccessPoints": "X.X.X",
4  "suitecommerce/StoreLocator": "X.X.X",
5  "suitecommerce/StoreLocatorGoogleMapsImplementation": "X.X.X",
6
7  "StoreLocatorAccessPoints",
8  "StoreLocator"
9
10     "StoreLocator.Model"
11
12     "StoreLocator.ServiceController"
```

3. Delete (or disable within comment tags) the following line:

```
1 | Location.sca
```

4. Save and redeploy the `distro.json` file. For more information, see the help topic [Deploy SCA Customizations to NetSuite](#).

Configure Store Locator Properties

Applies to: SuiteCommerce | SuiteCommerce Advanced

Configure Store Locator by going to the **Store Locator** subtab in the SuiteCommerce Configuration record. This subtab includes properties for Google Maps and general Store Locator settings. To set up location records for your stores, including address and business hours, see the help topic [Creating Locations](#).

Learn more about configurable Store Locator properties in the following topics:

- [Store Locator Google Maps Subtab](#)
- [Store Locator Subtab](#)

To configure Store Locator properties:

1. Go to Commerce > Websites > Configuration.
2. Select your website and domain, then click **Configure**.
3. Click the **Store Locator** subtab.
4. Set feature properties in the **Store Locator Google Maps** and **Store Locator** subtabs as needed.

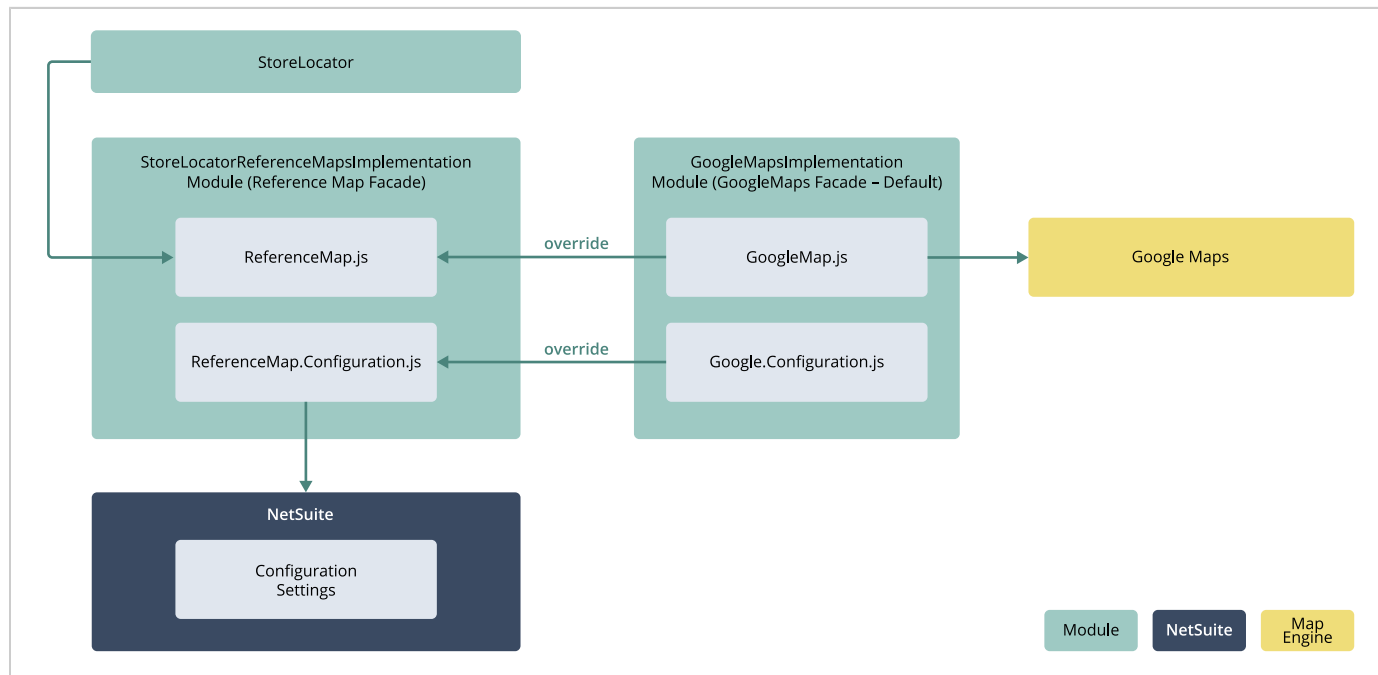

5. Click **Save**.

Map Engine Implementation

Applies to: SuiteCommerce | SuiteCommerce Advanced

Google Maps is the default map engine for Store Locator.

The following JavaScript facade pattern is used to implement Google Maps. You can also use this facade as a guide to integrate other map engines.

The facade features the following modules and files:

- **StoreLocatorReferenceMapsImplementation** – Contains the reference map facade used for map engine implementation. It defines the properties and methods for implementing the map engine. The Store Locator module relies on this, so avoid customizing it.

This module includes the following files:

- **ReferenceMap.js** – Contains operation signatures that override the logic specific to map engine implementation.
- **ReferenceMap.Configuration.js** – A facade for Google Maps configuration. It declares the methods used to communicate with the configuration options defined in your NetSuite account.
- **GoogleMapsImplementation** – Contains the logic needed to implement Google Maps as the Store Locator base map. Its files override the corresponding files in StoreLocatorReferenceMapsImplementation. If you want to implement a different map engine, create a new module to replace this one. See [Implementing Different Map Engines](#) for more information. New modules must reference StoreLocatorReferenceMapsImplementation.

This module includes the following files:

- **GoogleMap.js** – Contains all the code required to override the ReferenceMap.js file. It enables communication between Store Locator and Google Maps.

- **Google.Configuration.js** – A facade for implementing Google Maps as the Store Locator base map. It overrides the methods called by `ReferenceMap.Configuration.js`.

Google Maps Platform Terms of Service

To use Google Maps API, agree to Google's license terms, get a Google Maps API key, and give it to NetSuite.

Note: A standard Store Locator configuration means that your website complies with Google's licensing terms. However, ensure your website policies and any customizations you make to the Store Locator feature don't break Google Maps Platform terms.

Note the following key points in the Google Maps Platform Terms of Service:

- Offer Store Locator for free and make sure it's not behind a firewall.
- Link to [Google Maps Platform Terms of Service](#) on your terms and conditions page and state that customers are bound by these terms.
- Include a link to [Google Privacy Policy](#) in your privacy policy.
- Don't remove or hide Google branding on your site.

Refer to the [Google Maps Platform Terms of Service](#) for the full list of terms.

Important: Google Maps Platform is free for many use cases. If you have a high-traffic site, be aware of [Google Maps Platform usage limits](#). For high-traffic sites, you can buy a premium license or enable Google billing. Check [Google Maps Platform pricing](#) for current prices and plans. To track daily map usage, use the [Google API Dashboard](#).

Implementing Different Map Engines

SuiteCommerce Advanced (SCA) allows you to implement different map engines.

Note: The following procedure uses **XyzMap** as an example. You can use the existing `GoogleMap.js` and `Google.Configuration.js` files as a template to create a new map engine.

To implement a different map engine:

1. Create a new module to replace `StoreLocatorGoogleMapsImplementation`. This module will define the new map engine's implementation. The new module could be called `StoreLocatorXyzMapImplementation`. For example, this new module could be named `StoreLocatorXyzMapImplementation`.
2. Within this new module, create a new implementation file called `XyzMap.js`, where Xyz is the name of the map engine you are implementing. This file will contain the logic to make the specific map engine work with SCA. This file must define `ReferenceMap` as a dependency and implement all the functions defined as required for the map engine.
3. Create a new `Xyz.Configuration.js` file. This file will serve as the facade for the map engine configuration options. This file must define `ReferenceMap.Configuration` as a dependency and implement all the functions defined that are required for the map engine.
4. Edit the `distro.json` file to reference your new module. Store Locator supports only one map engine, so you must delete code that references `StoreLocatorGoogleMapsImplementation` or disable it behind comment tags. For example, your edited `distro.json` code might look like this:

```
1 "suitecommerce/StoreLocatorXyzMapImplementation": "1.0.1",  
2 //"suitecommerce/StoreLocatorGoogleMapsImplementation": "1.0.1",
```

For information about the distribution file and its location, see the help topic [The distro.json and ns.package.json Files](#).

5. Save and redeploy the distro.json file to NetSuite. For more information, see the help topic [Deploy SCA Customizations to NetSuite](#).

Web Store Orders Workbook

i Applies to: SuiteCommerce | SuiteCommerce Advanced

SuiteAnalytics Workbook offers many workbook and dataset templates, each with predefined source data, criteria, pivot tables, and charts. For more information about SuiteAnalytics Workbook, see the help topic [Workbook and Dataset Templates](#).

Explore these topics for information about the SuiteAnalytics Web Store Orders workbook in NetSuite:

- [Web Store Orders Dataset](#)
- [Web Store Orders Workbook](#)

Web Store Orders Dataset

i Applies to: SuiteCommerce | SuiteCommerce Advanced

This dataset combines fields from the Transaction and Transaction Line record types, and a custom formula, to help you analyze data related to web store orders. It forms the source data for the [Web Store Orders Workbook](#).

Dataset Configuration

The Web Store Orders dataset combines fields from two record types, a custom formula, and multiple criteria filters. To edit the dataset, see the help topic [Defining a Dataset](#).

Root Record Type	Joined Record Type	Custom Formula Fields	Data Grid	Criteria Filters
Transaction	Transaction Line	Item Quantity ■ ABS({ transactionlines.quantity})	The following fields are included in the dataset. Transaction: ■ Date ■ Internal ID ■ Source ■ Website Transaction Line: ■ Amount (Credit) (Transaction Currency) ■ ID	The following criteria is used to filter the dataset: ■ Transaction: Date on or after start of this month ■ Transaction: Source any of Web, SCIS ■ Transaction: Type is Sales Order ■ Transaction Line: ID not equal 0 ■ Item: Display in Web Site is true ■ Item: Inactive is false ■ Item: Type any of Inventory Item, Assembly, Kit/Package, Non-inventory Item, Other Charge, Service, Discount, Download Item

Web Store Orders Workbook

i Applies to: SuiteCommerce | SuiteCommerce Advanced

The SuiteAnalytics Web Store Orders workbook template lets you retrieve and visualize web store order information based on your criteria. You can group orders by item and the customers who ordered them, or you can group by customer and the items they ordered.

Accessing the web store order workbook template

1. In NetSuite, on the top navigation menu, click **Analytics**.
2. On the Analytics Home page, expand the list under **Workbook Templates** and click **Web Store Orders**.

This displays the **Web Store Orders** workbook template.

i Note: At this stage, you may see a note displayed: Transactions in SuiteAnalytics Workbook. It provides information about how to use the Transaction record type in SuiteAnalytics Workbook. If you don't want to see this message again, check the **Don't show me again** box and then click **Let's start**.

3. The workbook user interface includes multiple tabs:
 - The **Dataset** tab, where you customize your source data and criteria
 - The **Pivot** tab, where you pivot your workbook source data
 - The **Chart** tab, where you create charts from your workbook source data

For more information about each tab, see the help topic [Navigating SuiteAnalytics Workbook](#).

Charts

The following charts are included in this workbook:

- **Total Ordered Items per Website** – This chart displays the total number of items sold through the web store.
- **Total Item Value per Website** – This chart shows the sum of the totals from all orders made from a web store. Transactions are converted to your default subsidiary's base currency, since they can be in different currencies.

New Fields

The Web Store Order Workbook Template uses a new Website field that is not available in the NetSuite Report application.

Field Name	Record Location in SuiteAnalytics Workbook	Join Path in SuiteAnalytics Workbook
Website	Transaction Website	Transaction > Website

Pivot Tables

The following pivot tables are included in this workbook:

- **Web Store Orders** – This is a summary of web store transactions by item name. The Aggregate column lists the number of ordered items, the number of orders, and the number of unique customers. To segment data by year, quarter, or month, add the **Date** field to the table **Columns**, in the **Layout** panel. The default criteria for this workbook includes data from SuiteCommerce InStore sites.
- **Items Ordered by Customers** – This pivot table displays the list of items purchased, the customers who bought them, and the web store the items were purchased through.
- **Customers Ordering Items** – This pivot table displays the list of customers that purchased items, the items purchased, and the web store the customers purchased those items through.

SuiteCommerce MyAccount Overview

i Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced

Explore the following FAQs to better understand your SuiteCommerce MyAccount (SCMA) implementation.

- [What is SuiteCommerce MyAccount?](#)
- [What is the difference between a SuiteCommerce MyAccount website and a SuiteCommerce or SuiteCommerce Advanced website?](#)
- [Is it possible to have a SuiteCommerce MyAccount site if I already have a SuiteCommerce or SuiteCommerce Advanced site?](#)
- [What is the difference between SuiteCommerce MyAccount and the My Account area of a SuiteCommerce website?](#)
- [What is the difference between SuiteCommerce MyAccount and Premium Customer Center?](#)
- [Does SuiteCommerce MyAccount require SuiteBilling?](#)
- [Does SuiteCommerce MyAccount support Site Management Tools?](#)
- [Does SuiteCommerce MyAccount support SuiteCommerce Themes?](#)
- [Does SuiteCommerce MyAccount support SuiteCommerce Extensions?](#)
- [Does SuiteCommerce MyAccount support multiple languages?](#)
- [Are there any changes in the Configuration record for SuiteCommerce MyAccount?](#)
- [What areas of SuiteCommerce MyAccount can be customized?](#)

What is SuiteCommerce MyAccount?

SuiteCommerce MyAccount (SCMA) is a self-service web portal where your customers can manage their account information, view recent transactions, pay invoices, and more.

SCMA includes various features and information in the My Account area of your site, such as:

- Subscriptions management for SuiteBilling subscription-based purchases (SuiteBilling must be enabled).
- Purchases area, including information about current and past purchases, and the option to reorder items.
- Billing information, including account balances, invoices, transaction history, and printable statements.
- Account settings, such as email preferences and password management.
- Support case management.
- Quotes management.

Like SuiteCommerce (SC), SCMA is a SaaS product, which means that:

- The application is delivered as a bundle.

- The bundle code is locked and you can't edit it.
- Updates roll out automatically in phases.

What is the difference between a SuiteCommerce MyAccount website and a SuiteCommerce or SuiteCommerce Advanced website?

SuiteCommerce (SC) is NetSuite's primary ecommerce shopping solution. It offers a full shopping experience, including customer portal (My Account) functionality and the ability to search, browse, and add items to a cart or wishlist.

SuiteCommerce MyAccount (SCMA) is NetSuite's online customer portal solution. It lets your customers view their transactions and pay invoices.

SC and SuiteCommerce Advanced (SCA) are composed of the following three applications:

- Shopping
- Checkout
- My Account

SCMA only includes the My Account application, not Shopping or Checkout.

Customers have to log in to use your SCMA site, but SC or SCA sites can be public.

The following table shows which SC and SCA features are supported in SCMA.

 **Note:** If a cell is blank, that feature isn't supported in SCMA.

SC/SCA Feature or Functionality	Included with SCMA
Purchases	
See Orders / Purchase History	✓
Enter Orders	-
Reorder Items	✓
View Returns	✓
Request a Return	✓
Quote Creation	All quotes must be created by a sales rep in NetSuite.
Quote Management	✓
Quote to Sales Order	✓
Shopping Cart	-
Checkout	Users can only pay for an existing quote or invoice, or reorder previously purchased items.

SC/SCA Feature or Functionality	Included with SCMA
Billing	
Account Balance	✓
Invoices	✓
Make a Payment	✓
Print a Statement	✓
Transaction History	✓
Other	
Product Lists / Wishlists	-
Save for Later	-
Case Management	✓
My Account Settings	✓
Subscription Management	✓
Secure domains with automatically renewing TLS certificates	✓
Components and classes in the Extensibility API (where applicable)	✓
Homepage	Logged-out users are directed to the login page. Logged-in users are directed to the account overview page.
Item Search API	Item details can be retrieved with SuiteScript.
Item browsing (keyword search, commerce categories, or product detail pages)	-
CDN	There are no public pages except the login page.
Custom Themes	Site must use the SC Base Theme, but it can be configured with Site Management Tools (SMT).

Is it possible to have a SuiteCommerce MyAccount site if I already have a SuiteCommerce or SuiteCommerce Advanced site?

Yes. SuiteCommerce MyAccount (SCMA) needs a separate license, but you can have two sites at the same time, one for SuiteCommerce (SC) or SuiteCommerce Advanced, and another for SCMA.

One SC license lets you run one SC website, and includes a My Account portal and a secure domain. One SCMA license gives you a My Account portal and a secure domain. If you have both an SC and an SCMA license, you get two My Account portals and two secure domains (one standalone and one linked to your SC site).

What is the difference between SuiteCommerce MyAccount and the My Account area of a SuiteCommerce website?

To help you get to know your SuiteCommerce MyAccount (SCMA) solution, let's clarify a few terms:

My Account – This is the area or module found on any SuiteCommerce (SC) or SuiteCommerce Advanced (SCA) site. With My Account, customers can view information about their account on your website.

SuiteCommerce MyAccount – SCMA is an ecommerce solution that gives your customers a self-service site for basic online account management. SSCMA uses the same framework as SC, but only includes some My Account features. SCMA sites don't have shopping or checkout features.

The following table shows which My Account features are supported in SCMA.

 **Note:** If a cell is blank, that feature or functionality isn't supported by SCMA.

My Account Feature or Functionality	Included with SCMA
Purchases	
See Orders / Purchase History	✓
Enter Orders	–
Reorder Items	✓
View Returns	✓
Request a Return	✓
Quotes	✓
Quote to Sales Order	✓
Billing	
Account Balance	✓
Invoices	✓
Make a Payment	✓
Print a Statement	✓
Transaction History	✓
Other	
Product Lists/Wishlists	–
Save for Later	–
Case Management	✓
My Account Settings	✓

My Account Feature or Functionality	Included with SCMA
Subscription Management	✓

What is the difference between SuiteCommerce MyAccount and Premium Customer Center?

SuiteCommerce MyAccount (SCMA) is meant to replace Premium Customer Center, but it doesn't include all the same features. Premium Customer Center comes with a Site Builder site that has checkout features. SCMA doesn't support shopping or checkout features.

Does SuiteCommerce MyAccount require SuiteBilling?

No. SuiteCommerce MyAccount (SCMA) is a self-service portal for managing account information. If SuiteBilling is turned on in your NetSuite account, you can also manage subscriptions through your SCMA site.

Does SuiteCommerce MyAccount support Site Management Tools?

Yes. Site Management Tools (SMT) works with SuiteCommerce MyAccount (SCMA). With SMT, you can:

- Create landing pages for SCMA.
- Change your site's look and feel with third-party themes or the SuiteCommerce Base Theme.
- Change page layouts.
- Add Content Types to a page.

Note: To update the My Account area of your Commerce website using SMT, you need a single secure domain.

Does SuiteCommerce MyAccount support SuiteCommerce Themes?

No. SuiteCommerce MyAccount (SCMA) doesn't support SuiteCommerce (SC) Themes.

However, you can perform either of the following tasks to customize how your SCMA site looks:

- Install and activate the SC Base Theme with the Extension Manager. Then use the Theme Skin Manager in Site Management Tools to change the layout and appearance. See the help topic [Theme Skin Manager](#) for more information.
- Use the SC Base Theme as a starting point to build your own theme with the Theme Developer Tools. See the help topic [Overview](#) for more information.

Does SuiteCommerce MyAccount support SuiteCommerce Extensions?

Yes. You can activate many SuiteCommerce Extensions (add-ons for your site) on your SuiteCommerce MyAccount domain, or build your own extension with the Extension Developer Tools.

- For more information about the extensions that are available, see [Commerce Extensions](#).
- For more information about creating your own extension, see the help topic [Overview](#).

Does SuiteCommerce MyAccount support multiple languages?

Yes. Since SuiteCommerce MyAccount (SCMA) shares the same code base as SuiteCommerce, SCMA inherits the multi-language feature.

Are there any changes in the Configuration record for SuiteCommerce MyAccount?

Yes. Only the following tabs are available for SCMA sites in the SuiteCommerce Configuration record:

- **My Account** tab
- **Advanced** tab
- **Checkout** tab
- **Integrations** tab
- **Multi-Domain** tab
- **Layout** tab

What areas of SuiteCommerce MyAccount can be customized?

Unlike SuiteCommerce Advanced (SCA), developers can't make code-level changes to SuiteCommerce MyAccount (SCMA). However, the code for MyAccount is similar to what you see in SuiteCommerce (SC) and SCA sites, so things should work the same across all versions. Developers should generally treat a MyAccount site like the My Account area of an SC site. This means that customizations for the My Account area of an SC or SCA site should work smoothly on SCMA.

 **Note:** Like with SC and SCMA, you should configure SCMA instead of customizing it.

Configuration options available for SCMA include:

- **Customer Center Custom Permissions** - used to hide menu items and prevent certain customers from using some features in My Account. See the help topic [Customer Center Custom Permissions](#).
- **Transaction List Columns** subtab - used to set up fields for orders, quotes, returns, and invoices. See the help topic [Transaction List Columns Subtab](#).

You customize SCMA about the same way you customize an SC site. SCMA customization can be done using:

- Extensions (including many built by NetSuite). See [Commerce Extensions](#) for information about the extensions distributed by NetSuite. See the help topic [Overview](#) for instructions on creating your own extensions.
- Extensibility API (components and classes are available where needed). See the help topic [Overview](#).
- Configuration files. See the help topic [JSON Configuration Files](#).
- Site Management Tools (SMT). See the help topic [Site Management Tools](#).

Important: Before you start customizing your SCMA implementation, review [Overview](#) to learn about the skills and resources you need.

Here are some ways you can customize your SCMA site:

- Change how your login page looks.
 - Page types let you create custom templates for the login page. See the help topic [Create Page Types](#).
 - If you don't want to use a new template, custom content types let you add or replace child views with the Extensibility API. See the help topic [Overview](#).
- Create simple landing pages with SMT. See the help topic [Landing Pages](#).
- Add new page routes and locations in My Account.
 - Page types let you add new routes that can be combined with an extension to perform CRUD operations on standard and custom records. See the help topic [Create Page Types](#).
 - You can use the MyAccountMenu component to add menu items to the My Account page. See the help topic [MyAccountMenu](#).

Product Lists

Applies to: SuiteCommerce | SuiteCommerce Advanced

The Product Lists (Wishlists) feature lets users create and manage lists of items they want to buy from your Commerce website. With Product Lists, users can do the following:

- Add items to a product list while browsing your website.
- Create new lists when adding items.
- Edit item order details on product list pages.
- Move items between lists.
- Add a list to the shopping cart with one click.
- Reorder lists of items.

Note: Product lists only work on SuiteCommerce websites.

With Product Lists, users can add items to a predefined or custom list:

- **Predefined lists** are automatically available to your users. By default, one predefined list, My List, is available. You can set up your website to have multiple predefined lists. Alternatively, you can set up your website with no predefined lists, so users must always create custom lists.
- **Custom lists** are created by the user. Users can add these lists on the product list page or create them when they add an item to a list. You can set up your website so users can't create custom lists.

For example, you can give your users two predefined lists, like Gifts and Favorites. Users can add items to either of these predefined lists, or create a new list, like Christmas, and add items there.

Note: Logged-in customers and their contacts can see both predefined and custom lists.

For more information about configuring a website for predefined and custom lists, see [Configuring Product Lists](#).

Product List Custom Records

Applies to: SuiteCommerce | SuiteCommerce Advanced

Product Lists custom records store and manage product lists each customer's product lists. You can access these custom records from the **SuiteCommerce Extensions** tab of the customer record.

To use Product Lists, first install the Reference Product Lists Records SuiteApp. See the help topic [Install Your Commerce Website Applications](#) for detailed information about how to install this SuiteApp.

Note: You need the Reference Product Lists Records SuiteApp for the Elbrus release of SuiteCommerce Advanced, even if you don't use Product Lists records.

The following records are added when the SuiteApp is installed:

- **Lists:**
 - **Product Lists Type** lets you define lists as default, predefined, later, or quote. Any list a user adds is automatically set to default. Your users automatically have access to predefined lists. Lists set to later let users save items to buy later. Lists set to quote let users ask for a quote on a list of items.

- Product Lists Scope** lets you set lists as private, public, or shared. Currently, only private lists are supported, and each list is set as private by default. Only the logged-in users can view and manage private lists.

Note: You can set up predefined lists in the website configuration file or the customer record. If you define a predefined list in a customer record, only that customer can use it. It's best to set up predefined lists in the website configuration file so all customers can use them. A predefined list only displays in the customer record when the customer adds items to it. For information about configuration procedures, see [Configuring Product Lists](#).

- Records:**
 - Product Lists Items** lets you manage item data linked to a product list.
 - Product Lists** lets you manage product list data.
 - Product Lists Items Priority** is used to prioritize items within a product list. This functionality is currently not supported.
- Subtabs:** The **Product Lists** subtab is displayed under the **SuiteCommerce Extensions** tab in the customer record. See [SuiteCommerce Extensions Tab](#). The **Product Lists Items** subtab is displayed under the **SuiteCommerce Product Reviews** tab in the item record.

You can customize these records if required.

- Note:** If the Reference Product Lists Records SuiteApp is not installed:
- Product lists don't display on the Wishlist page in My Account.
 - Users will see an error if they try to add an item to a product list in ShopFlow.

SuiteCommerce Extensions Tab

Applies to: SuiteCommerce | SuiteCommerce Advanced

You can manage product lists from the **Product Lists** subtab under the **SuiteCommerce Extension** tab in the customer record.

Important: If required, you can edit list and item attributes. However, the product list records are intended for storing and showing data from the website, so you shouldn't edit them.

Sales Marketing Address Financial Company Profile SuiteCommerce Extensions				
Product Lists				
Product Lists Name	Creation Date/Time	Description	Scope *	Type *
Christmas		Christmas List	private	default
Sample		Sample List	private	default
			private	default
✓ Add ✕ Cancel + Insert				

Note the following:

- If you edit a predefined list in a customer record, it overrides the same list in the configuration file. How you edit predefined lists in the configuration file depends on which SuiteCommerce Advanced version you're using.

- The scope attribute for a product list isn't supported in ShopFlow and My Account.
- The Item Options field on the Product Lists Items displays the options the user selected. For, example, for gift certificates, the recipient's email address is stored in this field. You shouldn't edit the Item Options field.

Configuring Product Lists

Applies to: SuiteCommerce | SuiteCommerce Advanced

See the following help topics to configure product lists:

- [Configuring Predefined Templates](#)
- [Configuring Item Display Options](#)

Note: Only the default predefined list, My List, is automatically translated. If you add more predefined lists, be sure to update the translation files as needed. Custom lists created by users aren't translated. For detailed information about translation see the help topic [Localization](#).

Configuring Predefined Templates

Applies to: SuiteCommerce | SuiteCommerce Advanced

Depending on which SuiteCommerce Advanced (SCA) version you're using, perform the following procedures to configure predefined templates. For information about configuring properties for all SCA versions, see the help topic [Wishlist Subtab](#).

To add predefined templates:

1. Go to Commerce > Websites > Configuration.
2. Select your website and domain, then click **Configure**.
3. In the configuration record, go to the **Shopping** tab and the **Wishlist** subtab.
4. Set properties you need.
5. Click **Save**

To add predefined templates (pre-Vinson):

1. In the SC.Configuration.MyAccount.js file, duplicate the list_templates function and rename the list.
2. Add predefined templates.

```

1  , product_lists: {
2
3      additionEnabled: true
4      , loginRequired: true
5      , list_templates: [
6          {
7              'templateid': '1'
8              , 'name': 'My List'
9              , 'description': 'sample predefined template'
10             , 'scope': {
11                 'id': '2'
12                 , 'name': 'private'
13             }
14         }
15     ]

```

```

16 , {
17     'templateid': '1'
18     , 'name': 'New List'
19     , 'description': 'new sample predefined template'
20     , 'scope': {
21         'id': '2'
22         , 'name': 'private'
23     }
24 }
25 ]
26 ]

```

Configuring Item Display Options

Applies to: SuiteCommerce | SuiteCommerce Advanced

Depending on which SuiteCommerce Advanced (SCA) version you're using, perform the following procedures to configure item display options. For information about configuring properties for all SCA versions, see the help topic [Wishlist Subtab](#).

To configure display options:

1. Go to Commerce > Websites > Configuration.
2. Select your website and domain and click **Configure**.
3. In the configuration record, go to the **Shopping** tab and the **Wishlist** subtab.
4. Set properties you need.
5. Click **Save**

To configure display options (pre-Vinson):

1. Create a custom module that includes SC.MyAccount.Configuration object as a dependency. See the help topic [Configure Properties](#) for details.

Note: Do not edit the original SC.MyAccount.Configuration.js source file. See the help topic [Develop Your SCA Customization](#) for information and best practices on customizing JavaScript.

2. Redefine the product_lists_templates array in the custom module. For details on these properties, see the help topic [Display Modalities for Product List Items](#).

The following example shows a possible configuration.

```

1 , product_lists_templates: [
2   {id: 'list', name: 'List', columns: 1, icon: 'list-header-view-icon-list', isDefault: true}
3   , {id: 'condensed', name: 'Condensed', columns: 1, icon: 'list-header-view-icon-condensed'}
4 ]

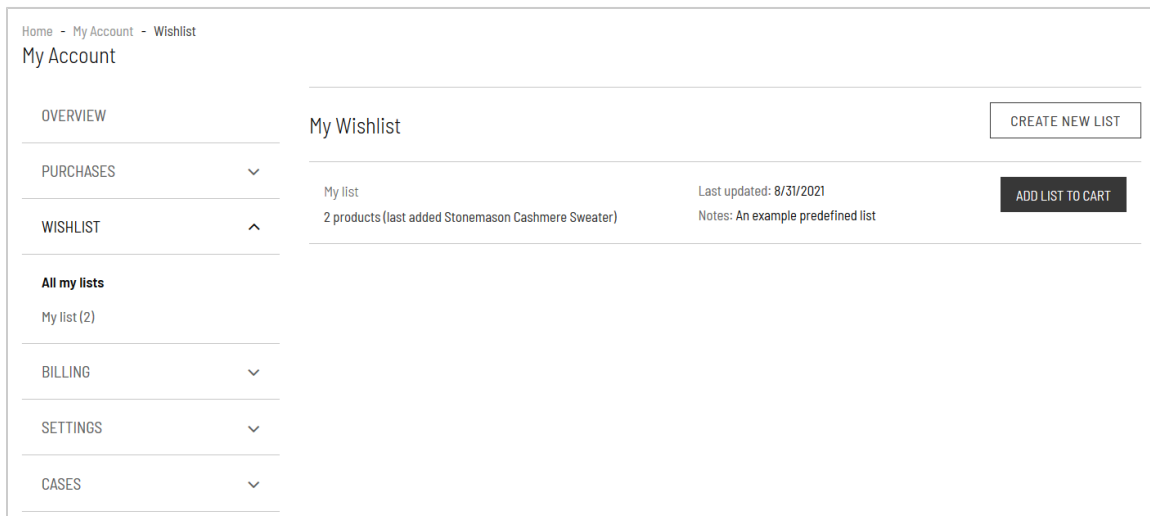

```

Product Lists Customer Experience

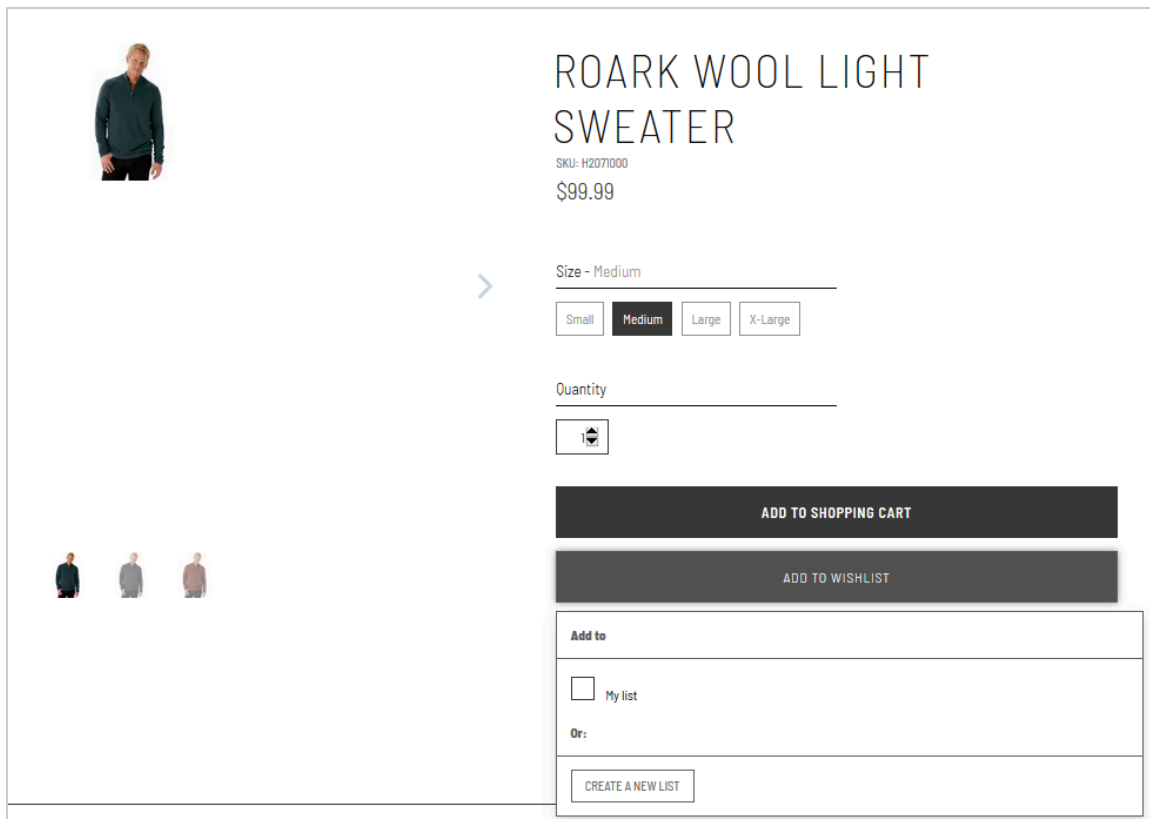

Applies to: SuiteCommerce | SuiteCommerce Advanced

After logging in to their account, customers can access and create product or wishlists by clicking **All my lists** under the **WishList** menu on the navigation bar. On the **My Wishlist** page, customers can click **Create New List** to make a new list.

The following screenshot shows a customer account with an associated Wishlist:

The following screenshot shows how customers can also create product lists by clicking **Add to Wishlist** on the item's Product Detail page. They can add the item to the predefined list, **My list**, or create a new list for the item.

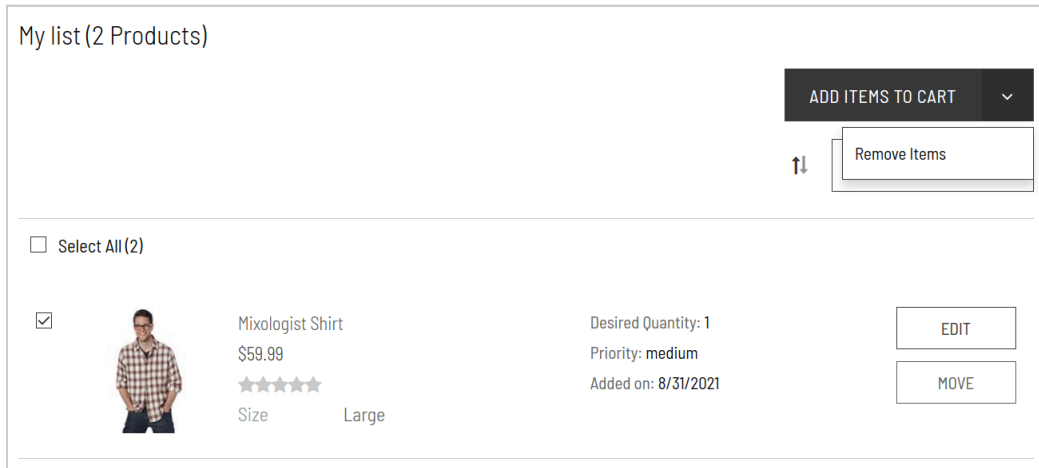

Customers can view their lists from their account page, and they can perform any of the following actions on items in their lists:

- **Edit** — Customers can change the size, quantity, and priority. Priority controls where the item appears in the list. Customers can also add notes or descriptions to better organize their items.

- **Move** — Customers can move items to other lists.
- **Add Items to Cart** — Customers can add items to their carts and proceed to checkout.
- **Remove** — Customers can take items off the list.

To remove items, customers check the box next to the item they want to remove, click the down arrow next to **Add Items to Cart**, and then click **Remove Items**, as shown in the following screenshot:

Support Cases for Commerce

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced

This topic explains how to enable the Support Cases feature for your Commerce website. With the Support Cases feature, users can create and track cases on a dedicated page. Logged-in users access their support cases in the My Account area of your website, under **Cases**.

The following topics provide more information about the Support Cases feature:

- [Enable Commerce Support Cases](#)
- [Configure Commerce Support Cases Properties](#)
- [Grant Shoppers Access to Commerce Support Cases](#)
- [Commerce Support Cases User Experience](#)

For more information about general NetSuite Support Case setup, see the help topic [Support Case](#).

Enable Commerce Support Cases

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced

To let your customers use support cases, make sure the Customer Support and Service feature is enabled for your account.

To enable the Customer Support and Service feature:

1. In NetSuite, go to Settings > Company > Enable Features.
2. Go to the **CRM** tab.
3. In the Basic Features area, check the **Customer Support and Service** box.
4. Click **Save**.

After enabling the Customer Support and Service feature, you need to configure support case values. See [Configure Commerce Support Cases Properties](#).

Configure Commerce Support Cases Properties

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced

To set up support case properties, enter values for:

- **Status Start ID** – This is the NetSuite status that indicates a case has started.
- **Status Close ID** – This is the NetSuite status that indicates a case has been closed.
- **Origin ID** – This is the internal ID of the origin where the case was first created.

To configure Support Cases Properties:

1. In NetSuite, go to Commerce > Websites > Configuration.
2. Select your website and domain and click **Configure**.
3. Go to the **My Account** tab and the **Cases** subtab.
4. Set values for the following fields, as required:

- **Status Start ID**
 - 1 – Not Started
 - 2 – In Progress
 - 3 – Escalated
 - 4 – Re-opened
 - 5 – Closed

- **Status Close ID**
 - 1 – Not Started
 - 2 – In Progress
 - 3 – Escalated
 - 4 – Re-opened
 - 5 – Closed

- **Origin ID**

For more information, see the help topic [Support Case Origin](#).

5. Click **Save**.

See the following configuration reference topics for information about each of these settings:

- [Status Start ID](#)
- [Status Close ID](#)
- [Origin ID](#)

Grant Shoppers Access to Commerce Support Cases

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced

To let shoppers access support cases in the My Account area of your Commerce website, give their role permission to view cases.

To grant shoppers access to support cases:

1. In NetSuite, go to Setup > Users/Roles > Manage Roles.
2. Click **Customize** next to the role you want to grant support case access.
3. Go to the **Permissions** tab and the **Lists** subtab.
4. Add the Cases permission with Edit level.
5. Click **Save**.

To remove shoppers access to support cases:

1. In NetSuite, go to Setup > Users/Roles > Manage Roles.
2. Click **Customize** next to the role you want to grant support case access.
3. Go to the **Permissions** tab and the **Lists** subtab.
4. Delete the Cases permission with Edit level.
5. Click **Save**.

Commerce Support Cases User Experience

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced

The sample My Account page below shows a typical support case experience. The Support Cases list page lets users view basic information about their cases including Case Number, Subject, Creation Date, Last Message date, and Status.

Home > My Account > Support Cases

Transaction Lists

i Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced

The Transaction Lists feature lets you set up how you show past transaction information in the My Account area of your Commerce website.

You can set up the following transaction lists to include specific fields as columns. You can also add custom fields and choose the display order for each column.

- Returns
- Quotes
- Order History
- Open Invoices
- Paid Invoices

i Note: Invoices pending approval don't show up in the My Account area when the Approval Routing feature is turned on.

See the following topics for helpful information about Transaction Lists.

- [Configure Transaction Columns](#)
- [Transactions and Advanced Employee Permissions](#)

Configure Transaction Columns

i Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced

You configure transaction columns in the SuiteCommerce Configuration record.

To configure transaction columns:

1. Go to Commerce > Websites > Configuration.
2. From the **Select Website** list, choose the site you want to set up.
3. From the **Select Domain** list, select the domain you want to set up.
4. Click **Configure**.
5. Click on the **My Account** tab and the **Transaction List Columns** subtab.
6. Enable each type of transaction list you want to set up. You can choose from the following:
 - Return Authorization Columns
 - Quotes Columns
 - Order History Columns
 - Invoice Columns

⚠ Important: If you enable column management for a list, the settings on the **Transaction List Columns** subtab override any other configuration. For example, if you're integrating SCIS with your site and turn on column management, your My Account transaction columns follow these settings. To retroactively add any columns from your SCIS integration, you'll need to create them manually.

7. In NetSuite, go to Commerce > Websites > Configuration and choose the site and domain you want to configure.

8. Go to the **My Account** tab and **Transaction List Columns** subtab, then add a line for each field you want to show as a column on your site.

The list order determines how columns display on your domain (top-to-bottom, left-to-right), as shown in the example below.

Note: Some columns, like the **Purchase No.** can't be configured.

Transaction list columns order history

ID	Label
trandate	Date
amount	Amount
status	Status

Purchase History

From to

Purchase No.	Date	Amount	Order Status
122841	3/13/2019	\$49.99	Pending Approval

9. Set up the **Transaction List Columns** table for each list you enabled:
 - a. Add a valid field to the ID property. This property must match the **Field ID** of the field you want to display.
 - b. Add the label you want to display for this field to the Label property.

Tip: Refer to the following Record Browser pages. On each page below, scroll to the **Search Columns** area for a list of valid fields and their IDs.

- Sales Order-related fields
- Invoice-related fields
- Quote-related fields (Estimate record)

For more information about these configuration properties, see the help topic [Transaction List Columns Subtab](#).

Transactions and Advanced Employee Permissions

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced

If you've enabled the Advanced Employee Permissions feature, your customers might not be able to view their transaction information in the My Account area of your Commerce website.

 **Note:** To confirm if Advanced Employee Permissions have been enabled, go to Setup > Company > Enable Features. Go to the Employees tab and the Permissions area. If enabled, the **Advanced Employee Permissions** box will be checked.

 **Note:** When the Advanced Employee Permissions feature is enabled, your customer must be assigned a custom Customer Center Role. See the Account Administration topic [Customizing the Customer Center Role](#).

Follow the steps in the Employee Management help topic, [Setting Employee Access for Advanced Employee Permissions](#), to set access for advanced employee permissions. However, to let Commerce website customers view their My Account transactions, you must perform these extra steps:

- Select **Employee Self** from the **Permission** list.
- Select **View** from the **Level** list.
- Select **Active and Non-Terminated** from the **Restrictions** list.

Subscriptions for Commerce Websites

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced

Subscriptions for Commerce websites applies to SuiteCommerce MyAccount, SuiteCommerce, and the 2021.1 release of SuiteCommerce Advanced and later. This feature lets website users view and manage their existing SuiteBilling subscriptions right from your website. Users can perform many of the subscription management tasks previously handled by company employees.

Users can also view and manage non-inventory items.

Note: This feature requires that the SuiteBilling feature be enabled. See the help topic [SuiteBilling](#).

Website users access their My Subscriptions page by logging in to their account and clicking **Subscriptions**. On the My Subscriptions page, users can view basic information about their subscriptions. They can click on a subscription to view more details on the Subscription Detail page.

The following topics provide helpful information about subscriptions for Commerce websites:

- [Setup and Configure Subscriptions for Commerce Websites](#)
- [How Subscriptions for Commerce Websites Works](#)
- [Subscriptions for Commerce Websites User Experience](#)

Setup and Configure Subscriptions for Commerce Websites

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced

Subscriptions for Commerce websites integrates with NetSuite's SuiteBilling feature. First, you'll need to set up SuiteBilling to create subscription plans, price books, price plans, and billing accounts. After you've set up SuiteBilling, you can configure several key options. These options let you control what users can change through your website.

Watch the following help video for information about setting up Subscriptions for Commerce websites:

 [Setting Up SuiteBilling Subscriptions for Commerce Websites](#)

The following topics provide helpful information about setting up and configuring Subscriptions for Commerce websites:

- [Set Up Subscriptions for Commerce Websites](#)
- [Configure Subscriptions for Commerce Websites](#)

Set Up Subscriptions for Commerce Websites

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced

This topic shows you how to set up subscriptions for Commerce websites.

To set up subscriptions for SuiteCommerce websites:

1. If you haven't set up SuiteBilling for your account, go to [SuiteBilling Setup](#) and follow the steps to set up subscriptions.

When you're prompted to create a subscription plan, be sure to enable the **Display in Web Store** option on the Lists > Accounting > Items > Edit Item > Web Store tab. See the help topic [Creating Items for Subscription Plans](#).

2. Configure subscription options in the configuration record.

This step is optional, but it lets you control key parts of what users can manage for their subscriptions. See [Configure Subscriptions for Commerce Websites](#).

To allow users to manage non-inventory items:

1. Go to Lists > Accounting > Items and click **Edit** for each item you want to make available.
2. On the **Preferences** subtab, check the **Can be Fulfilled/Received** box.
3. Click **Save**.

See the help topic [Advanced Billing and Advanced Shipping](#) for more details.

Configure Subscriptions for Commerce Websites

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced

This topic shows you how to set up subscription options in the SuiteCommerce Configuration record. See the help topic [Configuration Properties Reference](#). Subscription configuration options let you control what users can change on your website.

To configure subscription options:

1. In NetSuite, go to Commerce > Websites > Configuration.
2. Select your website and domain and click **Configure**.
3. Go to the **My Account** tab and the **Subscriptions** subtab.
4. Select a **Subscription Line Status Change** option. Options include:
 - **Allow Suspending/Resuming** — The user can suspend and resume a subscription line item.
 - **Allow Cancellations** — The user can cancel a subscription line item.
 - **Don't Allow Status Changes** — The user cannot change the status of a subscription line item.
5. Check or clear the **Allow the User to Cancel/Suspend Required Lines** box.
This lets you choose if users can cancel or suspend required subscription lines.
6. Select a **Subscription General Status Change** option. Options include:
 - **Allow Suspending/Resuming** — The user can suspend and resume a subscription.
 - **Allow Cancellations** — The user can cancel a subscription.
 - **Don't Allow Status Changes** — The user cannot change the status of a subscription.
7. Check or clear the **Disallow the User to Upgrade Quantity** box.
This lets you choose if users can increase the quantity of a subscription line item.
8. Check or clear the **Disallow the User to Downgrade Quantity** box.
This lets you choose if users can decrease the quantity of a subscription line item.

9. Click **Save**.

You set up these properties on the **My Account** tab, **Subscriptions** subtab. See the help topic [Subscriptions Subtab](#) for details.

- [Subscription Line Status Change](#)
- [Allow the User to Cancel/Suspend Required Lines](#)
- [Subscription General Status Change](#)
- [Disallow the User to Upgrade Quantity](#)
- [Disallow the User to Downgrade Quantity](#)

How Subscriptions for Commerce Websites Works

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced

The following topics provide helpful information about how subscriptions work on Commerce websites:

- [Subscription Status](#)
- [Subscription Pricing Models and Modifiers](#)
- [Subscription Date Visibility](#)

Subscription Status

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced

Subscription status labels provide a high-level overview of the status of subscriptions and related line items. Examples of values include Active, Suspending, Suspended, Canceling, Canceled, Closing, Closed, and others, as needed, to indicate the overall status of a subscription.

When a subscription add-on's status changes, its label changes too, but the main subscription's label doesn't change.

The Commerce web store displays status labels that might be different from the ones in the NetSuite SuiteBilling interface.

The following table shows the differences between the status labels in NetSuite and the ones your customers see in your Commerce web store.

Subscriptions

NetSuite Status	Commerce Web Store Status	Subscription Condition	Status Display Duration
Active	Active	The subscription is active.	This status displays until a user action triggers a change in the subscription state.
Active	Suspending	The subscription is active but is pending suspension.	This status displays until the end of the current day.
Active	Canceling	The subscription is active but the subscription or add-on was canceled and the user can not reactivate.	This status displays until the end of the current day.

Suspended	Suspended	The subscription is canceled and the user can reactivate.	This status displays until a user action triggers a change in the subscription state.
Suspended	Canceled	The subscription or add-on was canceled and the user can not reactivate.	This status displays indefinitely.
Suspended	Closing subscription	A change order to close the subscription is in process.	This status displays until the end of the current day.
Suspended	Reactivating	An activate change order is in process.	This status displays until the end of the current day.
Terminated	Closed	The subscription is closed.	This status displays indefinitely.
Closed	Closed	The subscription is closed (used primarily for one-time add-ons).	This status displays indefinitely.

The following table shows the differences between the Subscription Lines status labels in NetSuite and the ones your customers see in your Commerce web store.

Subscription Lines

NetSuite Status	Commerce Web Store Status	Subscription Line Condition	Status Display Duration
Active	Pending activation	The add-on is purchased but has not been activated.	This status displays until the end of the current day.
Active	Active	The subscription line or add-on is active.	This status displays until a user action triggers a change in the subscription state.
Active	Suspending	The add-on is active with a pending suspend status.	This status displays until the end of the current day.
Active	Canceling	The subscription line or add-on is active with a pending suspend status and the user can not reactivate.	This status displays until the end of the current day.
Active	Changing quantity	The subscription line or add-on is active and the user is changing quantity.	This status displays until the end of the current day.
Suspended	Suspended	The subscription line or add-on is suspended.	This status displays until a user action triggers a change in the subscription state.
Suspended	Canceled	The subscription line or add-on was canceled and the user can not reactivate.	This status displays indefinitely.
Suspended	Closing	The subscription line or add-on is suspended with a pending closure status.	This status displays until the end of the current day.
Activate	Reactivating	The subscription line or add-on is suspended with a pending activate status.	This status displays until the end of the current day.
Terminated	Closed	The subscription line or add-on is closed.	This status displays indefinitely.

Closed	Closed	The subscription line or add-on is closed. This is normally used for one-time add-ons.	This status displays indefinitely.

Subscription Pricing Models and Modifiers

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced

You can use pricing models and pricing modifiers when building your pricing strategy in NetSuite SuiteBilling.

See the following topics for information about structuring your pricing:

- [Subscription Pricing Models](#)
- [Subscription Pricing Modifiers](#)

Note: See the SuiteBilling help topic [Creating Price Plans](#) for information about how to create price plans using SuiteBilling.

Subscription Pricing Models

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced

Pricing models let you set prices based on how many items you sell. No matter which model you use, Commerce web stores show the total price on the page.

Subscriptions provide two pricing models:

- [Tiered Pricing](#)
- [Volume Pricing](#)

The differences between these two models are explained below, using the same number of items to show how each one affects the total cost.

Tiered Pricing

With tiered pricing, each item is billed based on its price tier, no matter how many items are sold. Don't mix different types of tiers on the same subscription line. The subscription line details page only displays the minimum of the first tier and the maximum of the last tier. The subscription line summary displays intermediate tiers. It's best not to set minimums or maximums on the intermediate tiers.

Tiered Pricing Example

Tier	Item Count	Cost per Item
Tier 1	1 - 10	\$3.00
Tier 2	11 - 20	\$2.80
Tier 3	Over 20	\$2.50

In this example, the account has three pricing tiers and the customer is buying 40 items.

- The first 10 items fall under Tier 1 and are charged \$3.00 each.

- The next 10 items (items 11–20) are in Tier 2 and cost \$2.80 each.
- The last 20 items (items 21–40) are in Tier 3 and cost \$2.50 each.

Therefore, the total for all 40 items is:

- 10 items at \$3.00/each = \$30.00
- 10 items at \$2.80/each = \$28.00
- 20 items at \$2.50/each = \$50.00
- Total of all items = \$108.00

Volume Pricing

With volume pricing, all items are billed at the same price based on how many a shopper orders. Minimum and maximums don't display for fixed subscription lines, and it's best not to set them.

Volume Pricing Example

Volume Level	Items Ordered	Cost per item at this volume level
Volume Level 1	1 - 10	\$3.00
Volume Level 2	11 - 20	\$2.80
Volume Level 3	Over 20	\$2.50

In this example, the customer buys 40 items, so Volume Level 3 applies. Each item costs \$2.50, for a total of \$100.00.

Subscription Pricing Modifiers

i Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced

Subscriptions for Commerce Websites provides two pricing modifiers:

- [Discount Pricing Modifiers](#)
- [Usage Pricing Modifiers](#)

You can combine these modifiers with different pricing models, like Tiered or Volume, to give your customers extra savings or volume discounts.

Subscriptions for Commerce websites supports the pricing model and modifier combinations shown below.

	Tiered Pricing Model	Volume Pricing Model	No Pricing Model
Discount Pricing Modifier	X	X	X
Usage Pricing Modifier			X

Discount Pricing Modifiers

Discount pricing modifiers take a percentage off the total purchase amount, based on the total net amount.

Example:

- Total Amount: \$95.00
- Discount: 10%
- Calculated value of the discount ($\$95.00 * 10\%$) = \$9.50
- Total amount after discounts ($\$95.00 - \9.50) = \$85.50

Usage Pricing Modifiers

Usage Pricing Modifiers don't change the total price directly, but they affect how the price shows up in Commerce websites. Since the total amount is based on how much a service is used, the total is not known prior to billing. For example, if you charge \$5.00 per megabyte used per month, the total isn't known until the end of the month.

Subscription Date Visibility

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced

The Subscriptions website interface displays several dates users need to know to effectively manage their subscriptions:

- **Activation Date:** When the subscription first becomes available to the customer.
- **Last Billing Date:** When the customer was last billed for the subscription.
- **Next Billing Date:** When the customer will get their next bill for the subscription.
- **Renewal:** When the subscription was last renewed.
- **Added:** When the add-on was added to the subscription.

Subscriptions for Commerce Websites User Experience

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced

Website users can:

- View the status and details of their current subscriptions, including:
 - Subscription plan name
 - Activation date
 - Last billing date
 - Next billing date
 - Renewal date
 - Subscription status
- View optional add-ons available for their subscriptions.

Add-on lines are options added to the plan but not included when the subscription started.
- See which add-ons are currently active in their subscriptions.
- View add-on details like service description, quantity, cost summary, and pricing information.
- Cancel or pause subscription line items and add-ons.

You can set up these options in your subscription configuration record. See [Configure Subscriptions for Commerce Websites](#).

- Change the quantity of optional add-on items.

You can set up these options in your subscription configuration record. See [Configure Subscriptions for Commerce Websites](#).

- Pause and restart a subscription.

You can set up these options in your subscription configuration record. See [Configure Subscriptions for Commerce Websites](#).

- Cancel or pause a subscription.

You can set up these options in your subscription configuration record. See [Configure Subscriptions for Commerce Websites](#).

Users can also filter their subscription list by billing account. See the following sample My Subscriptions page:

Save for Later

Applies to: SuiteCommerce | SuiteCommerce Advanced

Using the Save for Later feature, users can move items from the Cart to a list for later reference and then add items from the Save for Later list directly to the Cart.

Note: The Save for Later feature is built on the same architecture as Product Lists.

Save for Later provides the following functionality:

- Items in the Save for Later list are restored with each login session.
- By default, users can change the quantities in the Save for Later list.
- When an item in a Save for Later list goes out of stock, shoppers can't add it to their cart and they'll see an out of stock message.
- If a shopper isn't logged in, they'll be sent to the Login page when they click **Save for Later** on an item in their cart

Save for Later Prerequisites

Applies to: SuiteCommerce | SuiteCommerce Advanced

The following are prerequisites for using Save for Later on your site:

- **Installed Reference Product Lists Records bundle:** By default the Save For Later module is enabled but you must have the Reference Product Lists Records bundle installed in your account for the feature to work correctly. This bundle installs the custom records used to store and manage items in Save for Later lists for each logged in user. Note that a Save for Later list is a type of Product List, so we leverage the same custom records used for Product Lists. For details on using the Reference Product List Records, see [Product List Custom Records](#).
- **Login:** Before shoppers can move an Item to the Save For Later list, they are prompted to log in.

Save for Later Configuration Options

Applies to: SuiteCommerce | SuiteCommerce Advanced

The correct configuration procedure depends on which version of SuiteCommerce Advanced you're using.

To configure a Product List as Save for Later:

1. Select the domain to configure at Commerce > Websites > Configuration.
2. In the SuiteCommerce Configuration record, go to the **Shopping** tab and the **Wishlist** subtab.
3. To create a list as Save for Later, enter 2 for the **Type ID**. Set the remaining fields as desired. For more information, see the help topic [List Templates](#).

By default, a **Save for Later** template is defined within the `product_lists` object in the backend configuration file.

To configure a Product List as Save for Later (pre-Vinson):

1. Create a custom module that includes the backend Configuration object as a dependency.

Note: Don't edit the original `Configuration.js` source file. See the help topic [Develop Your SCA Customization](#) for information and best practices on customizing JavaScript.

2. Modify the description and name parameters as desired.

You'll need to set the Type ID to 2 for the list to work as a Save for Later list.

```

1 | {
2 |   templateid: '2'
3 |   , name: 'Saved for Later'
4 |   , description: 'This is for the cart saved for later items'
5 |   , scope: {
6 |     id: '2'
7 |     , name: 'private'
8 |   }
9 |   , type: {
10 |    id: '2'
11 |    , name: 'later'
12 |   }
13 | }
```

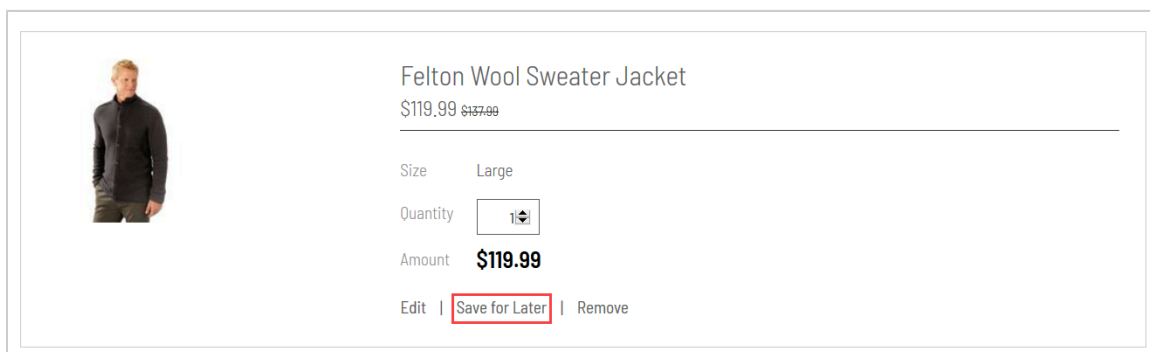

3. Save and deploy to your site.

Save for Later Customer Experience

Applies to: SuiteCommerce | SuiteCommerce Advanced

Registered users can choose to remove items from the Cart to a Save for Later product list.

The following screenshot shows how customers can create a Save for Later product list by clicking **Save for Later** on individual items in the Shopping Cart.

Items added to the Save for Later product list remain in the cart, below the items the shopper is buying.

The following screenshot shows the appearance of the Shopping Cart with a Save for Later product list.

Quotes for Commerce Websites

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced

The Quotes for Commerce websites feature lets your customers request quotes online. Customers can search for and add items, enter shipping information, and leave comments to build a quote request. See [Quotes for Commerce Websites User Experience](#) for more information.

The following topics provide helpful information about Quotes for Commerce websites:

- [Set up Quotes in NetSuite](#)
- [Configure Quotes Properties](#)
- [Quotes for Commerce Websites User Experience](#)

More Information

Before setting up Quotes for Commerce websites, be aware that:

- Quotes for Commerce websites applies to SuiteCommerce MyAccount (SCMA), SuiteCommerce (SC), and the Mont Blanc release of SuiteCommerce Advanced (SCA) and later.
- In NetSuite, the terms “estimates” and “quotes” are used interchangeably.
If you're an Administrator, you can change record and transaction names from the NetSuite defaults to ones that fit your company's terminology. For example, you can rename the Estimate transaction to Quote. See the Account Administration topic [Change Record and Transaction Names](#) for instructions.
- You need to give your customers permission to request a quote. If they don't have permission, they'll be prompted to contact the merchant. See [Give Customers Permission to Request and View Quotes](#).
- Only customers can request a quote. Leads and prospects can't use this feature.
- The **Add to Quote** button is displayed on the Product Details Page (PDP) regardless of whether you have given your customers permission to request a quote.
If a customer doesn't have permission to request a quote, after they click the **Add to Quote** button, a warning message is displayed.
If a customer does have permission to request a quote, after they click the **Add to Quote** button, the product is added to a quote.
- SuiteCommerce lets customers create a quote and make purchases from a quote, but Site Builder Premium only lets customers make purchases from a quote.
- Customers can only buy from a quote after it reaches a certain status in the Estimate/Quote record. See [Set the Customer Status Internal ID](#).
- Customers need to add their default shipping and billing addresses before they request a quote. They can do this in the My Account area of your website.
- The Quotes for Commerce websites feature is not compatible with the following features:
 - Site Builder Basic
 - Subsidiaries
 - Multiple Ship To
 - Gift Certificates
- Customers can add items to a quote regardless of the item's out of stock behavior.
- Parent matrix items cannot be added to a quote, only child items.

- If you want to send customers an email after they submit a quote, you'll need to set this up in NetSuite as a Workflow Action (see the help topic [Creating an Action](#)) or as a User Event Script (see the help topic [User Event Scripts](#)).
- After submitting a quote request, customers can't add or remove items from the quote, or update an item's quantity on the Request a Quote page.
- Handling costs aren't displayed in the quote summary total. They're added to the order total after the quote becomes a purchase.
- Credit card payment is validated when the sales order is processed within the UI, not when a customer makes a purchase from a quote.

Set up Quotes in NetSuite

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced

Perform the following setup tasks in NetSuite to enable Quotes on your Commerce website:

- [Give Customers Permission to Request and View Quotes](#)
- [Confirm Item Searcher Fields are Defined](#)
- [Set Up Search Fields for Quotes](#)
- [Customize the Standard Quote Form to Display the Shipping Address](#)
- [Enable Online Ordering and Customer Access Features](#)

Note: You should install the latest Reference Product List Records bundle. This bundle includes the custom records used to store and manage quote items for each logged-in customer. See the help topic [Install Your Commerce Website Applications](#) for details on installing bundles.

Quotes for Commerce websites works without the Reference Product List Records bundle installed. However, installing this bundle ensures that product list items are persistent and won't be lost if the customer leaves the site before submitting a quote. Shipping information and comments aren't persistent, regardless of bundle installation.

Give Customers Permission to Request and View Quotes

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced

Edit the Customer Center role in NetSuite so your customers can request a quote and view their submitted quotes.

To edit the Customer Center role permissions for Quotes:

1. Go to Setup > Users/Roles > Manage Roles.
2. Click **Customize** next to the Customer Center role.
3. Go to the **Permissions** tab and the **Transactions** subtab.
4. Change the level of access for the **Estimate/Quote** permission to **Create**.
5. Click **OK** to accept the change.
6. Click **Save**.

7. Give your customers access to the Customer Center role so they can view quotes. See the Account Setup help topic [Giving Customers Access](#) for instructions.

See the Account Setup help topic [Setting Permissions](#) for detailed information about setting the level of access for a permission.

After a customer submits a quote request, NetSuite creates an Estimate/Quote record.

Confirm Item Searcher Fields are Defined

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced

You need to make certain Item Searcher field sets visible on your Commerce website so the Quotes feature works properly.

Important: The Quotes feature needs Item Searcher fields, which you add to existing field sets. Don't replace any established fields with these fields. See [Define Field Sets](#) for detailed information about field sets.

To confirm Item Searcher fields are defined:

1. Go to Commerce > Websites > Website List.
2. Click **Edit** next to your website.
3. Go to the **Field Sets** tab.
4. Confirm Item Searcher fields are in place as defined in the following table.
5. If any Item Searcher fields are missing, add them to the field set as shown in the following table:

Name	Field Set ID	Fields to be Added to Field Set
Items Searcher	itemssearcher	itemimages_detail: Item Images (Detail) displayname: Display Name itemid: Name storedisplayname2: Store Display Name 2 urlcomponent: URL Component custitem_ns_pr_count: Product Reviews Count (Custom) custitem_ns_pr_rating: Product Reviews Rating (Custom) minimumquantity: Minimum Quantity itemoptions_detail: Item Options (Detail) matrixchilditems_detail : Matrix Child Items (Detail) instock: In Stock showoutofstockmessage: Display Out-of-Stock Message outofstockmessage: Out of Stock Message onlinecustomerprice_detail: Price for Current Customer (Detail) pricelevel1: Retail pricelevel1_ formatted : Retail (Formatted) itemtype: Type ispurchasable: Available for Purchase

6. Click **Save**.

Set Up Search Fields for Quotes

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced

Set up specific search fields in NetSuite so customers can search your site by Item Name or Stock Keeping Unit (SKU).

Note: This step is required for a search to work, even if customers don't search by SKU.

To set up Search Fields for Quotes:

1. Go to Commerce > Websites > Website List.
2. Click **Edit** next to your website.
3. Go to the **Search Index** tab and the **Search Fields** subtab.
4. Add these Search Fields and Type of Match in the order shown in the following table:

Search Field	Type of Match
Name	Starts With
Name	Exact
Name	Keyword

See [Select and Configure Search Fields](#) for detailed information about Search Fields.

Customize the Standard Quote Form to Display the Shipping Address

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced

Commerce websites use NetSuite's Estimate/Quote record to manage quotes. To view Estimate/Quote records, go to Transactions > Sales > Prepare Quotes > Lists. Select Default from the **View** list to view all Estimate/Quote records.

An Estimate/Quote record uses the Standard Quote form, which doesn't display shipping information by default. Customize the Standard Quote form so customers can perform the following actions:

- View and edit the shipping address.
- Make a purchase from a quote.

To customize the Standard Quote Form:

1. Go to Customization > Forms > Transaction Forms.
2. Click **Customize** next to the **Standard Estimate/Quote** form.
3. Go to the **Screen Fields** tab and the **Shipping** subtab.
4. Complete the following steps in the **Ship To** row:
 - Check the box in the **Show** column.
 - Select **Shipping Address** from the **Field Group** list.
5. Click **Save**.

Enable Online Ordering and Customer Access Features

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced

Make sure that the Online Ordering and Customer Access features are enabled to let customers convert quotes to an order.

To enable Online Ordering and Customer Access features:

1. Go to Setup > Company > Enable Features.
2. Go to the **Web Presence** tab.
3. Under **Access**, check the **Online Ordering** and **Customer Access** boxes.
4. Click **Save**.

Note: If the Online Ordering and Customer Access features aren't enabled, customers won't see the **Review and Place Order** button in their quote records on your website.

After a customer makes a purchase from a quote, the quote is closed and NetSuite creates a Sales Order record linked to the original Estimate/Quote record.

Configure Quotes Properties

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced

You can set up the following properties for the Quotes feature:

- Quotes text displayed on your website. See [Customize Request a Quote Properties](#).
- Status that triggers functionality to let customers make purchases from a quote. See [Set the Customer Status Internal ID](#).
- The invoice form used to create a purchase from a quote. See [Define an Invoice Form](#).
- Time (in days) within which the Quote Expiration Notification appears on your website and the quote expires. See [Set Quote Expiration](#).
- Sales representative information displayed on your website's Quote Details page. See [Customize Sales Representative Information](#).
- Functionality to let shoppers view quotes and make purchases without creating quotes directly from your website. See [Disable Quotes](#).

See the help topic [Quotes Subtab](#) for information about configurable properties.

Customize Request a Quote Properties

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced

You can set up the following Request a Quote properties for your website:

- Request a Quote Bottom Message
- Request a Quote Business Days
- Show the 'Request a Quote' Hyperlink

- Hyperlink Text

To customize the Request a Quote properties:

1. Go to Commerce > Websites > Configuration.
2. Select your website and domain and click **Configure**.
3. Go to the **My Account** tab and the **Quotes** subtab.
4. Configure the following properties as required:
 - **Request a Quote Bottom Message** - Enter a message to display to your logged-in customers after they click **Request a Quote**.
 - **Request A Quote Business Days** - Enter a message to tell your customers when a sales representative will contact them. For example: "A sales representative will contact you within two business days."
 - **Show 'Request a Quote' Hyperlink** - Check this box to display the **Request a Quote** link on your website.
 - **Hyperlink Text** - Enter the text you want to use for the **Request a Quote** link.
5. Click **Save**.

To customize the Request a Quote properties (SuiteCommerce Advanced pre-Vinson):

1. Create a custom module that includes the SC.MyAccount.Configuration object as a dependency. See the help topic [Create a Custom Module](#) for instructions.

Note: Don't edit the original RequestQuoteWizard.Configuration.js source file. See the help topic [Best Practices for Customizing SCA](#) for information and best practices for customizing JavaScript.

Note: This task requires developer experience.

2. Update the bottomMessage property in the custom module to match the text you want to display after a logged-in customer clicks **Request a Quote**.
3. Update the confirmationMessage property in the custom module to match the text you want to display to tell your customers when a sales representative will contact them.
4. To update the **Request a Quote** hyperlink text, you need to customize the template, requestquote_accesspoints_headerlink.tpl. See the help topic [Overview](#) for instructions on customizing SCA source code.
5. Refer to the SuiteCommerce Advanced pre-Vinson process in [Disable Quotes](#) to remove the **Request a Quote** hyperlink from your website.
6. Save and deploy to your site.

Set the Customer Status Internal ID

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced

Set up the Customer Status Internal ID so customers can make a purchase from a quote.

After a customer submits a quote request, links to the Review or Purchasing pages are turned off. This prevents customers from making a purchase from the quote before the merchant allows it.

In NetSuite, the Estimate/Quote record's **Status** field lists all available Customer Statuses for a quote. When the merchant manually changes this field to the Customer Status with an Internal ID matching the **Purchase Ready Status ID** field in your site configuration, all website links to the Review or Purchasing pages are enabled. The customer can then make a purchase.

Note: The **Customer Status List** displays the Internal IDs for all Customer Statuses set up in your account. The Customer Status you choose can't be a closed status. A closed status is one that indicates the customer either already purchased (100% probability) or won't purchase (0% probability). Open Estimate/Quote records can only be given open Customer Statuses. See the help topic [Customer Statuses](#) for information about creating a Customer Status.

Before you set the Customer Internal ID, keep in mind:

- The customer needs the right Customer Center role permissions. See [Give Customers Permission to Request and View Quotes](#).
- The customer needs a shipping address and method set up. See the Marketing topic [Setting Preferences on the Customer Record](#).
- The merchant must assign a sales representative to the quote. See [Customize Sales Representative Information](#).

The **Customer Status List** (Setup > Sales > Customer Statuses) displays the Customer Statuses configured for your account and their associated Internal IDs. You enter the Internal ID of the Customer Status in your site configuration.

Note: If you don't see the Internal ID in the **Customer Status List**, see the help topic [Setting the Internal ID Preference](#) for instructions to display internal ID values in the NetSuite UI.

See the following sample **Customer Status List**:

Customer Status List						
New Submit Refresh						
☒ Show Inactives						
Inactive	Internal ID	Customer Status	Stage	Probability	Description	Include In Lead Reports
☐	6	Unqualified	Lead	0		Yes
☐	14	Closed Lost	Prospect	0		
☐	9	Identified Decision Makers	Prospect	30		
☐	8	In Discussion	Prospect	20		
☐	11	In Negotiation	Prospect	75		
☐	10	Proposal	Prospect	50		
☐	12	Purchasing	Prospect	90		
☐	7	Qualified	Prospect	10		
☐	13	Closed Won	Customer	100		
☐	16	Lost Customer	Customer	0		
☐	15	Renewal	Customer	100		

Example

You want customers to be able to make a purchase from a quote when it reaches the **Qualified** Customer Status.

In NetSuite, you set up your account to include the **Qualified** Customer Status. Go to Setup > Sales > Customer Statuses and see that NetSuite has assigned an Internal ID of 7 for this status. You update the **Purchase Ready Status ID** field in your site configuration to 7.

After a customer creates a quote on your site, your sales team changes the associated Estimate/Quote record's **Status** field to **Qualified**. Now the **Purchase Ready Status ID** field matches the Customer Status record's Internal ID. The **Review and Place Order** button is enabled, and the customer can finish the purchase. After they place an order, the quote becomes a Sales Order record in NetSuite.

 **Note:** For detailed information about working with sales orders and customizing sales order forms, see the Order Management topic [Sales Orders](#).

To configure the Customer Status Internal ID:

1. Go to Setup > Sales > Customer Statuses.
2. Note the Customer Status Internal ID you want to use to let customers make purchases from quotes. You'll use this Internal ID to configure the **Purchase Ready Status ID** field in Step 6.
3. Go to Commerce > Websites > Configuration.
4. Select your website and domain and click **Configure**.
5. Go to the **My Account** tab and the **Quotes** subtab.
6. Enter the Customer Status Internal ID in the **Purchase Ready Status ID** field.

 **Important:** The value in the **Purchase Ready Status ID** field must match a valid Customer Status Internal ID as defined in NetSuite. If you leave it empty, quotes can't become purchases. By default, this field is set to 12, which matches the **Purchasing** Customer Status.

7. Click **Save**.

To configure the Customer Status Internal ID (SuiteCommerce Advanced pre-Vinson):

1. Go to Setup > Sales > Customer Statuses.
2. Note the Customer Status Internal ID you want to use to let customers make purchases from quotes. You will use this Internal ID to configure code in Step 4.
3. Create a custom module that includes the SC.MyAccount.Configuration object as a dependency. See the help topic [Create a Custom Module](#) for instructions.

 **Note:** Don't edit the original Configuration.js source file. See the help topic [Best Practices for Customizing SCA](#) for information and best practices for customizing JavaScript. This task requires developer experience.

4. Update the purchase_ready_status_id property in the custom module. Enter the value of the Customer Status record's Internal ID as noted in Step 2.
5. Save and deploy to your site. See the help topic [Deploy SCA Customizations to NetSuite](#) for more information.

Define an Invoice Form

 **Applies to:** SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced

Choose the invoice form you want to use when customers buy from a quote.

 **Important:** Without an invoice form, customers can't buy from a quote. See the Order Management topic [Sales Orders](#) for detailed information.

To define the invoice form:

1. Go to Customization > Forms > Transaction Forms.
2. Note the Internal ID of the Standard Sales Order - Invoice form. You'll use this Internal ID to configure the **Invoice Form ID field** in Step 6.

If the Internal ID isn't displayed in the **Custom Transaction Forms** list, see the help topic [Setting the Internal ID Preference](#) for instructions to display internal ID values in the NetSuite UI.

Note: It's best to use the Standard Sales Order – Invoice form. NetSuite can't guarantee what will happen if you use other custom forms.

3. Go to Commerce > Websites > Configuration.
4. Select your website and domain and click **Configure**.
5. Go to the **My Account** tab and the **Quotes** subtab.
6. Enter the Internal ID of the **Standard Sales Order - Invoice** in **Invoice Form ID**.
7. Click **Save**.

To define the invoice form (SuiteCommerce Advanced pre-Vinson):

1. Go to Customization > Forms > Transaction Forms.
2. Note the Internal ID of the Standard Sales Order - Invoice form. You will use this Internal ID to configure the **Invoice Form ID** field in Step 4.
3. Create a custom module that includes the SC.MyAccount.Configuration object as a dependency. See the help topic [Create a Custom Module](#) for instructions.

Note: Don't edit the original Configuration.js source file. See the help topic [Best Practices for Customizing SCA](#) for information and best practices for customizing JavaScript. This task requires developer experience.

4. Update the `invoice_form_id` property in the custom module to match the Internal ID of the **Standard Sales Order - Invoice** form as noted in Step 2.
5. Save and deploy to your site. See the help topic [Deploy SCA Customizations to NetSuite](#) for more information.

Set Quote Expiration

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced

Set how many days after a quote request is submitted you want quotes to stay valid. After that, the quote can't become a purchase, regardless of its status.

Example

You want quotes to stay valid for 14 days after a customer submits a request. You set the **Days to Expiration** field to 14. Any quote created on your site has 14 days to become a purchase. If a customer waits 15 days, they won't be able to buy from that quote.

To configure the quote's expiration:

1. Go to Commerce > Websites > Configuration.
2. Select your website and domain and click **Configure**.
3. Go to the **My Account** tab and the **Quotes** subtab.

4. In the **Days to Expiration** field, enter how many days until the quote expires.
If you enter a value of 0, the **Default Quote Expiration (In Days)** value in the Sales Preference record will set the quote expiration. To check this value, go to Setup > Sales > Sales Preferences.
5. In the **Days Before Expiration Notification** field, enter how many days before a quote expires you want to display an expiration notice on your website.
6. Click **Save**.

To configure the quote's expiration (SuiteCommerce Advanced pre-Vinson):

1. Create a custom module that includes the SC.MyAccount.Configuration object as a dependency. See the help topic [Create a Custom Module](#) for instructions.

 **Note:** Don't edit the original Configuration.js source file. See the help topic [Best Practices for Customizing SCA](#) for information and best practices for customizing JavaScript.
This task requires developer experience.

2. Update the days_to_expire property in the custom module to match the number of days before a quote expires.
3. Update the quote.daysToExpirationNotification property in the custom module to match the number of days before a quote expires when you want to display an expiration notification on your website.
4. Save and deploy to your site. See the help topic [Deploy SCA Customizations to NetSuite](#) for more information.

Customize Sales Representative Information

 **Applies to:** SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced

You can customize the sales representative information that appears on your website's Quote Details page. Information displayed on your site depends on the **Sales Rep** field in the quote's Estimate/Quote record in NetSuite.

Before you customize sales representative information, keep in mind:

- If the **Sales Rep** field lists a sales representative with contact information (phone number and email address) set up in NetSuite, that information appears on the Quote Details page.
- If the **Sales Rep** field lists a sales representative without contact information set up in NetSuite, your default customized sales representative contact information appears on the Quote Details page.
- If the **Sales Rep** field is blank, your site displays two disclaimer messages, one under the Order Summary (Disclaimer Summary message) and one at the bottom of the Quote Details page (Disclaimer message). You can customize these messages.

To view the **Sales Rep** field, go to Transactions > Sales > Prepare Quotes > Lists and click **View** next to the Estimate/Quote record you want.

To customize sales representative information:

1. Go to Commerce > Websites > Configuration.
2. Select your website and domain and click **Configure**.
3. Go to the **My Account** tab and the **Quotes** subtab.

4. Update the following fields:
 - **Default Phone for Sales Rep** - Enter the default sales representative's phone number. This phone number appears on the Quote Details page if a sales representative is assigned but doesn't have a phone number set up.
 - **Default Email for Sales Rep** - Enter the default sales representative's email address. This email address appears on the Quote Details page if a sales representative is assigned to the quote but doesn't have an email set up.
 - **Disclaimer** - Enter a disclaimer to appear at the bottom of the Quote Details page. This message appears if no sales representative is assigned to the quote.
 - **Disclaimer Summary** - Enter a disclaimer summary to display under the Order Summary area of the Quote Details page. This message appears if no sales representative is assigned to the quote.
5. Click **Save**.

To customize sales representative information (SuiteCommerce Advanced pre-Vinson):

1. Create a custom module that includes the `SC.MyAccount.Configuration` object as a dependency. See the help topic [Create a Custom Module](#) for instructions.

 **Note:** Don't edit the original `Configuration.js` source file. See the help topic [Best Practices for Customizing SCA](#) for information and best practices for customizing JavaScript. This task requires developer experience.

2. Configure the following properties in the custom module as required:
 - `defaultPhone`
 - `defaultEmail`
 - `disclaimer`
 - `disclaimerSummary`
3. Save and deploy to your site. See the help topic [Deploy SCA Customizations to NetSuite](#) for more information.

Disable Quotes

 **Applies to:** SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced

You can configure SuiteCommerce or SuiteCommerce Advanced to disable the Request a Quote functionality. This lets shoppers view quotes and make purchases without creating quotes on your site.

To disable the Request a Quote functionality:

1. Go to Commerce > Websites > Configuration.
2. Select your website and domain and click **Configure**.
3. Go to the **My Account** tab and the **Quotes** subtab.
4. Clear the **Show Request a Quote Hyperlink** box to remove the **Request a Quote** hyperlink from your website.
5. Click **Save**.
6. Go to Setup > Users/Roles > Manage Roles.

7. Click **Customize** next to the Customer Center role.
8. Go to the **Permissions** tab and the **Transactions** subtab.
9. Change the **Estimate/Quote** permission level to **View**.
10. Click **OK** to accept the change.
11. Click **Save**.

To disable the Request a Quote functionality (SuiteCommerce Advanced pre-Vinson):

1. Using code editor software, open the distribution file (distro.json) in the root directory of the SuiteCommerce Advanced source code.
2. See the help topic [The distro.json and ns.package.json Files](#) for information about the distribution file and its location.

Note: This task requires developer experience.

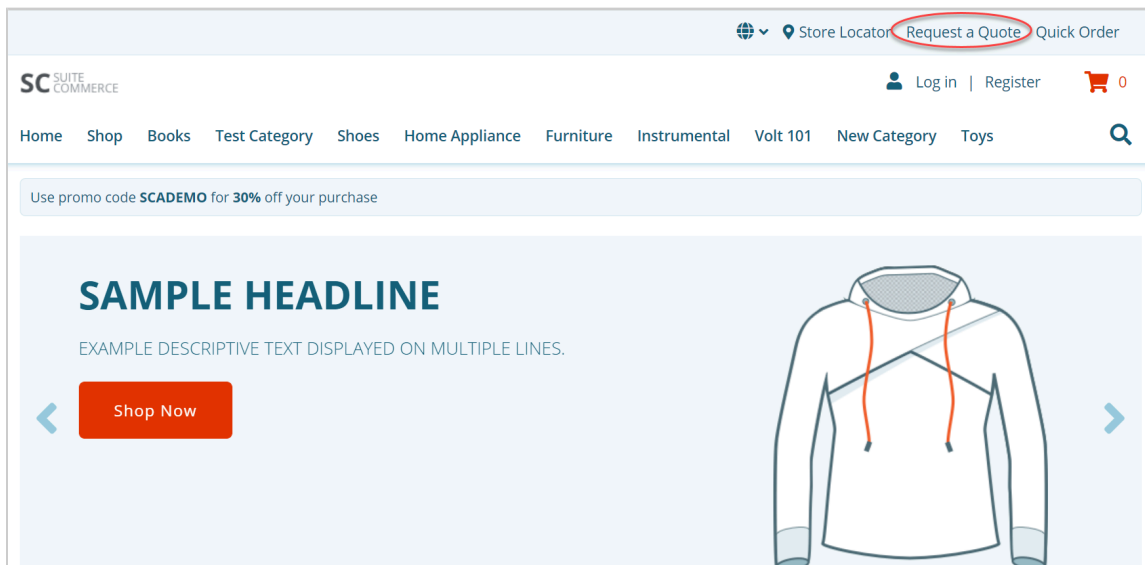

3. Delete (or disable within comment tags) any lines that include either of the following references:
 - RequestQuoteAccessPoints
 - RequestQuoteWizard
4. Save and redeploy the distro.json file to NetSuite. See the help topic [Deploy SCA Customizations to NetSuite](#) for instructions.

Quotes for Commerce Websites User Experience

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced

After you enable Quotes for Commerce websites, your customers, logged in or not, will see a **Request a Quote** link in your site's Shopping header.

See the following sample Commerce website with the **Request a Quote** link displayed in the Shopping header:

If customers aren't logged in, they'll be asked to log in after they click **Request a Quote**.

Note: Customers need permission to request a quote. See [Give Customers Permission to Request and View Quotes](#).

The **Request a Quote** link directs logged-in customers to a page where they can:

- Search for items and add them to a quote
- Enter, edit, and remove shipping information
- Add optional comments
- Submit the quote

See the following sample Request a Quote page:

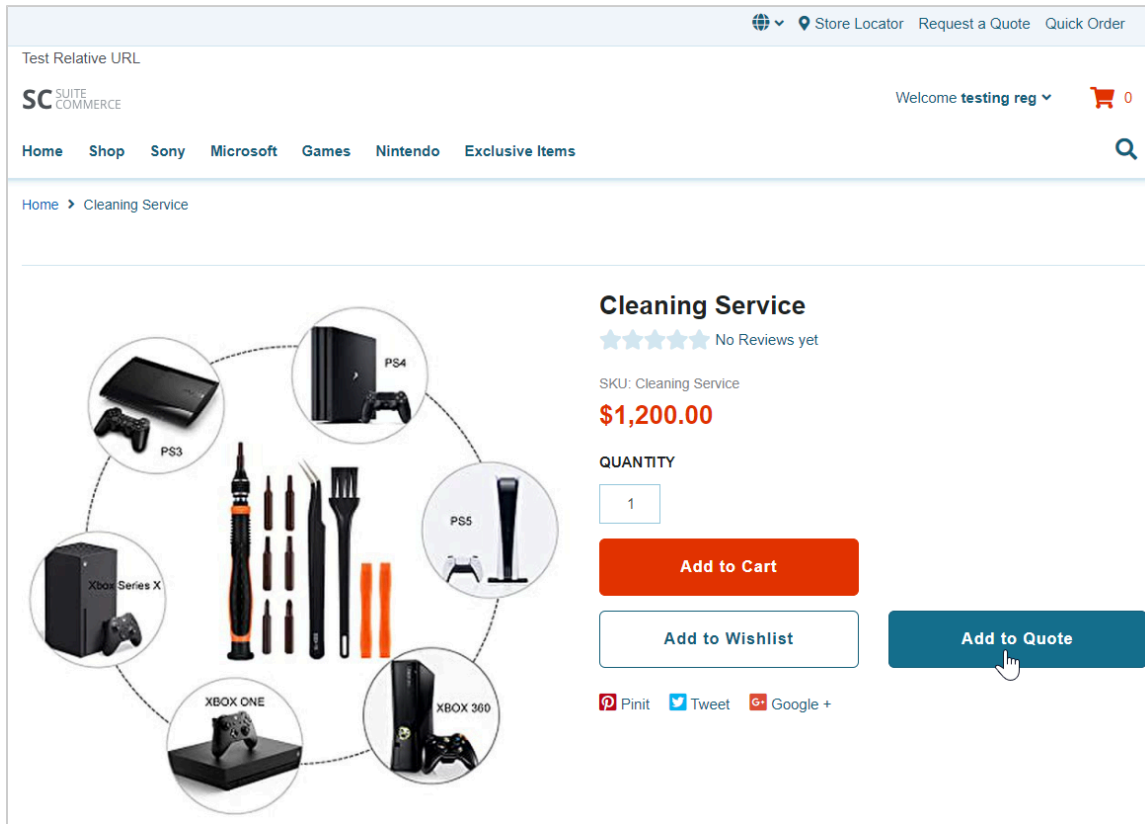

The screenshot shows a web page titled "Request a Quote" with the following elements:

- Header:** Navigation links (Home, Shop, Games, Nintendo, Exclusive Items, Sony, Microsoft), a search bar, and a "Request a Quote" link.
- Section Header:** "Request a Quote" with a sub-header "No Items Yet" and a "Submit Quote Request" button.
- Text:** "Once your quote has been submitted, a sales representative will contact you in **XX business days**. For immediate assistance call us at (000)XXX-XXXX or email us at xxx@xxxx.com"
- Add Items:** A section with a search bar "Which item(s) would you like to add?" and a "Quantity" field, followed by an "Add Item" button.
- Choose a Shipping Address:** A section with a "Selected" address (2955 Campus DR STE 100, San Mateo California 94403, United States, 099123123) and an "Add Address" button.
- Comments:** A section with a text area "Do you have any remarks or comments with this quote request? (Optional)" and a "Maximum 999 characters" limit.
- Footer:** A "Submit Quote Request" button and contact information.

After a customer submits a quote request, the following updates take place:

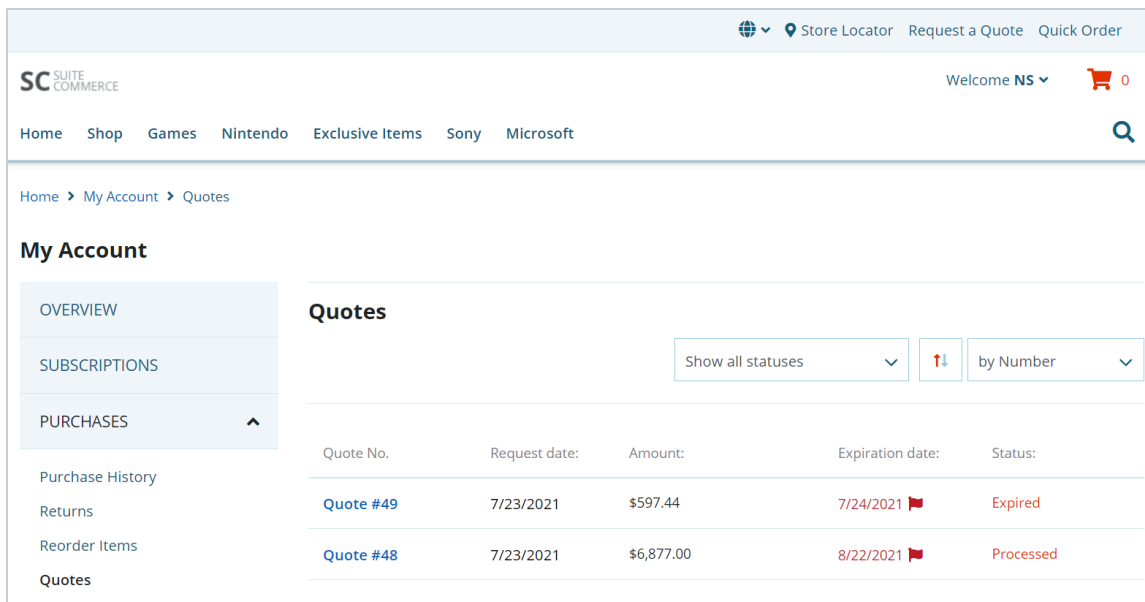

- NetSuite creates an Estimate/Quote record
- An **Add to Quote** button appears on the Product Details Page (PDP)

See the following sample Product Details Page with the **Add to Quote** button displayed:

Customers can view their quotes in the Purchases area of My Account.

See the following sample Quotes page:

After a customer clicks on a quote, they can:

- Download the quote as a PDF
- Review the quote and place an order

Overview

Applies to: SuiteCommerce | SuiteCommerce Advanced

An attractive and functional layout is only the start of making your web store effective. You also need to actively reach out and attract new customers and offer an interactive and engaging omnichannel experience for shoppers, guiding them through the shopping process. SuiteCommerce offers all the tools you need to manage your marketing efforts. You can:

- Offer various types of promotions and discounts
- Generate new sales opportunities with correlated and related items
- Personalize your website with merchandising zones to display complementary products based on search criteria or custom content delivery pages
- Communicate directly with customers by using personalized email templates and newsletter subscriptions
- Convert shoppers into your brand ambassadors with social sharing

Promotions in Commerce Web Stores

Attract shoppers to your web store by offering various types of promotions or discounts, including Item, Fixed Price Item, Order, Shipping, and Free Gift promotions and let them combine coupon codes with other promotions. With SuitePromotions, you can combine promotions on the same transaction and automatically apply eligible promotions.

Storefront Merchandising Tools

Generate up-sell opportunities by suggesting complementary and best-selling products and offering pre-paid gift certificates.

Advertising

Tell customers about your products and advertise your brands and success stories.

SuiteCommerce Customer Management

Decide how users register for your website, so they can sign in as new or existing customers, or check out as guests.

Communications

Personalize how you address customers by customizing web store email templates, manage newsletter subscriptions and add social sharing features.

SuiteCommerce Product Reviews

Set up and manage product reviews so users can submit their own and see ratings from others.

Product Comparison

Let users compare up to four products side-by-side. You can configure the comparison page and select the item fields to show in the table.

Promotions in Commerce Web Stores

Applies to: SuiteCommerce Advanced

This information refers to SuiteCommerce and the Elbrus release of SuiteCommerce Advanced and later.

SuitePromotions set up transactions that provide various types of discounts to users including:

- **Item:** A percentage or currency amount discount on items
- **Fixed Price Item:** A fixed discounted price on items
- **Order:** A discount applied at the order level
- **Shipping:** A discount providing free shipping on specific shipping methods
- **Free Gift:** A discount in the form of an item provided free to users meeting specific order criteria (available in Aconcagua only)

To apply an item, fixed price item, order, or shipping promotion in the web store, users enter a coupon code associated with a NetSuite promotions record.

Note: Although you have to specify a coupon code when you create a Free Gift promotion, users don't need to enter the code to get the free gift. Free Gift promotions are automatically applied during the checkout process in the web store. Free Gift isn't supported in the My Account Request a Quote workflow.

Site users can:

- Apply or remove multiple promo codes in their shopping cart and when reviewing their order during checkout.
- View an error message if a promo code cannot be added to an order.
- View discount totals.
- View applied promotions on the Order Details page.
- Apply single-use and multi-use coupon codes.
- Remove a free gift from the shopping cart page.

Site administrators can:

- Configure the site to automatically apply eligible promotions to a transaction.
- Automatically apply the best promotion to transactions eligible for multiple promotions.
- Audit promotions activity to view and track promotions applied to a transaction.

Note: NetSuite doesn't provide default policies for promotions. Use Site Management Tools (SMT) to create a landing page and add the details of the free gift Terms and Conditions and Returns policies to that page. Also using SMT, you can add a link to the landing page in your site footers.

Set Up SuitePromotions for Commerce Web Stores

Applies to: SuiteCommerce Advanced

To prepare your site to use SuitePromotions:

1. Enable SuitePromotions features.

2. Set up SuitePromotions records.
3. Configure SuiteCommerce Advanced to use SuitePromotions.

Step 1: Enable SuitePromotions Features

1. In NetSuite, go to Setup > Company > Enable Features.
2. On the Transaction tab, check the following boxes in the **Sales** section:
 - Promotion Codes
 - SuitePromotions
 - Auto-apply Promotions
3. Save the record.

Step 2: Set Up SuitePromotions Records

1. Create SuitePromotions. See the help topic [Creating Promotions](#).
2. Apply promotions and view the status of applied promotions. See the help topic [Applying Promotions and Discounts to a Transaction](#).
3. Get the most out of SuitePromotions. See the help topic [SuitePromotions Best Practices](#).

Step 3: Configure SuiteCommerce Advanced to use SuitePromotions

1. In NetSuite, go to Commerce > Websites > Configuration.
2. Select the website and domain to configure, then click **Continue**.
3. On the **Shopping Catalog** tab, check **Allow Adding More Than One Promocode** to enable stackable promotions.
4. Click **Save**.
5. Go to Commerce > Websites > Web Site List.
6. Click the **Edit** link for your website.
7. On the **Shopping** tab, under Promotions, check **Auto-Apply Promotions**.
8. Click **Save**.

Note: If you intend to use the SuitePromotions feature, enable all prerequisites. You must enable both **Auto-Apply Promotions** and **Allow Adding More Than One Promocode** to use SuitePromotions in your web store. Remove all configuration prerequisites if you don't intend to use SuitePromotions.

Known Limitations of SuitePromotions on Commerce Web Stores

Applies to: SuiteCommerce Advanced

Be aware of the following known limitations of SuitePromotions when used in Commerce and Site Builder web stores:

- SuitePromotions aren't supported on Site Builder extensions.
- SuitePromotions require SuiteCommerce or the Kilimanjaro release of SuiteCommerce Advanced and later.

- SuitePromotions uses **Audience** to support the **Partners** types of promotions. See the help topic [Setting Customer Eligibility on SuitePromotions](#) for details.
 - Users can view the aggregate discount, but they can't view line-item discount amounts.
 - Posting types can't be mixed. Any associated discount and mark-up items must be all posting discounts or all non-posting discounts. See the help topic [Discount and Markup Items in Advanced Revenue Management \(Essentials\)](#) for details.
 - The **Apply Discount To** property can only be set to **All Sales**. Otherwise unexpected issues can arise with your site.
 - Auto-Apply promotions have a limit of 30 promotions per transaction.
 - Auto-Apply Promotions can not be removed manually or by using the Commerce API.
 - Free Gift promotions don't work with the **Multi Ship To** feature.
 - Best Offer logic doesn't apply to Free Gift promotions.
 - Parent matrix items can't be selected as a free gift.
 - Items with options can't be selected as a free gift.
 - You can only use inventory items with Free Gift Promotions for orders placed through the SuiteCommerce web store. If you try to use other item types, the free gift won't be added, and you'll get an error that says, "Sorry, something went wrong. We couldn't add your gift to the order."
- However, you can use any item type with Free Gift Promotions for orders placed through the NetSuite user interface.

SuitePromotion Notifications on Commerce Web Stores

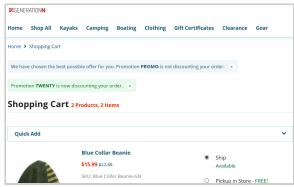

Applies to: SuiteCommerce Advanced

When properly configured to use Auto-Apply promotions, the application provides a list of applied promo codes based on rules defined in the promotions record. Notifications are displayed to help users understand which promotions are applied to their order as they shop.

Changes in the list of applied promotions can occur when users do the following:

- Add or remove items in the cart
- Increase or decrease the item quantity
- Add or remove a promo code
- Change the shipping address or method

The following notifications can be returned:

Condition	Notification	Example
When the promo code is applied	Promotion PROMOCODE is now affecting your order	 The screenshot shows a shopping cart interface with a navigation bar at the top. Below the navigation bar, there's a message: "We have chosen the best possible offer for you. Promotion PROMOCODE is not discounting your order." This message is highlighted with a green border. Below this, the shopping cart items are listed, including a "Blue Cotton Sweater" for \$19.99. At the bottom, there are links for "Ship" and "Add to Cart".
When the promo code is not applied because of best offer logic	We have chosen the best possible offer for you. Promotion PROMOCODE is not affecting your order	

When the promo code is not applied because requirements are not met	Promotion PROMOCODE is not affecting your order. ERROR_MESSAGE.	
---	---	--

Developer Reference

Applies to: SuiteCommerce Advanced

This section includes some technical details that may be useful for developers when troubleshooting or performing more advanced implementations.

- [Auto-Apply Promotions API](#)
- [URL Parameters for Promotions](#)

Auto-Apply Promotions API

Applies to: SuiteCommerce Advanced

When the Auto-Apply feature is enabled, the `applyPromotionCode(promocode)` order method behaves in the following manner:

- If the promotion code you're applying delivers a better value to the shopper than the exclusive promotion, the promotion code is accepted and the exclusive promotion is removed.
- From both manually and automatically applied promotions, the best combination of promotions is computed and applied to a transaction.

When troubleshooting auto-apply promotions, the following fields in the `promocode` JSON object results can be useful:

- `is_auto_applied`: determines if the promotion code is applied manually or automatically.
- `applicability_status`: determines if the promotion code is applied to the sales order or not.
- `applicability_reason`: determines the reason a promotion code was not applied.

Note: You can also determine the auto-apply statuses from NetSuite promotion records. See the help topic [Viewing the Status of Applied Promotions](#).

URL Parameters for Promotions

Applies to: SuiteCommerce Advanced

Several URL parameters for promotions are available. These are query strings that can be passed through the URL to automatically add specific promotions to the user's shopping cart. URL parameters are useful for tracking email marketing campaigns.

The following Promotions URL parameters are available:

URL Parameter	Description
<code>promocode</code>	To add multiple promotion codes, you can specify the <code>promocode</code> parameter in the URL multiple times.

URL Parameter	Description
	For example, ?promocode=FIFTYPERCENT&promocode=100FF10.
promocodeaction=add	Specifying promocodeaction=add mimics the default behavior and is not required. The default behavior is to add any promocodes specified in the URL to the order.
promocodeaction=overwrite	Setting promocodeaction=overwrite causes the promocodes passed to overwrite any existing promocodes previously set in that domain. Use the overwrite URL parameter to sync promocodes when bridging between domains. For example: Suppose a shopper has added items to the cart. The shopper then applies promocodes to that order in the checkout domain but then returns to the shopping domain and specifies new promocodes. Setting promocodeaction=overwrite causes the promocodes specified in the shopping domain to overwrite those specified in the checkout domain.

Storefront Merchandising Tools

i Applies to: SuiteCommerce | SuiteCommerce Advanced

Marketing strategy and planning is about getting your products to consumers at the right place, at the right time, and at the right price.

Commerce web stores let you:

- Guide consumers in their decision-making by suggesting complementary products
- Create up-sell opportunities by personalizing the static items to be displayed together or by automating the selection based on what your customers buy
- Create up-sell opportunities by personalizing recommended items for shoppers, either manually or automatically, including with machine learning that suggests products based on what customers buy
- Let shoppers sort products by best sellers so your top items stand out
- Feature entire product categories and individual items to attract consumers' attention
- Encourage business by offering customers gift wrap options and prepaid stored-value money cards for future purchases
- Promote collections featuring various curated looks by displaying a book of must-have styles

Product Merchandising

i Applies to: SuiteCommerce | SuiteCommerce Advanced

The Product Merchandising SuiteApp lets you define and display merchandising zones on your ecommerce site. Merchandising zones display complementary, cross-sell or up-sell products. The content for merchandising zones is generated from interactive elements that display dynamic groups of items based on search rules you define.

For example, on a sporting goods store website, a shopper narrows the search criteria on a page to show men's featured items. You want to market various accessories to this shopper too. You define a merchandising rule to search for accessories and display the results in a merchandising zone on the page whenever the search criteria are narrowed to display men's shirts.

With Product Merchandising, you can:

- Add merchandising zones within the site's template
- Incorporate custom content in merchandising zones
- Create merchandising rules to target content display based on specific selection criteria

The screenshot shows the GENERATION N website interface. At the top, there are navigation tabs: SHOP ALL, WOMEN, MEN, GEAR, ACCESSORIES, and a search bar. Below the navigation, the breadcrumb path is HOME / SHOP. On the left, there is a 'NARROW BY' sidebar with filters for SHOP BY (Clearance, Featured, New Arrivals, Staff Pick), PRICE (\$32.99 to \$59.99), CATEGORY (Sportswear), TYPE (Shirts), and GENDER (Men, Women). The main content area displays 12 results, sorted by TOP RATED. The first four items are long-sleeved shirts: CARDWELL LS SHIRT (\$45.99), STRICKLAND LS SHIRT (\$54.99), MCHENRY LS SHIRT (\$32.99), and MARTY IN REVERSE LS SHIRT (\$59.99). Below these, a red-bordered box highlights a merchandising zone containing various accessories: ZEUS CLOVE - M, JALAPENO CLOVE - M, MICRO DOME M - M, BARN DOOR BELT, WINTER MOMENTUM RUNNING GLOVE - M, and POWER STRETCH CLOVE - M. A blue callout box on the right states: 'Based on Selected Criteria, the Product Merchandising Zone below is populated'. A red arrow points from the 'Shirts' filter in the sidebar to the merchandising zone.

Important: The Product Merchandising SuiteApp is only available with the SuiteCommerce Advanced feature.

Product Merchandising Overview

Applies to: SuiteCommerce | SuiteCommerce Advanced

When using the Product Merchandising SuiteApp, a product merchandiser or marketing manager must work with a web developer to set up site templates with merchandising zones. After the initial setup is complete, these zones can be targeted with different content defined within merchandising rules without the need to rely on a developer for further customization.

Note: Good initial planning in the types of merchandising zones required simplifies maintenance of sites and reduces the need for development costs.

The workflow for how a merchandising zone is implemented is as follows:

- First, the product merchandiser works with a developer to define the selection criteria that would result in certain products to display. Selection criteria is based on available facets and sort options defined during the SuiteCommerce Advanced Web Site Setup.
- The developer adds merchandising zones to website template files or creates new templates as needed to accommodate the desired display. These templates call the merchandising rule that initiates a query to the item search API, which then returns item data as requested by the rule.

Note: If Content Delivery pages are used for the display of the Merchandising Rules, these pages must be defined after the Product Merchandising rules are defined. See the help topic [Content Delivery Integration](#) for details on using the Content Delivery SuiteApp.

- The developer provides the product merchandiser with the Merchandising IDs to be used when setting up merchandising rules.
- The product merchandiser defines the Product Merchandising rules based on the information used from the developer.

Create a Product Merchandising Rule

Applies to: SuiteCommerce | SuiteCommerce Advanced

Product Merchandising rules can be defined after you've coordinated with your developer to define the merchandising zones that will be available on your website. For more information, see [Product Merchandising Overview](#).

To create a merchandising rule:

1. Go to Setup > SuiteCommerce Advanced > Merchandising Rules > New.
2. Enter a **Merchandising ID** for this merchandising rule.

This ID is used as a key by your website template to display the corresponding merchandising rule parameters. A list of available IDs should be provided by your website developer.

Note: You can define the Product Merchandising rules first and then give your developer the right Merchandising IDs. The Merchandising IDs must match EXACTLY to what the developer is using when defining the content templates. When Content Delivery pages are used for defining merchandising zones, active Product Merchandising IDs are automatically available for selection during the Enhance or Landing page setup.

3. Enter a **Title** for your merchandising rule.
4. In the **Description** field, enter a short description of this rule.
5. Enable **Inactive** if this rule should NOT be used in the website.

Important: Merchandising rules that are defined as Inactive aren't available in Content Delivery records.

6. Select the website this rule is displayed in.
Merchandising rules are only available in SuiteCommerce Advanced websites.
7. Select a field set to define the information your website uses when displaying item results.
Field sets are defined during the initial site setup at Commerce > Websites > Website List > Field Sets. Only those field sets associated with the selected website are available.

1. If desired, enable the **Apply on Current Selections** box.

When enabled, the current search criteria is included in the query to the item search API.

2. In the **Filter** column, select a field from the dropdown menu.

The fields displayed are determined by the website chosen in [Step 6](#). After a filter is selected, a popup for setting up values opens. Depending on the type of field selected the options available for your filter vary. Fill in the filter criteria you need for your rule.

Note: Depending on the type of field you can again select whether the item will only be displayed if it matches the search criteria of the current session as described in [Step 9](#). If desired, enable the **Apply on Current Selections** box by enabling **Current Selection**.

When using Commerce Categories in the **Filter** column, enter the name of the commerce category you need to filter in the **Value** column. To learn more, see [Commerce Categories](#).

Important: When working with matrix items, you may get inconsistent results if values set for custom fields vary from the matrix parent compared to the matrix child. To avoid this, set the custom field for the desired result on the parent item and then use More Actions > Update Matrix to set the child items as needed.

3. Click **Set** to close the popup, and then **Add** to save the line.
10. Enter your **Sort** criteria:

You can sort items based on Sort defined for your website at Commerce > Websites > Website List > Sort Fields. Sort fields are defined during the initial Web Site Set Up and are used in the website

to determine the sort order of search results. For detailed information about defining Sort Fields, refer to [Search Settings Overview](#).

1. In the **Sort** column, select which field you want results sorted by.

Fields available are determined by the website chosen in [Step 6](#). After a filter is selected, a popup for setting up values opens. Depending on the type of field selected the options available for your filter vary. Fill in the filter criteria you need for your rule.

2. Select **Ascending** or **Descending** in the **Sort Option** column.
3. Click **Add**.

Sorting is applied in the order each field is entered.

11. Define **Advanced** options:

In the **Advanced** tab you can specify Items to exclude and whether a custom template should be used for this rule. Check with your developer if a custom template needs to be specified. If left blank the default template is used.

12. Click **Save**.

Product Merchandising rules are now available for your website. If not already done, your developer will need to set up Product Merchandising zones that call these rules from your website template files. After rules are defined and called from a website you can modify the rule as needed without need for further development work.

If you use the Content Delivery SuiteApp, you can also use merchandising rules to define the search results to display in a content area. For more information, see the help topic [Content Delivery Integration](#).

Prepare Pages for Product Merchandising Zones

Applies to: SuiteCommerce | SuiteCommerce Advanced

Preparing pages for Product Merchandising zones should be done by your web application developers since it involves editing code on the related page.

Configure the Reference Implementation

To call Merchandising Rules from your site pages, you must first configure the SuiteCommerce Advanced SSP to include the merchandising script.

To include the Product Merchandising script:

1. Go to Commerce > Hosting > SSP Applications.
2. Click **Edit** next to the SuiteCommerce Advanced SSP application used for the web site where product merchandising is used. For example, SuiteCommerce Advanced — Dev [version].
3. In the **Libraries** subtab under **Scripts**, click **Add**.
4. Go to the path of the dynamic_merchandising_library_v2.js file in the Product Merchandising reference installation.

Libraries
Library Script File *
Web Site Hosting Files/Live Hosting Files/SSP Applications/NetSuite Inc. - SCA 2021.2.0/Development/ssp_libraries.js
Web Site Hosting Files/Live Hosting Files/SSP Applications/NetSuite Inc. - Dynamic Merchandising/Merchandising SSP/src/dynamic_merchandising_library_v2.js

Important: If you're using a custom ssp application, you will need to define this library for your custom ssp application.

5. Click **Save**.

Correlated and Related Items

Applies to: SuiteCommerce | SuiteCommerce Advanced

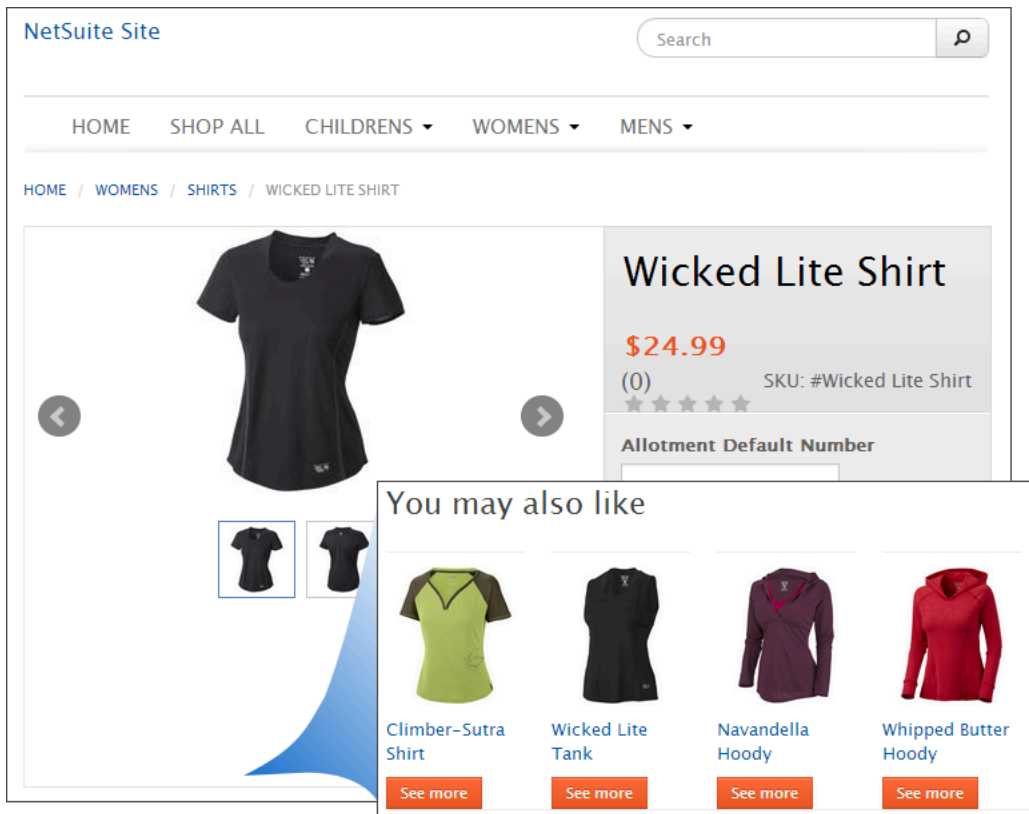

Correlated and related items create up-sell opportunities by displaying additional items to shoppers in your web store.

Related items represent static item relationships that are defined on individual item records in your NetSuite account. These can be items that you want to promote or complementary items associated with the item in the shopping cart. For example, if you're selling a T-shirt, you may want to suggest a pair of pants or a sweatshirt.

Correlated items are dynamically created from the site statistics based on the shopper's buying behavior, such as the ratio of items added to the shopping cart versus those that were ultimately purchased. The list of correlated items is updated every 30 days.

In Commerce web stores, you can:

- Customize the related items to be displayed.
- Display correlated and related items on the item's Product Details and View Cart pages of your web store.
- Define the correlation and lift thresholds to be used for calculating correlated items.
- Specify how many correlated and related items are displayed in your web store.

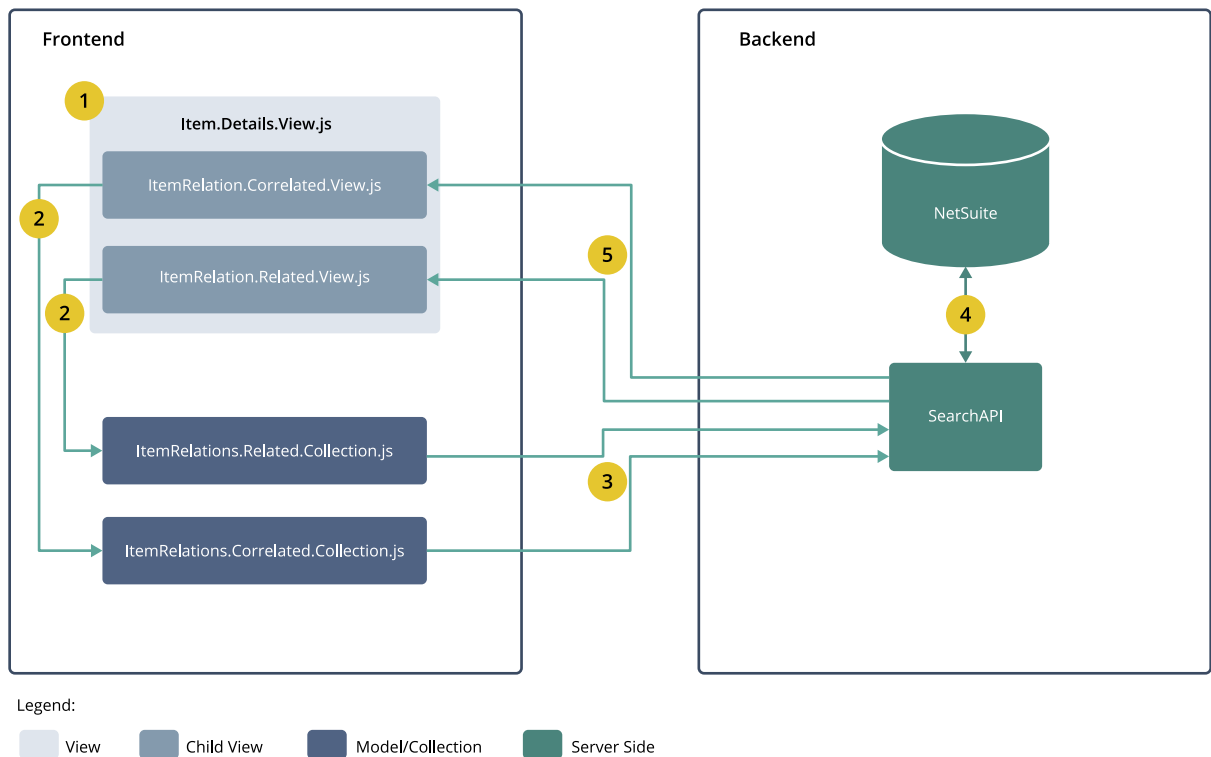

The following topics provide helpful information about correlated and related items:

- [Architecture Overview](#) — Information about how the correlated and related items architecture functions.
- [Set Up NetSuite](#) — How to display correlated and related items in your web store.
- [Related Items](#) — How to use related items in your web store to cross-sell products that complement each other.
- [Customize Views](#) — How to change the number of correlated or related items displayed and how they are displayed in your web store by customizing the associated view files.

Architecture Overview

Applies to: SuiteCommerce | SuiteCommerce Advanced

The correlated and related items architecture functions in the following way:

1. The `Item.Details.View.js` file contains two child views, one for correlated items and one for related items.
2. The `ItemRelations.Related.View.js` and `ItemRelations.Related.Collection.js` child views invoke fetch requests to the corresponding collection files.
3. The `ItemRelations.Related.Collection.js` and the `ItemRelations.Related.Collection.js` files call the Search API for correlated and related items respectively.
4. The Search API syncs with data stored in NetSuite.
5. The `ItemRelation.Correlated.View.js` and `ItemRelation.Related.View.js` files receive the correlated or related items from the Search API.

Set Up NetSuite

Applies to: SuiteCommerce | SuiteCommerce Advanced

To display correlated and related items in your web store, follow these steps:

- [Add Related Items on Item Records](#)
- [Define Required Field Sets](#)

Add Related Items on Item Records

Related items must first be added to an item record to display in your web store. See [Related Items](#) for information about linking related items to an item record.

 **Note:** Correlated items can not be customized. These are determined by the shopper's purchasing history and are automatically stored on each item record as read-only information.

Define Required Field Sets

 **Important:** If you're using the Checkout Application within a Site Builder site (Site Builder Extensions edition), the required Fields Sets are defined in the configuration within the SspLibraries module. Normally, you don't need to perform additional configuration for related and correlated items to appear.

The Item.KeyMapping File

The Item.KeyMapping.js file defines the following three Related Items properties, which map information returned from the Item Search API:

- relatedItems – Related items
- relatedItemsDetail – Related items in the Product Details Page (PDP)
- correlatedItemsDetail – Correlated items in the PDP

The following code snippet from the Item.KeyMapping.js file shows these mappings. This file is located within the Item module. However, for pre-Elbrus releases of SuiteCommerce Advanced, the file is located within the ItemsKeyMapping module.

```
1 // @property _relatedItems Related items
2 , _relatedItems: 'related_items'
3
4 // @property _relatedItemsDetail _relatedItemsDetail Related items in the PDP.
5 , _relatedItemsDetail: 'relateditems_detail'
6
7 // @property _correlatedItemsDetail Correlated (Up-sell) items in the PDP.
8 , _correlatedItemsDetail: 'correlateditems_detail'
```

To ensure that the necessary information from the Search API is available, define the following required Field Sets in your Web Site Setup page. For more information about defining Field Sets, see [Define Field Sets](#).

Name	Field Set ID	Fields Included in Field Set
Correlated Items	correlateditems	The same fields as included for search.
Correlated Items Details	correlateditems_details	correlateditems_detail: Correlated Items (Detail)
Related Items	relateditems	The same fields as included for search.
Related Items Details	relateditems_details	relateditems_detail: Related Items (Detail)

 **Note:** For detailed descriptions of these fields, see [Derived Fields for Field Sets](#).

If you're using a setup script, these field sets are automatically defined. See the help topic [Set Up Initial Field Sets](#) for information about setting up field sets with a script.

For information about the search fields you should use, see the help topic [Prepare the Web Site Setup Record](#).

Related Items

Applies to: SuiteCommerce | SuiteCommerce Advanced

You can use related items in your web store to cross-sell products that complement each other.

For example, an electronics web store created a related items group containing cables, extension cords and surge protectors. When a shopper views a monitor on the web store, the list of related items displays, and they can view the additional products they need.

There are two ways you can set up related items in NetSuite:

- **Create Related Items Groups** – First, create groups of related items. Then, add these groups to items you sell in your web store.
- **Associate Individual Related Items** – Associate individual items to items you sell in your web store.

Note: When a shopper adds a child matrix item to the cart, its related items aren't displayed in the related items area on the Shopping Cart page.

Note: For performance reasons, you should use a maximum of 100 related items per item record.

Create Related Items Groups

Applies to: SuiteCommerce | SuiteCommerce Advanced

A related items group is a set of items you can choose to recommend when specified items are displayed in your web store.

For example, Wolfe Electronics creates a related items group called Power Cords and Appliances that contains items like cables, extension cords, and surge protectors. Wolfe Electronics chooses to display this related item group with the monitors it sells in its web store. When shoppers view Wolfe Electronics' monitors, they can also view related products they might need.

To create a related item group:

1. Go to Commerce > Marketing > Related Item Categories > New.
2. In the **Category** field, enter a name for your related item group. For example: Power Cords and Appliances.
In Step 10, you will select this category name when adding related item groups to items.
3. In the **Brief Description** field, enter a short message describing this group. For example: Cables, extension cords, and surge protectors.
This step is optional.
4. Go to the **Basic** tab and the **Item** subtab to add an item from the list. Each item's brief description appears in the **Item Description** field.
5. Click **Add**.
6. Repeat steps 4 and 5 to add more items to your item group.

7. Click on an item to move it up and down in the **Item** list. This changes the order the items display in your web store.
8. When you have finished, click **Save**.
9. Go to Lists > Accounting > Items.
10. Click **Edit** next to the item (for example, Monitor) with which you want to associate your related items group.
 - a. Go to the **Web Store** tab and the **Related Items** subtab.
 - b. In the **Related Item** column, select the related item group from the list of categories. In this case, Category: Power Cords and Appliances.
 - c. Click **Add**.
11. Click **Save**.

Your related items group now displays with the item you're selling in your web store.

 **Note:** If you use multiple websites, note that items only appear on websites specified on the item record. For example, if you include item A and item B in the same related items group, then you must publish both items A and B to the same websites, if you want the two items to always appear together.

Associate Individual Related Items

 **Applies to:** SuiteCommerce | SuiteCommerce Advanced

If you don't want to associate an entire group of items with an item, you can select individual related items on an item record.

To associate related items to an item record:

1. Go to Lists > Accounting > Items.
2. Click **Edit** next to the item you want to add a related item to.
3. Go to the **Web Store** tab and the **Related Items** subtab.
4. In the **Related Item** column, choose an item to associate with the item you're selling.
5. Click **Add**.
Click **Add Multiple** to add several items quickly.
6. You can move items up and down to change the order they appear in your web store.
7. When you have finished, click **Save**.

Now your related items appear beneath the item you're selling in your web store.

Customize Views

 **Applies to:** SuiteCommerce | SuiteCommerce Advanced

By default, the number of correlated and related items displayed is only limited by the number of correlated and related items you set up in NetSuite. The view displays these items within one row.

However, you can change the number of correlated or related items displayed and how they are displayed by customizing the associated view files.

To specify the number of correlated or related items to display:

1. Create a custom module that includes the following objects as dependencies, depending on the views you're customizing.

- **ItemRelations.Correlated.View** – Sets the behavior of Correlated Items displayed.
- **ItemRelations.Related.View** – Sets the behavior of Related Items displayed.

 **Note:** Don't edit the original `ItemRelations.Correlated.View.js` or `ItemRelations.Related.View.js` source files directly. See the help topic [Develop Your SCA Customization](#) for information and best practices for customizing modules.

2. Customize either the `ItemRelations.Correlated.View` or `ItemRelations.Related.View`.
 - To edit the number of items displayed per row, customize the appropriate view and extend the `viewsPerRow` property of the `initialize` method. Replace `Infinity` with the number of items you want to display.
 - To add rows displaying correlated or related items, customize the appropriate view to add the `rowCount` property to the `initialize` method. Specify the number of rows you want to display. If you don't specify a value for `rowCount`, the default is one row.

Best Sellers

 **Applies to:** SuiteCommerce | SuiteCommerce Advanced

The Best Sellers extension adds a sorting option that lets you showcase best-selling items in your web store. Best Sellers can be used in several ways:

- Sort your product list page by best-selling items
- Set up specific merchandising zones to showcase best-selling items

 **Important:** Commerce extensions are only available if they are provisioned and set up in your account. For more information, see [Commerce Extensions](#).

Best Sellers adds additional fields to your item records that are considered when calculating best-selling item sorting. You can choose to exclude specific items or override the best seller calculation to highlight specific items in the product list, custom landing pages, and merchandising zones. You can use either sales quantity or sales amount to determine whether an item is a best seller for a given period.

Installation

The Best Sellers extension **does not require activation** for a specific website or domain. However you need to install the SC Best Sellers SuiteApp. For more information, see [Installing Theme and Extension SuiteApps](#).

To install the SC Best Sellers SuiteApp:

1. In NetSuite, go to Customization > SuiteBundler > Search & Install Bundles.
2. In the **Keywords** field, enter the Bundle ID or 'best sellers' and click **Search**.
3. Verify that the SC Best Sellers SuiteApp is returned in the search and select it.
4. Review the SuiteApp details and then click **Install**.

Best Seller Fields in the Item Record

When you install the Best Sellers extension, the following fields are added to your Item record, in the **SuiteExtensions** tab, **Best Sellers** subtab:

- Exclude Item
- Override Calculation
- Last 7 Days – Sales Quantity
- Last 30 Days – Sales Quantity
- Last 90 Days – Sales Quantity
- Last 365 Days – Sales Quantity
- Last 7 Days – Sales Amount
- Last 30 Days – Sales Amount
- Last 90 Days – Sales Amount
- Last 365 Days – Sales Amount

Best Seller Calculation

When the Best Sellers extension is installed, all items are automatically included in the calculation by default. When the best seller calculation script is run, the item's accumulated sales quantity and amount for a given period are entered in the best seller fields in the Item record. These values are used to create a list of items with the highest sales amount or highest sales quantity. The script is run when the Best Sellers extension is installed for the first time to take into account all existing transactions. It's then run daily at the end of the day to consider the current day's transactions.

Exclude Items From Best Seller Sorting

You may decide that you don't want an item to appear as a best seller in your web store if it's a low-margin item, for example. You can choose to exclude it from the automatic calculation by selecting the **Exclude Item** box. When you select this option, all sales amount and sales quantity fields are set to 0 for this item and you can't change the values. The item is no longer included in the calculation.

If you want to re-include an item in the best seller calculation, clear the **Exclude Item** box. The sales amount and sales quantity for the given periods are re-calculated when the best-seller calculation script is run again.

Override Best Seller Sorting

You may decide that you want an item to appear as a best seller in your web store, even though it has a lower sales turnover. You can manually change the best seller calculation by selecting the **Override**

Calculation box. When you select this option, you can enter values in the sales amount and the sales quantity fields for the various periods. To force an item to be listed as the best seller, you must enter the highest sales quantity or sales amount value for that period. You can determine this value by executing a saved search with the appropriate criteria.

You can choose to override the best seller calculation for all periods or for a specific period. The fields that you don't change retain the values from the last calculation.

To remove the override, clear the **Override Calculation** box. The sales amount and sales quantity for the given periods are re-calculated when the best seller calculation script is run again.

Set Up Best Sellers in the Web Store

i Applies to: SuiteCommerce | SuiteCommerce Advanced

To make best-selling items available as a sorting option, facet, or search criteria in your web store, you must first add it to your Web Site Setup record.

To set up a best seller field as a search, facet, or sort field for your website:

1. Go to Commerce > Websites > Website List.
2. Click **Edit** for the website where you want to set up best seller sorting.
3. Go to the **Search Index** tab.
4. Go to the **Search Fields**, **Facet Fields**, or **Sort Fields** subtab, depending on whether you want to use Best Sellers as a search, facet, or sort option.

For more information about search settings, see [Search Settings Overview](#).

5. In the **Field Name** list, select the best seller custom fields and click **Add**.

You can add any or all of these fields according to whether you want to determine best-selling items by sales quantity or sales amount.

6. Click **Save**.

Best Seller Fields

The SuiteCommerce Best Sellers extension adds the following fields to the Item record to calculate the best seller rating:

Field Name	Field ID
Last 7 Days – Sales Amount	custitem_ns_sc_ext_ts_7_amount
Last 7 Days – Sales Quantity	custitem_ns_sc_ext_ts_7_quantity
Last 30 Days – Sales Amount	custitem_ns_sc_ext_ts_30_amount
Last 30 Days – Sales Quantity	custitem_ns_sc_ext_ts_30_quantity
Last 90 Days – Sales Amount	custitem_ns_sc_ext_ts_90_amount
Last 90 Days – Sales Quantity	custitem_ns_sc_ext_ts_90_quantity
Last 365 Days – Sales Amount	custitem_ns_sc_ext_ts_365_amount

Field Name	Field ID
Last 365 Days – Sales Quantity	custitem_ns_sc_ext_ts_365_quantity

Apply Best Seller Sorting in the Web Store

Applies to: SuiteCommerce | SuiteCommerce Advanced

You can use the Best Sellers extension in several ways in your web store:

- Sort option for product lists
- Facet for filtering product list pages
- Selection criteria for product merchandising rules

Best Sellers in Product Lists

When you have set up best sellers as a sort field for your web store, you can use it for sorting your product list page.

To include best seller sorting in your product list page:

1. Go to Commerce > Websites > Configuration.
2. Select your website and domain and click **Continue**.
3. In the **Search** tab, **Results Sorting** subtab, in the **ID** column, enter the field ID of the best seller sort option you want to display in your web store for Desktop, Phone and Tablet screen formats and the sort order.

For example, `custitem_ns_sc_ext_ts_30_amount:asc` for best sellers from the last 30 days, sorted in ascending order.

For a list of the sort options available, see the [Best Seller Fields](#) table.
4. Enter the text you want to display for the sort option in the **Name** field and click **Add**.
5. Click **Save**.

Best Sellers as Facets

You can access a product list page containing only best-selling items by setting up the best seller field as a facet and using it as a URL parameter. For example, `example.com/search?order=custitem_ns_sc_ext_ts_30_amount:desc`. For more information about using facet fields as URL parameters, see [Facets as Parameters](#).

Best Sellers in Product Merchandising Zones

You can also use best seller sorting in a merchandising rule to feature your best sellers more prominently in a merchandising zone.

To do this, you first must create a merchandising rule. For more information about how to set up merchandising rules, see [Product Merchandising](#).

When you have created a best sellers merchandising rule, you can then add a merchandising zone with this rule to your website using Site Management Tools. For more information, read the help topic [Merchandising Zone Content](#).

Intelligent Item Recommendations for Commerce Websites

Applies to: SuiteCommerce | SuiteCommerce Advanced

Note: Intelligent item recommendations are incompatible with the Personalized Catalog Views feature. If you use both features on the same Commerce website, intelligent item recommendations may display items to your customers that should not be visible to them based on their personalized catalog view settings.

The Intelligent Item Recommendations feature uses artificial intelligence algorithms to calculate and display items that a shopper may be interested in buying. The algorithms use data such as:

- What the shopper bought in the past.
- What other shoppers with similar transaction histories bought in the past.
- What other items were bought by shoppers who bought a specific item.
- Items that have similar names, descriptions, and categories.

Intelligent item recommendations are useful for:

- Sales representatives – Intelligent item recommendations can be used to identify and add relevant items to sales orders, estimates, and opportunity records.
- Commerce website shoppers – You can add recommendations to different areas of your website to show shoppers items they may want to buy.

For an overview of Intelligent Recommendations and how they apply to Customer Relationship Management, SuiteCommerce, or SuiteCommerce Advanced, see the help topic [Intelligent Recommendations](#).

To use intelligent item recommendations on your website:

- Implement SuiteCommerce or SuiteCommerce Advanced 2018.2 or later, and Site Management Tools (SMT) version 3 or later. See [Account Requirements for Intelligent Item Recommendations for Websites](#).
- Install and activate the Intelligent Item Recommendations extension. See [Install and Activate Intelligent Item Recommendations](#).
- Review the default recommendation scenarios for each context and create new ones if needed. See the help topic [Recommendation Scenarios and Blocklists](#).
- Configure how intelligent item recommendations look in the Recommended Items SMT content area on your website. See [Configure the Intelligent Item Recommendations Extension](#).
- Add one or more Recommended Items content areas to your website. See [Add and Remove Intelligent Item Recommendations from your Website](#).
- Periodically review the data gathered by intelligent item recommendations. See [Intelligent Item Recommendations Analytics](#).

Account Requirements for Intelligent Item Recommendations for Websites

i Applies to: SuiteCommerce | SuiteCommerce Advanced

To display intelligent item recommendations, your Commerce website must use both:

- SuiteCommerce or SuiteCommerce Advanced 18.2 or later.
- Site Management Tools (SMT) version 3 or later.

Whether a particular type of recommendation is available on a specific website depends on the following:

Type of Recommendation	Subsidiary/Site Requirements
■ Order or Cart Items ■ Customers Who Bought This Also Bought ■ Recently Viewed Items ■ Customer Purchase History	■ At least 50 items in the website catalog ■ A minimum number of transactions in the past 12 months
■ Buy Again	■ A minimum number of repeat purchases in the past 12 months
■ Alternative Items	■ At least 50 items in the website catalog ■ A system-supported language, excluding Vietnamese

To check which types of recommendations are available for a website, go to Commerce > Marketing > Recommendation Availability.

Install and Activate Intelligent Item Recommendations

i Applies to: SuiteCommerce | SuiteCommerce Advanced

To use intelligent item recommendations on your website, you must install and then activate the SC Intelligent Item Recommendations extension.

To install the Intelligent Item Recommendations extension:

1. Go to Customization > SuiteBundler > Search & Install Bundles.
2. In the **Keywords** field, enter “intelligent item recommendations” and click **Search**.
3. Verify that the SC Intelligent Item Recommendations extension is returned in the search and select it.
4. Review the extension details and then click **Install**. For more information about installing extensions, see [Installing Theme and Extension SuiteApps](#).
5. In the confirmation popup window, click **OK**.
6. On the Preview Bundle Install page, review the extension details and then click **Install**.
7. In the confirmation popup window, click **OK**.

To activate the Intelligent Item Recommendations extension:

1. Go to Commerce > Extensions > Extension Manager (Administrator).
2. Next to the website where you want to use intelligent item recommendations, click **Edit**.
3. Go to the **Extensions** tab.
4. Next to Intelligent Items Recommendations, check the box in the **Active** column.
5. Click **Activate**.
6. After you activate the Items Recommendations extension, it displays in the **Active Extensions** column for your website on the Extension Manager Page.

Configure the Intelligent Item Recommendations Extension

Applies to: SuiteCommerce | SuiteCommerce Advanced

Use the SuiteCommerce Configuration record to determine how intelligent item recommendations appear in the Recommended Items SMT content area on your website.

To configure intelligent item recommendations:

1. In NetSuite, go to Commerce > Websites > Configuration.
2. Select the website and domain where the Intelligent Item Recommendations extension is activated and click **Configure**.
3. Go to the **Extensions** tab and the **Intelligent Recommendations** subtab.
4. Configure the following fields as required:

Field	Description
Minimum Number of Items in Content Area	The minimum number of items that should be shown in each Recommended Items content area on your website.
Maximum Number of Items in Content Area	The maximum number of items shown in the content area at a time. For example, if the total number of recommended items is 20, and the maximum is set to 5, the shopper can see a maximum of 5 items in the content area at a time. They can scroll to see the remaining 15 items. The default maximum number is 10 and it can't exceed 20. The number of items visible to a shopper at a time also depends on the display size of their device. Note: You can adjust the total number of recommended items shown in the recommended items content area using the Number of Items Displayed field. For more information, see Add and Remove Intelligent Item Recommendations from your Website.
Width of Item Image	The width, in pixels, of the item images to be shown in the Recommended Items content areas on your website.

Field	Description
Height of Item Image	The height, in pixels, of the item images to be shown in the Recommended Items content areas on your website.
Enable Quick View for Items	Add a Quick View button to each recommended item displayed on your website. Clicking the Quick View button lets shoppers see details of the recommended item without leaving the product page of the item they are already on.

5. Click **Save**.

After configuring the Intelligent Item Recommendations extension, you can add intelligent item recommendations to your website. See [Add and Remove Intelligent Item Recommendations from your Website](#).

Add and Remove Intelligent Item Recommendations from your Website

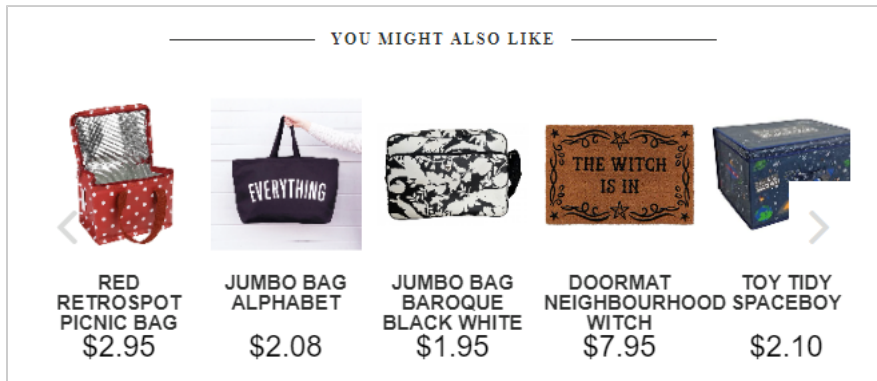

i Applies to: SuiteCommerce | SuiteCommerce Advanced

To display intelligent item recommendations to shoppers, you must add the Recommended Items SMT content type to your website. For each **Recommended Items** content area you add to your website, you can select the recommendation scenario it should use, how many items it should show, and what it should show if no recommendations are available.

The screenshot shows the 'Recommended Items Settings' form. It includes the following fields and options:

- Name:** A text input field.
- Visibility:** Two radio button options: 'Always Visible' (selected) and 'Visible on Specific Dates'.
- Recommendation Scenario *:** A dropdown menu with a question mark icon.
- Heading:** A text input field with a question mark icon.
- Number of Items Displayed:** A text input field containing the value '10' with a question mark icon.
- Fallback Recommendations *:** A dropdown menu with 'Popular Items' selected and a question mark icon.
- Fallback Recommendations Heading:** A text input field with a question mark icon.
- Tags:** A text input field.

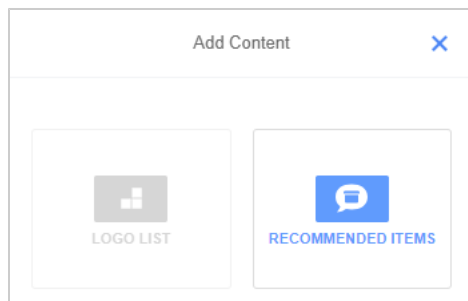

When they have been published to the website, each content area shows the name and image of each recommended item. The item price, item rating, and quick Add to Cart button are also shown if they are configured for the website. Clicking on an item takes the shopper to the item's product detail page (PDP) for more information and purchasing options.

For more information about Site Management Tools and content types, see the help topic [Site Management Tools Overview](#).

To add intelligent item recommendations to your website:

1. In your website, go to the page where you want to add intelligent item recommendations.
If you're adding an Item-specific recommendation, you must go to a product detail page.
2. Log in to SMT.
For more information, see the help topic [Users and Roles in Site Management Tools](#).
3. In **Edit** mode, click **Add** on the Site Management toolbar.
4. Drag the **Recommended Items** content type to the page.

Note: If you don't see this content type, check that the extension has been installed and is active. Click **Settings** on the Site Management toolbar to access the Content Manager. Drag the content type from the Inactive Content Types list to the Active Content Type list.

The location you drop the content type in depends on the type of recommendations you want to add. If you want to add recommendations based on:

- Shoppers who bought this also bought or alternative items, drop the content type in the page type area on a product detail page.
- For all other options, that is, order or cart items, recently viewed items, shopper purchase history, or buy again you can place the content type in multiple areas on the page.
 - If you drag it to an area marked All Pages, then the content displays on any page that contains that area.
 - If you drag it to page type area, then the content displays on any page of that type.
 - If you drag it to an area marked as This Page, then the content displays only on the page that you add it to.

For more information about the scopes of different SMT areas, see the help topic [Area and Scope](#).

5. In the **Name** field, enter a name for the content type you're adding. This is an internal identifier for the content type. It's not displayed to the user anywhere on the website, but it's used to identify the content type in NetSuite and in SMT.
6. Choose when you want the intelligent item recommendations to be visible from the **Visibility** options.
For more information about visibility options, see the help topic [View Site as of a Specific Date in Site Management Tools](#).
7. From the **Recommendation Scenario** list, choose the recommendation scenario you want to add to the content area.
8. In the **Heading** field, enter the name for the heading displayed above the intelligent item recommendations. For example, you can display them as "You might like these items" or "Customers who bought this also bought..."
9. In the **Number of Items Displayed** field, enter the number of recommended items you would like to display. A maximum of 20 items can be displayed.

Note: If not enough intelligent item recommendations are available, the number of items displayed may be less than the value you enter in this field.

10. If a shopper with no transaction history visits the website, for example, a brand new shopper or a guest shopper, the extension can't calculate shopper context recommendations. Similarly, if an item has never been purchased before, the extension can't calculate item context recommendations. From the options in the **Fallback Recommendations** list, select what shoppers should see when no intelligent recommendations are available. The options are:
 - Hide Recommendations – hides the intelligent items recommendation area
 - Popular items – displays the bestselling items in the website catalog
 - New items – display the items most recently added to the website catalog
11. In the **Fallback Heading** field, enter the name for the heading displayed above the fallback items, for example, "Bestsellers."
12. In the **Tags** field, set keywords to help filter your content in the Review Changes list.
For more information about content tags, see [Content Tags and Filter Tools](#).

To remove intelligent item recommendations (published content):

1. While logged in to SMT on your website, go to the page that contains the Intelligent item recommendations you want to remove.
2. In **Edit** mode, click on the **Recommended Items** content area you want to remove.
This highlights the Intelligent item recommendations and displays the content controls.
3. Click **Remove**.
4. Click **OK**.

To discard intelligent item recommendations (unpublished content):

1. While logged in to SMT on your website, select the **Review & Publish Changes** list from the Site Management toolbar.
2. Select the **Recommended Items** content in the list.
3. Click **Discard**.

4. Click **OK**.

Intelligent Item Recommendations Analytics

i Applies to: SuiteCommerce | SuiteCommerce Advanced

The Intelligent Item Recommendations workbook enables you to view and analyze data collected by the Intelligent Item Recommendations extension, for example:

- the number of times shoppers viewed or interacted with a recommendation
- how many transactions can be traced back to these interactions
- the value of transactions that can be traced back to recommendations

Intelligent Item Recommendations Workbook

SuiteAnalytics Workbook is a powerful analytical tool that enables you to create and view highly customizable workbooks using NetSuite data. It offers many workbook and dataset templates, each with predefined source data, criteria, pivot tables, and charts. For more information about SuiteAnalytics Workbook, see the help topic [SuiteAnalytics Workbook Overview](#).

This section contains the information for the Intelligent Items Recommendations workbook in NetSuite.

Intelligent Item Recommendations Dataset

i Applies to: SuiteCommerce | SuiteCommerce Advanced

This dataset enables you to analyze how shoppers interact with the intelligent item recommendations displayed in your website. This dataset forms part of the source data for the [Intelligent Item Recommendations Workbook](#).

Dataset Configuration

The Intelligent Item Recommendations dataset contains fields from three record types and one custom formula. To edit the dataset, see the help topic [Defining a Dataset](#).

Root Record Type	Joined Record Type	Custom Formula Fields	Data Grid	Criteria Filters
Intelligent Item Recommendations	■ Conversions ■ Recommendation Scenario	The following custom formula is included in the dataset: ■ Click Through Rate - $ABS(\{clickevents\} / \{showevents\})$	The following record fields are included in the dataset: Recommendation Scenario ■ Website Intelligent Item Recommendations ■ Recommendation Scenario	(none)

Root Record Type	Joined Record Type	Custom Formula Fields	Data Grid	Criteria Filters
			- Date - Show Events - Click Events - Carousel Events	

Estimated Revenue Dataset

Applies to: SuiteCommerce | SuiteCommerce Advanced

This dataset lets you view the number and value of transactions that can be traced back to shoppers clicking on the intelligent item recommendations displayed in your website. This dataset forms part of the source data for the [Intelligent Item Recommendations Workbook](#).

Dataset Configuration

The Estimated Revenue dataset contains fields from three record types. To edit the dataset, see the help topic [Defining a Dataset](#).

Root Record Type	Joined Record Type	Custom Formula Fields	Data Grid	Criteria Filters
Intelligent Item Recommendations	- Conversions - Recommendation Scenario	(none)	The following record fields are included in the dataset: Conversions - Amount (Credit) (Transaction Currency) - Transaction - Item > Item Name/ Number - Entity > Name Recommendation Scenario - Website Intelligent Item Recommendations - Recommendation Scenario - Date	(none)

Intelligent Item Recommendations Workbook

Applies to: SuiteCommerce | SuiteCommerce Advanced

The Intelligent Item Recommendations workbook lets you view and analyze data collected by the Intelligent Item Recommendations extension. The workbook is a useful tool to understand the success of recommendations because it lets you track customer behavior after they see a recommendation. For

example, the workbook tracks when a customer sees a recommendation, when they click through to view the item, if they buy the recommended item, and the estimated revenue generated by these purchases.

The Intelligent Items workbook shows data on the following interactions:

- **Show Events** – number of times intelligent item recommendations were shown to shoppers
- **Click Events** – number of times shoppers clicked on a recommendation
- **Carousel Events** – number of times shoppers chose to see more recommendations by clicking on the next and previous arrows in the recommended items carousel
- **Click Through Rate** – percentage of times that customers clicked through to a recommended product after being shown a recommendation

To access the workbook, click the Analytics tab in the navigation menu and then click the **Intelligent Item Recommendations** link in the Workbook Templates list on the Workbooks subtab.

The workbook includes multiple tabs:

- **Table Tabs**
 - **Recommendation Interactions** – this table contains the number of show, click, and carousel events per day in For Shopper and For Item recommendation contexts. It also displays the daily click through rate.
 - **Estimated Revenue** – this table contains the daily transaction details of each recommended item shoppers bought within seven days of clicking through to the item. The details are available for both For Shopper and For Item recommendation contexts. Details in the table include sales order numbers, item names/numbers, item value, and customer name.
- **Pivot Tab**
 - **Interaction Pivot** – displays show events, click events, and carousel events per day. Daily grand totals of interactions across all websites are shown to the right of the table. Grand totals of each interaction per website for the last 30 days are shown at the bottom of the table.
- **Chart Tabs**
 - **Interaction Chart** – a bar chart that displays the total show events, click events, and carousel events per day for the past 30 days. Seeing this information visually helps to identify patterns in the conversion rate.
 - **Click Through Rate** – a line graph that shows the daily click through rate for the last 30 days.
 - **Estimated Revenue** – an area chart that shows the estimated revenue generated per day due to recommendations for the last 30 days.

For more information about each tab, see the help topic [Navigating SuiteAnalytics Workbook](#).

If you have more than one website, the tables and charts contain data for all websites. You can choose to apply filters to view the data for only the websites you need.

Featured Category

Applies to: SuiteCommerce | SuiteCommerce Advanced | Site Management Tools

The Featured Category extension lets you highlight a commerce category on your website. This extension allows you to customize your featured category's appearance and behavior. You can choose how many items you want to show and add a button to link to the category page. For each item highlighted in the featured category section, you can display the product image, name, and price. Clicking on an item takes users to the product detail page (PDP) for more information and purchasing options.

To use this extension, you must enable Commerce Categories for your Commerce web stores and create at least one category. To set up a commerce category, see [Commerce Categories](#).

Important: Commerce extensions are only available if provisioned, installed, and activated for a selected domain in your account. For more information, see [Commerce Extensions](#).

Note: Extensions require SuiteCommerce or the Aconcagua release of SCA or later.

Use Site Management Tools (SMT) to add, configure, or delete a featured category on multiple areas of your website. Adding this content type to enhanced or custom landing pages allows you to promote a category in the place and style you want. For more information about Site Management Tools, see the help topic [Site Management Tools Overview](#).

This topic explains how to:

- [Add a Featured Category](#)
- [Configure a Featured Category](#)
- [Remove a Featured Category](#)
- [Use a Custom Field Set](#)

Add a Featured Category

To add a featured category to your web store, add the **Featured Category** content type to a page of your site using SMT.

To add a featured category:

1. In your website, go to the page where you want to add a featured category.
2. Log in to SMT.
For more information about logging in to SMT, see the help topic [Users and Roles in Site Management Tools](#).
3. In **Edit** mode, click **Add** on the Site Management toolbar.
4. Drag the **Featured Category** content type to the page.

Note: If you don't see this content type, ensure that the extension has been installed and is active. Click **Settings** on the Site Management toolbar to access the Content Manager. Drag the content type from the Inactive Content Types list to the Active Content Type list.

You can drag a **Featured Category** content type to multiple areas on the page.

For more information about the scopes of different SMT areas, see the help topic [Area and Scope](#).

5. Configure the settings to best fit your needs.
See [Configure a Featured Category](#).

Configure a Featured Category

Configure properties to customize your featured category. You decide how to sort the items, adjust the display options, and the header and button texts.

The following procedures explain how to:

- Configure general settings
- Configure layout and style settings

To configure general settings:

1. While logged in to SMT on your website, go to the page that contains the featured category.
2. In the **Featured Category** box, click **Edit**.
This displays the Featured Category Settings in the side panel.
3. In the **General** tab, set the following fields:

Field	Description
Name	Sets the name for the featured category banner.
Visibility	Determines the visibility option that determines when you want to make the featured category visible. For more information about visibility options, see the help topic View Site as of a Specific Date in Site Management Tools .
Category	Select the commerce category you want to feature with this content type.
Item Sorting	Determines the sorting option for the featured products. You can only use the best sellers sorting options if you have installed SC Best Sellers. For more information, see Best Sellers .
Show Item Names	If checked, displays the item name with the item picture in the featured category section.
Show Item Prices	If checked, displays the item price with the item picture in the featured category section.
Tags	Sets keywords to help filter your content in the Review Changes list. For more information about content tags, see Content Tags and Filter Tools .

4. Click **Save**.

To configure layout and style settings:

1. While logged in to SMT on your website, go to the page that contains the featured category.
2. In the **Featured Category** box, click **Edit**.
This displays the Featured Category Settings in the side panel.
3. In the **Layout & Style** tab, set the following fields:

Field	Description
Header	Sets the title for the featured category section. Basic HTML formatting tags are supported.
Header Alignment	Determines how you want to position the header in the featured category section.
Link Header	If checked, links the header to a commerce category or a custom URL. You can list the custom URL in the Custom Category URL field.
Category Button Text	Sets the button text.

Field	Description
	This button redirects shoppers to the commerce category page. If you leave this field blank, the button does not appear.
Category Button Style	Sets the button style. The button style definition is taken from your theme.
Custom Category URL	Determines the custom URL (relative or absolute) to which you want the header and button to link. If you leave this field blank, the header and category button direct users to the linked commerce category page (determined by the Category ID field in the General tab). For the header to link to this custom URL, check the Link Header box. For the button to link to this custom URL, enter a label in the Category Button Text field.
Number Of Items - Mobile	Determines how many items you want to display on mobile devices.
Number Of Columns - Mobile	Determines how many columns you want to use to display items on mobile devices.
Number Of Items - Tablet & Desktop	Determines how many items you want to display on tablet and desktop devices.
Number Of Columns - Tablet & Desktop	Determines how many columns you want to use to display items on tablet and desktop devices.

4. Click **Save**.

Remove a Featured Category

Depending on whether you have published the content to your website, use SMT to delete the featured category content type from your site in one of two ways:

- **Discard** the featured category if you haven't published the content.
- **Remove** the featured category if you have already published the content.

To discard a featured category (Unpublished Content):

1. While logged in to SMT on your website, select the **Review & Publish Changes** list from the Site Management toolbar.
2. Select the **Featured Category** content in the list.
3. Click **Discard**.
4. Click **OK**.

To remove a featured category (Published Content):

1. While logged in to SMT on your website, go to the page that contains the featured category content you want to remove.
2. In **Edit** mode, click the **Featured Category** box.
This highlights the featured category content and displays the content controls.
3. Click **Remove**.
4. Click **OK**.

Use a Custom Field Set

To optimize your website performance, you can create a custom field set using only the fields required by the extension and choose this field set to be used with Featured Category.

You can create a custom field set by running a script. Then you can select this field set on the SuiteCommerce Configuration record.

Important: If you don't select a custom field set to be used, the extension defaults to using the **search** field set.

The minimum fields required by the Featured Category extension are:

Field ID	Field Name
storedisplayname2	Store Display Name 2
displayname	Display Name
itemid	Name
internalid	Internal ID
itemimages_detail	Item Images (Detail)
matrixchilditems_detail	Matrix Child Items (Detail)
pricelevel1_formatted	Base Price (Formatted)
onlinecustomerprice_detail	Price for Current Customer (Detail)
urlcomponent	URL Component

To use a custom field set:

1. [Create a custom field set](#)
2. [Select the custom field set](#)

Create a custom field set

Using the code sample included in this section, create a custom field set using the required fields.

To create a custom field set:

1. Copy the contents of the Field Set Script below to a text editor.
2. Edit the `siteID` variable with the site ID you want to use.

The site ID is displayed in the URL when you go to the Web Site Setup page for the desired site.

Note: The default value of 9999 fails, since no site is ever assigned an ID of 9999.

3. Optional: Edit the `fieldsetId` and `fieldsetName` variables with the field set ID and field set name you want to use.
4. Run the script in the SuiteScript debugger:
 - a. Go to Customization > Scripting > Script Debugger.

- b. Enter the SuiteScript Debugger domain (by clicking the link as indicated) and then re-enter your login credentials if prompted.
- c. From the API Version dropdown, select 1.0.
Important: This script can only be run against **SuiteScript Version 1.0**.
- d. Copy and paste your modified script code into the debugger.
- e. Click **Debug Script** and then hit the **Continue** button.

After the script has executed, field sets are properly populated and can be verified in the **Field Sets** tab of the Web Site Setup record.

Field Set Script

```

1 var siteID = 99999 // change to the site ID you want to use
2 ,   fieldsetName = 'Featured Category Extension Field Set' // change to the field set name you want to use
3 ,   fieldsetId = 'featuredcategory_fieldset' // change to the field set ID you want to use
4 ,   siteRecord = nlapiLoadRecord('website', siteID);
5
6 siteRecord.selectNewLineItem('fieldset');
7 siteRecord.setCurrentLineItemValue('fieldset', 'fieldsetname', fieldsetName);
8 siteRecord.setCurrentLineItemValue('fieldset', 'fieldsetid', fieldsetId);
9 siteRecord.setCurrentLineItemValue('fieldset', 'fieldsetrecordtype', 'ITEM');
10 var fields =
11 'storedisplayname2,displayname,itemid,internalid,itemimages_detail,matrixchilditems_detail,pricelevel1_formatted,onlinecustomer
12 price_detail,urlcomponent';
13
14 siteRecord.setCurrentLineItemValue('fieldset', 'fieldsetfields', fields);
15 siteRecord.commitLineItem('fieldset');
16
17 recId = nlapiSubmitRecord(siteRecord);

```

Select the custom field set

After creating the custom field set, you can select this field set to be used with the Featured Category extension.

To select the field set:

1. After creating the custom field set, go to Commerce > Websites > Configuration.
2. Select the website and domain where the Featured Category extension is activated and click **Configure**.
3. Go to the **Extensions** tab, **Featured Product** subtab.
4. In the **Field Set ID** field, select the custom field set you created in the previous step.
If no field set is selected, the extension will continue using the **search** field set.
5. Click **Save**.

Featured Product

Applies to: SuiteCommerce | SuiteCommerce Advanced | Site Management Tools

The Featured Product extension lets you highlight a recommended product on your website. You can customize the appearance and behavior of the featured product and add a text ribbon. You can display the product image or upload a new image to be shown.

Clicking on an item takes shoppers to the product detail page for more information and purchasing options.

 **Important:** Commerce extensions are only available if provisioned, installed, and activated for a selected domain in your account. For more information, see [Commerce Extensions](#).

 **Note:** Extensions require SuiteCommerce or the Aconcagua release of SCA or later.

The information for the featured product is taken from the Item record. You can choose whether to show the availability and pricing information. For matrix items with different prices, a price range is displayed. In addition, you can use the product image taken directly from the Item record or upload a new image.

You can add a featured product to multiple areas on your website using Site Management Tools. For more information about Site Management Tools, see the help topic [Site Management Tools Overview](#).

This topic explains how to:

- [Add a Featured Product](#)
- [Configure a Featured Product](#)
- [Remove a Featured Product](#)
- [Use a Custom Field Set](#)

Add a Featured Product

To add a featured product to your web store, add the **Featured Product** content type to a page of your site using SMT.

To add a featured product:

1. In your website, go to the page where you want to add a featured product.
2. Log in to SMT.
For more information about logging in to SMT, see the help topic [Users and Roles in Site Management Tools](#).
3. In **Edit** mode, click **Add** on the Site Management toolbar.
4. Drag the **Featured Product** content type to the page.

 **Note:** If you don't see this content type, ensure that the extension has been installed and is active. Click **Settings** on the Site Management toolbar to access the Content Manager. Drag the content type from the Inactive Content Types list to the Active Content Type list.

You can drag a **Featured Product** content type to multiple areas on the page.

For more information about the scopes of different SMT areas, see the help topic [Area and Scope](#).

5. Configure the settings to best fit your needs.
See [Configure a Featured Product](#).

Configure a Featured Product

Configure properties to customize your featured product. You can decide which product information to display, select the image, and choose the ribbon and button texts.

To configure a featured product:

1. While logged in to SMT on your website, go to the page that contains the featured product.
2. In the **Featured Product** box, click **Edit**.
This displays the Featured Product Settings in the side panel.
3. Set the listed fields, using the table below as a reference.
4. Click **Save**.

Field	Description
Name	Sets the name for the featured product that appears in the Review Changes list in SMT.
Visibility	Determines the visibility option that determines when you want to make the featured product visible. For more information about visibility options, see the help topic View Site as of a Specific Date in Site Management Tools .
Product	Sets the product that you want to feature. With the Featured Product extension, you can only feature one item at a time. If you want to feature more than one item, create a special commerce category for the items you want to display and use the Featured Category extension. See Featured Category .
Hide Product Price	If checked, hides the price of the featured product. If you have set up your website to restrict pricing to registered users and don't check this box, the item's price is only displayed when the user is logged in.
Hide Product Availability	If checked, hides the stock availability of the featured product. For an out-of-stock item: ■ If you have set up your web store to show products when out of stock and don't check this box, the item is displayed as out of stock. ■ If you have set up your web store to hide products when out of stock and check this box, the featured product is not displayed.
Change Image	Changes the image displayed for the featured product. If no image is selected, the extension uses the image from the Item record.  Note: If there are multiple images associated with the Item record, the first image is used. If there are no images in the Item record or if you have entered the ID of a matrix child item, your theme's image placeholder is used. To upload a new image using the Image Manager, click No File Chosen and select an image. To change the existing image, click Remove Image, then click No File Chosen to select another image.  Important: This field sets the image for the Featured Product extension only. It does not change the image associated with the Item record.
Ribbon Text	Sets the ribbon text displayed on the featured product image. For example, you can use this field to add the text "Special Offer." The ribbon style is taken from your theme. If you leave this field blank, the ribbon does not appear.
Button Text	Sets the text displayed on the button. This button redirects shoppers to the product page.
Button Style	Determines the type of button displayed. The button style is taken from your theme.

Field	Description
Image Resize ID	Links to the image resizing option you want the image to use. To use this option, you must enter an enabled Image Size ID (Images tab > Image Resizing section) of the Web Site Setup record (Commerce > Websites > Web Site List). For more information about Image Resizing, see Image Resizing and Compression .
Tags	Sets keywords to help filter your content in the Review Changes list. For more information about content tags, see Content Tags and Filter Tools .

Remove a Featured Product

Depending on whether you have published the content to your website, use SMT to delete the featured product content type from your site in one of two ways:

- **Discard** the featured product if you have not published the content.
- **Remove** the featured product if you have already published the content.

To discard a featured product (Unpublished Content):

1. While logged in to SMT on your website, select the **Review & Publish Changes** list from the Site Management toolbar.
2. Select the **Featured Product** content in the list.
3. Click **Discard**.
4. Click **OK**.

To remove a featured product (Published Content):

1. While logged in to SMT on your website, go to the page that contains the featured product content you want to remove.
2. In **Edit** mode, click the **Featured Product** box.
This highlights the featured product content and displays the content controls.
3. Click **Remove**.
4. Click **OK**.

Use a Custom Field Set

To optimize your website performance, you can create a custom field set using only the fields required by the extension and choose this field set to be used with Featured Product.

You can create a custom field set by running a script. Then you can select this field set on the SuiteCommerce Configuration record.

Important: If you don't select a custom field set to be used, the extension defaults to using the **details** field set.

The minimum fields required by the Featured Product extension are:

Field ID	Field Name
itemimages_detail	Item Images (Detail)
itemoptions_detail	Item Options (Detail)
internalid	Internal ID
matrixchilditems_detail	Matrix Child Items (Detail)
onlinecustomerprice_detail	Price for Current Customer (Detail)
quantityavailable	Available
displayname	Display Name
itemid	Name
storedetaileddescription	Detailed Description
storedisplayname2	Store Display Name 2
isinstock	In Stock

To use a custom field set:

1. [Create a custom field set](#)
2. [Select the custom field set](#)

Create a custom field set

Using the code sample included in this section, create a custom field set using the required fields.

To create a custom field set:

1. Copy the contents of the Field Set Script below to a text editor.
2. Edit the `siteID` variable with the site ID you want to use.
The site ID is displayed in the URL when you go to the Web Site Setup page for the desired site.

 **Note:** The default value of 9999 fails, since no site is ever assigned an ID of 9999.

3. Optional: Edit the `fieldsetId` and `fieldsetName` variables with the field set ID and field set name you want to use.
4. Run the script in the SuiteScript debugger:
 - a. Go to Customization > Scripting > Script Debugger.
 - b. Enter the SuiteScript Debugger domain (by clicking the link as indicated) and then re-enter your login credentials if prompted.
 - c. From the API Version dropdown, select 1.0.
Important: This script can only be run against **SuiteScript Version 1.0**.
 - d. Copy and paste your modified script code into the debugger.
 - e. Click **Debug Script** and then hit the **Continue** button.

After the script has executed, field sets are properly populated and can be verified in the **Field Sets** tab of the Web Site Setup record.

Field Set Script

```

1 var siteID = 99999 // change to the site ID you want to use
2 ,   fieldsetName = 'Featured Product Extension Field Set' // change to the field set name you want to use
3 ,   fieldsetId = 'featuredproduct_fieldset' // change to the field set ID you want to use
4 ,   siteRecord = nlapiLoadRecord('website', siteID);
5
6 siteRecord.selectNewLineItem('fieldset');
7 siteRecord.setCurrentLineItemValue('fieldset', 'fieldsetname', fieldsetName);
8 siteRecord.setCurrentLineItemValue('fieldset', 'fieldsetid', fieldsetId);
9 siteRecord.setCurrentLineItemValue('fieldset', 'fieldsetrecordtype', 'ITEM');
10 var fields = 'itemimages_detail,itemoptions_detail,internalid,matrixchilditems_detail,onlinecustomerprice_detail,quantityavailable,displayname,itemid,storedetaileddescription,storedisplayname2,isinstock';
11
12 siteRecord.setCurrentLineItemValue('fieldset', 'fieldsetfields', fields);
13 siteRecord.commitLineItem('fieldset');
14
15 recId = nlapiSubmitRecord(siteRecord);

```

Select the custom field set

After creating the custom field set, you can select this field set to be used with the Featured Product extension.

To select the field set:

1. After creating the custom field set, go to Commerce > Websites > Configuration.
2. Select the website and domain where the Featured Product extension is activated and click **Configure**.
3. Go to the **Extensions** tab, **Featured Product** subtab.
4. In the **Field Set ID** field, select the custom field set you created in the previous step.
If no field set is selected, the extension will continue using the **details** field set.
5. Click **Save**.

Gifts

Applies to: SuiteCommerce | SuiteCommerce Advanced

With Commerce web stores, you can add shopping features to your web store that help customers shop for other recipients:

- You can offer digital gift certificates that give users store credit for your web store
- You can let users add gift wrapping and personalized messages to their orders

Gift Certificates

Applies to: SuiteCommerce | SuiteCommerce Advanced

You can sell gift certificates on your website that allow customers to purchase store credit they can send to someone as a gift.

Gift Certificates are set up as items in NetSuite. For more information about setting up Gift Certificates, see the help topic [Gift Certificates](#).

After setting up Gift Certificates, see the following topics for more information about working with Gift Certificates:

- [Buy Gift Certificates in the Web Store](#)
- [Apply Gift Certificates in the Web Store](#)
- [Gift Certificate Management](#)

Buy Gift Certificates in the Web Store

i Applies to: SuiteCommerce | SuiteCommerce Advanced

To purchase a gift certificate, a user enters the recipient's information and their own information in the fields displayed on the Web store page and then adds the gift certificate to the shopping cart. When the user submits the transaction, a notification email is automatically sent to the recipient indicating that a gift certificate has been purchased for them.

A corresponding sales order is generated in your account. After you bill that sales order, the recipient receives another email with the gift certificate authentication code. They can use the authentication code to redeem the gift certificate in the web store.

To use the gift certificate in the web store, see [Apply Gift Certificates in the Web Store](#).

Apply Gift Certificates in the Web Store

i Applies to: SuiteCommerce | SuiteCommerce Advanced

To use a gift certificate on a web store order, the user enters their gift certificate authentication code in the corresponding field on the Payment Method page. A message is displayed to the user indicating whether the gift certificate code is valid. Users can apply multiple gift certificates to one web store order.

Gift certificates are applied in the order they're entered, and customers can't change the amount used from each one.

The Gift Certificate field displays at two points during the checkout process: on the payment information page, and on the order confirmation page. On the last page of checkout, each discount applied to the order displays in the item list.

If there is a remaining balance on the order that is not covered by the gift certificate or by multiple gift certificates, or if the gift certificates have expired, the user is not allowed to submit the order until they enter their credit card information.

If the amount of the gift certificate is greater than the order total, the user is allowed to submit the order, and use the gift certificate code again.

You can view the remaining value on a gift certificate in the list at Lists > Accounting > Gift Certificates.. For more information about gift certificate status, see the help topic [Viewing and Editing Gift Certificate Status](#).

You can also add a Gift Certificate value check page using the SuiteCommerce Gift Certificate Value Check extension where gift certificate recipients can view their balance. For more information, see [Gift Certificate Management](#).

Gift Certificate Management

Applies to: SuiteCommerce | SuiteCommerce Advanced

The Gift Certificate Management extension lets you do the following:

- **Group Gift Certificates in Your Web Store** — group existing Gift Certificates to display them as item options in your web store.
- **Add Gift Certificate Value Check** — allow users to check the remaining balance of gift certificates on a new landing page.
- **Display Gift Certificates in My Account** — let users check the remaining balance of gift certificates, review gift certificate details, and store the gift certificates in their My Account.

Important: Commerce extensions are only available if provisioned, installed, and activated for a selected domain in your account. For more information, see [Commerce Extensions](#).

Note: Extensions require SuiteCommerce or the Aconcagua release of SCA or later.

Prerequisites

To take advantage of the Gift Certificate Management extension, you must have previously set up Gift Certificates for your site. For more information, see the help topic [Setting Preferences for Gift Certificate Authentication Codes](#).

Group Gift Certificates in Your Web Store

Applies to: SuiteCommerce | SuiteCommerce Advanced

This extension introduces Gift Certificate Groups, which lets you display related gift certificates together on the Product Listing Page (PLP) and Product Detail Pages (PDP) of your site, instead of listing each gift certificate individually.

For example, you can create one group called \$50–\$500 Gift Certificates and one group called \$1000–\$1500 Gift Certificates. You can assign multiple gift certificates to a group. For each group, choose one gift certificate to display on the PLP, while hiding the others. On the PLP, one gift certificate displays using the group name. When users click on a category of gift certificates, the PDP shows one gift certificate with all gift certificates in that group as item options for sale.

The result of this approach mimics matrix items, but by using Gift Certificate Groups as the mechanism behind the item options you retain more control over how the gift certificates display on your site.

To set up Gift Certificate Groups for your site, you must:

1. [Configure Gift Certificate Groups](#)
2. [Update Field Sets](#)
3. [Enable Gift Certificate Groups for a Gift Certificate](#)
4. [Create a Gift Certificate Group](#)
5. [Add Facet Fields](#)

Watch the following help video for information about grouping gift certificates in your web store:

[Setting Up Gift Certificate Groups](#)

Configure Gift Certificate Groups

Use the SuiteCommerce Configuration record to enable the gift certificate grouping feature and determine how the gift certificate item options display on your site.

To configure Gift Certificate Groups:

1. In NetSuite, go to Commerce > Websites > Configuration.
2. Select the website and domain where the Gift Certificate Management extension is activated and click **Configure**.
3. Go to the **Extensions** tab and the **Gift Certificate Advanced** subtab.
4. In the **Gift Certificate Item Options** section, set the following fields:

Field	Description
Group Certificates as Item Options	If checked, enables the grouping feature that displays gift certificates as item options.
Item Options Title — Gift Certificates	Sets the title that appears before the gift certificate item option on the PDP.
Show Image Options Swatch	If checked, enables images for the gift certificate item options.
Item Options Button Label — Gift Certificates	Sets the label for the gift certificate item option button. You can use the following placeholders, which are replaced by their associated values automatically: ■ <code>[[name]]</code> – item name ■ <code>[[price]]</code> – item price If Require Login for Pricing is enabled on the Web Site Setup record, this label will omit the price. If the only tag or text present is <code>[[price]]</code>, the label displays the gift certificate name. For more information about the Require Login for Pricing field, see the help topic Shopping Preferences. This field is overridden by the Item Options Button Label field on the Item record.
Hide Inventory Types from Facets	If checked, hides Inventory Types from Facets filters that are automatically added by the extension to group the certificates.
Price Range	Sets the label for the price range of the gift certificate group to display on the PLP. You can use the following placeholders, which are replaced by their associated values automatically:

Field	Description
	■ <code>[[minPrice]]</code> ■ <code>[[maxPrice]]</code>

5. Click **Save**.

Update Field Sets

The field sets for a website determine the data that is exposed to site templates. To employ the Gift Certificate Management grouping feature, you must add the **Item Options Button Label** and **Gift Certificate Group ID** fields to the site's **details** field sets. For more information about field sets, see [Define Field Sets](#).

To add Gift Certificate Management fields to the Web Site Setup Record:

1. Go to Commerce > Websites > Website List.
2. Click **Edit** next to the website for which you're adding Gift Certificate Management.
3. Go to the **Field Sets** subtab.
4. Add the **Item Options Button Label** and **Gift Certificate Group ID** fields to the **details** field set.

For each field, perform the following steps:

- a. Locate the **Fields Included in Field Set** column of the **details** field set and click the **Set** button.
 - b. Select the fields from the **Field Name** list and click **Add**.
 - c. In the Field Set window, click **Submit**.
 - d. In the Field Set row, click **OK**.
5. Repeat Step 4 for the **Search** field set.
 6. After adding the **Item Options Button Label** and **Gift Certificate Group ID** to both field sets, click **Save**.

Enable Gift Certificate Groups for a Gift Certificate

To group items using Gift Certificate Management, the extension must be enabled at the item level. Using the Item record, you can associate the gift certificate with a group and determine how you want to display the item on your site. You can use this record to designate one gift certificate in each group to be visible on the PLP, while making the others only appear on the PDP.

To enable Gift Certificate Groups for a gift certificate:

1. In NetSuite, go to Lists > Accounting > Items.
2. Click **Edit** next to the item which you want to add to a gift certificate group.
Go to the **SuiteCommerce Extensions** tab and the **Gift Certificate Advanced** subtab.
3. Set the following fields:

Field	Description
Item Options Button Label	Sets the label for the gift certificate item option buttons. You can use the following placeholders, which are automatically replaced by their associated values: ■ <code>[[name]]</code> – item name

Field	Description
	■ <code>[[price]]</code> – item price If Require Login for Pricing is enabled on the Web Site Setup record, this label will omit the price. If the only tag or text present is <code>[[price]]</code>, the label displays the gift certificate name. For more information about the Require Login for Pricing field, see the help topic Shopping Preferences. This field overrides the Item Options Button Label field on the SC Configuration record.
Only Show in Product Detail Page	If checked, hides this gift certificate from the PLP, Search results, and Filter results. The Gift Certificate Group determines which item options to display on the PDP. For example, you can choose one gift certificate in each group to display on both the PLP and PDP; for the other gift certificates in the group, check this box to make it only appear on the PDP.
Gift Certificate Group	Determines the Gift Certificate Group to which the gift certificate is linked. You can choose an existing group from the drop-down list or make a new group. For more information, see Create a Gift Certificate Group.

4. Click **Save**.

Create a Gift Certificate Group

Gift Certificate Groups let you choose which gift certificate items you want to associate with each other.

To create a gift certificate group:

1. In NetSuite, go to Lists > Accounting > Items.
2. Click **Edit** next to the item which you want to add to a gift certificate group.
3. Go to the **SuiteCommerce Extensions** tab and the **Gift Certificate Advanced** subtab.
4. In the **Gift Certificate Group** field, click the **New** button.
This opens the new Gift Certificate Group record.
5. In the **Name** field, enter a group name.
6. Click **Save**.
This closes the Gift Certificate Group record and lists the new group in the **Gift Certificate Group** field.
7. Click **Save**.

 **Tip:** The **Name** field displays as the Gift Certificate Group name on the PLP. Using the example from above, you can set the **Name** field as **\$1000-\$1500 Gift Certificates** and select this group for each gift certificate you want to include in the group. The **Web Store Display Name** field on the Gift Certificate record (Gift Certificate record > Web Store > Web Store Display) displays as the gift certificate name on the PDP. Doing this displays the group name on the PLP, while showing the individual gift certificate with item options on the PDP.

Add Facet Fields

To set up facets for Gift Certificate Management, select facet fields on the Web Site Setup record.

Follow the instructions for selecting facet fields in [Select and Configure Facet Fields](#), ensuring that you add the following facet fields on the Web Site Setup record:

- Type

- Only Show in Product Detail Page
- Gift Certificate Group ID

Add Gift Certificate Value Check

i Applies to: SuiteCommerce | SuiteCommerce Advanced

The Gift Certificate Management extension lets you add a value check feature to your website so users can check the balance on their gift certificates. You can add a predefined page where gift certificate recipients can check the balance without having to log in and visit their My Account page.

Shoppers can check the status of gift certificates by entering the gift certificate code in the field. They can view the gift certificate's balance and the expiration date. If the gift certificate has expired, a message is displayed to the user indicating the expiration date.

This topic explains how to:

- [Configure Gift Certificate Value Check](#)
- [Link to the Gift Certificate Value Check Page](#)

This extension also lets you include the value check feature on the My Account page. To enable features on the My Account page, see [Display Gift Certificates in My Account](#).

Watch the following help video for information about enabling users to check gift certificate balances:

 [Adding a Gift Certificate Value Check](#)

Configure Gift Certificate Value Check

Use the SuiteCommerce Configuration record to enable the gift certificate value check application, set a URL path for the landing page, and customize labels and messages to fit your needs.

To configure Gift Certificate Value Check:

1. In NetSuite, go to Commerce > Websites > Configuration.
2. Select the website and domain where the Gift Certificate Management extension is activated and click **Configure**.
3. Go to the **Extensions** tab, **Gift Certificate Value Check** subtab.
4. Check the **Enable Gift Certificate Value Check** box to show the Gift Certificate Value Check application on a landing page of your website.
5. Fill out the listed fields for each category, using the tables below as references.
6. Click **Save**.

Landing Page Fields:

Field	Description
URL Path	Determines the URL path for the Gift Certificate Value Check page.
Page Title — Landing Page	Sets the title for the Gift Certificate Value Check page.
Input Label — Landing Page	Sets the label for the input field where users supply a gift certificate code.
Input Placeholder	Determines the placeholder for the input field to give users an example of a gift certificate code.
Check Button Label	Sets the label for the check balance submit button.

Field	Description
Field Help	Determines the field level help for the Gift Certificate input field.
Paste Icon Help	Determines the help message for the paste icon.
Field Min. Length	Sets the minimum length for the gift certificate code.
Field Max. Length	Sets the maximum length for the gift certificate code.
Save to My Account Button Label	Sets the label for the button that saves the certificate to My Account after login. The user is first directed to a login page if not logged in.

Messaging Fields:

Field	Description
Invalid Code Warning	Determines the message to display when a user enters an invalid code.
Expired Code Warning	Determines the message to display when a user enters an expired code.
Inactive Code Warning	Determines the message to display when a user enters an inactive code.
Remaining Value Label	Sets the label to display the remaining value of the gift certificate.
Gift Certificate Code Label	Sets the label to display the code of the gift certificate.
Past Expiration Date	Sets the label to display when a gift certificate expired.
Future Expiration Date	Sets the label to display when a gift certificate will expire.

Link to the Gift Certificate Value Check Page

You access the Gift Certificate Value Check page by adding the path entered in the **URL Path** field on the SC Configuration record to your website domain (the default path is gift-certificate-balance).

You can add the Gift Certificate Value Check page URL as a link on your website footer using Site Management Tools (SMT). For more information about how to add a hyperlink to your website footer using SMT, see [Adding Text and Image Content](#).

Display Gift Certificates in My Account

i Applies to: SuiteCommerce | SuiteCommerce Advanced

The Gift Certificate Management extension lets you include a gift certificate section on shoppers' My Account pages. Users can use this section to check the remaining balance of their gift certificates and store gift certificates in one place.

When a user orders a gift certificate, the extension checks if the recipient's email address is associated with an account of your web store. If the recipient has an account, the extension automatically stores the gift certificate in the gift certificate section of the recipient's account.

After storing a gift certificate, users can see the following gift certificate details:

- Code number
- Remaining balance
- Expiration date
- Sender
- Date sent
- Original amount

Note: If you use a theme based on SuiteCommerce Base Theme 19.1 or earlier, the gift certificate section of My Account does not appear on mobile devices. Mobile users can still use the gift certificate value check feature on a landing page.

Watch the following help video for information about enabling users to review gift certificate details and store gift certificates:

 [Enabling Shoppers to Check and Store Gift Certificates](#)

Configure Gift Certificates in My Account

Use the SC Configuration record to enable gift certificate value check and storage on the My Account page. You can determine the feedback messages and appearance of the Gift Certificate Table in My Account.

To configure Gift Certificates in My Account:

1. In NetSuite, go to Commerce > Websites > Configuration.
2. Select the website and domain where the Gift Certificate Management extension is activated and click **Configure**.
3. Go to the **Extensions** tab, **Gift Certificate Advanced** subtab.
4. In the **Gift Certificate My Account** section, check the **Enable Gift Certificates in My Account** box to show Gift Certificates in the My Account application.
5. Fill out the listed fields for each category, using the tables below as references.
6. Click **Save**.

My Account Fields:

Field	Description
Page Title — My Account	Sets the title for the My Account page.
Available Balance Label — My Account	Sets the label to display the available balance of a gift certificate.

Table Fields:

Field	Description
Title — Gift Certificate Table	Sets the title for the gift certificate table.
Description — Gift Certificate Table	Determines the description for the gift certificate table.
Code — Gift Certificate Table	Sets the label for the gift certificate code column of the gift certificate table.
Remaining Balance — Gift Certificate Table	Sets the label for the remaining balance column of the gift certificate table.
Expiry Date — Gift Certificate Table	Sets the label for the expiration date column of the gift certificate table.
Sender — Gift Certificate Table	Sets the label for the sender column of the gift certificate table.
Date Format	Determines the format in which the date appears.
Date Sent — Gift Certificate Table	Sets the label for the date sent column of the gift certificate table.
Original Amount — Gift Certificate Table	Sets the label for the original amount column of the gift certificate table.

Field	Description
Expired Label — Gift Certificate Table	Determines the message to display in the remaining balance column of the gift certificate table when the gift certificate has expired.
Remove — Gift Certificate Table	Sets the label for the remove gift certificate link in the gift certificate table.
Copy Icon Help — Gift Certificate Table	Determines the help message for the copy icon.
Copy Confirmation — Gift Certificate Table	Determines the confirmation message that appears when the gift certificate code is copied to the clipboard.
More Details — Gift Certificate Table	Sets the label to show more details of the gift certificate table in mobile versions.
Less Details — Gift Certificate Table	Sets the label to show fewer details of the gift certificate table in mobile versions.

Messaging Fields:

Field	Description
Code Saved to My Account	Determines the message to display after a gift certificate code has been successfully saved. Message stays visible for five seconds.
Code Removed from My Account	Determines the message to display after a gift certificate code has been successfully removed. Message stays visible for five seconds.
Undo Remove Code from My Account	Sets the label for the button to undo the remove gift certificate code action.
Duplicate Code in My Account	Determines the message to display if a duplicate gift certificate code is entered.
Expired Code Warning Message	Determines the message to display if an expired gift certificate code is entered.
General Warning	Determines the message to display when there is an error with saving, loading, or deleting.

Gift Wrap & Message

i Applies to: SuiteCommerce | SuiteCommerce Advanced

The Gift Wrap & Message extension lets you offer gift wrap options in your web store and allow users to add personalized messages to their orders. You can:

- create multiple gift wrap items, organizing your options by size, color, and type
- determine items to be gift wrapped and the gift wrap options to be used
- display gift wrap colors and images in the web store
- customize the messages displayed to users

Important: Commerce extensions are only available if provisioned, installed, and activated for a selected domain in your account. For more information, see [Commerce Extensions](#).

Note: Extensions require SuiteCommerce or the Aconcagua release of SCA or later.

Gift options are displayed in the product detail page and in the cart summary. Users see a link to add gift wrap below the product options. When they click this link, the gift wrap options available for the product

are shown. You can include gift wrap options as images or text, and provide a description. The gift wrap price is displayed.

You can set up various gift wrap options for each item or a single gift wrap option for all items. Items only display the gift wrap options that can be used.

You can also let users to add a personalized message to their order. They can enter their name, the recipient's name, and add a personalized text message. You can then print the message and attach it to the order's packing slip.

Installation

SuiteCommerce Gift Wrap & Message is an extension SuiteApp. You need to install the SuiteApp and activate the extension for a specific website or domain. For more information, see [Installing Theme and Extension SuiteApps](#) and [Manage Themes and Extensions](#).

Set Up Gift Wrap

Applies to: SuiteCommerce | SuiteCommerce Advanced

To set up SuiteCommerce Gift Wrap & Message in your web store, you need to perform the following steps:

1. [Add Gift Wrap Fields to the Website Setup](#)
2. [Create Gift Wrap Items](#)
3. [Assign Gift Wrap Options to Web Store Items](#)

Add Gift Wrap Fields to the Website Setup

To check whether an item can be gift wrapped and the gift wrap options applicable, you need to add the gift wrap fields to the detail field set for your website. You also need to add the gift wrap item to the facet fields to hide the gift wrap items from your web store search.

When you add the gift wrap fields to your Website Setup record, they are displayed on all domains. For information about how to hide gift wrap fields in other domains associated with your website, see [Disable Gift Wrap](#).

To add the gift wrap fields to the setup:

1. Go to Commerce > Websites > Website List.
2. Click **Edit** beside the website to which you want to add gift wrap fields.
3. Go to the **Field Sets** tab.
4. In the **Fields Included in the Field Set** field for the details Field Set ID, add the following fields:
 - Gift Wrap Options — `custitem_ns_sc_ext_gw_options`
 - Can Be Gift Wrapped — `custitem_ns_sc_ext_gw_iswrappable`
5. Click **Add**.
6. Go to the **Search Index** tab, to **Facet Fields** subtab.
7. Select Gift Wrap Item in the **Facet Field Name** dropdown field and click **Add**.
8. Save the Website Setup record.

Create Gift Wrap Items

Gift wrap items represent the different gift wrap options you make available to users in your web store. You can create gift wrap items as inventory or non-inventory items.

If you want to offer different options (like colors, sizes, or patterns) for a gift wrap category, you create a matrix item. For example, if you want to offer gift wrap boxes in various colors, you create the box as the parent matrix item and create the various colors as child matrix items. You should create a new matrix item per wrap variation. For example, one matrix item for standard wrapping & colors and a second matrix item for premium wrapping. For more information, see the help topic [Matrix Items](#).

To create a gift wrap item:

1. Go to Lists > Accounting > Items > New.
2. Click the **Item Type**. For the gift wrap item, use either **Inventory** or **Non-Inventory Item** types.
3. In the **Web Store** tab, select the **Display in Web Store** box.
4. Set up the gift wrap as an item for the web store.

Enter information in the following fields:

- **Item Name**
- **Item Price**
- **Web Store Display Name**

If you don't enter a value in this field, the item's display name is taken.

- **Display Name**

Add up to 30 characters as a description for the gift wrap in the **Web Store Description** field. This is displayed beside the gift wrap option in the web store.

For information about setting up items for your web store, see [Item Record Setup](#).

5. Attach images to display in the web store for the gift wrap item.
For example, if you offer different gift wrap patterns, you can display a sample of the wrap. See [Item Images](#).
6. Go to the **SuiteCommerce Extensions** tab, to the **Gift Wrap** subtab.
7. Check the **Gift Wrap Item** box.
8. Click **Save**. If you create a Matrix Item, click **Create Matrix**.

Assign Gift Wrap Options to Web Store Items

Gift wrap options are determined at item level. You assign all gift wrap options that can be used for the item in the Item record.

You can edit each item individually or update the gift wrap options using a mass update script. For information about how to update options using mass update, see the help topic [SuiteScript 2.x Mass Update Script Type](#).

To select the gift wrap options for an item:

1. Go to Lists > Accounting > Items.
2. Click **Edit** next to the item for which you want to add gift wrap options.
3. Go to the **SuiteCommerce Extensions** tab, to the **Gift Wrap** subtab.

4. Check the **Can be gift wrapped** box.
5. In the **Gift Wrap Options** box, select all gift wrap options that can be used for the item.
6. Click **Save**. If the item is a matrix item, click **Update Matrix**.

Customize Gift Wrap

Applies to: SuiteCommerce | SuiteCommerce Advanced

When you install SuiteCommerce Gift Wrap & Message, gift wrap options are displayed in the product detail page and in the cart summary. By default, the gift message section is hidden.

Gift options in the product detail page use the selector template set up in your site configuration for matrix items. If you associate images with the gift wrap item record, SuiteCommerce Gift Wrap & Message uses these images to show the gift wrap options.

Default label text is provided for all gift wrap fields.

Configure Gift Wrap Display Options

You can determine how the gift option is displayed in the web store. You set up the color options for gift wrap as transaction item options. See the help topic [Creating Custom Transaction Item Options](#).

If you want gift wrap item options to use a different selector template, you need to create separate item options for gift wrap.

You can set up images for each gift wrap item that lets the user view different patterns or colors. For more information, see [Item Images](#).

Note: When setting up images for each gift wrap item, it's necessary to use the correct file name format for the images. For the **Item Identifier** dropdown list, choose **Display Name/Code**. Depending on how you configured your transaction item options, the images could then be named with the format `giftColors.red.jpg`, for example. For more information, see [Define the File Name Format](#).

To determine the display option for gift wrap items:

1. Go to Commerce > Websites > Configuration.
2. Go to the **Advanced** tab, **Item Options** subtab.
3. In the **Item Options and Custom Transaction Column Fields** section, enter the ID of the item option you have set up for gift wrap colors in the **Cart Option ID** field.
4. In the **Selector Template**, select the template that you want to use to select gift wrap option such as colors or patterns.

Use `product_views_option_tiles.tpl` to display gift wrap options as text, and `product_views_option_color.tpl` to display gift wrap options as colors or images. If you don't specify this value, the default used is `product_views_option_tiles.tpl`.
5. Click **OK**.
6. Save the Configuration record.

To display gift wrap images:

1. Go to Commerce > Websites > Configuration.
2. Go to the **Shopping Catalog** tab, **Multi-Image Option** subtab.
3. In the **Multi-Image Option** column, enter the ID of the transaction item option field that you used for the gift wrap item.
4. Click **OK**.
5. Save the Configuration record.

Customize Gift Wrap Text

You customize the text used for Gift Wrap & Message field labels in the SuiteCommerce Configuration record. The text fields that can be customized are listed in the following table.

Field	Description
Title - Gift Options	Title displayed above the gift options on the product page. Default value: Buying a gift?
Product Page - Loading	Message displayed when loading the gift options for the item. Default value: Loading...
Product Page - Loading Error Text	Message displayed when an error occurred while loading the gift options for the item. Default value: Gift Wrap options failed to load. Please retry.
Add Gift Wrap Button Label	Text displayed on the button to view gift wrap options. This field is required. Default value: Add Gift Wrap
Description - Gift Options	Text displayed to describe the gift wrap options. Default value: We'll add a gift message to the packing slip and hide the prices.
Price Label - Gift Options	Label to indicate the price of the gift wrap option. Use the <code>{{price}}</code> placeholder to replace the value. Default value: Price: {{price}}
Default Wrap Item - Gift Options	Select the default gift wrap item to be used for items where no gift wrap has been specified. If you don't specify a default gift wrap, the first gift wrap option for the item is taken.
Show Message Section	Check this box if you want to allow users to add personalized messages to their gift order.
Section Label - Message	Text to describe the personalized message area. Default value: Add a personalized gift message to your order!
Sender Label - Message	Text used to indicate the field where the user enters the sender's name. Default value: From:
Recipient Label - Message	Text used to indicate the field where the user enters the recipient's name. Default value: To:
Message Area Label - Message	Text used to described the personalized message field. Default value: Add Gift Message:

Field	Description
Remove Gift Button Label	Text displayed on the button to remove the gift wrap options on the product page. This field is required. Default value: Remove Gift Wrap
Gift Wrap Info - Cart Summary & Checkout	Text indicating that gift wrap items are counted in the cart's item total. Default value: Gift wrap included in the item count.
Gift Wrap Info - Cart Lines	Text used in the cart to indicate the gift wrap options selected. Default value: Gift Wrap:
Gift Wrap Value – Cart Lines	Text used in the cart to indicate the total for the gift wrap options selected. Use the {{name}} and {{price}} placeholders for the gift option name and price, respectively. Default value: {{name}} {{price}}

To change the gift wrap default text:

1. Go to Commerce > Websites > Configuration.
2. In the SuiteCommerce Configuration record, go to the **Extensions** tab.
3. On the **Gift Wrap & Message** subtab, customize the text as required.
4. Click **Save**.

To enable the gift message section:

1. Go to Commerce > Websites > Configuration.
2. In the SuiteCommerce Configuration record, go to the **Extensions** tab.
3. On the **Gift Wrap & Message** subtab, check the **Show Message Section** box.
4. Click **Save**.

Disable Gift Wrap

 **Applies to:** SuiteCommerce | SuiteCommerce Advanced

When you install the SuiteCommerce Gift Wrap & Message extension, gift wrap options are displayed in all domains associated with the Website Setup record by default. You can disable gift wrap for specific domains in the SuiteCommerce Configuration record. When you have disabled the extension for a specific domain, you must clear the domain cache.

Important: If you're using the Kilimanjaro release of SuiteCommerce Advanced or earlier, you need to disable gift wrap fields by modifying the source code template. For more information, see the help topic [Disabling Display of SuiteCommerce Gift Wrap & Message Extension Transaction Line Fields](#).

To disable SuiteCommerce Gift Wrap & Message:

1. Go to Commerce > Websites > Configuration.
2. Select the website and domain where you want to disable SuiteCommerce Gift Wrap & Message.
3. In the SuiteCommerce Configuration record, go to the **Extensions** tab.
4. On the **Gift Wrap & Message** subtab, clear the **Enable Gift Wrap** box.

5. Click **Save**.

To clear the domain cache:

1. Go to Commerce > Content Management > Cache Invalidation Requests.
2. Click **New Invalidation Request**.
3. Double-click on the domain for which you want to clear the cache.
4. Choose the **Clear cache for the whole domain(s)** option.
5. Click **Submit**.
6. Click **OK**.

Gift Wrap Customer Experience

Applies to: SuiteCommerce | SuiteCommerce Advanced

When SuiteCommerce Gift Wrap & Message is activated, customers can add gift wrap to individual items on the product detail page. This is an example of the initial Gift Wrap & Message link:

BUYING A GIFT?

Add Gift Wrap

When the customer clicks on the Add Gift Wrap link, the item section expands to include a Gift Wrap box and form fields to add a personal message to the recipient. This is an example of the Gift Wrap & Message item options section:

BUYING A GIFT?

We'll add a gift message to the packing slip and hide the prices.

Look Book

Applies to: SuiteCommerce | SuiteCommerce Advanced

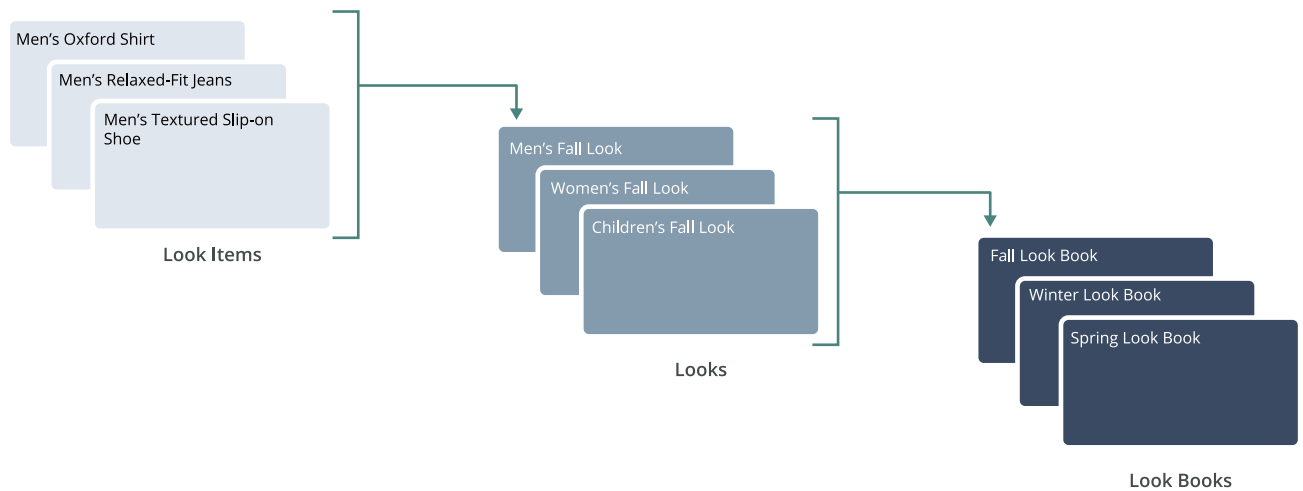

The Look Book extension lets you create a visual portfolio on your site representing individual looks of a larger collection. Look Book lets you showcase new items, engage customers through images to convey a theme, highlight corresponding items within a collection, and drive additional sales. The Look Book displays as a slider of Looks that are linked to a collection of Look Items. Users can browse through the high impact slides to shop the look that is right for them. In addition, they can see a **Looks Good With** section on the product detail page (PDP) of an included item that links to other Look Items in a Look.

Important: Commerce extensions are only available if provisioned, installed, and activated for a selected domain in your account. For more information, see [Commerce Extensions](#).

Note: Extensions require SuiteCommerce or the Aconcagua release of SCA or later.

For example, if you have a clothing store, you can create a Look Book for each season, with each season highlighting a Men's Look, a Women's Look, and a Children's Look. Each of these Looks can then feature

Look Items that are ready for purchase. In the following diagram, you can see how you select items (Oxford Sports Shirt, Relaxed-Fit Jeans, and Men's Textured Slip-On Shoes) to include in the Men's Fall Look of the Fall Look Book.

- **Look Item** — A Look Item is a product that you choose to display with other associated items on the Look page. Related Look Items appear as part of a **Looks Good With** section, which is created with the extension on the PDP.
- **Look** — A Look is a collection of related Look Items, with multiple Looks comprising a Look Book. You can display your various Looks in the Look Book slider, with each Look getting its own slide. By clicking on a Look slide, you can reach a Look page containing its Look Items.
- **Look Book** — A Look Book is a collection of related Looks. This is the first thing users see when visiting the Look Book page of your site. It displays as a photo slider, which users can interact with to click through the included Look slides. You can create different Look Books for different occasions, each highlighting different Looks.

Note: Look Books must be accessed through the URL path, so you can choose how to link to the Look Book page from your site. For example, you can use SMT Text Content to add a link to your home page. For more information about SMT Text Content, see [Site Management Tools Text Content](#).

Each Look has a corresponding record in NetSuite, which you can configure to change how the Look displays. After creating a Look Book record in NetSuite, you can add Look records to associate with the Look Book. Each Look record then allows you to add corresponding Look Item records.

This image is an example of a Look.

To enable the Look Book feature for your site, you must:

1. [Configure the Look Book extension](#)
2. [Create a Look Book](#)
3. [Add Looks to a Look Book](#)
4. [Add Look Items to a Look](#)

Configure the Look Book extension

Applies to: SuiteCommerce | SuiteCommerce Advanced

Use the SuiteCommerce Configuration record to determine the Look Book section titles and display style.

To configure the Look Book:

1. In NetSuite, go to Commerce > Websites > Configuration.
2. Select the website and domain where the Look Book extension is activated and click **Configure**.
3. Go to the **Extensions** tab.
4. On the **Look Book** subtab, set the following fields:

Field	Description
PDP Section Title	Sets the title for the Look Book section appearing on the PDP.

Field	Description
Look Subtitle	Determines the subtitle for the Look page.
Look Details Title	Sets the title for the Details section of the Look page.
Display Look Book Slide	If checked, your domain displays the Look Book title and description on the first slide of the Look Book slider. If cleared, your domain displays the Look Book title and description in the header above the slider.

5. Click **Save**.

After configuring the extension, you can create a Look Book. See [Create a Look Book](#).

Create a Look Book

i Applies to: SuiteCommerce | SuiteCommerce Advanced

You can create multiple Look Books to present a variety of collections. You decide the name, image, descriptions, and text color of the Look Book to find a display that fits your needs. After creating the Look Book, you can add the associated Looks.

To create a Look Book:

1. In NetSuite, go to Lists > Web Site > Look Book > New.
2. Set the following fields:

Field	Description
Name	Sets the name for the Look Book.
Inactive	If checked, the Look Book is inactive and does not appear on your site.
URL	Determines the URL path for the Look Book page. This URL is appended to the Look Book prefix. The final URL for the Look Book page should end in /lookbook/[URL], where [URL] equals the value of this field.
Short Description	Sets the short description for the Look Book. This displays above the Long Description .
Long Description	Sets the long description for the Look Book. This displays below the Short Description .
Right Align Text	If checked, aligns the text on the Look slides to the right.
Text Color	Determines the color of the text on the slides. This field supports text, HEX, or RGB.
Image	Sets the background image for the Look Book title slide. To use a Look Book title slide, Display Look Book Slide (located on the SC Configuration record) must be checked.
Title Tag	Determines the title tag used for third-party indexing.
Meta Description	Determines the meta description used for third-party indexing.
Meta Keywords	Determines the meta keywords used for third-party indexing.

3. Click **Save**.

After saving, a **Custom** tab is created on the Look Book record, where you can add Looks.

For more information about adding Looks to a Look Book, see [Add Looks to a Look Book](#).

Add Looks to a Look Book

i Applies to: SuiteCommerce | SuiteCommerce Advanced

After you create your Look Book, you can add Looks to the Look Book record.

Looks allow you to present a variety of subcategories within a unified Look Book. Each Look appears as a slide of the Look Book slider. When someone clicks a Look slide, it opens your Look page with the relevant Look Items.. After creating a Look record in NetSuite, you can add the associated Look Items.

To add Looks to a Look Book:

1. In NetSuite, go to Lists > Web Site > Look Book.
2. Click **Edit** next to the Look Book to which you want to add Looks.
3. In the **Custom** tab, click **New Look**, or click **Edit** to modify an existing Look.
4. In the Look record, set the following fields:

Field	Description
Name	Sets the name for the Look.
Inactive	If checked, the Look is inactive and does not appear on your site.
Sequence Number	Determines the position of the Look in the Look Book slider. Looks appear in ascending order.
URL	Determines the URL path for the Look page. This URL is appended to the Look Book URL (determined by the URL field of the Look Book record). The final URL for the Look page should end in /lookbook/my_lookbook/[URL], where [URL] equals the value of this field.
Look Book	Associates the Look with a Look Book.
Short Description	Sets the short description for the Look. This displays above the Long Description .
Long Description	Sets the long description for the Look. This displays below the Short Description .
Text Color	Determines the color of the text on the Look page. This field supports text, HEX, or RGB.
Right Align Text	This property is reserved for use in a future release.
Link Text	Sets the label for the link that appears on the Look slide of the Look Book. The link points to the Look page.
Carousel Image	Sets the image for the Look slide.
Main Look Image	Sets the main image for the Look page.
Alternative Look Image	Sets an additional image to appear on the Look page. If a Main Look Image and Alternative Look Image are both added, then a slider with both pictures appears on the Look page.

Field	Description
Title Tag	Determines the title tag used for third-party indexing.
Meta Description	Determines the meta description used for third-party indexing.
Meta Keywords	Determines the meta keywords used for third-party indexing.

5. Click **Save**.

After saving, a **Custom** tab is created on the Look record, where you can add Look Items.

For more information about adding Look Items to a Look, see [Add Look Items to a Look](#).

Add Look Items to a Look

Applies to: SuiteCommerce | SuiteCommerce Advanced

After you create a Look, you can edit the Look record in NetSuite to add Look Items to that Look.

On your site, a Look Item appears on the associated Look page and includes a picture, description, price, and link to the item's PDP. Additionally, a **Looks Good With** section appears on the item's PDP, which includes other Look Items. In NetSuite, you customize the Look Item record to designate a name, picture, and description for the item that highlights the Look without changing the inventory item information.

To edit the Look Item record:

1. In NetSuite, go to Lists > Web Site > Look Book.
2. Click **Edit** next to the Look Book that contains the Look to which you want to add Look Items.
3. In the **Custom** tab of the Look Book record, click **Edit** to modify an existing Look.
4. In the **Custom** tab of the Look record, click **New Look Item**, or click **Edit** to modify an existing Look Item.
5. Set the following fields:

Field	Description
Name	Sets the name for the Look Item. This is the name for the item that appears on the Look page and Looks Good With section of the PDP. The item name on the PDP header remains the same as the Item record.
Inactive	If checked, the Look Item is inactive and does not appear on your site.
Item	Associates the Look Item with an Item record.
Sequence Number	Determines the position of the Look Item on the Look page and Looks Good With section of the PDP. Look Items appear in ascending order.
Look	Associates the Look Item with a Look.
Description	Sets the Look Item description to display on the Look page and Looks Good With section of the PDP.
Link Text	Sets the label for the link that appears on the Look page and Looks Good With section of the PDP. The link points to the Look Item page.
Image	Determines the image to display with the Look Item on the Look page and Looks Good With section of the PDP.

6. Click **Save**.

After you set up the extension, users can visit a Look Book page with a slider of Looks, select a Look to view the Look Items, and shop related Look Items from an associated product.

Advertising

Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount

Informing your customers about your brand is an ongoing task that requires careful planning and consideration. Customers need to know what you offer, and you want to build brand loyalty.

Commerce web stores let you:

- Share your product inventory with third-party solutions so you can present your brand consistently in multiple sales channels.
- Feature your success stories prominently on your website to encourage new business.
- Highlight key brands in attractive formats.

Product Feeds

Applies to: SuiteCommerce | SuiteCommerce Advanced

This information refers to SuiteCommerce or the Aconcagua release of SuiteCommerce Advanced and later.

A product feed contains a list of items and their attributes that can be used by third-party solutions for marketing purposes. You can use product feeds to advertise your products in marketplaces, shopping channels, and product comparison search engines. With product feeds, you can share your product inventory in a structured format and present your brand consistently in multiple sales channels. You can incorporate promotions data in your Google product feed to display promotions in Google Shopping ads.

Important: Commerce web store extensions are only available if they are provisioned and set up in your account. For more information, see [Commerce Extensions](#).

The SuiteCommerce Product Feeds extension lets you create product feeds for the following services:

- Google Shopping
- Google Shopping with Merchant Promotions
- Facebook Dynamic Ads
- Custom CSV output

Note: SuiteCommerce Product Feeds requires SuiteCommerce or the Aconcagua release of SuiteCommerce Advanced and later. It also requires installation of the SuiteCommerce Configuration bundle.

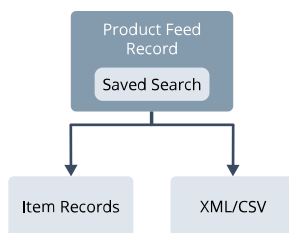

Product Feed Overview

SuiteCommerce Product Feeds is an extension SuiteApp that includes the Product Feed record, the Promotion Feed record, a Status page, and basic saved search templates for creating your product feeds.

SuiteCommerce Product Feeds lets you create product and promotion feeds containing the following item types:

- Inventory items (and matrix items)
- Non-inventory items (and matrix items)
- Download items
- Kit/Package items
- Assembly items (not including the component items)
- Gift certificates

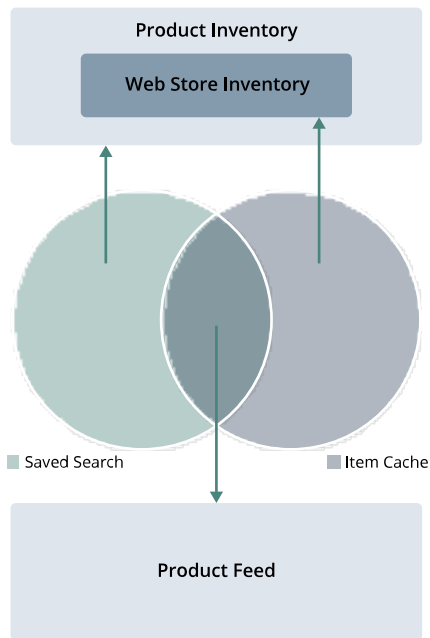

The workflow for generating a product feed is identical for all data feed types, though the attributes for each data feed type may vary according to the destination and the nature of the product. You use the Product Feed record to determine the settings required to retrieve information about your product inventory, compile the data, and export it in the desired feed format.

The product feed output is generated using data from two sources: item cache and saved searches. When you install SuiteCommerce Product Feeds for the first time or when you update the SuiteApp, an item caching process is triggered to obtain information about all the items that are displayed in the web store. The information obtained relates to the item's in-stock status, whether it's a matrix item, its URL component, and the URLs of the images associated with the item. This process can take several hours, depending on how many items need to be cached. You can also manually trigger an item cache rebuild in Lists > Feeds > Status. The caching process is specific to SuiteCommerce Product Feeds only.

To ensure the item cache stays up to date, SuiteCommerce Product Feeds checks every 15 minutes for any changes in item availability, or in item and image links. For example, if your web store is set up to hide items when out of stock and the inventory stock for an item is 0, information for that item will not be retrieved during the item caching. When the item comes back into stock, it's included during the next caching process. An optimized full rebuild of the item cache is performed every 2 hours.

When you create a product feed, you associate a saved search in the Product Feed record. The saved search retrieves information for all supported items (or those items that match the search criteria, if specified in the Criteria tab) and displays all the fields indicated in the Results tab. The default saved search templates provided with SuiteCommerce Product Feeds have been set up to include all the required and optional feed attributes as custom labels.

When you generate the product feed, the product feed generator runs the selected saved search and compares the items returned with the item details previously cached. Only items with information that has been cached and that match the saved search criteria are included in the feed output. The product feed generator then takes the result of this combination in the feed output and exports the fields specified in the saved search with the custom label field.

The product feed output can be accessed at a public URL indicated in the Product Feed record. You can either download the output or allow the third-party service to fetch the product feed at this public URL. You can schedule the product feed generator to automatically refresh your product feed at a specific time interval to ensure your product feed is always up-to-date with the latest changes in inventory.

The attributes for each product feed type vary from merchant to merchant. You may need to configure the default saved search templates to include additional data depending on the service and the items you want to include. Items must be inventory items. For example, requirements may vary if the item is apparel or electronics, or there may be specific requirements for the target country. You enter values for these product feed-specific fields on the Item record:

- Editing each Item record manually
- Using Mass Update to update all item records based on specific criteria
- Using the CSV import tool

Product Feed-Specific Fields

When you install the SuiteCommerce Product Feeds extension SuiteApp, product feed-specific fields are added to the Feeds tab on the Item record. According to your product feed implementation, the fields on the Item record may vary from the fields here, but they may include the following:

Shared Fields subtab:

Field	Description
Age Group (Feeds)	Demographic for which your product is intended.

Field	Description
Category (Feeds)	Product category to which you want to assign your item. By default, Google Product categories have been provided.
Color (Feeds)	Used to describe the item's physical characteristics. Use this field to indicate color variations in matrix items.
Condition (Feeds)	Condition of the product.
Custom Label (Feeds)	You can use these attribute fields to add additional labels to your product feed.
Gender (Feeds)	Gender for which your product is intended.
Material (Feeds)	Used to describe the item's main fabric or material.
Pattern (Feeds)	Used to describe the item's graphic print or pattern.

Google subtab:

Field	Description
Adult (Feeds)	Indicates a product includes nudity or sexually suggestive content.
AdWords Redirect (Feeds)	A URL used to specify additional parameters for your product page.
Energy Efficiency Class (Feeds)	Energy label.
Is Bundle? (Feeds)	Indicates a product is a merchant-defined custom group of different products featuring one main product.
ID Exists? (Feeds)	Indicates whether the product has a unique product ID.
Max. Energy Efficiency Class (Feeds)	Energy label. Used in conjunction with Energy Efficiency Class.
Max. Handling Time (Feeds)	The longest amount of time between when an order is placed for a product and when the product ships.
Min. Energy Efficiency Class (Feeds)	Energy label. Used in conjunction with Energy Efficiency Class.
Min. Handling Time (Feeds)	The shortest amount of time between when an order is placed for a product and when the product ships.
Multipack (Feeds)	Identifies the number of identical products sold within a merchant-defined multipack.
Shipping Height (Feeds)	Height of the product used to calculate the shipping cost by dimensional weight.
Shipping Label (Feeds)	Label that you assign to a product to help assign correct shipping costs in Google Merchant Center account settings.
Shipping Length (Feeds)	Length of the product used to calculate the shipping cost by dimensional weight.
Shipping Width (Feeds)	Width of the product used to calculate the shipping cost by dimensional weight.
Size System (Feeds)	Country of the size system used by product.
Size Type (Feeds)	Your apparel product's cut.

For more information about the product feed specifications for Google Merchant Center, see [Google Shopping Product Data Specification](#).

Before You Begin

Be aware of the following important information:

- Set up all required settings in your merchant account before generating the product feed in NetSuite. The data requirements may vary from merchant to merchant.
 - **Google Shopping:** You must have previously signed up for a Google Merchant account and performed basic setup operations (for example, transport and tax options). For more information about setting up a Google Merchant Center account, see [Google Merchant Center Help](#).
 - **Facebook:** You must have a Facebook ad account and a Facebook page. You must first create a catalog in Facebook and associate it with your Facebook ad account. For more information, see [Facebook Catalog Setup for Dynamic Ads](#).
- Mark your product as **display in website** and **active**. SuiteCommerce Product Feeds performs an item caching process to fetch all web store items. If you don't mark them as active and display in website, they aren't considered.

For more information about how to ensure items are retrieved, see [Item Record Setup](#).

- Ensure that item image names are as per the guidelines in [Image File Naming Guidelines](#). If item image names don't follow these guidelines, their URLs may not be correct, which can cause merchants to reject the product feed.
- Determine the number of items to be included in the feed output. The product feed generator supports up to 60,000 items within a single feed, including matrix items. If you want to export a larger number of items, use complex formulas, or calculate values in real time, split your items into smaller feeds.

 **Note:** A product feed is a scheduled script and subject to the same performance limitations. For more information, see the help topics [SuiteScript Governance and Limits](#), [Optimizing SuiteScript Performance](#), and the SuiteAnswers article [SuiteScript Error SSS_TIME_LIMIT_EXCEEDED](#) for more details.

- If you want to include **promotions as part of your Google product feed**, enable the SuitePromotions feature and set up SuitePromotions Item Promotions.

For more information about creating item promotions in SuitePromotions, see the help topic [Creating Item Promotions](#)

- An item included in the product feed can only have a **maximum of 10 promotions** associated. For more information about setting up a Google Merchant Promotions, see [Create a Promotion Feed](#).
- Google Merchant Center only allows you to include up to **500 promotions** in one promotion feed. If the number of promotions associated to the feed exceeds this number, the feed is rejected. For more information, see [Google Merchant Promotions Participation Criteria and Policies](#).
- Promotion feeds undergo an approval process in Merchant Promotions. This process may take up to 24 hours. See Google's [Promotion Approval Process](#).

Set Up Product Feeds

 **Applies to:** SuiteCommerce | SuiteCommerce Advanced

This information refers to SuiteCommerce or the 2019.2 release of SuiteCommerce Advanced or later.

Before you start to create your product feed using the SuiteCommerce Product Feeds extension, you must first set up the service where you want to use the product feed and identify the requirements for the data feed. You also need to update your item records with the required information for the product feed type.

You can create product feeds that contain the following item types:

- Inventory items (and matrix items)
- Non-inventory items (and matrix items)
- Kit/Package items
- Assembly items (not including the component items)
- Download items
- Gift certificates

Required Features

Before installing Product Feeds, check that the following features are enabled in your NetSuite account.

- **Items & Inventory** subtab:
 - Matrix Items
 - Inventory
- **Transactions** subtab:
 - Promotion Codes
 - SuitePromotions
- **Commerce** subtab:
 - SuiteCommerce or SuiteCommerce Advanced
- **SuiteCloud** subtab:
 - Custom Records
 - Server SuiteScript
 - Create Bundles with SuiteBundler
- **CRM** subtab:
 - Mail Merge (optional)
- **Company** subtab:
 - Inline Editing (optional)

Installation

The SuiteCommerce Product Feeds extension **doesn't require activation** for a specific website or domain. However you need to install the SC Product Feeds SuiteApp. For more information, see [Installing Theme and Extension SuiteApps](#).

To install the SC Product Feeds SuiteApp:

1. In NetSuite, go to Customization > SuiteBundler > Search & Install Bundles.
2. In the **Keywords** field, enter the Bundle ID or 'product feeds' and click **Search**.

3. Verify that the SC Product Feeds SuiteApp is returned in the search and select it.
4. Review the SuiteApp details and then click **Install**.

Update Product Feed Fields

When you install the SuiteCommerce Product Feeds extension, product feed-specific fields are added to the Feeds tab in your Item records to collect product-feed specific information. For a list of the fields added to the Item record, see [Product Feed-Specific Fields](#).

Important: Required fields for the target product feed type must not be left blank in the Item record. Otherwise, an error will be triggered in the service when you upload the product feed.

According to the product feed type you want to create, these attributes are considered either required or optional for the item and vary from merchant to merchant.

- [Google Shopping](#)
- [Google Merchant Promotions](#)
- [Facebook Dynamic Ads](#)
- [Other Services](#)

You can update these fields manually on each Item record, use the Mass Update menu option, or use CSV import.

Google Shopping

Product feeds to be imported into the Google Merchant Center should contain at least the following fields:

- ID
- Title
- Description
- Link
- Image link
- Availability
- Price
- Condition
- Google product category

Other attributes may be required depending on the item type to be included and the target country of the product feed. For more information about the specific requirements for your feed, see the [Google Shopping Product Specifications](#).

Google Merchant Promotions

Product feeds including promotion information to be imported into the Google Merchant Center should contain at least the following fields:

- [Google Shopping](#) fields, and
- Promotion ID
- Product applicability
- Offer type
- Long title
- Promotion effective dates
- Redemption channel

All the required attributes are mapped to existing fields in the Promotion record in NetSuite. For a list of the attributes that can be provided in the promotion feed, see the [Merchant Promotions feed specifications](#).

Facebook Dynamic Ads

Product feeds to be imported into a Facebook Catalog for Dynamic Ads should contain at least the following fields:

- ID
- Availability
- Condition
- Description
- Image link
- Link
- Title
- Price
- GTIN, MPN, or brand

Other attributes may be required depending on the item type to be included. For more information about the specific requirements for your feed, see [Facebook Product Catalog Specifications](#).

Other Services

SuiteCommerce Product Feeds can also be used to create a custom CSV output, which can be used as a data feed for other marketplaces, shopping channels, and product comparison search engines. The attributes required for these services vary according to the product type to be included. You should verify the fields required for each specific case before updating the Item record.

To update the product feed fields using Mass Update:

1. Go to Lists > Mass Update > Mass Updates.
2. Enter a description for the mass update in the **Title of Action** field.
3. Filter the items using advanced search criteria.

For example, you can restrict item selection by using **name** as a filter, setting **contains** as the name, and entering an item keyword. For more information about how to filter items in Mass Update, see the help topic [Advanced Search Criteria Filters](#).

4. On the **Mass Update** tab, enter the values for all the product feed-specific fields you want to update on the Item record.
For example, you may want to update the Category field to contain the Google product category. Select the **Category** box, and then enter the percent sign (%) and a keyword such as apparel to display all categories containing the keyword apparel.
5. Click **Save**.

You may need to repeat this operation several times to update all the fields for the items you want to include in your product feed. For more detailed information about setting up the Mass Update to update item fields, see the help topic [Defining a Mass Update](#).

To import using CSV import

1. Go to Lists > Search > Saved Searches > New.
2. Restrict the search using [Advanced Search Criteria Filters](#) to retrieve the items you want to update.
3. Click **Preview**.
4. In the list of search results, click **Export — Microsoft Excel** and save the export file.
5. In the resulting export file, change the fields you want to update as required.
6. Save the product catalog export file in CSV format.
7. Go to Setup > Import/Export > Import CSV Records.
8. Import the updated product catalog file.

For more detailed information about how to import data using the Import Assistant, see the help topic [Importing CSV Files with the Import Assistant](#).

Next Steps

When you have updated the Item record with all the required and the optional fields, you are now ready to create a product feed.

- [Create a Product Feed](#): Set up a data feed for Google Shopping, Facebook Catalogs, or in CSV format.
- [Create a Promotion Feed](#): Set up a data feed for use in Google Shopping with Merchant Promotions.

Create a Product Feed

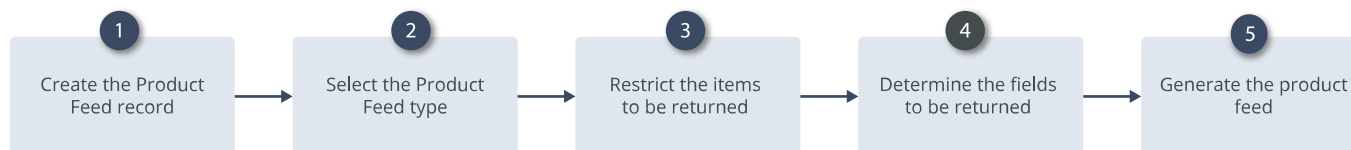

i Applies to: SuiteCommerce | SuiteCommerce Advanced

This information refers to SuiteCommerce or the 2019.2 release of SuiteCommerce Advanced or later.

The SuiteCommerce Product Feeds extension SuiteApp contains the Product Feed record that lets you create product data feeds for marketplaces, shopping channels, and product comparison search engines.

The SuiteCommerce Product Feed extension includes default saved searches for Google, Facebook and custom CSV. You can use these templates to create a new saved search with additional information that you may want to include in your product feed. Only saved searches created within the Product Feed record are displayed in the Saved Search field.

The Product Feed record lets you create product feeds for Google Shopping, Facebook Catalog, and custom CSV output. The fields displayed vary depending on the feed type selected.

The steps for creating a product feed are:

1. Create the Product Feed record
2. Select the Product Feed type
3. Restrict the items to be returned
4. Determine the fields to be returned
5. Generate the product feed

Note: Before you start to create a new product feed, ensure you have considered all requirements for product feeds. See [Before You Begin](#).

Permissions for Product Feeds Settings

Only the administrator role has access permissions to Product Feeds settings by default. If you want to give other roles the ability to access these settings, you can edit the role and add permissions to the following custom records:

- Product Feed
- Promotion Feed
- Feed Type
- Linked Promotion
- FG Prefetch Task
- FG Item Website Cache
- Google Category

For more information about setting permissions for roles, see the help topic [Setting Permissions](#).

To create a new product feed:

1. Go to Lists > Feeds > Product Feeds > New.
2. In the **Name** field, enter a title to help you identify the product feed.
3. In **Feed Type**, select the product feed type you want to create.
You can create feeds for Google Merchant Center, Facebook Catalogs, and in custom CSV format. For more information, see [Product Feed Overview](#).
4. In **Web Site**, select the website of your web store.
The website is used to determine the web store items retrieved. It's also used in the product link. For example, if the product feed is imported into Google, users are redirected back to this website when they click the item.
5. In **Domain**, select the domain of the web store to be used for the product feed.
This field is used in the same way as Website, to filter the items retrieved.

6. In **Saved Search**, select the saved search you want to use to map item fields to the product feed attributes.

The saved search template used should match the product feed type selected in the Feed Type field.

If you want to change the default saved search settings, click **Open Selected Search** to edit the criteria and attributes and save a copy. Only saved searches created from the Product Feed record are displayed in the list.

For more information about using saved search to restrict items and determine product feed attributes, see [Set Product Feed Attributes](#).

7. In the **Feed Description** field, add a detailed description of the product feed.

This information can be particularly useful if you need to separate your items into several product feeds or want to assign different attributes.

8. In the **Feed Schedule** section, you define the feed generation frequency settings:

In the **Generate Feed** field, select the frequency for product feed generation.

If you select **Manually**, the product feed is only generated when you click the **Generate Now** button after saving the record.

Note: If you want the target service to fetch the data feed from the public link, take into account the interval with which the service fetches and processes the data feed when choosing a value for the feed schedule.

9. If you choose Google product feed as the feed type and want to incorporate promotion data for use in Merchant Promotions, select the **Promotions Feed Configuration** to be used.

For more information, see [Create a Promotion Feed](#).

10. If you select custom CSV as the feed type, the **Custom CSV Export Settings** section is shown:

- a. Check the **Hide CSV Header** box if you don't want to export the attribute labels as headers in the resulting CSV output file.

Otherwise, the attributes defined in the saved search in the Custom Label column are exported as a header row.

- b. Check the **Item Link** box if you want to export an extra column that includes a link to the product item in the output.

If you select this box, enter the label to be used for item links in the **Item Link Label** field. The default value is link. Item Link is a required attribute for Google and Facebook product feeds.

- c. Check the **Image Link** box if you want to export an extra column that includes a link to the item's product image in the output.

If you select this box, enter the label to be used for image links in the **Image Link Label** field. The default value is image_link. Image Link is a required attribute for Google and Facebook product feeds.

- d. Check the **Availability** box if you want to export an extra column that includes the item's availability in the output.

If you select this box, enter the label to be used for availability status in the **Availability Label** field. The default value is availability. Availability is a required attribute for Google and Facebook product feeds.

- e. Check the **Parent Record ID (Matrix Item)** box if you want to export the ID of the parent record for each child item exported in the output.

If you select this box, enter the label to be used for parent record ID in the **Parent Record ID Label (Matrix Items)** field. The default value is item_group_id.

11. Click **Save**.

When you have saved the Product Feed record, you can proceed to generate the feed. See [Generate the Product Feed](#)

Set Product Feed Attributes

SuiteCommerce Product Feeds includes default saved searches for Google, Facebook, and custom CSV. These saved searches have been set up to include all the required and optional attributes for the product feed type as custom labels. However, you may want to include additional information in your product feed that isn't defined in these saved searches or select other custom fields as the data source.

When you select a saved search for a specific product feed in the **Saved Search** field, you can choose to keep the standard settings defined for the default saved search. Alternatively, you can click the **Open Selected Search** button and create a customized copy of the saved search. This new search can then be selected when you create subsequent product feed records.

When you click the **Open Selected Search** button, a popup window appears where you can refine the saved search by entering specific criteria for selecting the items to be included in the product feed and for mapping the NetSuite fields to the custom label to be used for the product feed type. If you don't see the popup window, check that your browser doesn't block popup windows.

Using the **Criteria** tab, you can restrict the items retrieved. Items retrieved by the saved search are compared with items in the cache during the feed generation process. For more information about how to set filters in the Criteria tab, see the help topic [Advanced Search Criteria Filters](#).

The **Results** tab defines the display options for the saved search results. In Product Feeds, this tab is used to determine the product feed attributes exported for the feed type selected. In the Columns subtab, the **Field** column contains either NetSuite standard fields or formulas that are used when generating the product feed. For fields with the Formula (Text) value, you determine specific values or the source fields to be taken during generation. The **Custom Label** column contains the product feed attribute label that is used in the feed output. The values in the Custom Label may change depending on the saved search template selected.

Note: Formula (Text) fields have been used as placeholders in the default saved searches to ensure all product feed attributes are included in the Custom Label field. If you leave these fields blank, they aren't included in the feed.

Make sure you specify the field source for these attributes if you want to include them.

For more information about refining saved searches, see the help topic [Defining a Saved Search](#).

Additional Attributes for Google

Listed below are additional attributes available for you to use with the Google saved search. These fields are supported on the Google product feed template but aren't automatically exposed. To use these attributes in your saved search, see [Adding Attributes to a Saved Search](#).

- structured_title_digital_source_type
- structured_title_content
- structured_description_digital_source_type
- structured_description_content
- additional_image_link
- virtual_model_link
- mobile_link

- cost_of_goods_sold
- subscription_cost_period
- subscription_cost_period_length
- subscription_cost_amount
- loyalty_program_program_label
- loyalty_program_tier_label
- loyalty_program_price
- loyalty_program_loyalty_points
- loyalty_program_cashback_for_future_use
- loyalty_program_member_price_effective_date
- auto_pricing_min_price
- certification_certification_authority
- certification_certification_name
- certification_certification_code
- certification_certification_value
- product_length
- product_width
- product_height
- product_weight
- product_detail_attribute_name
- product_detail_attribute_value
- product_detail_section_name
- product_highlight
- ads_redirect
- lifestyle_image_link
- external_seller_id
- pause
- shipping_country
- shipping_price
- shipping_region
- shipping_postal_code
- shipping_location_id
- shipping_location_group_name
- shipping_service
- shipping_min_handling_time
- shipping_max_handling_time
- shipping_min_transit_time
- shipping_max_transit_time
- ships_from_country
- transit_time_label

- free_shipping_threshold_price_threshold
- tax_rate
- tax_country
- tax_region
- tax_postal_code
- tax_location_id
- tax_tax_ship

Adding Attributes to a Saved Search

You can update your saved search to include the attributes you would like from this list.

To add attributes to the saved search for a product feed:

1. In NetSuite, go to Lists > Feeds > Product Feed.
2. Click **Edit** next to the product feed you want to edit.
3. In the **General** tab, under the **Saved Search** field, click **Open Selected Search**.
4. In the Saved Item Search record, go to the **Results** tab, **Columns** subtab.
5. Add new fields, using the above list of attributes to populate the **Custom Label** field.

 **Note:** Each attribute is only supported one time. This means for each attribute you would like to use, only include it in the Columns table one time.

For more information about how to format these attributes, see [Google Product Data Specification](#).

Change Currency in Facebook Feeds

The default currency in Facebook product feeds is USD. A different currency can be used by modifying the product feed saved search settings.

To change the currency in a Facebook Feed:

1. On the Product Feeds page, click **Open Selected Search**.
2. On the **Results** tab of the Saved Search, locate currency_iso_code in the **Custom Label** column.
3. Change USD in the **Formula** column to the currency you need. For example, for AUD, change the value in the Formula column to UPPER('AUD').
4. If the Multiple Currencies feature is enabled, do the following additional steps:
 1. On the **Criteria** tab of the Saved Search, select Pricing Fields... in the **Filter** column.
 2. In the **Saved Item Search** popup window, select Currency from the **Pricing Filter** list, select the required currency, and click **Set**.
 3. In another row on the **Criteria** tab, select Pricing Fields... in the **Filter** column.
 4. In the popup window, select Price Level from the **Pricing Filter** list, select the required price level, and click **Set**.
 5. On the **Results** tab, click on Online Price and select Pricing Fields.... from the list.
 6. In the popup window, select Unit Price from the **Pricing Field** list and click **Ok**.
 7. Click **Save**.

If you were using the default saved search for Facebook product feeds, then enter a new name in **Search Title** and click **Save As**. Ensure that the new search is selected in the **Saved Search** field on the Product Feed page.

Additional Considerations For Matrix Items

- Child matrix items may not contain all the required information. Check that the parent item and child item have all the required values and they are mapped correctly to the corresponding attribute in the **Results** tab.

For example, check that the field used to source the data for the following attributes is correct:

- **Title:** By default, the Name field is used for the title product feed attribute. For matrix items, the child item name may result from a combination of the parent name and the matrix option. If you want to use the parent name instead, after the Name field, insert a new field **Parent Fields... > Name** and use title as a custom label.
- **Description:** The store description may only be defined on the parent matrix item. To ensure this attribute isn't left empty, insert an additional field, **Parent > Store Description**, after the Description field and enter description as the custom label.

Ensure you don't overwrite the existing Name and Description fields, as these are used for non-matrix items. The order in which the values are taken for matrix items is determined by their position in the list. For example, if a value is present for Store Description, it's taken; if not, the value for Parent > Store Description is taken.

- The Google and Facebook product feeds use the parent matrix item ID to group product variants. The `item_group_id` attribute is mapped to the parent item ID in the default saved searches for these feed types. For more information, see [Google Product Feed specifications](#).
- To ensure that product images are displayed correctly, check that the image names are as per the guidelines in [Image File Naming Guidelines](#). It's particularly important that the image file names for child matrix items have a non-numeric value after the last delimiter in the image file name. If an image name ends in a numeric value, Google may refuse to accept the product feed.

Note: Required fields must not be left blank in the Item record. Otherwise, an error will be triggered in your merchant center when you upload the product feed. See [Update Product Feed Fields](#).

When you have entered the criteria for filtering the items and verified the field mapping, click **Save** to return to the Product Feed record.

Generate the Product Feed

When you have set up the product feed, determined the item selection criteria, and mapped all required and optional attributes using the saved search, you generate the product feed. The feed generation process compares the items cached previously with those returned by the saved search. It exports the matching items with the information fields specified in the saved search in the output.

With the SuiteCommerce Product Feeds extension, you can generate the product feed in two different outputs depending on the product feed type selected:

- XML output file
- Custom CSV output

The product feed is generated automatically or manually. If you select an interval in the **Generate Feed** field when creating the product feed, the product feed is refreshed according to the interval set. If you

select **Manually** in the Generate Feed field, the product feed is only refreshed with the latest data when you click the **Generate Feed Now** button.

The Product Feed record contains the timestamp of the last feed generation and a public URL where you can access the product feed output. These fields are empty until you generate the product feed for the first time.

You can view the status of the generation in the **Generation History** list. This list shows the last 20 generation tasks for the Product Feed record. If you want to view the status of several feeds simultaneously, see [View the Feed Status](#).

To generate a product feed manually:

1. Go to Lists > Feeds > Product Feeds.
2. Click **View** for the product feed you want to generate.
3. In the Product Feed record, click **Generate Feed Now**.

If the item cache has not yet been built for the feed, the **Generate Feed Now** button is replaced by the message **Caching Website Items**.

The status of the product feed generation is shown in the **Generated At** field at the top of the form.

Note: The first time the product feed is generated, the process may take up to one hour. Subsequent product feed generation is likely to be faster, but the time taken depends on the number of items to be included in the feed.

When the product feed has been generated, a public URL link is shown in the **Feed Link** field.

If you have selected the Google or Facebook product feed type, you can copy and paste this public URL into your service settings so that the service can fetch and process the product feed automatically.

Alternatively, you can click the **Download Feed** button to access an XML output and download a static copy of the product feed. If the product feed type is custom CSV and you click **Download Feed**, you download the CSV output.

Create a Promotion Feed

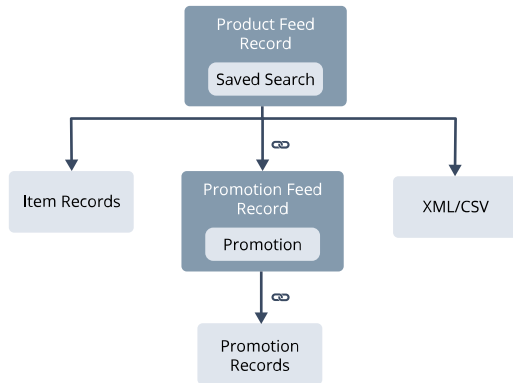

Applies to: SuiteCommerce | SuiteCommerce Advanced

The SuiteCommerce Product Feeds extension SuiteApp includes the Promotion Feed record that enables you to incorporate NetSuite promotions data in the Google product feed for use in Merchant Promotions as part of Google Shopping ads.

Promotion Feed Overview

The Promotion Feed uses the Product Feed and Promotion Feed records to collect the necessary data for export. The mechanism for obtaining the data included in the promotion feed is identical to that of the Product Feed, with additional promotional information retrieved by the Promotion Feed record. See [Product Feed Overview](#).

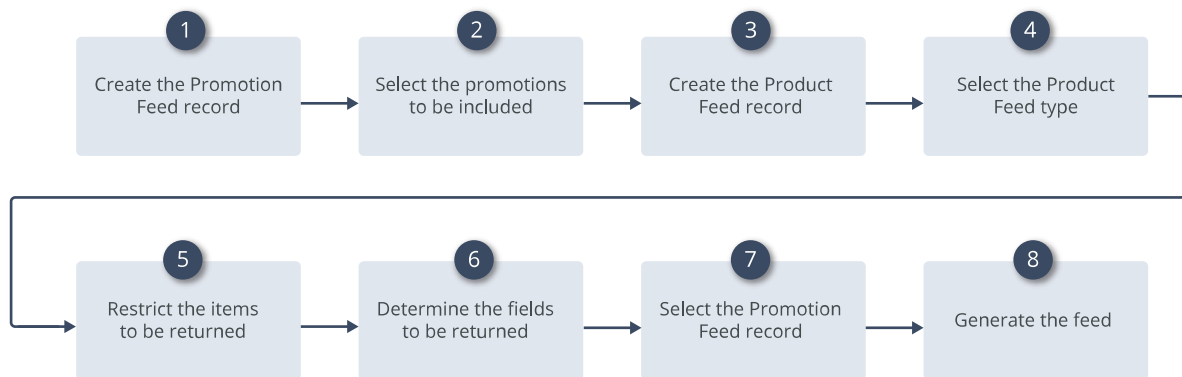

You create a Promotion Feed record where you specify the promotions you want to include in the feed. You then link to this record when you create the product feed. When you generate the product feed, the product feed generator retrieves the data for the promotions indicated in the Promotion Feed record.

Promotions included as part of the promotions feed must meet the following criteria:

- Be a SuitePromotions item promotion. For more information about setting up item promotions in NetSuite, see the help topic [Creating Promotions](#)
- Use the default Item Promotion form
- Have no specific items in the Buy conditions
- Be available to all customers. Promotions limited to specific customers aren't supported
- Be available to all sales channels. Promotions limited to specific locations aren't supported
- Be applicable to the website selected in the product feed rec
- Adhere to Google Merchant Promotions requirements. See Google [Merchant Promotions Program Policy](#) and [Editorial Guidelines](#)

For more information about considerations to bear in mind before creating a promotion feed, see [Before You Begin](#).

The steps for creating a Google product feed with Merchant Promotions are the following:

1. Create the Promotion Feed record
2. Select the promotions to be included
3. Create the Product Feed record
4. Select the Product Feed type
5. Restrict the items to be returned
6. Determine the fields to be returned
7. Select the Promotion Feed record

8. Generate the feed

Create a Promotion Feed Record

The Promotion Feed record creates a link to the Promotion record. The product feed generator uses the Promotion Feed record to get the promotion data associated with the items retrieved in the feed.

To create a new promotion feed record:

1. Go to Go to Lists > Feeds > Product Feeds > New.
2. In the **Name** field, enter a title to help you identify the promotion feed.
This is particularly useful if you need to create several promotion feeds to separate your items into smaller product feeds.
3. In the **Feed Description** field, you can add a detailed description of the promotion feed.
4. In the **Promotions Included** tab, select all the promotions you want to include in the feed.
The promotions are identified by the **Coupon Code**. Select the coupon code in the field and click **Add**.
5. In the **Linked Promotion** tab, select all the promotions you want to include in the feed.
The promotions are identified by the **Coupon Code**. Select the coupon code in the field and click **Add**.
6. Click **Save**.

Create a Product Feed Record

The next step in creating a promotion feed is to create a Google product feed. To do this, you select Google Product Feed as the feed type, and then select either the default saved search for Google product feeds and enter your specific criteria, or select an existing saved search that has been defined for Google product feeds.

For more information, read [Create a Product Feed](#).

Link the Promotion Feed Record

You need to associate the Promotion Feed record with the Product Feed record so that the required information can be retrieved from the Promotion records and included in the product feed output with the corresponding Google Merchant promotion attributes.

To associate the promotion feed with the Google product feed:

1. Create a new product feed and select Google product feed as the feed type.
See [Create a Product Feed](#).
2. In the **Saved Search** field, select the default Google feed item search or create a new saved search to map NetSuite fields to Google attributes.
See [Set Product Feed Attributes](#).
3. Determine the feed generation settings in the **Feed Schedule** section.
4. In the **Promotion Feed Configuration**, select the promotion feed record you created.
5. Click **Save**.

Generate the Promotion Feed

When you have created the Promotion Feed and Product Feed records, linked the Promotion Feed on the Product Feed record, and saved the settings, you can generate the promotion feed. You generate it in the same way as the product feed by either setting an interval or clicking **Generate Feed Now**. For more information, see [Generate the Product Feed](#).

You can access the link to the promotion feed from the Promotion Feed record.

View the Feed Status

 **Applies to:** SuiteCommerce | SuiteCommerce Advanced

SuiteCommerce Product Feeds includes an overview of your product and promotion feeds. To access the Feed Status page, go to Lists > Feeds > Status.

You can check the generation status of product and promotion feeds, synchronize Google categories, and view information about the processes run to cache information about website items.

Web store item details such as the item's in-stock status, whether an item is a matrix item, the URL component for the item, and the URLs of the images associated with the item are cached when you install SuiteCommerce Product Feeds for the first time or when you update the SuiteApp.

SuiteCommerce Product Feeds automatically checks the item details every 15 minutes to detect any additions or updates made to the item details already in cache. You can view when a check was last performed in **Cache Update End**. An optimized rebuild process is run automatically every 2 hours to detect any changes in existing information for items, and the item details for any items that have been added or removed from the product inventory are updated in the cache.

You can trigger the item caching process manually by clicking **Rebuild Item Cache**. The item cache is cleared, and then fully rebuilt. For more information about the item caching process performed by SuiteCommerce Product Feeds, see [Product Feed Overview](#).

 **Note:** If a product feed is generated while the cache is being cleared and rebuilt, the feed may contain incomplete data. In such cases, you should manually regenerate the product feed to make sure it's created with complete and accurate data.

If a feed generation fails or results in an error, the previous, successful feed output is retained until the next time the feed is generated successfully.

With Feed Status, you can synchronize Google product categories. When you click **Sync Google Categories**, the product feed generator obtains the latest version of the Google product taxonomy for use in the Item record.

Feed Status also displays a list of the feed generation tasks performed for product feeds and promotion feeds on the **Product Feed Generation History** and **Promotion Feed Generation History** subtabs, respectively. The **Caching History** subtab contains a log of all caching jobs performed. The generation history subtabs display the following information:

- feed type
- website domain
- creation date
- generation start date and time

- generation end date and time
- generation status

If you click **View**, you can view the associated Product or Promotion Feed record.

Testimonials

Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount

The Testimonials extension lets you add up to three testimonials combining text and image on your web page. You can select horizontal or vertical layout. You can add a header, body quotes, and caption and label text for each testimonial. You can link each testimonial to an internal or external URL. With Testimonials, you can showcase your existing customers and feature press mentions.

Important: Commerce web store extensions are only available if they are provisioned and set up in your account. For more information, see [Commerce Extensions](#).

Note: Extensions require SuiteCommerce or the Aconcagua release of SCA or later.

This image is an example of a testimonial.

CAMPING WITH THREADS

Our Threads tent performed extremely well on a recent trip to the Pacific Northwest. As an outdoors enthusiast, I highly recommend Threads camping equipment.

— John McKellen, Senior Editor at Oregon Camper

Our Threads Amber ENV-3 tent kept us safe and secure. Designed to withstand extreme conditions, I feel the ENV-3 is a great choice for anyone interested in high-altitude camping.

— Zoe Lerch, Host of Get Outdoors on ABC Mornings

The Amber ENV-3 tent is an affordable choice for beginners and seasoned campers alike. It's perfect for year-round camping adventures and is available in a wide range of sizes and colors.

— Robert Rich, Oregon State Tourism

This topic explains how to:

- [Add a Testimonial](#)
- [Discard or Remove a Testimonial](#)
- [Change the Image Link](#)

Add a Testimonial

You can add a testimonial to multiple areas on your website using Site Management Tools. For more information about Site Management Tools, see the help topic [Site Management Tools Overview](#).

To add a testimonial:

1. Go to the page where you want to add testimonials.
2. Click **Add** on the Site Management toolbar.
3. Drag the **Testimonials** content type to the page.

 **Note:** If you don't see this content type, check that the extension has been installed and is active. Click the **Settings** button on the Site Management toolbar to access the Content Manager. Drag the content type from the Inactive Content Types list to the Active Content Type list.

You can drag the Testimonials content type to multiple areas on the page:

- If you drag it to an area marked as **all pages**, the content displays on any page that contains that area.
 - If you drag it to an area marked as **page type**, the content displays on any page of that type.
 - If you drag it to an area marked as **this page**, the content displays only on the page that you add it to.
4. On the **General** tab:
 - a. Use the **Name** field to enter a description of your new content.
See [Content Tags and Filter Tools](#).
 - b. Set the content visibility options.
See the help topic [View Site as of a Specific Date in Site Management Tools](#).
 - c. In the **Header** field, enter the section title.
A preview displays in the page.
 - d. In the **Layout** field, select horizontal or vertical layout.
On mobile screen sizes, the layout is always vertical. However, you can choose horizontal layout for desktop and tablet screens.
 - e. In the **Image Display** field, select round or square to determine the image shape you want to display.
 - f. In the **Text Color** field, choose the text field color.
By default, the Header, Caption, and Label text fields use different colors that are taken from your theme. If you select **Dark**, all text fields use the dark text color defined in your theme. If you select **Light**, all text fields use the light text color defined in your theme.
 - g. In the **Area to Link** field, select the area of the testimonial you want to link.
The options are:
 - Caption
 - Label
 - Image
 - Entire Area
 - No Link
 - h. If you want the URLs to open in a new window or tab, select the **Open in New Window** box.
 - i. Use the **Tags** field to enter keywords that help you filter your content in the Review Changes list.
See [Content Tags and Filter Tools](#).
 5. On the **Testimonials** tab:

- a. Select the image you want to display using the Image Manager.
See [Image Manager](#).
The image form is determined by **Image Display** in the **General** tab.
 - b. In the **Alt Text** field, enter an image description.
This text is used to improve web accessibility for visually impaired users and for SEO.
 - c. Enter your testimonial text in the **Block Quote** field.
 - d. Enter text in the **Caption** and **Label** fields.
If you don't want to display any text, leave these fields blank.
You can use these fields to include your customer's name and company.
 - e. If you want to link the testimonial to an internal or external page, enter the URL in the **Link** field.
This link is opened when the user clicks the area you selected in the **Area to Link** field on the **General** tab. You can enter absolute URLs (<http://www.example.com>) and relative URLs (</search>).
6. Repeat step 5 to add up to two additional testimonials.
 7. Click **Save**.

Discard or Remove a Testimonial

If you haven't published your testimonials and you decide to remove them, you can discard them. If you have already published your testimonials, you can remove them directly from the page where they are located. For more information about the differences between discarding and expiring content, see the help topic [Discard or Expire Content in Site Management Tools](#).

To discard testimonials:

1. Go to the Review & Publish Changes list.
2. Select the Testimonials content in the list.
3. Click **Discard**.
4. Click **OK**.

To remove testimonials:

1. Go to the page that contains the testimonials you want to remove.
2. Click the **Testimonials** box.
This highlights it and displays the content controls.
3. Click **Remove**.
4. Click **OK**.

Change the Image Link

After the testimonial is configured, if you need to change the image link or text, use the following procedure.

To change an image link or alternative text:

1. Go to the page that contains the testimonial.
2. Select the **Testimonials** box, and then click the **Settings** button.
This displays the Testimonials Settings in the side panel.
3. On the **Testimonials** tab, enter the URL for the link in the **Link** field or enter the alternative text in the **Alt Text** field.
4. Click **Save**.

Logo List

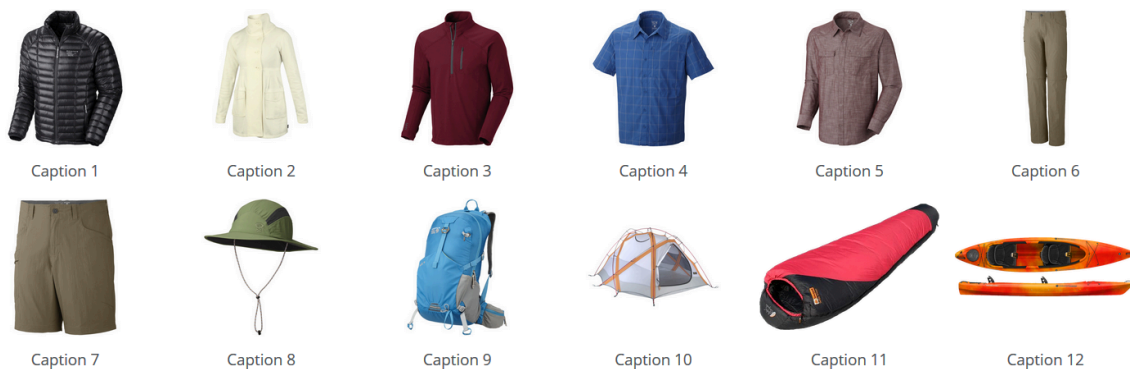

i Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount | Site Management Tools

The Logo List extension lets you add up to 12 images to your web page, add some descriptive text, and set an internal or external URL for each image. You can choose grid or carousel layout and determine how many images to display per line according to screen size. For example, with Logo List, you can display your top brands or partners, highlight certifications and awards, or showcase promotions.

! **Important:** Commerce web store extensions are only available if they are provisioned and set up in your account. For more information, see [Commerce Extensions](#).

i Note: Extensions require SuiteCommerce or the Aconcagua release of SCA or later.

Logo List

Grid

Logo List

Carousel

You can add a logo list to multiple areas on your website using Site Management Tools. For more information about Site Management Tools, see the help topic [Site Management Tools Overview](#).

To add a logo list:

1. Go to the page where you want to add a logo list.
2. Click **Add** on the Site Management toolbar.
3. Drag the **Logo List** content type to the page.

 **Note:** If you don't see this content type, check that the extension has been installed and is active. Click the **Settings** button on the Site Management toolbar to access the Content Manager. Drag the content type from the Inactive Content Types list to the Active Content Type list.

You can drag the Logo List content type to multiple areas on the page:

- If you drag it to an area marked as **all pages**, then the content displays on any page that contains that area.
 - If you drag it to an area marked as **page type**, then the content displays on any page of that type.
 - If you drag it to an area marked as **this page**, then the content displays only on the page that you add it to.
4. In the **General** tab:
 - a. Use the **Name** field to enter a description of your new content.
See [Content Tags and Filter Tools](#).
 - b. Set the content visibility options.
See the help topic [View Site as of a Specific Date in Site Management Tools](#).
 - c. In the **Header** field, enter the title for the content.
A preview displays in the page.
 - d. In the **Layout** field, choose either grid or carousel layout for your logo list.
 - e. In the **Logos per Line - Desktop**, **Logos per Line - Tablet** and **Logos per Line - Phone** fields, select the number of logos you want to display per line for each device type.
 - f. In the **Text Color** field, choose the color you want for the text fields.
By default, the color is taken from your theme. If you select **Dark**, the text uses the dark text color defined in your theme. If you select **Light**, the text uses the light text color defined in your theme.
 - g. If you want the URL links to open in a new window or tab, select the **Open in New Window** box.
 - h. Use the **Tags** field to enter keywords that help you filter your content in the Review Changes list.
See [Content Tags and Filter Tools](#).
 5. In the **Logos** tab:
 - a. Select the image you want to display using the Image Manager.
See [Image Manager](#).
 - b. In the **Alt Text** field, enter a description of the image.
This text is used to improve web accessibility for visually impaired users and SEO purposes.
 - c. Enter the logo description in the **Caption** field.

This text is displayed below the image. If you don't want to include any text, leave this field blank.

- d. If you want to link the image to an external page, enter the URL in the **Link** field.

You can enter absolute URLs (<http://www.example.com>) and relative URLs (</search>).

- 6. Repeat step 5 for as many logos as you want to display. You can add up to 12 logos. All images should have the same resolution for optimum display.
- 7. Click **Save**.

If you haven't published your logo list and you decided to remove it, you can discard it. If you have already published your logo list, you can remove it directly from the page where it's located. For more information about the differences between discarding or expiring content, see the help topic [Discard or Expire Content in Site Management Tools](#).

To discard a logo list:

- 1. Go to the Review & Publish Changes list.
- 2. Select the Logo List content in the list.
- 3. Click **Discard**.
- 4. Click **OK**.

To remove logo list content:

- 1. Go to the page that contains the logo list you want to remove.
- 2. Click the **Logo List** box.
This highlights it and displays the content controls.
- 3. Click **Remove**.
- 4. Click **OK**.

To change an image link or alternative text:

- 1. Go to the page that contains the logo list.
- 2. Click the **Logo List** box, and then click the **Settings** button.
This displays the Logo List Settings in the side panel.
- 3. In the **Logos** tab, enter the URL to link to the logo in the **Link** field or enter the alternative text in the **Alt Text** field.
- 4. Click **Save**.

SuiteCommerce Customer Management

i Applies to: SuiteCommerce | SuiteCommerce Advanced

Managing your customers and leads efficiently while making the sign-up process easier for customers is key to the success of your web store. Commerce web stores let you adapt your web store to your shoppers' registration preferences, avoiding cart abandonment. You can track your customers' movements and shopping behavior with specific records in NetSuite.

Web Store Registration

Your web store's registration flow can be customized as required. By default, all new customers who register in your web store and haven't yet completed an order are created as Lead records. Using Lead records, you can track potential customers and follow up with specific marketing actions such as email campaigns and promotions to encourage sales and conversion. When a new customer completes an order, the Lead record is converted into a Customer record. Some shoppers might not create an account and check out as guests, but you can still track their sales activity with a Lead record.

You might want only existing NetSuite customers to access your web store and give them specific login credentials. The Advanced Sign Up extension lets you use a custom signup form that fits your needs. This is particularly helpful for wholesalers who want their customers to register before shopping on their site.

After customers register on your website, the information displayed on the My Account pages can also be customized to adapt to your business needs. Customers can see their purchase history, request a return, update billing or shipping information, and even create or view estimates.

Not everyone who registers on your site stays an active customer. Passwords expire for web store customers who meet either of the following criteria:

- The customer has not logged in within the previous three years.
- It has been more than 90 days since the customer registered a login name and created a password, and the customer never logged in again.

If this happens, the customer gets an error saying their password's expired. They can set a new password using the standard forgot password feature.

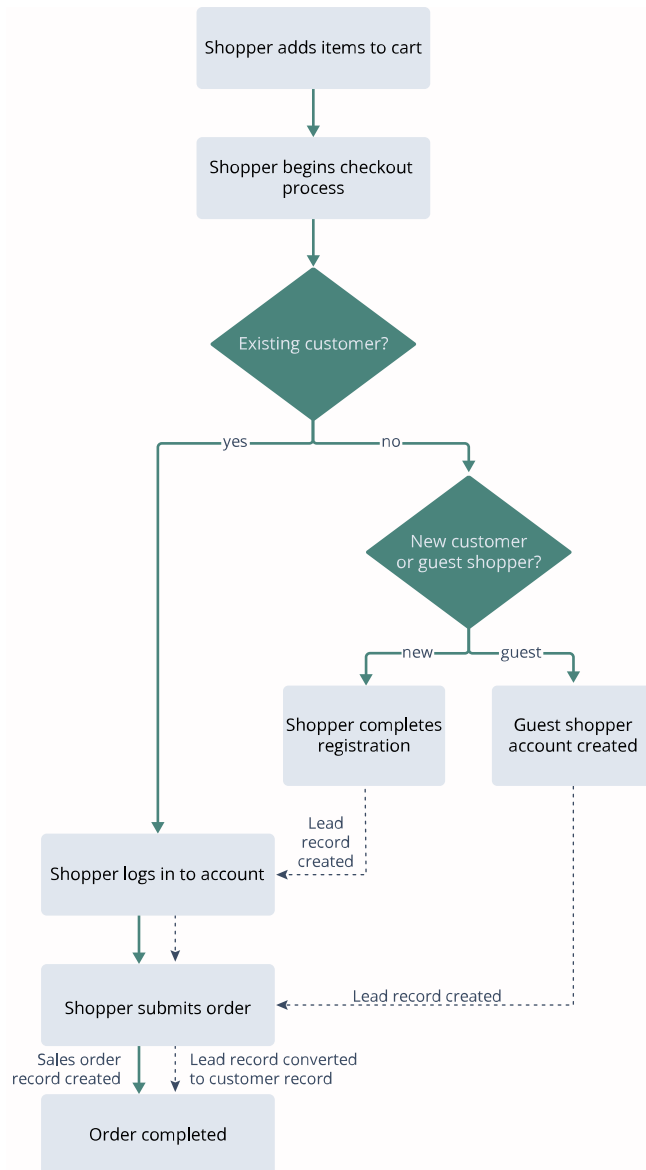

Customer Registration Flow

i Applies to: SuiteCommerce | SuiteCommerce Advanced

There are 3 ways shoppers can proceed with an order in your web store:

- [Guest Shopper](#)
- [New Customer](#)
- [Existing Customer](#)

Different flows and actions are triggered depending on the type of customer.

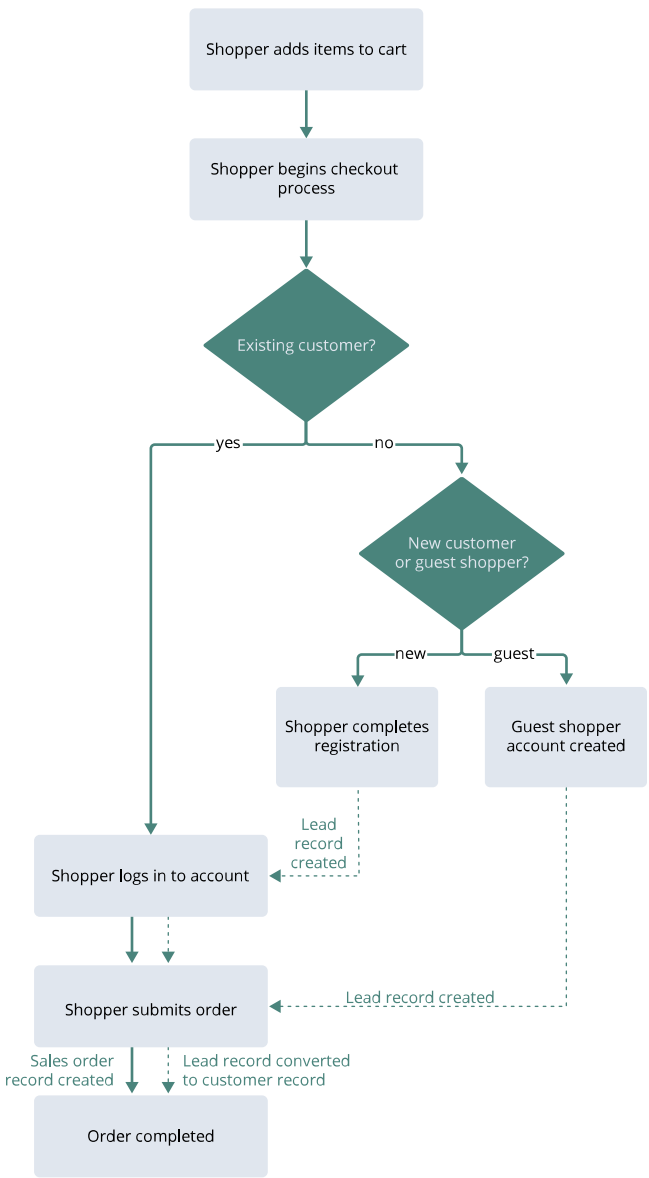

Guest Shopper

Shoppers can submit an order without creating a login and password. However, even though the shopper isn't logged in, you can track the shopper's movements to determine patterns in shopping behavior and identify sales trends.

To enable the Guest Shopper flow:

1. Go to Commerce > Websites > Web Site List.
2. On your Web Site Setup record, click **Edit**.
3. On the **Shopping** subtab, in the **Registration Page** section, set the **Customer Registration Is** field as either **disabled** (for Guest Checkout only) or **optional** (Existing Customer, New or Guest Shopper).

4. Click **Save**.

When shoppers check out as guests, they need to enter their name and email so you can send an order confirmation after they finish. The information is used to create a Lead record. If you don't use auto-generated numbers, the customer ID is automatically generated as Guest Shopper XY where XY is a sequential number. This means that if you search for the customer or lead by name, you'll see Guest Shopper XY.

Lead 🔍 🔒

Guest Shopper 64

[Edit](#) [Back](#) [Convert](#) [Print](#) [Export](#) [Actions](#)

▼ **Primary Information**

Customer ID	Email
Guest Shopper 64	jrwolfe@email.com
Name	Phone
Guest Shopper	905-219-8307
Subsidiary	Address
Generation N US	2955 Campus Drive
	Suite 100
	San Mateo, CA CA 94403
	United States Map

Note: If Customer records in your account use Auto-Generated Numbers, the Customer ID of the Lead record is created using the company's set numbering sequence with New Customer, not as Guest Shopper XY. For more information, see the help topic [Set Auto-Generated Numbers](#).

When the shopper places the order, the Lead record is converted into a Customer record. The sales order that the shopper completed appears in the **Sales** subtab of this guest shopper record, in **Transactions**.

If the shopper decides to create an account after completing the order, the existing Customer record is modified to add any additional information provided.

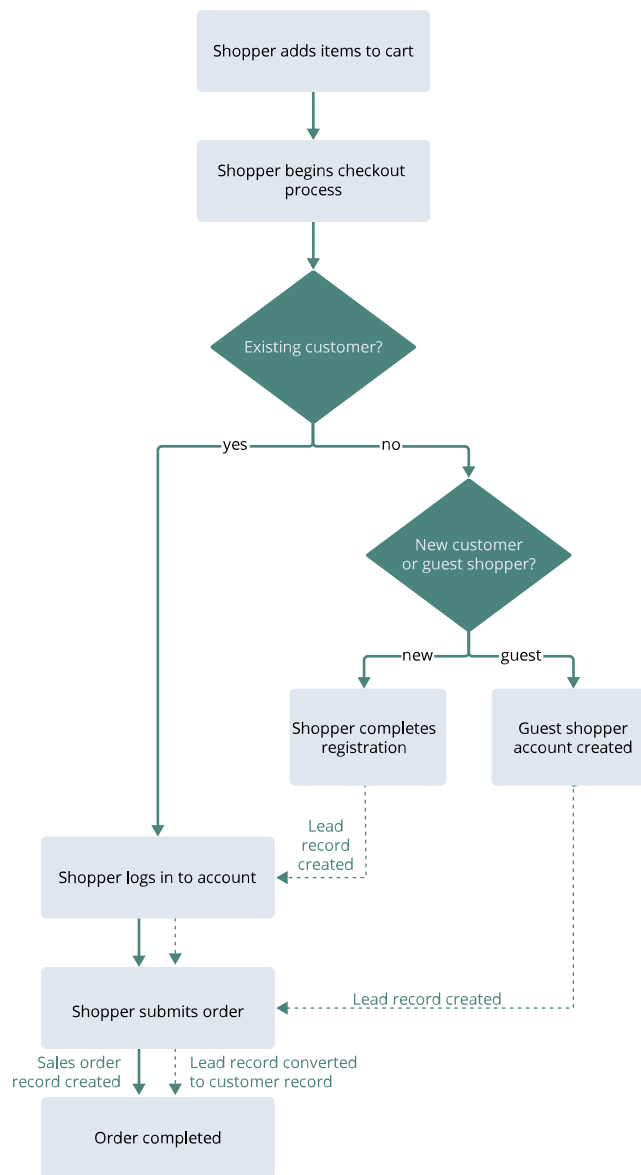

Note: Since no customer-specific record is created, shoppers who choose the guest shopper option need to enter personal information every time they purchase from your web store.

New Customer

The New Customer flow lets shoppers create an account in the web store. With an account, shoppers can view their purchase history, perform item returns, and configure default shipping and payment options to use when they purchase.

To enable the New Customer flow:

1. Go to Commerce > Websites > Web Site List.
2. On your Web Site Setup record, click **Edit**.
3. On the **Shopping** subtab, in the **Registration Page** section, set the **Customer Registration Is** field as either **optional** (for Existing Customer, New Customer or Guest Shopper) or **required** (Existing or New Customer).
4. Click **Save**.

When shoppers register as new customers, a standard registration form containing fields such as First and Last Name, Email Address and Password is displayed.

Using the registration form, customers can opt in or out of email marketing campaigns. For more information about how customer email subscriptions are managed in NetSuite, see the help topic [Subscription Management](#).

When the shopper has submitted the required information, several actions are triggered. If **Web Site Duplicate Email Management** is enabled, a check is performed to ensure there is no existing Lead or Customer record with the same email address. If a duplicate Lead or Customer record with the same email address is found, the shopper is notified with an alert message. For more information, see [Detect Duplicate Customer Email](#).

If email duplication detection isn't enabled, a new Lead record is created.

Important: If Duplication Detection is disabled, a new Lead record is created every time a shopper registers as a new customer. You should review Lead and Customer records regularly using the Duplicate Detection & Merge feature to detect possible duplicates. For more information, see the help topic [Duplicate Record Detection](#).

The shopper enters a shipping address and a contact phone number, selects a delivery method, and enters a payment method. Depending on the checkout flow, the information entered is added to the Lead record either after each step or when the order is submitted. For more information about the checkout flow, see [Checkout Flows](#).

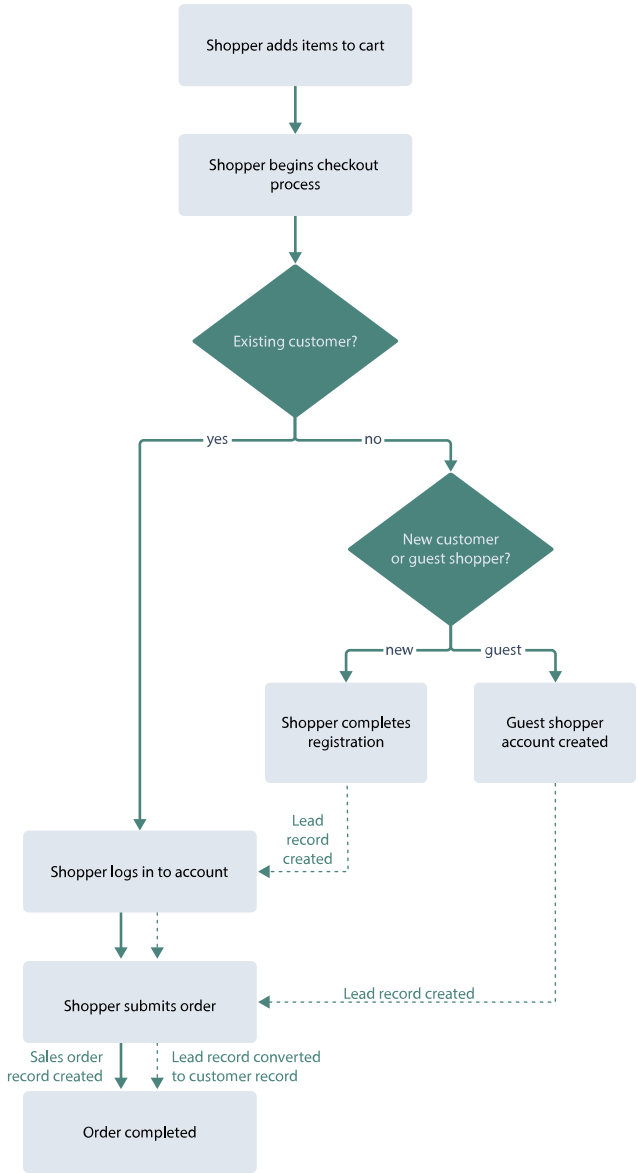

When the shopper places the order, the Lead record is converted into a Customer record. The sales order reference is added to the **Sales** subtab, in **Transactions**.

Existing Customer

In this flow, a Customer record has been created previously, either by the customer or by the Site Administrator. This flow is particularly useful in a B2B scenario where the organization wants to provide partners or customers with login credentials. Information such as shipping and payment information, as well as any special pricing conditions, for example, can be automatically taken from the Customer record.

To enable the Existing Customer flow:

1. Go to Commerce > Websites > Web Site List.
2. On your Web Site Setup record, click **Edit**.
3. On the **Shopping** subtab, in the Registration Page section, set the **Customer Registration Is** field as **optional** (Existing Customer, New or Guest Shopper), **required** (Existing Customer or New) or **existing customer only** (Existing Customer).
4. Click **Save**.

The customer enters the login credentials provided by the website administrator or the email address and password used originally to create the account in the existing customer form.

During checkout, the default shipping address, delivery method and payment method are taken from the Customer record. The customer can optionally edit these default options if required. If any changes are made to shipping, delivery or payment details, the information is updated in the Customer record either after each step (in multi-step checkout) or when the order is submitted.

Since the customer already has a Customer record, there's no conversion, but the sales order gets added to the Sales subtab under Transactions.

Configure Customer Website Settings

Applies to: SuiteCommerce | SuiteCommerce Advanced

This section provides information about how to set up your web store for customers. It involves several steps:

Set up the customer registration flow	Configure Site Registration
Determine specific permissions for customers	Create the Website Customer Center Role
Prevent customers from signing up several times using the same email address	Detect Duplicate Customer Email
Manage customer registration on multiple sites	Assign Customers to Websites

Configure Site Registration

Applies to: SuiteCommerce | SuiteCommerce Advanced

To set up your website for customers, you need to determine the registration workflow for your web store. There are four possible site registration scenarios:

- Existing Customer, New Customer or Guest Shopper
- Existing Customer only
- Existing Customer or New Customer
- Guest Shopper only

Depending on the requirements of your business, you may choose one of the various options. For a more detailed description on the various registration flows and their operation, see [Customer Registration Flow](#).

To configure site registration:

1. Go to Commerce > Websites > Web Site List.
2. On your Web Site Setup record, click **Edit**.
3. On the **Shopping** subtab, **Registration Page** section, select the desired option in the **Customer Registration Is** field. The options are: disabled, optional, existing customer only, and required.
 - To enable all possible registration flows, select **optional**.
 - To only enable [Existing Customer](#) or [New Customer](#) registration flows, select **required**.
 - To enable [Guest Shopper](#) registration flow only, select **disabled**.
 - To enable [Existing Customer](#) registration flow only, select **existing customer only**.

For more information about the different flows, see [Customer Registration Flow](#).

4. Click **Save**.

Note: If you have multiple websites, you may want to ensure that a customer only has access to a specific site. Customers are assigned to all sites by default. To change this behavior, see the help topic [Assign Customers to Websites](#).

Create the Website Customer Center Role

Applies to: SuiteCommerce | SuiteCommerce Advanced

You should create a specific Customer Center role for your website. The Customer Center role determines the information shown in the My Account section of your website, and the login access permissions given to customers. All new customers are automatically assigned this role when they register.

Note: In the following scenario, the standard Customer Center role is used; however, you should customize this role to suit your web store requirements.

Note: Customers who have access to the Customer Center role always have access to your web store.

To customize the Customer Center role:

1. Go to Setup > Users/Roles > Manage Roles.
2. Click **Customize** next to the Customer Center role.
3. In the **Name** field, enter a name for your custom Customer Center role.
For example, Website Customer Center.
4. In the **Subsidiaries** field, select the subsidiary your website is associated with.
5. Click the **Permissions** subtab.
 1. On the **Transactions**, **Lists**, and **Setup** subtabs, click the name of the task for which you want to change access.
 2. In the **Level** column, adjust the permission level for the task.
For example, to prevent customers from generating statements from their My Account page, change the value from **Create** to **None**.
 3. Click **OK**.
6. Click the **Forms** subtab. On Transaction and CRM, check the box in the Preferred column next to the form.
7. Click **Save** to create the custom role.

The table below gives some of the permissions available for the standard Customer Center and their impact on your website's My Account section. The default permission level for the standard Customer Center is given. For a full list of the standard role permissions defined for the Customer Center, read the help topic [Standard Roles Permissions Table](#).

Users with NetSuite specialized center roles can see only files on records they have access to, and files with the Company-Wide Usage, or the Available Without Login preferences enabled. For more information, see the help topics [NetSuite Specialized Centers](#) and [Permissions and File Cabinet Files](#).

Transaction subtab

Permission	Standard Customer Center permission	Action in My Account
Estimate	View	Customers can view quotes created by their sales representative in My Account.
Generate Statements	Create	Customers can print a statement that lists all transactions, including invoices, credit memos and payments, for a given date range.
Invoice	View	Customers can view their invoice history. Note: Invoices that are pending approval aren't displayed in the My Account area of your Commerce website when the Approval Routing feature is enabled.
Return Authorization	Create	Customers can request item return directly from My Account.

Permission	Standard Customer Center permission	Action in My Account
Sales Order	Edit	Customers can view their purchase history in My Account.

Lists subtab

Permission	Standard Customer Center Permission	Action in My Account
Issues	View	If you have set up Issue Management, customers can view issues and their status.
Cases	Edit	If you have set up Support Management, customers can view cases and their current status.

For more detailed information about configuring the Customer Center role to suit your requirements, see the help topic [Customizing the Customer Center Role](#).

To set the default customer role for your website:

1. Go to Setup > Company > General Preferences.
2. In the **Default Role for New Customers** field, select the newly customized Website Customer Center role.
3. Click **Save**.

Detect Duplicate Customer Email

 **Applies to:** SuiteCommerce | SuiteCommerce Advanced

The Website Duplicate Email Detection feature prevents web store shoppers from creating duplicate customer accounts on your website. This feature detects duplicate email addresses when a customer chooses to register for an account. If a duplicate email address is detected, the customer is notified with an alert message, but the web store checkout workflow can proceed.

To set up duplicate email management for your website:

1. Enable the feature.
 - a. Go to Setup > Company > Enable Features.
 - b. On the Web Presence subtab, check the box next to **Web Site Duplicate Email Management**.
 - c. Agree to the terms of service.

Warning: This feature potentially allows an attacker to enter numerous test email addresses to build up a list of registered site users. To mitigate this risk, install a CAPTCHA control or another program that slows down the registration process on your website. To enable the feature, you must agree to a Terms of Service statement that you understand and accept this risk.

- d. Click **Save**.

2. Go to Setup > Company > General Preferences.
3. Under **Web Site Duplicate Email Management**, select **Enable Duplicate Detection**.
4. Click **Save**.

After you enable website duplicate email detection, shoppers can't sign up for a customer account with an email address that belongs to an existing customer. If a duplicate email address is detected, the shopper can either register with a new email address or reset the password for their customer account. In OneWorld accounts, shoppers aren't allowed to register with an email address that is already assigned to an existing customer in the same subsidiary.

Exceptions to Duplicate Website Email Detection

Duplicate customer email management only affects customer registration on your website. Note the following cases when the system doesn't block the customer from entering a duplicate email address.

Duplicate email addresses are allowed in the following cases:

- PayPal Express Checkout.
- Contacts with web store access using the same email address as the associated Customer.
- Customers in a OneWorld account who register in different subsidiaries. (They are only blocked from signing up with the same email address in the same subsidiary.)
- Customers and Leads without web store access, such as in guest checkout. (A new Anonymous or Default Customer record is created with each guest checkout. Duplicate email addresses aren't blocked.)

Customize the Error Message Shown when a Duplicate Email Address is Detected

You can customize the error message that is displayed to the shopper when a duplicate email address is detected. Shoppers who try to register with an existing email address are shown an error message indicating that the email address is already in use. The error message that is displayed by default prompts the customer to log in with the original password or enter a different email address. You can customize the message that notifies the shopper of the duplicate email address.

To customize the alert message for duplicate website email detection:

1. Go to Commerce > Content Management > Customize Text.

Note: Refer to [Using Web Site Text Groups](#) for general instructions on working with the **Customize Web Site Text** user interface.

2. Click on the Error Messages subtab.

The **Default Text** column displays the default value for each block of text that appears in the web store. The blank fields in the **Customization** column are for your customized changes to the existing text. The **Description** column provides more information about some of the fields.

3. Use the browser search to find the following block of text on the page. You can modify the text of the alert message that customers see when they try to register on your website with an email address that already exists:

You registered as a new customer, but a customer already exists with the email, {1}.
Please log in with the original password, or enter a different email address.

 **Note:** The variable in the message, {1}, is replaced with the duplicate email address.

4. Copy the HTML in the **Default Text** column, make your changes, and then paste your customized HTML in the **Customization** column.
5. Click **Save**.

Customize Customer Registration Communications

 **Applies to:** SuiteCommerce | SuiteCommerce Advanced

The registration process is a key point of contact in the shopping cycle. Reaching out to customers in a language they understand is important for encouraging lead conversion and increased sales. Commerce web stores let you customize the email templates used during the registration process so that you can personalize the shopping experience and process leads more efficiently.

Registration Confirmation Template

When a new customer has completed registration on the website, an email message is sent that confirms customer registration. The template used for this email message can be customized. For more information about customizing the default email template for registration confirmation, see [Registration Confirmation Email Messages](#).

Advanced Sign Up

 **Applies to:** SuiteCommerce | SuiteCommerce Advanced | Site Management Tools

The SuiteCommerce Advanced Sign Up extension lets you use an alternate sign-up form on your Commerce website in addition to, or instead of, the existing standard customer registration form.

The Advanced Sign Up form is particularly suited to wholesalers who want their users to register before they are able to shop on their site. To complete the registration process, users must be approved either manually or through the automatic approval process.

You can decide which fields to include on the Advanced Sign Up form and whether the form creates a lead or customer record in NetSuite.

To increase security, you can add a CAPTCHA challenge to your Advanced Sign Up form.

 **Important:** Commerce extensions are only available if provisioned, installed, and activated for a selected domain in your NetSuite account. For more information, see [Commerce Extensions](#).

 **Note:** The Advanced Sign Up extension requires SuiteCommerce or SuiteCommerce Advanced release 2019.1 or later.

This topic explains how to:

- [Configure Advanced Sign Up](#)
- [Set Up Advanced Sign Up Email Templates](#)
- [View the Advanced Sign Up Saved Search](#)

- [Customize the Advanced Sign Up Form with Site Management Tools](#)
- [Add CAPTCHA to an Advanced Sign Up Form](#)

Note: This extension only works if you're using a single domain for web store and checkout. For more information about types of domains, see the help topic [Types of Domains](#).

Note: This extension can't be used if your site is password-protected. For more information, see the help topic [Restrict Access to Your Entire Site](#).

Before You Begin

To take advantage of the Advanced Sign Up extension, you must set the **Type of Customer Registration** field to a setting that fits the needs of your website. You can find the **Type of Customer Registration** field in the **Shopping** tab, **Registration Page** subtab of the Web Site Setup record.

Refer to the table below for the **Type of Customer Registration** field options and the resulting behaviors for the standard customer registration and Advanced Sign Up forms. For more information about types of customer registration, see [Customer Registration Flow](#).

Type of Customer Registration	Does the standard customer registration form appear on the site?	Does the Advanced Sign Up form appear on the site?	Are links to the Advanced Sign Up form added? Where?
Disabled	No	No	No
Existing Customers Only	No	Yes	Yes — a Register link in the header of your website and a Create a New Account link at the bottom of the standard login form
Optional	Yes	Yes	Yes — a Create a New Account link at the top of the standard customer registration form
Required	Yes	Yes	Yes — a Create a New Account link at the top of the standard customer registration form

Configure Advanced Sign Up

Applies to: SuiteCommerce | SuiteCommerce Advanced | Site Management Tools

To determine how the Advanced Sign Up form displays on your Commerce website, configure the properties on the SuiteCommerce Configuration record. You can choose the form titles, button labels, error messages, and more. You can also decide which fields to include on your form based on the information you want from users.

The Advanced Sign Up form only has one address field, but you can create custom fields to support additional address information.

To configure Advanced Sign Up properties:

1. Activate the Advanced Sign Up extension in your NetSuite Account.

For more information about activating an extension, see [Manage Themes and Extensions](#).

2. Go to Commerce > Websites > Configuration.
3. Select the website and domain where the Advanced Sign Up extension is activated and click **Configure**.
4. Go to the **Extensions** tab and the **Advanced Sign Up** subtab.
5. Fill out the listed fields for each category, using the tables below as references.
6. Click **Save**.

General Fields:

Field	Description
URL Path	Sets the URL path for the Advanced Sign Up form. Don't use the URL path /register . This creates an error with your site.
Header Link	Sets the label for the header link. This field only applies if the Type of Customer Registration list on the Website Setup record is set to Existing Customers Only . You can find the Type of Customer Registration list in the Shopping tab, Registration Page area of the Website Setup record. For more information, see Before You Begin .
Login Form New Account Message	Determines the message to display offering users to register for a new account. The placeholder <code>[[link]]</code> is automatically replaced by the Login Form Link .
Login Form Link	Sets the label for the login form link. This link is used in the Login Form New Account Message and leads to the URL path listed in the URL Path field.
Register New Users As	Determines how new users are registered in NetSuite.
Form Countries	Determines which countries appear in the Country list in the signup form. You must select at least one country if you want the Country field to display on the form. Selected countries must also be listed in the Countries Website Ships To field. This field is located in the Website Setup record. Go to the Shopping tab and the Shipping Page area. You can find the Countries Website Ships To field in the Shopping tab and ShippingPage area of the Website Setup record.
Offer Marketing Email Subscription	If checked, a marketing email subscription checkbox displays on the signup form. For users who choose to subscribe, the Global Subscription Status field is set to Soft Opt-In and subscription fields are checked on the customer or lead record.
Marketing Email Subscription Label	Sets the label for the marketing email subscription option on the signup form.
Auto-Approve Accounts That Meet Criteria	If checked, auto-approves accounts that meet specific criteria set in the Auto-Approve Saved Search .
Auto-Approve Saved Search	Determines the saved search that NetSuite uses to auto-approve accounts that meet specific criteria. For example, you could set up a saved search that only returns customer records with a certain type of email address. If you select this saved search to use for auto-approval and the user completes the form with a qualifying email address, the user is automatically approved. For more information about creating a saved search, see the help topic Defining a Saved Search .

Field	Description
Assign Role	Sets the NetSuite user role to assign to new users.
Price Level	Sets the price level to assign to new users.

Messaging Fields:

Field	Description
Form Header	Sets the header to appear at the top of the signup form.
Form Title	Sets the title for the signup form.
Form Subtitle	Sets the subtitle for the signup form.
Submit Button Label	Sets the label for the button that submits the signup form.
Confirmation Title	Sets the title for the confirmation message that displays after the user successfully submits the signup form.
Confirmation Message	Determines the message for the confirmation that appears after successfully submitting the signup form.
Required Field Warning Message	Determines the message to display when a required field is left blank. The placeholder [[field]] is automatically replaced by the field name.
File Too Large Error Message	Determines the message to display when a user selects a file that is too large. For fields where the Field Type is File Upload , a user can upload a file with a maximum size of 10 megabytes (MB).
Submission Error Message	Determines the message to display if the signup form fails to successfully submit.
Email Template	Sets the email template used for the Advanced Sign Up email to alter users that their registration is pending approval. To create an email template, see the Set Up the Status Pending Email Template section below.
Email Employee Sender	Determines from which employee the Advanced Sign Up email originates. To avoid problems with the Advanced Sign Up email, select an active employee for this field.

Form Fields:

For each field you want to include on the Advanced Sign Up form, insert a row in the Sign Up Form Fields table, and complete the following fields as needed.

Field	Description
Field Type	Sets the type of field to use on the signup form. For fields where the Field Type is File Upload , a user can upload a file with a maximum size of 10 megabytes (MB). The following file extensions are supported: JPEG, PNG, and PDF.
Field ID	Links the Field ID of the NetSuite field you want to employ to store values for this field. You must set a Field ID for every form field. If the field doesn't have a corresponding internal Field ID, you can enter a placeholder ID. You can use NetSuite fields native to the customer record or custom fields.

Field	Description
Label	Sets the field label to display on the signup form.
Placeholder	Sets the placeholder to display for the field on the signup form.
Required	If checked, the field displays as a required field on the signup form.
Pattern	Determines the desired pattern for the field using regular expressions. For example, if the field requires a 5-digit postal code, you can enter: <code>^\d{5}\$</code> .
Field Error Message	Determines the message to display for a field when a user completes the field incorrectly.

Public Access to Advanced Sign Up Form on Password-Protected Websites

If you operate a password-protected Commerce website and want to make your Advanced Sign Up form available publicly, perform the following steps.

To display the Advanced Sign Up form publicly:

1. Go to Commerce > Websites > Configuration.
2. Select your website and domain and click **Configure**.
3. Go to the **My Account** tab and the **Overview** subtab.
4. In the **URL** field, enter the URL for your Advanced Sign Up form.
The URL will be the one that you set as the URL Path in the Advanced Sign Up form properties.
5. Click **Add**.
6. Click **Save**.

See the help topic [Set Public URLs](#) for more information about setting publicly-accessible URLs.

Set Up Advanced Sign Up Email Templates

i Applies to: SuiteCommerce | SuiteCommerce Advanced | Site Management Tools

You can customize the two emails associated with Advanced Sign Up that are sent to your users. See the following topics on how to set up the email templates to fit your needs.

- [Set Up the Status Pending Email Template](#) — This template comes with the Advanced Sign Up bundle and is used to notify users that their registration status is pending.
- [Customize the Customer Center Access Email Template](#) — This template is used for a standard NetSuite system-automated email alerting a customer that they have been given access to Customer Center role in NetSuite and need to set a password. You can customize this template to make it more specific to your website and the Advanced Sign Up process.

Set Up the Status Pending Email Template

After installing the Advanced Sign Up bundle, create the email template used to notify users that their registration status is pending. If you don't set up the email template, then no email is sent alerting your

users that their registration is pending approval. To set up the status pending email, create a new email template in NetSuite using a file included in the Advanced Sign Up bundle. For more information about modifying an email template, see the help topic [Customizing Templates for System-Automated Email](#).

Note: For advanced users experienced in HTML and FreeMarker, you can use the variables defined in the header of the included file to further customize the email template. For more information about modifying a template with FreeMarker, see the help topic [Scriptable Templates](#).

To set up the status pending email template:

1. In NetSuite, go to File Cabinet > SuiteBundles > [BUNDLE ID] > com.netsuite.advancedsignup > EmailTemplates.
In the path above, [BUNDLE ID] equals the Advanced Sign Up bundle ID. For the bundle ID, see [Commerce Extensions](#).
2. Click **Download** next to the **advanced_sign_up_processing.template.ftl** file.
3. Use this file to create a new email template:
 - a. In NetSuite, go to Documents > Templates > Email Templates > New.
 - b. In the **Name** field, give your new template a name.
This name displays as an option in the **Email Template** field of the SC Configuration Record, which you select to configure the extension's email template.
 - c. In the **Record Type** field, select **Custom Record**.
 - d. In the **Template** tab, perform the following steps:
 - i. In the **Subject** field, enter a message to display as the subject of the Advanced Sign Up email.
For example: Thanks for signing up!
If you're experienced with HTML and FreeMarker, you can adjust this subject to meet your needs.
If this field is left blank, the Subject displays the following message: Thanks for signing up!
 - ii. In the **Create Template From:** field, select **File**.
 - iii. Click the **New** icon to add a file.
 - iv. In the **Select File** field, choose the **advanced_sign_up_processing.template.ftl** file downloaded from the File Cabinet.
 - v. Click **Save**.
 - e. Click **Save** to create the email template.

Customize the Customer Center Access Email Template

The Customer Center Access Email template is a NetSuite system-automated email alert. It alerts customers that they have been given access to a NetSuite Customer Center role and must set a password. This email is sent to a user who has been approved and includes two links to NetSuite, one to set a password and one to log in.

For use with this extension, it makes more sense for the confirmation email to send users to the web store page to log in, as opposed to in NetSuite. You should edit the template so that the Click Here to Log In link points to your website URL. You can also add more information to make the template specific to your company.

To customize the Customer Center Access Email template, see the following topic on how to modify a system email template: [Customizing Templates for System-Automated Email](#).

View the Advanced Sign Up Saved Search

Applies to: SuiteCommerce | SuiteCommerce Advanced | Site Management Tools

After setting up the extension, you can view the saved search associated with Advanced Sign Up. The following saved search is created automatically when you install the extension:

- **Advanced Sign Up Pending Approval Customers** — You can check which customers have signed up on your site using the Advanced Sign Up form and are currently pending approval.

This saved search tells you which customer or lead records require action from you and helps ensure that you don't miss a user's signup request.

To view a saved search:

1. In NetSuite, go to Lists > Search > Saved Searches.
2. Click **View** next to the saved search you want to see.

For more information about how to view or use a saved search, see the help topic [Accessing a Saved Search](#).

You can also add the saved search results to a dashboard portlet for quick viewing. For more information, see the help topic [Displaying Saved Search Results on Your Dashboard](#).

Customize the Advanced Sign Up Form with Site Management Tools

Applies to: SuiteCommerce | SuiteCommerce Advanced | Site Management Tools

For further customization, you can use Site Management Tools (SMT) to:

- Add content to the signup form — You can add an image, text, merchandising zone, and HTML content by using the corresponding content type in SMT. In addition, you can add a Custom Content Type (CCT) related to another extension. When logged into SMT, the Advanced Sign Up form allows you to select the content type you want to add and drag it onto the form.
For more information about types of content, see the help topic [Site Management Tools Overview](#).
- Set color and font settings with the Theme Customizer — You can select font size, color, and family for the Header, Title, and Subtitle of the Advanced Sign Up form and the background color of the form using the Theme Customizer in SMT.

For more information, see the help topic [Theme Skin Manager](#).

Add CAPTCHA to an Advanced Sign Up Form

Applies to: SuiteCommerce | SuiteCommerce Advanced | Site Management Tools

To enhance the security of your Advanced Sign Up form, you can add a CAPTCHA challenge using a third-party CAPTCHA provider, either hCaptcha or Google reCAPTCHA v2.

CAPTCHA challenges prompt customers to complete simple tasks to verify they are human before submitting the sign up form. This adds an extra layer of protection against automated abuse and fraudulent activity and helps prevent bot attacks from creating spam submissions.

Note: CAPTCHA for an Advanced Sign Up form is different than SuiteCommerce CAPTCHA. For more information about setting up CAPTCHA for your SuiteCommerce web store, see the help topic [SuiteCommerce CAPTCHA](#).

To set up CAPTCHA for an Advanced Sign Up form:

1. Sign up with the provider of your choice and get a Site Key
Provider choices:
 - [Google reCAPTCHA v2](#)
 - [hCaptcha](#)
2. Create a secret key in NetSuite using API secrets
For more information, see the help topic [Creating Secrets](#).
In the Restrictions tab:
 - Check the box for **Allow for All Scripts**
 - For **Restrict to Domains**, add the corresponding CAPTCHA validation domain:
 - For hCaptcha: [api.hcaptcha.com](#)
 - For Google reCaptcha v2: [www.google.com](#)

Note that with this domain restriction, the secret key is only exposed when communicating with the designated CAPTCHA validation service.
3. [Configure CAPTCHA in NetSuite](#)

Configure CAPTCHA in NetSuite

To set up CAPTCHA for the Advanced Sign Up form, configure the fields on the SuiteCommerce Configuration record.

CAPTCHA configuration is domain-specific. You can disable CAPTCHAs that are no longer needed.

To configure CAPTCHA

1. Go to Commerce > Websites > Configuration.
2. Select the website and domain where the Advanced Sign Up extension is activated and click **Configure**.
3. Go to the **Extensions** tab and the **Advanced Sign Up** subtab.
4. Set the following fields:

Field	Description
CAPTCHA Type Option	Choose your CAPTCHA provider. You can choose between Google reCAPTCHA v2 and hCaptcha. To disable this CAPTCHA challenge, select Disabled .
CAPTCHA Site Key	Enter the public key provided by your CAPTCHA provider (reCAPTCHA or hCaptcha).
CAPTCHA Secret Key ID	Enter the private key's ID.

Field	Description
	For more information about how to create a secret key using API secrets, see the help topic Creating Secrets .

5. Click **Save**.

Note: It may take a little time for the changes to take effect. To see the changes sooner, trigger a [Cache Invalidation Request](#).

Communications

Applies to: SuiteCommerce | SuiteCommerce Advanced

Communications are a key part of your marketing strategy and aim to optimize customer engagement. Commerce web stores let you personalize your messages to make them more effective and build brand awareness.

You can:

- Create custom templates to be used for email communications from your website
- Choose the default template to be used for different communication types, such as order status emails, password recovery emails, and checkout error alerts
- Set the sender address for your emails.
- Manage users' newsletter subscriptions.
- Add social sharing capabilities to your website

Email Management

Applies to: SuiteCommerce | SuiteCommerce Advanced

There are tasks you can perform to manage customer email communication in the web store. Refer to the following topics for detailed information.

- **Web Store Email Setup**
 - [Website Email Settings](#) — this topic describes how to select web store email preferences including when the email is sent, to whom the email is sent, and the content of the email.
 - [Templates for Website Email Messages](#) – this topic describes how to define the content of web store email.
- [Change Email Address](#)

For information about email communications sent from NetSuite, see the help topic [Sending Email from NetSuite](#).

For information about customizing web store email templates, see the help topic [Scriptable Web Store Email Template](#).

Website Email Settings

Applies to: SuiteCommerce | SuiteCommerce Advanced

On the Web Site Setup page, you can set preferences for sending email messages for Commerce web stores.

- See [Set Website Email Preferences](#) for information about how to set the default **from** email address and the header and footer of website email.
- See [Select Email Templates for your Web Site](#) for information about how to set email preferences, such as when the email is sent, to whom the email is sent, and the content of the email, for different types of email messages sent from the web store.

If you have multiple websites, you can set preferences and select different email message templates for each site.

Set Website Email Preferences

Applies to: SuiteCommerce | SuiteCommerce Advanced

On the Web Site Setup record, you can set preferences and choose the content of different types of email sent from Commerce web stores. If you have multiple websites, you can set preferences and select different email message templates for each site.

To set preferences for email messages sent from your website:

1. Go to Commerce > Websites > Web Site List.
2. Click **Edit** next to the website you want to modify.
3. Click the **Email** subtab.
4. (Optional) In the **Default Web Store Email From** field, enter the email address to show in the From field when email notification messages are sent to website customers. Ensure that you have set up a DKIM key for the domain from which you want to send email. For more information about DKIM, see the help topic [DomainKeys Identified Mail \(DKIM\)](#).

Note: This address is only used if you leave the **Email From Address** field blank on any of the email template settings.

5. (Optional) To control the content in the header and footer of email, create files for the header and footer, upload them to the File Cabinet, and include them in the system email templates using the #include directive. For more information, see the help topic [Inserting Subtemplates into Templates](#).
6. You can set preferences and select email content for each email type on each of the subtabs displayed on the page. See [Select Email Templates for your Web Site](#), for a complete list of the preferences and settings available.
7. After you set your preferences, click **Save**.

Select Email Templates for your Web Site

Applies to: SuiteCommerce | SuiteCommerce Advanced

Email templates define the content used in your website email.

See [Templates for Website Email Messages](#) for more information.

On the Web Site Setup page, use the subtabs on the Email tab to set preferences and to choose content for each of the following types of web store email message:

- [Order Emails](#)
- [Digital Delivery Email](#)
- [Other Emails](#)

Order Emails

On the Order Emails subtab, you can set preferences for email messages generated at each stage of a web order: Order Received, Order Approved, Order Canceled, and Order Fulfilled. The Order subtab contains a section for each email type and the following procedure applies for all of them.

To set preferences for web store order email:

1. Select the **Send Email** box, to send an email message to customers when an order is received, approved, canceled or fulfilled.

If the shopper is a business customer that has one or more contacts placing orders on its behalf, the email preference **CC Customer on All Emails Related to Orders Placed by Contacts** determines the email addresses to which the order email message is sent. See [Identify Order Creator](#) for more information.

2. In the **Email From Address** field, enter the email address to use as the email's From address.

 **Note:** Ensure that you have set up a DKIM key for the domain from which you want to send email. See the help topic [DomainKeys Identified Mail \(DKIM\)](#) for more information.

3. If you want to receive copies of the order email messages sent to your customers, select the **Send BCC Emails** box and enter the email address in the following field.

You can enter more than one address separated by a comma.

4. Select the email template you want to use from the **Select a System Email Template** list. If you use multiple languages in your site, you can define multiple language versions in the same email template. See [Templates for Website Email Messages](#) for more information.
5. (Optional) Click on the Preview icon to see what your email will look like when it's sent. You can preview only those email that are based on system email templates. See [Preview Website Email Templates](#) for information about the preview options available.

Digital Delivery Email

On the Digital Delivery emails subtab, you can set preferences for email messages generated when a customer orders an item or a gift certificate to download.

To set preferences for web store digital delivery email:

1. Select the **Send Email** box, in the appropriate section, to send an email message to customers.

If the shopper is a business customer that has one or more contacts placing orders on its behalf, the email preference **CC Customer on All Emails Related to Orders Placed by Contacts** determines the email addresses to which the order email message is sent. See [Identify Order Creator](#) for more information.

2. In the **Email From Address** field, enter the email address to use as the email's From address.

 **Note:** Ensure that you have set up a DKIM key for the domain from which you want to send email. See the help topic [DomainKeys Identified Mail \(DKIM\)](#) for more information.

3. If you want to receive copies of the message sent to your customers when a gift certificate is purchased on your website, select the **BCC Gift Certificate Emails** box and enter the email address in the following field.

You can enter more than one address separated by a comma.

 **Note:** On the digital delivery subtab, you only have the option to BCC gift certificate email messages.

4. Select the email template you want to use from the **Select a System Email Template** list. If you use multiple languages in your site, you can define multiple language versions in the same email template. See [Templates for Website Email Messages](#) for more information.

5. (Optional) Click on the Preview icon to see what your email will look like when it's sent. You can preview only those email that are based on system email templates. See [Preview Website Email Templates](#) for information about the preview options available.

Other Emails

On the Other Emails subtab, you can set up the following email notifications:

- [Checkout Error Alerts](#)
- [Web Store Password Recovery Email Messages](#)
- [Registration Confirmation Email Messages](#)

Checkout Error Alerts

You can receive alerts if an order isn't submitted because of an error that occurred at checkout.

Email alerts sent to you, include a ticket number that refers to the error logged in NetSuite. If you receive several alerts, please contact NetSuite Customer Support with these ticket numbers to expedite a resolution.

To set preferences for checkout error alerts:

1. Select the **Send Email** box, to accept email alerts if a customer is unable to submit an order because an error was logged from your website.
2. In the **Email From Address** field, enter the email address to use as the email's From address.
You can use this field to filter the alert messages you receive. For example, this can be useful if you choose to forward error alerts to your mobile phone.

 **Note:** Ensure that you have set up a DKIM key for the domain from which you want to send email. See the help topic [DomainKeys Identified Mail \(DKIM\)](#) for more information.

3. In the **Email To** box, enter the email address where you want to receive web store alert messages. You can enter multiple email addresses separated by commas.
4. Select the email template you want to use from the **Select a System Email Template** list. If you use multiple languages in your site, you can define multiple language versions in the same email template. See [Templates for Website Email Messages](#) for more information.
5. (Optional) Click on the Preview icon to see what your email will look like when it's sent. You can preview only those email that are based on system email templates. See [Preview Website Email Templates](#) for information about the preview options available.

Web Store Password Recovery Email Messages

You can customize the password recovery email message delivered when web store customers want to reset the passwords they use to login on your website. By creating a custom email template specifically for password recovery purposes, you can apply the same company branding that you apply to other messages customers receive from your site.

 **Note:** The password recovery link expires one hour after it's sent.

To set preferences for web store password recovery email messages:

1. Select the **Send Email** box, to send an email message when a customer on your site makes a request to reset a password.
2. In the **Email From Address** field, enter the email address to use as the email's From address.

 **Note:** Ensure that you have set up a DKIM key for the domain from which you want to send email. See the help topic [DomainKeys Identified Mail \(DKIM\)](#) for more information.

3. Select the email template you want to use from the **Select a System Email Template** list. If you use multiple languages in your site, you can define multiple language versions in the same email template. See [Templates for Website Email Messages](#) for more information.
4. (Optional) Click on the Preview icon to see what your email will look like when it's sent. You can preview only those email that are based on system email templates. See [Preview Website Email Templates](#) for information about the preview options available.

Registration Confirmation Email Messages

You can set preferences for registration confirmation email messages on the Other Emails subtab of the Web Site Setup page.

To set preferences for registration confirmation email messages:

1. Select the **Send Email** box, to send a registration confirmation email message to customers who sign up on your website.
2. In the **Email From Address** field, enter the email address to use as the email's From address.
If you operate multiple sites, you can enter a different address for each site.

 **Note:** Ensure that you have set up a DKIM key for the domain from which you want to send email. See the help topic [DomainKeys Identified Mail \(DKIM\)](#) for more information.

3. If you want to receive copies of the registration confirmation email message, select the **BCC Registration Confirmation Email** box and enter the email address in the following field .
You can enter more than one address separated by a comma.
4. Select the email template you want to use from the **Select a System Email Template** list. If you use multiple languages in your site, you can define multiple language versions in the same email template. See [Templates for Website Email Messages](#) for more information.
5. (Optional) Click on the Preview icon to see what your email will look like when it's sent. See [Preview Website Email Templates](#) for information about the preview options available.

Templates for Website Email Messages

 **Applies to:** SuiteCommerce | SuiteCommerce Advanced

System email templates are used for all types of system-automated email in NetSuite, including website email. These templates can be customized and give you good control over the appearance and content of email sent from your web store. For example, you can change how ordered items show up and add product pictures.

If you have the Multi-Language feature enabled, you can set up multiple language versions of the same email template without needing to create individual templates for each language. Web store users receive the email message in their preferred language.

Website email templates have a preview feature that lets you see what the email will look like when it's sent to the customer. In the preview page, you can choose the website from which the email is sent, the language in which it's sent, and other key details, resulting in a preview that is an accurate representation of the email the web store customer will receive. For more information, see [Preview Website Email Templates](#).

The following default email templates are available for website email messages at Setup > Company > Email > System Email Templates. They are mobile-friendly and are available in all languages supported by NetSuite:

- **Template Category: Web Site Order Notifications**
 - Standard Web Site Order Received
 - Standard Web Site Order Canceled
 - Standard Web Site Order Approved
 - Standard Web Site Order Fulfilled
- **Template Category: Web Site Digital Delivery Notifications**
 - Standard Web Site Gift Certificate
 - Standard Web Site Gift Certificate Confirmation
 - Standard Web Site Download Available
 - Standard Web Site License Code
- **Template Category: Web Site Other Notifications**
 - Standard Web Site Checkout Errors
 - Standard Web Site Password Recovery
 - Standard Web Site Registration Confirmation

For information about each type of email and details on how to select the email templates you want to use in the web store, see [Select Email Templates for your Web Site](#).

 **Note:** If you want to use standard email templates for your website email messages, you should create copies of them and customize them as needed. Don't use the original default templates as these may be updated in future releases.

Create and Modify Email Templates

 **Applies to:** SuiteCommerce | SuiteCommerce Advanced

You can create new email templates and modify existing ones from Setup > Company > Email > System Email Templates. The process for creating and modifying email templates for website email is the same as that for creating and modifying other types of email templates. For more information see:

- [Customizing Templates for System-Automated Email](#)
- [Scriptable Templates](#)
- [Synthetic Fields for Scriptable Templates](#)

It's important to remember, that when you create a new email template for a website email, you must attach it to one or more of the following template categories:

- Web Site Order Notifications
- Web Site Digital Delivery Notifications

■ Web Site Other Notifications

For more information about template categories, see the help topic [System-Automated Template Categories](#).

Preview Website Email Templates

 **Applies to:** SuiteCommerce | SuiteCommerce Advanced

This feature shows you what the selected website email will look like to a web store customer. If you have multiple websites in your account or multiple languages defined in the email template, you can quickly see what the email will look like when sent in different languages from different websites.

 **Note:** Email preview is available only for system email templates for web stores. It's not available for other types of system email templates.

Watch the following help video for information about previewing system email templates.

 [Preview System Email Templates](#)

To preview a website email:

1. Go to Commerce > Websites > Web Site List.
2. Click **Edit** next to the website whose email you want to preview.
3. Click the **Email** subtab.
4. Click the subtab that contains the email you want to preview. For example, if you want to preview the Order Received email, click the **Order Emails** subtab.
5. Locate the email type you want to preview, for example, Order Received. Ensure the email template you want to preview is selected in **Select a System Email Template**, and click the preview icon next to it.

 **Tip:** If you can't see the preview icon, point to the **Select a System Email Template** field. The preview icon is displayed to the right of the field.

6. In the preview window, select the language in which to view the email. Multiple languages are available if the Multi-Language feature is enabled and if multiple languages are defined in the system email template.
7. (Optional) If you have more than one website set up in your account, you can change the website for which you want to see the email preview.
8. Depending on the **Email Type** you're viewing, other preview options may be available. These include:
 - **Sales Order** – the sales order for which you want to preview the email. This list is available for the email types: Order Received, Order Canceled, Order Approved, Gift Certificate, and Gift Certificate Confirmation.
 - **Fulfillment** – the item fulfillment number for which you want to preview the email. This list is available for the email: type Order Fulfilled.
 - **Gift Certificate** – the gift certificate for which you want to preview the email. The name and recipient email address of each gift certificate in the selected sales order is displayed in the list. This list is available for the email types: Gift Certificate, and Gift Certificate Confirmation.
 - **Cash Sale** – the cash sale number for which you want to preview the email. This list is available for the email types: Download Available, Gift Certificate Confirmation, and License Code.

- **Customer** – the name of the customer for whom you want to preview the email. This list is available for the email types: Checkout Errors, Password Recovery, and Registration Confirmation.

 **Note:** These lists contain the most recent values. You can also type in the value.

9. Click **Preview**.

You can generate previews with different combinations of preview options in the same preview window. For example, you can see what the Order Received email will look like in different languages and for different sales orders by changing the preview options.

Records and Fields Available in Website Email Templates

 **Applies to:** SuiteCommerce | SuiteCommerce Advanced

The following table lists all the records and synthetic fields that are supported in the Text Editor field on the System Email Templates page and in template files you create and attach there. In addition to the synthetic fields, you can also use the standard record fields belonging to the listed records. System email templates use the same record, field, and sublist IDs as SuiteScript. Refer to the [SuiteScript Records Browser](#) for a complete list of these IDs. For more information about the sublists and synthetic fields supported for website system email templates see the help topic [Web Site Notification Fields](#).

Record	Field	Available for Email Type
Web Site	customerCenterUrl	■ Order Received
	url	■ Order Approved
	domain	■ Order Canceled
		■ Order Fulfilled
		■ Download Available
		■ License Code
		■ Gift Certificate
		■ Gift Certificate Confirmation
	downloadLink	■ Download Available ■ License Code
	recoveryPasswordUrl	Password Recovery
	errorTicket	Checkout Errors
	cartContents	
Sales Order	trackingLink	■ Order Received
	overviewTable	■ Order Approved
	itemAvailabilities	■ Order Canceled ■ Order Fulfilled

Record	Field	Available for Email Type
	This field can be used to calculate whether an item is out of stock. The calculation to obtain this information depends on how you have set up the ordering workflow in NetSuite. See Include Out of Stock Information in Website Email for more information.	
	licenses	License Code
Cash Sale	licenses	License Code
Item Fulfillment	trackingLink	Order Fulfilled
	overviewTable	

The following synthetic fields aren't associated with a record but are available for use in website email templates:

Field	Usage	Available for Email Type
itemurls	Provides the URL of the item detail page. Usage format: \${itemurls[item.internalId]}	■ Order Received ■ Order Approved ■ Order Canceled ■ Order Fulfilled ■ Download Available ■ License Code ■ Gift Certificate ■ Gift Certificate Confirmation ■ Password Recovery ■ Checkout Errors ■ Registration Confirmation
itemimages	Provides the URL of the item image. Usage format: \${itemimages[item.internalId]}	

Note: When you use either of these fields, replace `item.internalId` with a valid item internal ID from your NetSuite account. This could be in the form of a constant number or a field containing the internal ID of the item, for example, `itemline.item.internalId`. For a usage example, see the Standard Web Site Order Received email template.

Include Out of Stock Information in Website Email

The `itemAvailabilities` synthetic field contains the number of items available for sale, taking into consideration items in warehouses minus items already committed to other orders. The exact formula to calculate whether an item is out of stock depends on how you have set up the ordering workflow in NetSuite. For example, it's possible to use scripts and custom workflows to change the point in the ordering process at which an order is fulfilled, thus affecting the items available in the warehouse. If your setup allows items to be set to 'backordered', this also affects the number of items available. Therefore, you should evaluate your workflows to determine how to use `itemAvailabilities` to calculate whether an item is out of stock. You can use the result of the calculation in an email template to display whether the item is out of stock or not.

Note: `itemAvailabilities` applies only to inventory items, kits, and assembly items.

The following are some sample formulas that could be used to calculate whether an item is out of stock:

Workflow in which order needs to be approved after it's placed

```

1 <#if (itemAvailabilities[itemline.item.internalId])?has_content && (itemAvailabilities[itemline.item.internalId]?number -
  itemline.quantity <0)>
2   This item is currently out of stock and may be back ordered.
3 </#if>

```

Workflow in which order is approved immediately after it's placed

```

1 <#if (salesorder.status == 'Pending Approval')>
2   <#if (itemAvailabilities[itemline.item.internalId])?has_content && (itemAvailabilities[itemline.item.internalId]?number -
    itemline.quantity <0)>
3     This item is currently out of stock and may be back ordered.
4   </#if>
5 <#elseif (salesorder.status == 'Pending Fulfillment')>
6   <#if (itemline.backordered?number gte 0)>
7     This item is currently out of stock and was back ordered.
8   </#if>
9 </#if>

```

Change Email Address

Applies to: SuiteCommerce | SuiteCommerce Advanced

This information refers to SuiteCommerce and the Kilimanjaro release of SuiteCommerce Advanced and later.

With Commerce and Site Builder web store extensions, users can change their registered email address in the My Account application on the Profile Information page:

1. To change the email address in Commerce web stores, users can go to Home > My Account > Profile Information. The registered address can be updated under **Email**.
2. To change the email address in Site Builder, users can go to the **My Account** tab, and then to **Change Email** under **Settings**.

After a user submits the change request, they receive emails to confirm the change. When the user clicks the confirmation link, a confirmation message is displayed within the login/checkout screen.

Note the following default behavior:

- After a user submits an email change request, two confirmation emails are generated as follows:
 - **Sent to the original email address:** this email informs the user that a change of email address has been requested with instructions to contact the site if they believe the message is generated in error.
 - **Sent to the new email address:** this email contains a confirmation link. When the user clicks the confirmation link for the new email address, they must be logged into the account with their original email before the email change is complete.
- Email changes can be audited on the Customer record at System Information > System Notes. The Change to the email field is recorded with the old and new values.
- The email communication generated for users when they request a change of email are security-sensitive. Therefore, these emails are not recorded in the communication tab of the Customer record. Only the owner of the email address is sent the communication.
- Expiration date for the confirmation is displayed in the confirmation email. A user can resubmit a request at any time to generate a new confirmation email.
- The confirmation email is a system-generated email and can't be customized.
- Users can continue to log in with their current email address and password until the new email address is verified.

Note: This feature is available by default in the Kilimanjaro release of SuiteCommerce Advanced. For instructions on backporting the feature to previous releases of SuiteCommerce Advanced, see the help topic [Change Email Address Patch](#).

Newsletter

Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount

Newsletter lets you manage website visitors' email subscriptions and lets them sign up for your email marketing campaigns.

SuiteCommerce validates the email address entered in the newsletter subscription form against any existing NetSuite Customer or Lead records with a matching address. For each newsletter subscriber, SuiteCommerce updates the NetSuite Customer record for existing customers or creates a new Lead record for new users.

Note: This is an email subscription opt-in feature only. It's not a marketing campaign or content management tool. After users opt in, it's up to the merchant to manage subscriptions for each Lead or Customer record. See the help topic [Subscription Management](#) for details.

For detailed information about creating and managing an email marketing campaign using NetSuite, see the help topic [Email Marketing Campaigns](#).

The Newsletter feature is available as a SuiteCommerce extension SuiteApp. SuiteCommerce Newsletter Sign Up lets you add a newsletter subscription form to your website using Site Management Tools.

SuiteCommerce Advanced Implementations

For Aconcagua release of SuiteCommerce Advanced, the Newsletter feature can be implemented as an extension or in the site template as part of the source code. If you choose to implement the Newsletter feature as an extension, you must disable the newsletter form in the source code. See [Disable the Newsletter Form](#).

For the Kilimanjaro Release of SuiteCommerce Advanced and earlier, the Newsletter feature is implemented in the site template as part of the core source code. See [Newsletter Sign Up Using Core SCA Source Code](#).

Email Subscription Overview

When a user signs up for a newsletter and enters an email address, SuiteCommerce checks for any existing Customer or Lead records in NetSuite that contain a matching address.

If the address already exists within a Customer or Lead record, SuiteCommerce checks the value of the **Global Subscription Status** field.

Note: The preferred record is the Customer record. If both a Customer record and a Lead record contain a matching address, SuiteCommerce only updates the Customer record. SuiteCommerce updates matching Lead records only if no Customer records are returned.

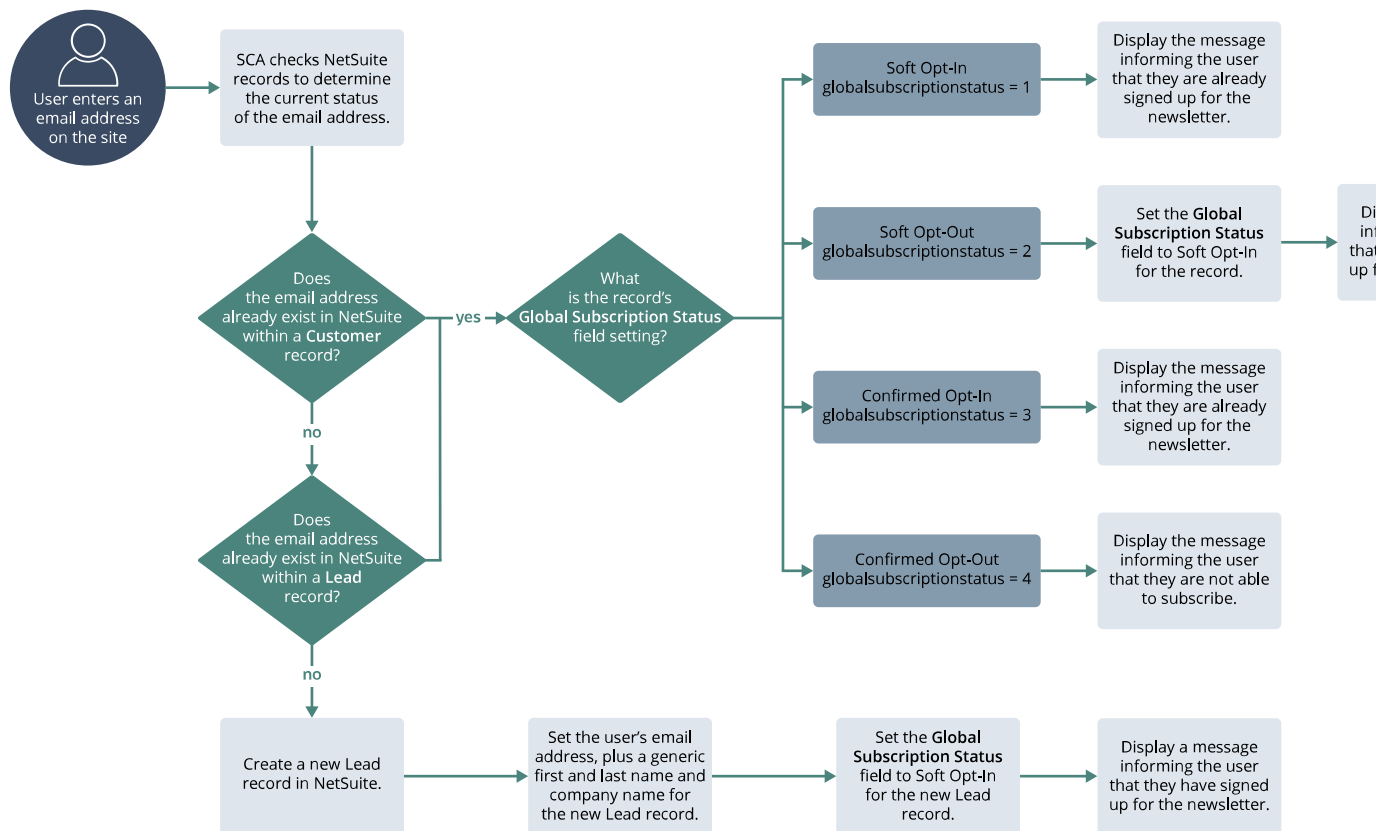

The values that can be set in the Global Subscription Status field are the following:

- **Soft Opt-In** (globalSubscriptionStatus = 1)
- **Soft Opt-Out** (globalSubscriptionStatus = 2)
- **Confirmed Opt-In** (globalSubscriptionStatus = 3)
- **Confirmed Opt-Out** (globalSubscriptionStatus = 4)

For more information about the subscription statuses, see the help topic [Subscription Management](#).

Depending on the value of the **Global Subscription Status** field, SuiteCommerce proceeds as follows:

- If the value is Soft Opt-In, no change is made to the Customer or Lead record. A message informs the user that they are already subscribed to the newsletter.
- If the value is Soft Opt-Out, SuiteCommerce changes the Global Subscription Status value in the Customer or Lead record to soft opt-in. A message informs the user that they have signed up for the newsletter.
- If the value is Confirmed Opt-In, no change is made to the Customer or Lead record. A message informs the user that they are already subscribed to the newsletter.
- If the value is Confirmed Opt-Out, no change is made to the Customer or Lead record. A message informs the user that they can not sign up for the newsletter.

If no Customer or Lead records with a matching address exist, SuiteCommerce creates a new Lead record and sets the **Global Subscription Status** field to Soft Opt-In. SuiteCommerce then uses the generic lead name and company name set up in SuiteCommerce Configuration field to populate the record's required **Name** or **Company Name** fields. The website then displays a message informing the user that they have signed up for the newsletter.

Set Up Newsletter

i Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount

SuiteCommerce leverages NetSuite's subscription management to manage the email preferences for your site's newsletter.

To use the Newsletter feature, you must enable subscriptions in NetSuite, install and activate the SuiteCommerce Newsletter Sign Up extension, and add the Newsletter Sign Up content type to your site using Site Management Tools.

i Note: For the Kilimanjaro Release of SuiteCommerce Advanced and earlier, the Newsletter feature is implemented in the site template as part of the core source code. You need to set up elevated permissions for the Newsletter service manually. See [Newsletter Sign Up Using Core SCA Source Code](#).

To enable subscriptions:

1. In NetSuite, go to Setup > Company > Enable Features.
2. Select the **CRM** tab.
3. In the Basic Features section, check the **Marketing Automation** option. This enables the Global Subscription Status in Customer and Lead records.
4. In the Marketing section, check the **Subscription Categories** and **Sales Campaigns** options. This enable these campaigns.
5. Click **Save**.

To install and activate the SuiteCommerce Newsletter Sign Up extension:

1. Go to Customization > SuiteBundler > Search & Install Bundles.
2. Install the SC Newsletter Sign Up bundle.
3. Go to Commerce > Extensions > Extension Manager.
4. Activate the SuiteCommerce Newsletter Sign Up extension. For more information, see [Manage Themes and Extensions](#).

When you have activated SuiteCommerce Newsletter Sign Up for your domain, you use Site Management Tools to add the newsletter subscription form to your website. See [Newsletter Sign Up](#).

Newsletter Sign Up with Aconcagua

For the Aconcagua Release of SuiteCommerce Advanced, the newsletter sign up feature can be implemented using the SuiteCommerce extension or using the newsletter sign up form incorporated in the site template as part of the core source code.

If you implement the Newsletter feature using the SuiteCommerce extension, you must hide the Newsletter sign up form in the core source code. For more information about how disable the newsletter sign up form, see [Newsletter Sign Up Using Core SCA Source Code](#).

Newsletter Sign Up

i Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount

The Newsletter Sign Up extension lets you add a newsletter sign up form to your website using Site Management Tools (SMT). After activating this extension, you can:

- Determine how the lead record is created in NetSuite.
- Decide which fields to display on the sign up form.
- Choose the layout and style of the sign up form.
- Customize the error and confirmation messages displayed to users.

The SuiteCommerce Newsletter Sign Up extension is available for SuiteCommerce and for the Aconcagua Release of SuiteCommerce Advanced or later. If you're implementing the Aconcagua Release of SuiteCommerce Advanced, you must disable the Newsletter feature implemented in the core source code. See [Disable the Newsletter Form](#).

Important: SuiteCommerce extensions are only available if provisioned, installed, and activated for a selected domain in your account. For more information, see [Commerce Extensions](#).

Before you can implement the Newsletter Sign Up extension, you must first:

1. Set up your SuiteCommerce site for the Newsletter subscription process. See [Set Up Newsletter](#).
2. Install and activate the SuiteCommerce Newsletter Sign Up extension. See [Themes and Extensions](#).

This topic explains how to:

- [Add a Newsletter Sign Up Form](#)
- [Configure a Newsletter Sign Up Form](#)
- [Remove a Newsletter Sign Up Form](#)

Use SMT to add, configure, or delete a newsletter sign up form on multiple areas of your website. Adding this form to enhanced or custom landing pages allows you to promote your newsletter in the place and style you want. For more information about Site Management Tools, see the help topic [Site Management Tools Overview](#).

Add a Newsletter Sign Up Form

Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount

To add a newsletter sign up form to your web store, add the **Newsletter Sign Up** content type to a page of your site using SMT.

To add a newsletter sign up form:

1. In your website, go to the page where you want to add a newsletter sign up form.
2. Log in to SMT.
For more information about logging in to SMT, see the help topic [Users and Roles in Site Management Tools](#).
3. In **Edit** mode, click **Add** on the Site Management toolbar.
4. Drag the **Newsletter Sign Up** content type to the page.

Note: If you don't see this content type, verify that the extension has been installed and is active. Click **Settings** on the Site Management toolbar to access the Content Manager. Drag the content type from the Inactive Content Types list to the Active Content Types list.

You can drag a **Newsletter Sign Up** content type to multiple areas on the page.

For more information about the scopes of different SMT areas, see the help topic [Area and Scope](#).

5. Click **Save**.

Configure a Newsletter Sign Up Form

Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount

Configure properties to customize your newsletter sign up form. You can decide how leads are created in NetSuite, adjust the display options, and choose the field and feedback message texts.

The procedures in this topic explain how to:

- [Configure Properties in NetSuite](#)
- [Configure General Settings](#)
- [Configure Message Settings](#)
- [Configure Layout and Style Settings](#)

Configure Properties in NetSuite

To set up the Newsletter Sign Up extension, you must set your preferences in NetSuite.

When a user signs up for the newsletter, SuiteCommerce checks for matching customer or lead records. If no matching record is found, a new lead record is created using the Standard Customer Form as a default.

SuiteCommerce then sets this new record's **Global Subscription Status** field to Soft Opt-In. If the user does not provide a first name, last name, or company, then the record populates with the **Default First Name**, **Default Last Name**, or **Default Company**, which you can set when configuring properties in NetSuite.

For more information about the newsletter subscription process, see [Email Subscription Overview](#).

To configure properties in NetSuite:

1. After activating the Newsletter Sign Up extension for a domain, go to Commerce > Websites > Configuration.
For more information about activating an extension, see [Manage Themes and Extensions](#).
2. Select the website and domain where you want to set up the extension and click **Configure**.
3. Go to the **Extensions** tab.

Important: If you previously implemented the Newsletter feature as part of a SuiteCommerce theme built prior to the 2018.2 release of SuiteCommerce or the Aconcagua release of SuiteCommerce Advanced, the properties for this feature are located in the **Legacy** tab, **Newsletter** subtab.

You can only configure the Generic First Name, Generic Last Name, and Company Name properties. See the help topic [Newsletter Subtab](#) for details.

4. In the **Newsletter Sign Up** subtab, set the listed fields, using the table below as a reference.

You can use the placeholder `[[email]]` to automatically populate the default fields with the user's email address. This enables you to identify a user who chooses to leave the name or company fields blank. For example, you can send a personalized marketing email generated from the lead record saying "Welcome user@example.com!" if a name is not known. This placeholder can be used with the following fields:

- Default First Name
- Default Last Name
- Default Company

Field	Description
Marketing Campaign for Lead	Sets the marketing campaign you want to use to track leads when a user subscribes to the newsletter. For more information, see the help topic Campaign Overview .
Default First Name	Sets the default text to display in the First Name field of the lead record if a first name is not supplied by the user.
Default Last Name	Sets the default text to display in the Last Name field of the lead record if a first name is not supplied by the user.
Create Lead as Company	If checked, creates newsletter sign up leads as companies, rather than individuals. This setting applies to newsletter sign up only. For more information, see the help topic Lead Management .
Associate Lead To	Determines the subsidiary with which you want the lead to be associated.
Default Company	Sets the default text to display in the Company field of the lead record if a first name is not supplied by the user.

5. Click **Save**.

Configure General Settings

Set the general fields in SMT to set up your newsletter sign up form. You can determine the name and display options for fields, as well as button and privacy policy text.

To configure general settings:

1. While logged in to SMT, go to the page that contains the newsletter sign up form.
2. In the **Newsletter Sign Up** box, click **Edit**.
This displays the Newsletter Sign Up Settings in the side panel.
3. In the **General** tab, set the following fields:

Field	Description
Visibility	Determines the visibility option that determines when you would like to make the form visible. For more information about visibility options, see the help topic View Site as of a Specific Date in Site Management Tools .
Header	Sets the title you want to display at the top of the newsletter sign up form.
Subtitle	Sets the descriptive text you want to display below the header text.
Email Field Label	Sets the label for the Email field.
Email Field Hint	Sets the text you want to use as a placeholder for the Email field.

Field	Description
Show First Name Field	If checked, displays the First Name field to the user.
Optional First Name	If checked, makes the First Name field optional. If the First Name field is left blank, the Default First Name field (SC Configuration record > Extensions > Newsletter Sign Up) is used for the First Name field of the lead record.
First Name Field Label	Sets the label for the First Name field.
First Name Field Hint	Sets the text you want to use as a placeholder for the First Name field.
Show Last Name Field	If checked, displays the Last Name field to the user.
Optional Last Name	If checked, makes the Last Name field optional. If the Last Name field is left blank, the Default Last Name field (SC Configuration record > Extensions > Newsletter Sign Up) is used for the Last Name field of the lead record.
Last Name Field Label	Sets the label for the Last Name field.
Last Name Field Hint	Sets the text you want to use as a placeholder for the Last Name field.
Show Company Field	If checked, displays the Company field to the user.
Optional Company	If checked, makes the Company field optional. If the Company field is left blank, the Default Company Name field (SC Configuration record > Extensions > Newsletter Sign Up) is used for the Company field of the lead record.
Company Field Label	Sets the label for the Company field.
Company Field Hint	Sets the text you want to use as a placeholder for the Company field.
Button Text	Determines the text you want to display on the submit button.
Privacy Policy Label	Determines the text you want to display as a link to a privacy policy page.
Privacy Policy Link	Determines the URL to which you want the privacy policy button to link. If you leave this field blank, a link does not display.
Tags	Sets keywords to help filter your content in the Review Changes list. For more information about content tags, see Content Tags and Filter Tools .

4. Click **Save**.

Configure Message Settings

You can determine the feedback messages shown to users by editing the message fields in SMT.

To configure message settings:

1. While logged in to SMT, go to the page that contains the newsletter sign up form.
2. In the **Newsletter Sign Up** box, click **Edit**.

This displays the Newsletter Sign Up Settings in the side panel.

3. In the **Messages** tab, set the following fields:

Field	Description
Empty First Name Field	Determines the message to display when a required First Name field is left blank.
Empty Last Name Field	Determines the message to display when a required Last Name field is left blank.
Empty Email Address Field	Determines the message to display when a required Email Address field is left blank.
Empty Company Field	Determines the message to display when a required Company field is left blank.
Invalid Email Address	Determines the message to display when an invalid email address is entered.
Opt-In Subscription Confirmation	Determines the message to display when the user successfully subscribes to the newsletter.
Already Opt-In	Determines the message to display when the user is already signed up for the newsletter.
Confirmed Opt-Out	Determines the message to display when the user has opted out of the newsletter.
Unexpected Error	Determines the message to display when there is an unexpected error during sign up.

4. Click **Save**.

Configure Layout and Style Settings

You can customize the look of the newsletter sign up form by setting the layout and style fields in SMT.

To configure layout and style settings:

1. While logged in to SMT, go to the page that contains the newsletter sign up form.
2. In the **Newsletter Sign Up** box, click **Edit**.
This displays the Newsletter Sign Up Settings in the side panel.
3. In the **Layout & Style** tab, set the following fields:

Field	Description
Newsletter Layout	Determines the layout for the newsletter sign up form. ■ Vertical - fields stacked in the middle of the container ■ Horizontal - fields listed horizontally across the container ■ Align Left - fields stacked in the left side of the container ■ Align Right - fields stacked in the right side of the container On mobile devices, the layout automatically appears as Vertical .
Background Image	Determines the image to use as the newsletter sign up form background. Images are aligned to center-middle of the container and cover the full background.
Image Resize ID	Sets the image resizing option you want the Background Image to use.

Field	Description
	To use this option, you must enter an enabled Image Size ID found in the Image Resizing section of the Web Site Setup record (Commerce > Websites > Website List > Images).

4. Click **Save**.

Remove a Newsletter Sign Up Form

Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount

Depending on whether you have published the content to your website, use SMT to delete the newsletter sign up form from your site in one of two ways:

- **Discard** the newsletter sign up form if you have not published the content.
- **Remove** the newsletter sign up form if you have already published the content.

To discard a newsletter sign up form (Unpublished Content):

1. While logged in to SMT on your website, select the **Review & Publish Changes** list from the Site Management toolbar.
2. Select the **Newsletter Sign Up** content in the list.
3. Click **Discard**.
4. Click **OK**.

To remove a newsletter sign up form (Published Content):

1. While logged in to SMT on your website, go to the page that contains the newsletter sign up form you want to remove.
2. In **Edit** mode, click the **Newsletter Sign Up** box.
This highlights the newsletter sign up content and displays the content controls.
3. Click **Remove**.
4. Click **OK**.

Newsletter Sign Up Using Core SCA Source Code

Applies to: SuiteCommerce Advanced

The Newsletter extension works for SuiteCommerce sites and SuiteCommerce Advanced sites implementing the 2018.2 release and later. If you're incorporating SuiteCommerce Advanced Aconcagua and earlier, you must use the sign up form incorporated in the source template file, as described in this section.

Be aware of the following for these implementations:

- The sign-up form leverages NetSuite's elevated permissions feature to enable email subscriptions for your site.
- Configuration properties are located on different tabs in the SuiteCommerce Configuration record, depending on your implementation. For more information, see [Configure a Newsletter Sign Up Form](#).

Set Up Newsletter

SuiteCommerce Advanced releases Vinson, Elbrus, Kilimanjaro, and Aconcagua use elevated permissions that need to be set up manually.

- Enable subscriptions
- Create a custom center
- Create a custom role
- Set up elevated permissions for the service file record

To enable subscriptions:

1. In NetSuite, go to Setup > Company > Enable Features.
2. Select the **CRM** tab.
3. In the Basic Features section, check the **Marketing Automation** option. This enables the Global Subscription Status in Customer and Lead records.
4. In the Marketing section, check the **Subscription Categories** and **Sales Campaigns** options. This enable these campaigns.
5. Click **Save**.

To create a custom center:

1. In NetSuite, go to Customization > Centers and Tabs > Centers > New.
2. In the **Label** field, enter any string to label your new center.
For example: Custom Employee Center.
3. Click **Save**.

To create a custom role:

1. In NetSuite, go to Setup > Users/Roles > Manage Roles > New.
2. In the **Name** field, enter a name for your new custom role.
For example: Custom Newsletter.
You select this name when assigning elevated permissions in the Service File record.
3. In the **Center Type** field, select the custom center you created earlier.
For example: Custom Employee Center.
4. If you're using NetSuite OneWorld, in the **Subsidiary** field, select the subsidiaries that are marked as default and online in the Website Setup record.
5. Click the **Permissions** and **Lists** subtabs.
6. Set the Level for the **Customers** permission to Edit.
7. Click **Save**.

To set Elevated Permissions for the service file record:

1. In NetSuite, go to Documents > Files > File Cabinet.
2. Browse to Web Site Hosting Files > Live Hosting Files > SSP Applications > [Applicable Bundle Folder] > Development > services.

3. Click **Edit** next to the `Newsletter.Service.ss` file.

Note: The elevated permission is linked to the `Newsletter.Service.ss` file. Therefore, you must set up the permissions for each deploy location (test site, production site, etc.) as necessary.

4. In the File record, check the **Available without login** option.
5. Click the **Permission** subtab.
6. Check the **Enabled** option.
7. In the **Execute as role** field, choose the custom role you created earlier.
For example: Custom Newsletter.
8. Check the **Run Script Without Login** option.
9. Click **Save**.

Disable the Newsletter Form

The Newsletter form is incorporated in the core source code of SuiteCommerce Advanced. You must edit the `distro` file to remove the form.

If you implement the Aconcagua version of SuiteCommerce Advanced and use the SuiteCommerce Newsletter Sign Up extension, you must first disable the Newsletter form. Otherwise, your site displays two sign up forms, one in your site's footer and the new newsletter form you add using Site Management Tools.

To disable the Newsletter feature:

1. Open the `distro.json` file in the root directory of the SuiteCommerce Advanced source code.
2. Search for and remove or disable any lines that include **Newsletter** within the `distro.json` file, where `x.x.x` equals the version.

For example:

```
1 | "suitecommerce/Newsletter": "x.x.x",
2 |
3 | "Newsletter.ServiceController",
4 |
5 | "Newsletter"
```

3. Save and redeploy the `distro.json` file.

Social Media

Applies to: SuiteCommerce | SuiteCommerce Advanced

Commerce web stores let you add a social dimension to your website by incorporating social media share buttons on your Product Details Pages (PDPs). You can drive more traffic to your website and offer shoppers a richer experience by letting them share items with their favorite social networks.

You can add:

- Pinterest Product Rich pins that are automatically populated with up-to-date information such as product image, pricing, description, and availability.

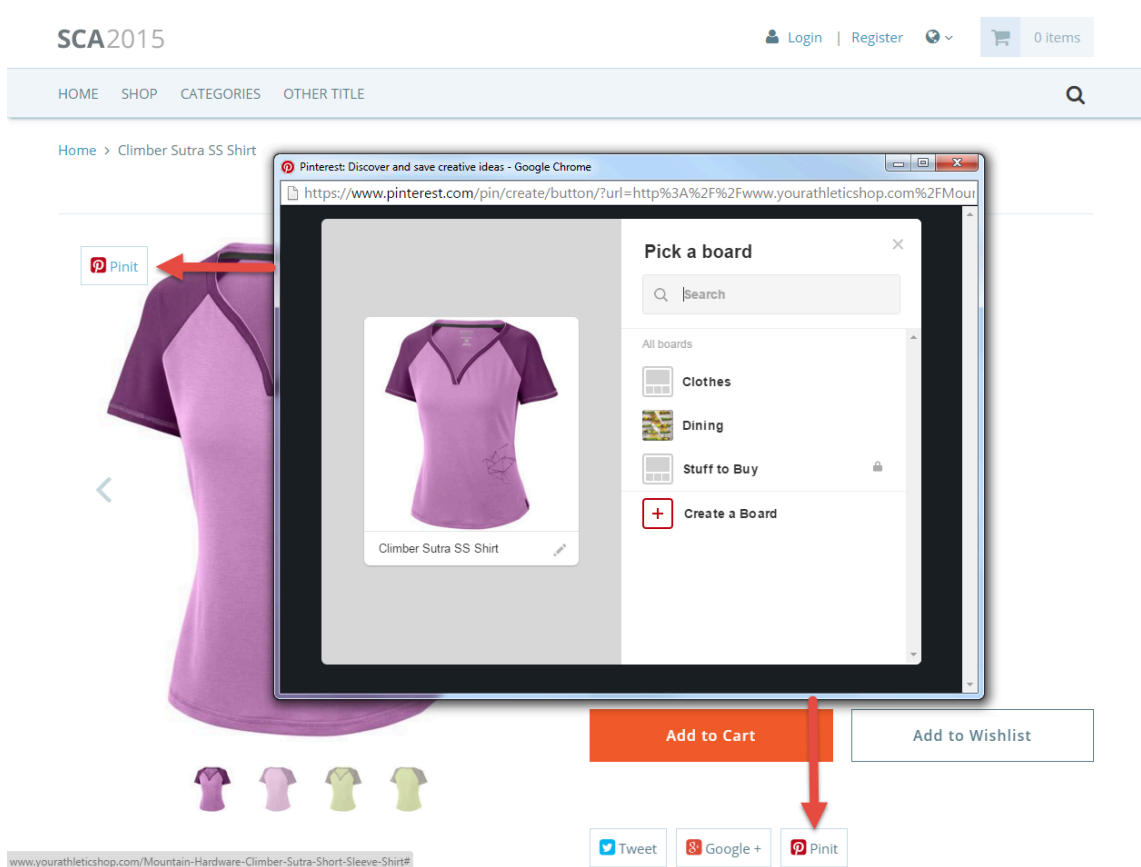

- Twitter Cards that enable consumers to attach your products' photos, videos, and media experiences to Tweets.
- Facebook Share buttons that let shoppers share your products with their friends on Facebook.

✓ **Tip:** You can also add a print option to the social media area of a PDP using the Product Page Printer extension. For more information, see [Product Page Printer](#).

Pinterest

Applies to: SuiteCommerce | SuiteCommerce Advanced

Commerce web stores support Pinterest Product Rich Pins on your Product Details Pages (PDPs). By default, shoppers can point to an image and then click the Pinterest icon or button in the cart details region. The Pinterest entry automatically populates with item details such as the product image, pricing, and availability.

Pinterest Open Graph

Pinterest uses Open Graph markup for data collection. With this method, product metadata is included in the HTML header of the PDP. The following Open Graph metadata tag mappings for Pinterest are defined in the SC.Shopping.Configuration.js file in the ShoppingApplication@x.x.x module:

```
1 | metaTagMapping: {
2 |     // [Open Graph] (http://ogp.me/)
```

```

3      'og:title': seo_title
4      , 'og:type': seo_type
5      , 'og:url': seo_url
6      , 'og:image': seo_image
7      , 'og:site_name': seo_site_name
8      , 'og:description': seo_description
9      , 'og:provider_name': seo_provider_name
10     , 'og:price:standard_amount': seo_price_standard_amount
11     , 'og:price:currency': seo_price_currency
12     , 'og:availability': seo_availability

```

For more information and details on supported fields, refer to the Pinterest developer documentation at [About Rich Pins](#).

The following screenshot shows Open Graph metadata collected in the HTML header output of a PDP:

```

<meta property="og:title" content="Topout Shorts">
<meta property="og:type" content="product">
<meta property="og:url" content="http://coolsuite.com/product/426">
<meta property="og:image" content="http://coolsuite.com/Images/TopoutShorts_01.jpg?
resizeid=58&resizeh=150&resizew=150">
<meta property="og:site_name" content="CoolSuite">
<meta property="og:description" content="Our popular, classically-styled hiking short is better than ever.
The Canyon Short remains a favorite with its timeless combination of comfort, performance and attention to
detail. The seams at the hip have been rotated away so they'll never pinch under a pack. The integrated
webbing belt adjusts easily. UPF 50 fabric blocks out UV rays.">
<meta property="og:provider_name" content="CoolSuite">
<meta property="og:price:standard_amount" content="24.99">
<meta property="og:price:currency" content="USD">
<meta property="og:availability" content="InStock">

```

Configure Pinterest Properties

To configure Pinterest properties:

1. Go to Commerce > Websites > Configuration.
2. Select your website and domain and click **Configure**.
3. Go to the **Integrations** tab and the **Pinterest** subtab.
4. Configure the following properties as required:
 - **Enable Hover** - Check this box to enable the Pinterest Pin It button to hover over an image.
 - **Enable Button** - Check this box to enable the Pinterest Pin It button to be displayed.
 - **Image Size** - Enter the Pinterest image size ID to show on Pinterest.
 - **Pinterest Popup Status** - Select yes to enable the Pinterest popup. Select no to disable it.
 - **Pinterest Popup Resizeable** - Select yes to make the Pinterest popup resizable. Select no to restrict resizing.
 - **Pinterest Popup Scrollbars** - Select yes to show scrollbars on the Pinterest popup menu. Select no to hide them.
 - **Pinterest Popup Personalbar** - Select yes to show a personal bar on the Pinterest popup menu. Select no to hide it.
 - **Pinterest Popup Directories** - Select yes to show a directories bar on the Pinterest popup menu. Select no to hide it.
 - **Pinterest Popup Location** - Select yes to show a location bar on the Pinterest popup menu. Select no to hide it.
 - **Pinterest Popup Toolbar** - Select yes to show a toolbar on the Pinterest popup menu. Select no to hide it.
 - **Pinterest Popup Menubar** - Select yes to show a menu bar on the Pinterest popup menu. Select no to hide it.

- **Pinterest Popup Width** - Enter the width (in pixels) of the Pinterest popup.
- **Pinterest Popup Height** - Enter the height (in pixels) of the Pinterest popup.
- **Pinterest Popup Top** - Enter the top offset (in pixels) of the Pinterest popup.

For more information about the Pinterest configurable properties, see the help topic [Pinterest Subtab](#).

5. Click **Save**.

To configure Pinterest properties (SuiteCommerce Advanced pre-Vinson):

1. Create a custom ShoppingApplication@x.x.x module to update the SC.Shopping.Configuration.js file. See the help topic [Develop Your SCA Customization](#) for instructions.

Note: Don't edit the original SC.Shopping.Configuration.js file. See the help topic [Best Practices for Customizing SCA](#) for information and best practices for customizing JavaScript. This task requires developer experience.

2. You can enable the Pin It Hover or the Pin It button or both options. Other configuration options are available as shown in the following code snippet:

```

1      // hover_pin_it_buttons
2      , hover_pin_it_button: {
3          enable_pin_it_hover: true
4          , enable_pin_it_button: true
5          , image_size: 'main' // Select resize id to show on Pinterest
6      , popupOptions: {
7          status: 'no'
8          , resizable: 'yes'
9          , scrollbars: 'yes'
10         , personalbar: 'no'
11         , directories: 'no'
12         , location: 'no'
13         , toolbar: 'no'
14         , menubar: 'no'
15         , width: '680'
16         , height: '300'
17         , left: '0'
18         , top: '0'
19     }
20     }
```

Important: The SC.Shopping.Configuration.js file also contains a Pinterest setting within the addThis.servicesToShow function. Due to the single page configuration of SuiteCommerce Advanced, enabling Pinterest from the addThis function can result in incorrect product information displayed in the user's Pinterest board.

The AddThis service is no longer available. See addthis.com.

3. Save and deploy to your website. See the help topic [Deploy SCA Customizations to NetSuite](#) for more information.

For detailed instructions about creating a custom SuiteCommerce Advanced module, see the help topic [Develop Your SCA Customization](#).

Validate Rich Pins

Validate and enable your Pinterest Rich Pins with the [Rich Pins Validator](#) tool on the Pinterest developer's site.

To use the validator tool, enter the URL for the product you want to test and click **Validate**. The validator returns a success or error message. If the webpage you're applying with is correctly marked-up, an approval message is displayed. If the validator returns an error message, instructions about how to correct your metadata are displayed.

After the pin is validated, click the **Apply now** button to verify your domain. The domain field will be automatically populated with your domain. After your domain is verified, your pins will appear on Pinterest within the hour.

Note: You only need to validate one URL to apply for Rich Pins for your entire domain. This validation applies to all pins on your website.

Twitter Cards

Applies to: SuiteCommerce | SuiteCommerce Advanced

Commerce web stores support Twitter Cards which let shoppers attach media experiences to Tweets that link to your Product Detail Pages (PDPs).

Shoppers can Tweet your products by clicking the Twitter button on the PDP. A card visible to all of the shopper's followers is automatically added to their Tweet. This card can display item details including an image, a description, and two other key item details such as price, availability, sizes, or colors.

For more information about Twitter Cards, see [Cards](#) on Twitter's developer platform.

Twitter Cards Data Collection

The following property mappings for Twitter are defined in the SC.Shopping.Configuration.JS file in the ShoppingApplication@x.x.x module:

```
1 // [Twitter Product Card](https://dev.twitter.com/docs/cards/types/product-card)
2 , 'twitter:card': seo_type
3 , 'twitter:site': seo_twitter_site
4 , 'twitter:creator': seo_twitter_creator
5 , 'twitter:title': seo_title
6 , 'twitter:description': seo_twitter_description
7 , 'twitter:image:src': seo_image
8 , 'twitter:domain': seo_domain
9 , 'twitter:data1': seo_twitter_price
10 , 'twitter:label1': seo_twitter_label_one
11 , 'twitter:data2': seo_availability
12 , 'twitter:label2': seo_twitter_label_two
```

The following screenshot shows Twitter metadata included in the HTML header output of a PDP:

```
<meta property="twitter:card" content="product">
<meta property="twitter:site" content="@YourAthleticSho">
<meta property="twitter:creator" content="@Fedmun">
<meta property="twitter:title" content="Trekkin Thermal Henley Shirt">
<meta property="twitter:description" content="A performance twist on a classic. We designed
this shirt to combine the look and comfort of a classic long underwear top....">
<meta property="twitter:image:src" content="http://coolsuite.com/Images/Trekkin-Thermal-
Henley-Shirt_01.jpg?resizeid=5&resizeh=150&resizew=150">
<meta property="twitter:domain" content="http://coolsuite.com">
<meta property="twitter:data1" content="$49.99 USD">
<meta property="twitter:label1" content="PRICE">
<meta property="twitter:data2" content="InStock">
<meta property="twitter:label2" content="AVAILABILITY">
```

Configure Twitter Cards

To configure Twitter Cards properties:

1. Go to Commerce > Websites > Configuration.
2. Select your website and domain and click **Configure**.
3. Go to the **Integrations** tab and the **Twitter** subtab.
4. Configure the following properties as required:
 - **Enable** - Check this box to enable the Twitter AddThis property.
 - **Twitter Popup Status** - Select yes to enable the Twitter popup. Select no to disable it.
 - **Twitter Popup Resizeable** - Select yes to make the Twitter popup resizable. Select no to restrict resizing.
 - **Twitter Popup Scrollbars** - Select yes to show scrollbars on the Twitter popup menu. Select no to hide them.
 - **Twitter Popup Personalbar** - Select yes to show a personal bar on the Twitter popup menu. Select no to hide it.
 - **Twitter Popup Directories** - Select yes to show a directories bar on the Twitter popup menu. Select no to hide it.
 - **Twitter Popup Location** - Select yes to show a location bar on the Twitter popup menu. Select no to hide it.
 - **Twitter Popup Toolbar** - Select yes to show a toolbar on the Twitter popup menu. Select no to hide it.
 - **Twitter Popup Menubar** - Select yes to show a menu bar on the Twitter popup menu. Select no to hide it.
 - **Twitter Popup Width** - Enter the width (in pixels) of the Twitter popup.
 - **Twitter Popup Height** - Enter the height (in pixels) of the Twitter popup.
 - **Twitter Popup Left** - Enter the left offset (in pixels) of the Twitter popup.
 - **Twitter Popup Top** - Enter the top offset (in pixels) of the Twitter popup.
 - **Twitter Popup Via** - Enter the account of the original tweeter. For example: @MerchantName.

For more information about the Twitter configurable properties, see the help topic [Twitter Subtab](#).
5. Click **Save**.

To configure Twitter Cards properties (SuiteCommerce Advanced pre-Vinson):

1. Create a custom ShoppingApplication@x.x.x module to update the SC.Shopping.Configuration.js file. See Create a Custom Module for instructions.

Note: Don't edit the original SC.Shopping.Configuration.js file. See the help topic [Best Practices for Customizing SCA](#) for information and best practices for customizing JavaScript. This task requires developer experience.

2. You can enable the Twitter button to be displayed on your PDPs. Other configuration options are available as shown in the following code snippet:

```
1 // @property {Object} twitter twitter Social Sharing Service
2 , twitter: {
3   enable: true
```

```

4      , popupOptions: {
5          status: 'no'
6      ,   resizable: 'yes'
7      ,   scrollbars: 'yes'
8      ,   personalbar: 'no'
9      ,   directories: 'no'
10     ,   location: 'no'
11     ,   toolbar: 'no'
12     ,   menubar: 'no'
13     ,   width: '632'
14     ,   height: '250'
15     ,   left: '0'
16     ,   top: '0'
17     }

```

In addition to the required card properties, Twitter Cards support two custom data types. By default, these are configured to return the item price and item availability. You should keep the default configuration for these properties.

3. To disable Twitter Product Cards, set the enable parameter to false in the twitter function. This removes the Twitter button from the PDP and disables Twitter functionality.
4. Save and deploy to your website. See the help topic [Deploy SCA Customizations to NetSuite](#) for more information.

For detailed instructions about creating a custom SuiteCommerce Advanced module, see the help topic [Develop Your SCA Customization](#).

Facebook Share

Applies to: SuiteCommerce | SuiteCommerce Advanced

Commerce web stores let you add a Facebook Share button on your Product Details Pages (PDPs) to help visitors to share items from your site. This button is enabled by default.

For sharing to work, you must obtain an appId from Facebook and associate the appId with your shopping domain. See the following help topics for more information:

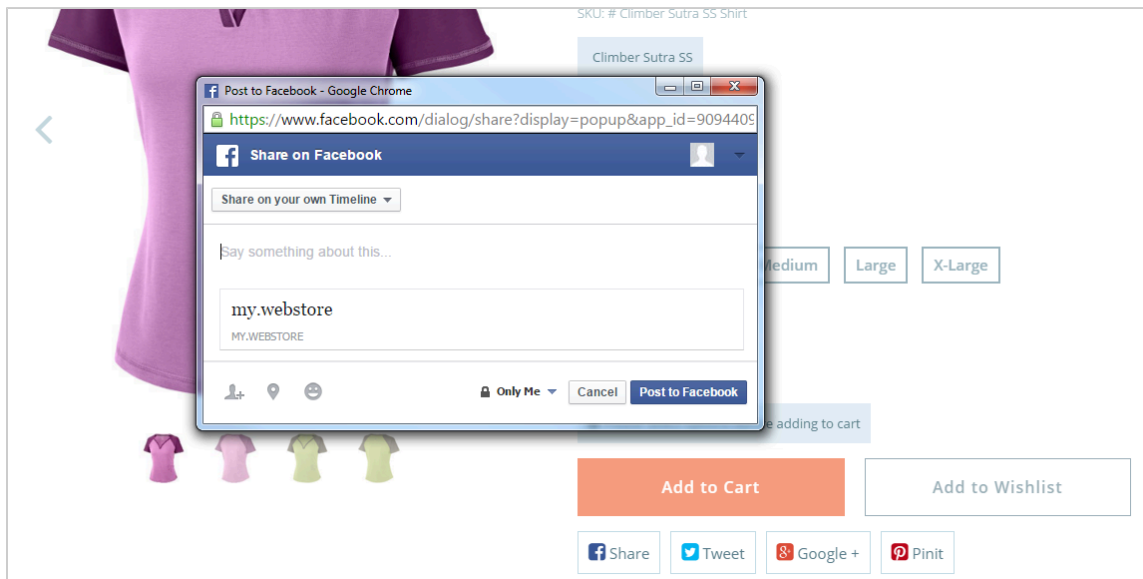

- [Facebook Share](#)
- [Facebook Open Graph](#)
- [Configure Facebook Share](#)
- [Facebook appId and Domain Association](#)

Facebook Share

The Facebook Share button lets visitors share an item from your website on Facebook. When a visitor clicks the Share button, the Share on Facebook window displays and lets the visitor enter comments about the page and choose how it's shared. Sharing options include:

- Own timeline
- Friend's timeline
- In a group
- On a page the visitor manages
- Private

If the visitor is not logged in to Facebook, then the Facebook login form is displayed first.

Facebook Open Graph

Facebook uses Open Graph markup for data collection. With this method, product metadata is included in the HTML header of the PDP. The following Open Graph metatag mappings for Facebook are defined in the SC.Shopping.Configuration.js file in the ShoppingApplication@x.x.x module:

```
1 metaTagMapping: {
2     // [Open Graph](http://ogp.me/)
3     'og:title': seo_title
4     , 'og:type': seo_type
5     , 'og:url': seo_url
6     , 'og:image': seo_image
7     , 'og:site_name': seo_site_name
8     , 'og:description': seo_description
9     , 'og:provider_name': seo_provider_name
10    , 'og:price:standard_amount': seo_price_standard_amount
11    , 'og:price:currency': seo_price_currency
12    , 'og:availability': seo_availability
13    , 'og:rating': seo_rating
14    , 'og:rating_scale': seo_rating_scale
15    , 'og:rating_count': seo_rating_count
16 }
```

The following screenshot shows Open Graph metadata included in the HTML header output of a PDP:

```
<meta name="og:title" content="Climber Sutra SS Shirt">
<meta name="og:type" content="product">
<meta name="og:url" content="http://my.webstore/product/7045?ck=QtIvsx0DATdJPsXb&cktime=131869">
<meta name="og:image" content="http://my.webstore/images/OL5278.media.purple.01.jpg?
resizeid=11&resizeh=600&resizew=600">
<meta name="og:site_name" content="Generation N Sports">
<meta name="og:description" content="Great shirt for all types of activities! Features Wicking, fast
drying fabric. Antimicrobial finish controls odor. Flat-lock seam construction eliminates chafe. The
Basics Camping & Hiking Weight 2.6 oz. / 75 g. Center Back Length 24.5" / 62 cm Materials Body Wicked
Taper SD">
<meta name="og:provider_name" content="Generation N Sports">
<meta name="og:price:standard_amount" content="26.99">
<meta name="og:price:currency" content="USD">
<meta name="og:availability" content="InStock">
<meta name="og:rating" content="0">
<meta name="og:rating_scale" content="5">
<meta name="og:rating_count" content="0">
```

Configure Facebook Share

Follow the correct configuration procedures below, depending on the version of SuiteCommerce Advanced you're implementing. For information about configurable properties, regardless of your implementation, see the help topic [Configuration Properties Reference](#).

See the Facebook developer documentation at <https://developers.facebook.com/docs/plugins> for more information about the Facebook Share plugin.

To configure Facebook Share properties:

1. Go to Commerce > Websites > Configuration.
2. Select your website and domain and click **Configure**.
3. Go to the **Integrations** tab and the **Facebook** subtab.
4. Configure the following properties as required:
 - **Enable** - Check this box to enable the Facebook sharing service.
 - **Application ID** - Enter your custom application ID to associate your domain to your application ID.
 - **Facebook Popup Status** - Select yes to enable the Facebook popup. Select no to disable it.
 - **Facebook Popup Resizable** - Select yes to make the Facebook popup resizable. Select no to restrict resizing.
 - **Facebook Popup Scrollbars** - Select yes to show scrollbars on the Facebook popup menu. Select no to hide them.
 - **Facebook Popup Personalbar** - Select yes to show a personal bar on the Facebook popup menu. Select no to hide it.
 - **Facebook Popup Directories** - Select yes to show a directories bar on the Facebook popup menu. Select no to hide it.
 - **Facebook Popup Location** - Select yes to show a location bar on the Facebook popup menu. Select no to hide it.
 - **Facebook Popup Toolbar** - Select yes to show a toolbar on the Facebook popup menu. Select no to hide it.
 - **Facebook Popup Menubar** - Select yes to show a menu bar on the Facebook popup menu. Select no to hide it.
 - **Facebook Popup Width** - Enter the width (in pixels) of the Facebook popup.
 - **Facebook Popup Height** - Enter the height (in pixels) of the Facebook popup.
 - **Facebook Popup Left** - Enter the left offset (in pixels) of the Facebook popup.
 - **Facebook Popup Top** - Enter the top offset (in pixels) of the Facebook popup.

For more information about the Facebook configurable properties, see the help topic [Facebook Subtab](#).
5. Click **Save**.

To configure Facebook Share properties (SuiteCommerce Advanced pre-Vinson):

1. Create a custom ShoppingApplication@x.x.x module to update the SC.Shopping.Configuration.js file. See the help topic [Develop Your SCA Customization](#) for instructions.

Note: Don't edit the original `SC.Shopping.Configuration.js` file. See the help topic [Best Practices for Customizing SCA](#) for information and best practices for customizing JavaScript. This task requires developer experience.

2. The Facebook share button is enabled by default, but you need to set the `appId` for your website. Other configuration options are available as shown in the following code snippet:

```

1      , facebook: {
2          enable: true
3      ,   appId: '123456789012345'
4      ,   popupOptions: {
5          status: 'no'
6      ,   resizable: 'yes'
7      ,   scrollbars: 'yes'
8      ,   personalbar: 'no'
9      ,   directories: 'no'
10      ,   location: 'no'
11      ,   toolbar: 'no'
12      ,   menubar: 'no'
13      ,   width: '500'
14      ,   height: '250'
15      ,   left: '0'
16      ,   top: '0'
17      }

```

3. To disable Facebook Share, set the `enable` parameter to `false` in the `facebook` function. This removes the Facebook Share button from the PDP and disables Facebook functionality.
4. Save and deploy to your website. See the help topic [Deploy SCA Customizations to NetSuite](#) for more information.

For detailed instructions about creating a custom SuiteCommerce Advanced module, see the help topic [Develop Your SCA Customization](#).

Facebook appId and Domain Association

As part of configuring the Facebook Share button on your website, you must obtain an `appId` from Facebook and associate it with your shopping domain. To obtain the `appId`, register as a developer with Facebook at [Create a Facebook for Developers account](#).

To obtain an appId and associate your domain:

1. Go to <https://developers.facebook.com/apps/>.
2. Click **Create a New App**.
3. In the **Display Name** field, enter the name of your web store or site.
4. The **Namespace** field is optional, but you can set it to a unique identifier for your app.
5. From the **Category** dropdown list, select the category that best describes your site.
6. Click the **Create App ID** button.
7. Complete the security check.
8. Click the **Settings** menu.
9. Click **Add Platform**.
10. Click **Website**.
11. In the **Site URL** field, enter the URL for your site.
12. In the **App Domains** field, enter your shopping domain.

13. Take note of the **App ID**. This is the value to enter as the **appId** in the shopping configuration file.

The screenshot shows the 'My Site' settings page in NetSuite, specifically the 'Basic' tab. The left sidebar contains navigation links: Dashboard, Settings, Status & Review, App Details, Roles, Open Graph, Alerts, Localize, Canvas Payments, Audience Network, Test Apps, and Analytics. The main content area is divided into three tabs: Basic, Advanced, and Migrations. Under the 'Basic' tab, the 'App ID' field is highlighted with a red box and contains the value '123456789012345'. Other fields include 'App Secret' (masked with dots and a 'Show' button), 'Display Name' (containing 'MySite'), 'App Domains' (containing 'my.website'), 'Site URL' (containing 'http://my.website/'), and 'Mobile Site URL' (containing 'URL of your mobile site'). At the bottom, there is a '+ Add Platform' button, a 'Delete App' button, and 'Discard' and 'Save Changes' buttons.

14. Click Save Changes.

Website Content

📘 Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount | Site Management Tools

An important part of managing your website is controlling the content you place on the site. The type of content can be vast and varied, from a banner image on the home page to marketing copy promoting a sale. See the following help topics to learn more about the types of content you can add to your website, and how to add them.

Content Overview

See the following for an overview of Content Types, moving content, and secure and unsecure content.

Pages

Learn how you can add pages to your website and how to use the Site Management Tools Page Layout Selector.

Text Content

[Commerce Custom Fields](#)

Learn how to add custom fields to your website.

Content Overview

Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount | Site Management Tools

Content is a piece of data that you place in an area on your website.

Each area can contain multiple pieces of content of the different types. For example, in one area you might place a piece of text content that serves as a header or title to an image or merchandising zone content. The scope of the area where you place the content determines on which pages that content displays. For example, if you place text content in an area with **all pages** scope, the text displays on any page on the site that includes the same area. If you place content in an area with **this page** scope, the content displays only on that page.

See the following help topics for information about using the different types of content:

- [Content Type Table](#)
- [Moving Content](#)
- [Mixed Secure and Unsecure Content](#)
- [Content Tags and Filter Tools](#)

Content Type Table

Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount | Site Management Tools

This table reviews the different types of content types available and provides a link to more in-depth information for each content type.

Content Type	Description
Site Management Tools Text Content	Use this content type when you want to add formatted text. This content type works well when you want to add simple text such as headings or larger blocks of text with WYSIWYG formatting and embedded images.
Columns	Use the Columns content type to add columns of text with images.
Blog	Use the Blog Post and Blog List content types to add a post or a blog summary.
Site Management Tools Image Content Type	Use this content type for adding a single image, such as a banner image. In addition to specifying the image, you can also specify a link for the image.
Image Manager	Learn how to use the image manager to add images to text and image content.
Photo Gallery	Use the Photo Gallery to add an album of up to eight images.
Slideshow	Use this content type to add a carousel of images.
Image Text Overlay	Use this content type to add images with overlying text and action buttons.
Merchandising Zone Content	Use this content type to place a merchandising zone on a page and tie that zone to a merchandising rule defined in NetSuite.
Merchandising Zone Content	The functionality of the enhanced merchandising zone is similar to that of the legacy merchandising zone, however it includes a configurable display, support for multiple languages, and it is compatible with SuiteCommerce Themes.

Site Management Tools HTML Content Type	Use this content type when you want to add HTML or JavaScript code to a page. This supports only code that should be placed between the <body> tags of the page.
Map & Contact	Use this content type to add a third-party map and contact information such as business address and opening hours.
Commerce Custom Fields	Learn how to add custom fields to your site by using the SuiteCommerce Custom Fields extension or by customizing a theme.

Moving Content

i Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount | Site Management Tools

After you place content in an area on a page, you may decide that you want to move it to a different area on that page or to a different location within the same area. For example, you may have inadvertently placed text content below an image when you had intended to place it above the image, or you may have placed a merchandising zone at the bottom of the page but you want to see how it looks at the top of the page.

You can move content on any page by dragging the content to the new location. When you move content from one area to another, the content takes the scope of the new area. For example, if you move content from an area with a scope of **page type**, to an area with a scope of **all pages**, the content is displayed on all pages.

To move content from one location to another:

1. Go to the page that contains the content you want to move.
2. Drag the content to the new location. When you begin moving the content, the page displays the areas on that page.
3. Position the content over the new area. If the area includes content, multiple Drop Indicators serve as visual cues where you can place the content.
4. Drop the content to place it in the new area. The placement of the content is saved automatically.

Mixed Secure and Unsecure Content

i Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount | Site Management Tools

When using a secure, encrypted connection, give special consideration to any HTML links you include. Specifically, be aware of the consequences of mixing the secure content with content from a location that is not secure. For example, linking to an image, script, or style sheet through an HTTP based URL instead of a secure HTTPS based URL. This is referred to as mixed content, because the main HTML content was loaded using a secure, HTTPS connection, but additional content on the page is referenced by an HTTP call which includes no security.

Linking to only secure content helps ensure the integrity of the content and provides a more secure shopping experience.

Linking to unsecure content presents the opportunity for malicious activity such as sniffing and man-in-the-middle attacks. For mixed passive content, such as image, audio, or other media source, a malicious party can alter the image or media and change what is displayed to the visitor. Mixed passive content does not allow for alteration of any other part of the page.

Mixed active content, such as script or iFrame source or hypertext links pose an even greater danger because it allows for even more destructive attacks such as installation of malware or theft of user personal data.

As a security measure, most web browsers check for mixed content and display a warning message to the user that the page contains content that is not secure. In some instances, this content does not display at all.

When you use a secure, encrypted connection and link to other content, SMT checks to see if that content is also secure. If it is not secure, then SMT warns you that the HTML includes a link to content that is not secure. Best practice is to link only to secure content.

Content Tags and Filter Tools

i Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount | Site Management Tools

Content tags let you add additional information to the SMT content and landing pages. This information is added to the landing page record and the content record. In the SMT UI, the field is named **Tags**. The content tags work with the sort and filter tools to help better identify specific landing pages and content.

Let's say you want to create a new piece of content or a landing page. Previously, in the unpublished changes list the content was labeled according to the type of content. You can give the content one or more content tags. The content tags could include, "banner, fall, special" to add more sorting and filtering ability. Ensure each content tag is separated by a comma.

Now for your upcoming sale you want to use "christmas sale" as a tag for all the content you want related to the upcoming sale. After you have added all content, use the sort and filter tools on the **Unpublished Changes** list to ensure the content has the correct visibility dates, tags, or path.

Tags

This field lets you save content with one or more descriptive tags. You can then apply bulk actions such as setting visibility dates or updating tags. You can use tags with these different types of contents:

- Website Content
- Landing Pages
- Commerce Categories
- Translations

Sort and Filter Tools

Sort and Filter tools provide help when you find yourself with a large amount of various types content. This could be one or more landing pages, text and image content, commerce categories or custom HTML content. Click **Reset** in the dropdown menu to return to the default view at any time. You have different Sort and Filter Tools depending on which menu you are viewing.

Pages

On the **Pages**, **Published Content**, and **Expired Content** tabs, the list of pages is paginated to aid with loading time if you have a large quantity of pages. The sorting and filtering options remain the same even after navigating away from the **Pages** tab and back.

You can filter by the following items:

On the **Pages** tab, you can filter by:

- Tag
- Path
- Page Type

You can sort these columns in ascending or descending alphabetical order:

- **Name/Tags**
- **Path**
- **Page Type**

Published Content

You can filter the list by:

- Visibility
 - Future
 - Now
- Content Type
 - HTML
 - Image
 - Merchandising Zone
 - Text
 - Other
 - Page
- Path
 - Use Location to search for content based on the URL path.
- Tag

Expired Content

You can filter the list by:

- Content Type
 - HTML
 - Image
 - Merchandising Zone
 - Text
 - Other
 - Page
- Path
 - Use Location to search for content based on the URL path.

- Tag

Translations

You can filter the list by:

- Content Type
 - HTML
 - Image
 - Merchandising Zone
 - Text
 - Other
 - Page
- Path
 - Use Location to search for content based on the URL path.
- Languages
 - All pages and content
 - Any missing translations

On the Languages dropdown list, you can also select missing for a specific language you have configured for your site. This returns all content that does not contain a translation for that language. The options here are dependent on the languages you have configured in your account.

Unpublished Changes

You can filter the list by:

- Path
- Tag
- Last Edited By

Visibility Timeline

You can filter the list by:

- Path
- Tag

Text Content

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced | Site Management Tools

Text on your site can originate from many places. For example, the item descriptions text comes from the item record in NetSuite. The text for your category labels comes from the category record. Facet navigation labels originate from the SuiteCommerce configuration record.

You can also add other types of text content to your site that don't depend on item or configuration records. This is text-based content you add directly in your site. For example, maybe you want to add marketing copy for an upcoming sale, or share your company's history on your About Us page.

See the following help topics for information about the available types of text content:

- [Site Management Tools Text Content](#)
- [Columns](#)
- [Blog](#)

Site Management Tools Text Content

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced | Site Management Tools

With Site Management Tools (SMT), you can drag and drop text content to the predefined areas on each page of your site. The text you add can serve a variety of purposes. Some of the most common uses for text content include:

- A notification that displays on select pages or all pages. For example, an upcoming sale, free shipping, or other special event.
- A header area for an image or merchandising zone, such as related or similar products or closeouts.
- A block or paragraph of text that contains a hypertext link to another page on your site or to an external site.
- Text or notifications that are specific to a product or facet list.

Depending on your business and the layout of your site, you may identify many more uses.

To learn more, explore the following help topics:

- [Adding Text and Image Content](#)
- [Editing Text Content](#)
- [Discarding or Removing Text Content](#)

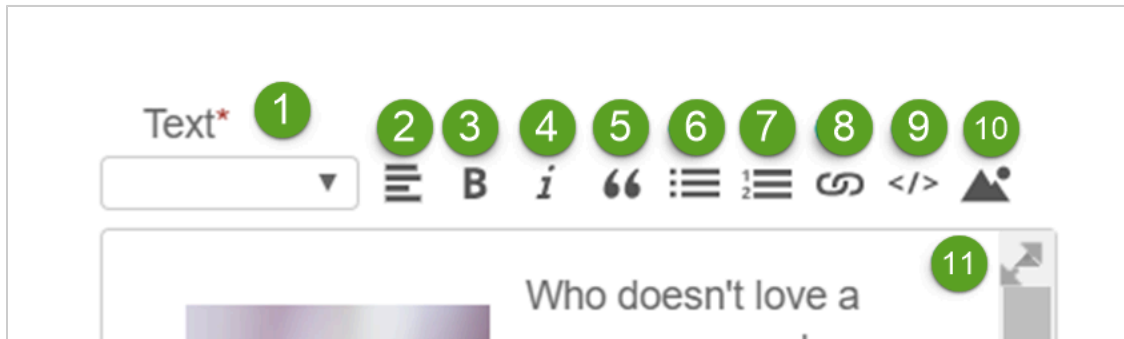

Adding Text and Image Content

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced | Site Management Tools

To add text to an area on a page, you drag the text content from the side panel and drop it in the area where you want to place it. If there's already content in the area, you'll see a drop indicator that shows exactly where your new content will go. When you drop the content, the page automatically opens the

text editor so you can add your text. The text editor is a WYSIWYG editor that lets you add formatted text and images to your site.

The following image shows the available formatting controls in the text editor.

Item	Description
1	Heading style list
2	Alignment
3	Bold
4	Italic
5	Block Quote
6	Bullet List
7	Numbered List
8	Insert Hyperlink
9	Switch to HTML View
10	Insert Image
11	Expand Editor

To add text and image content:

1. Log in to Site Management Tools. For details, see the help topic [Logging into Site Management Tools](#).
2. Go to the page where you want to add the content.
3. Click the Edit Mode icon  from the site management toolbar.
4. Click the Add icon  from the site management toolbar.
5. Drag the text content from the side panel to the area where you want to place it. You can drag the content to multiple areas of the page:
 - If you drag onto an area marked **all pages**, your content shows on any page that contains that area.
 - If you drag onto an area marked **page type**, your content shows on any page of that type.
 - If you drag onto an area marked **this page**, your content shows only on that page.
6. Position the content over the area and drop it. If the area already contains content, a horizontal line shows you where the new content will go.

7. In the **Name** field, enter a name for the text content.
8. Set the content visibility options. Choose from **Always Visible** or **Visible on Specific Dates**. For more information, see the help topic [View Site as of a Specific Date in Site Management Tools](#).
9. Enter your text in the text field and use the text editor toolbar to format it.
10. To add an image, position your cursor in the text editor where you want the image to appear.
11. Click the Image icon  from the text editor toolbar to open the Image Manager.
12. Select an existing image or upload a new image.
13. Click **Insert**.
14. Hover over the image in the text editor and click the gear icon.
15. In the **Alt Text** field, enter the alternate text to display when the image doesn't load. Alternate text is also used by screen readers and helps to promote Search Process Optimization (SEO).
16. Set the spacing for top, right, bottom, and center to control the space between the image and text.
17. Set the image dimensions. If you enter either width or height, the aspect ratio stays the same automatically.
18. Click **Save**.
19. In the **Tags** field, enter one or more descriptive tags. For details, see [Content Tags and Filter Tools](#).
20. Click **Save**.
21. Publish your changes. For details, see the help topic [Review and Publish Content in Site Management Tools](#).

Editing Text Content

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced | Site Management Tools

You can edit text content when you need to make changes.

To edit text content:

1. Log in to Site Management Tools. For details, see the help topic [Logging into Site Management Tools](#).
2. Go to the page where the text content is located.
3. Click the Edit Mode icon  from the site management toolbar.
4. Hover over the text content to display the content controls.
5. Click **Edit** to open the Text Settings in the side panel.
6. Make any required changes and click **Save**.

Discarding or Removing Text Content

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced | Site Management Tools

If you haven't published your text content yet and want to get rid of it, you can discard it. If it's already published, you can remove it directly from the page. To learn the difference between discarding and removing content, see the help topic [Discard or Expire Content in Site Management Tools](#).

To discard text content (unpublished content):

1. Log into Site Management Tools. For details, see the help topic [Logging into Site Management Tools](#).
2. Click the Review & Publish Changes icon  from the site management toolbar.
3. Select the text content from the Unpublished Changes list.
4. Click **Discard**.
5. In the pop up window that appears, click **Yes**.

To remove text content (published content):

1. Log into Site Management Tools. For details, see the help topic [Logging into Site Management Tools](#).
2. Go to the page where the text content is located.
3. Click the Edit Mode icon  from the site management toolbar.
4. Hover over the text content to display the content controls.
5. Click **X** to remove the text content from the page.
6. In the pop up window that appears, click **Yes**.

Columns

i Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced | Site Management Tools

The Columns extension lets you add, set up, or delete up to three columns of text, images, and call-to-action buttons with Site Management Tools (SMT). You can choose to add one, two, or three columns. The column layout automatically adjusts to fit your page and screen size. With Columns, you can organize your web content into manageable sections.

Important: Commerce extensions are only available if provisioned, installed, and activated for a selected domain in your NetSuite account. For more information, see [Commerce Extensions](#).

Note: Extensions require SuiteCommerce or the Aconcagua release of SuiteCommerce Advanced or later.

The following image is an example of how the Columns extension looks on a website.

- [Discarding or Removing a Column](#)

Setting User Role Access for Columns Extension

i Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced | Site Management Tools

To make the Columns extension work properly, set these permissions for the CCT Columns record:

- Customer Center role – Requires view permission.
- Employee Center role – Requires full permission.

To give the Customer Center role access to the CCT Columns record:

1. Go to Setup > Users/Roles > User Management > Manage Roles (Administrator).

2. Click **Customize** next to the Customer Center role.
3. Go to the **Permissions** tab and the **Custom Record** subtab.
4. From the **Record** list, select **CCT Columns**.
5. From the **Level** list, select **View**.
6. Click **Add**.
7. Click **Save**.

To give the Employee Center role access to the CCT Columns record:

1. Go to Setup > Users/Roles > User Management > Manage Roles (Administrator).
2. Click **Customize** next to the Employee Center role.
3. Go to the **Permissions** tab and the **Custom Record** subtab.
4. From the **Record** list, select **CCT Columns**.
5. From the **Level** list, select **Full**.
6. Click **Add**.
7. Click **Save**.

Adding a Column

i Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced | Site Management Tools

To add a column to your web store, add the Column content type to a page with Site Management Tools (SMT). You can add up to three columns.

To add a column:

1. Log into Site Management Tools. For details, see the help topic [Logging into Site Management Tools](#).
2. Go to the page where you want to add the column.
3. Click the Edit Mode icon  from the site management toolbar.
4. Click the Add icon  from the site management toolbar.
5. Drag the column content type from the side panel to the area where you want to place it. You can drag the column content type to multiple areas of the page:
 - If you drag onto an area marked **all pages**, your content shows on any page that contains that area.
 - If you drag onto an area marked **page type**, your content shows on any page of that type.
 - If you drag onto an area marked **this page**, your content shows only on that page.

i Note: If you don't see this content type, first check that the extension has been installed and is active. Then, click the gear icon on the site management toolbar and select **Custom Content Types**. Drag the content type from the Inactive Content Types list to the Active Content Type list.

6. From the Column Settings in the side panel, select the **General** subtab and set the following fields:

Field	Description
Name	Sets the name for the column to appear in the Review Changes list in SMT.

Field	Description
Visibility	Sets the visibility option that determines when you want to make the column visible. For more information, see the help topic View Site as of a Specific Date in Site Management Tools .
Header	Sets the title for the column.
Text Color	Determines the color for the text fields. By default, the Header , Caption , and Text fields use different colors that are inherited from your theme. If you select Dark , all text fields use the dark text color defined in your theme. If you select Light , all text fields use the light text color defined in your theme.
Column Alignment	Determines the positioning of the text content and button.
Open in New Window	If checked, opens a link from the column in a new tab or window.
Image Size ID	Links to the image resizing option you want the image to use. To use this option, you must enter an enabled Image Size ID found under the Images tab in the Image Resizing section of the Website Setup record. To access the Website Setup record, go to Commerce > Websites > Website Lists, and click Edit next to your site name. For more information, see Image Resizing and Compression .
Tags	Sets keywords to help filter your content in the Review Changes list. For more information, see Content Tags and Filter Tools .

7. Select the **Column** subtab and set the following fields:

Field	Description
Image	Sets the image to display using the Image Manager. For more information, see Image Manager . If you don't select an image, only the text column is displayed. For best results, optimize images before uploading.
Alt Text	Sets a description of the image to be used to improve accessibility and SEO.
Caption	Sets the column subtitle.
Text	Determines the text to display in the column. Basic HTML formatting tags are supported.
Button Text	Sets the button text. If you leave this field blank, the button doesn't appear.
Button Link	Sets the URL for the button link.

 **Note:** Each column has its own Column tab with its own settings. If you fill out only one Column tab, only one column appears.

8. Click **Save**.

Discarding or Removing a Column

 **Applies to:** SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced | Site Management Tools

You can delete a column from your site in Site Management Tools (SMT) using one of two methods, depending on whether you've published the content:

- Discard the column if it hasn't been published yet.
- Remove the column if it's already published and live on your site.

To discard a column (unpublished content):

1. Log into Site Management Tools. For details, see the help topic [Logging into Site Management Tools](#).
2. Select the Review & Publish Changes icon  from the site management toolbar.
3. Select the column content from the Unpublished Changes list.
4. Click **Discard**.
5. In the pop up window that appears, click **Yes**.

To remove a column (published content):

1. Log into Site Management Tools. For details, see the help topic [Logging into Site Management Tools](#).
2. Go to the page that contains the column you want to remove.
3. Select the Edit Mode icon  from the site management toolbar.
4. Hover over the column content box to display the content controls.
5. Click **X** to remove the column from the page.
6. In the pop up that appears, click **Yes**.

Blog

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced | Site Management Tools

The Blog extension lets you create blog posts for your website with Site Management Tools (SMT). You can add posts with images, add excerpts, and organize them with categories and tags.

You can create a blog spotlight to highlight selected posts on other areas of your site. Use an RSS feed to boost customer engagement, and turn on JSON-LD to help with search engine optimization (SEO).

Important: Commerce extensions are only available if provisioned, installed, and activated for a selected domain in your NetSuite account. For more information, see [Commerce Extensions](#).

Note: This extension requires SuiteCommerce or the 19.1 release of SCA or later.

When you activate the Blog extension, the following new components are available on your site:

- Blog Home Page – This page is created as the home page for your blog posts and has the URL path /blog appended to your website's URL. This page includes the following features:
 - Latest articles carousel
 - Featured articles section
 - More articles section
 - Search feature
- Blog Post – This component allows you to add new blog posts using SMT.

- **Blog Spotlight** – This component allows you to add a blog spotlight to highlight posts by category. This is useful for promoting a new product line or any trending topic.
- **Blog RSS Feed** – This component allows you to include your blog's RSS feed link on your site, so customers can subscribe and follow your latest posts.

Tip: You can add a menu item to your site so users can go to the blog right from your navigation. To do this, go to Commerce > Websites > Configuration. In the **Layout** tab, under **Navigation**, fill in the fields to create a blog menu item.

To learn more, explore these help topics:

- [Configuring the Blog Extension](#)
- [Adding a Blog Post](#)
- [Adding a Blog Spotlight](#)
- [Setting Up a Blog RSS Feed](#)
- [Display the RSS Feed Link on your Blog](#)
- [Enabling JSON-LD for Your Blog](#)

Important: NetSuite no longer supports the Blog Legacy extension. If you're using Blog Legacy, you should move your blog content over to the Blog extension. For more information about using Blog Legacy or migrating to the Blog extension, see [Blog Legacy](#).

Configuring the Blog Extension

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced | Site Management Tools

Use the SuiteCommerce Configuration record to choose how the Blog extension appears on your site. You can set home page labels, search behavior, how the Latest Articles section looks, and more.

To configure the Blog extension:

1. In NetSuite, go to Commerce > Websites > Configuration.
2. Select the website and domain where the Blog extension is activated and click **Configure**.
3. Go to the **Extensions** subtab.
4. In the **Blog** subtab, set the following fields:

Field	Description
Blog Name	Sets the blog name that appears on the blog home page.
Read Blog Post Label	Sets the label for the link that appears after the blog post preview that leads to the full blog post.
All Blog Posts Label	Sets the label for the blog post list.
Show Featured Blog Posts In Pagination	If checked, includes the featured blog posts section on every page. If cleared, the featured blog posts section only appears on the blog home page.
Blog Post List Label	Sets the title for the blog post list that appears on the blog home page.
Search Label	Sets the label for the search feature.

Field	Description
Search Placeholder	Sets the placeholder for the search feature.
Search Results Label	Sets the label for the search results.
No Search Results Message	Enter a message to display when the search returns no results. The <code>[[term]]</code> placeholder gets replaced by the search term automatically.
No Results Blog Post Suggestion Message	Sets the message to display when the search returns no results. In this case, the extension automatically suggests recent blog posts.
Mobile Search Close Label	Sets the label for the button that closes the search feature on mobile devices.
Categories Label	Sets the label for the Blog Post Categories section.
Pagination Label	Sets the label for the button that displays more blog posts.
Mobile Back To Top Label	Sets the label for the button that leads back to the top of the page on mobile devices.
Large Images Resize ID	Determines the image resizing option for large images added in the Content field using SMT. To use this option, you must enter an enabled Image Size ID found in the Image Resizing section of the Web Site Setup record (Commerce > Websites > Website List > Images subtab).
Thumbnail Images Resize ID	Determines the image resizing option you want to use for a Thumbnail Image added using Site Management Tools. To use this option, you must enter an enabled Image Size ID found in the Image Resizing section of the Web Site Setup record (Commerce > Websites > Website List > Images subtab).
Blog Posts Per Page	Determines the number of blog posts you want to display per page. Selecting a higher number of blog posts could reduce loading performance.
Empty State Label	Sets the label to display when there are no blog posts.
Empty State Message	Determines the message to display when there are no blog posts. You can suggest visiting the Product Listing page of your web store.
Empty State Button Label	Sets the label for the button that leads to the Product Listing page of your web store when there are no blog posts.
Show Latest Posts Section	If checked, includes the Latest Articles carousel on the blog home page. This section displays your three most recent posts, based on publication date, in a carousel.
Latest Posts Label	Sets the label for the Latest Articles carousel.
Latest Posts Carousel – Interval	Determines the time interval for the Latest Articles carousel.
Show RSS Feed Link	If checked, the RSS feed link will appear on your blog home page as the standard RSS icon. For more information, see Setting Up a Blog RSS Feed .

5. Click **Save**.

Adding a Blog Post

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced | Site Management Tools

Use Site Management Tools (SMT) to add content to your blog post, including the header and thumbnail images, category, and author. Publish your changes in SMT to have your blog post appear.

To add a blog post:

1. Log in to SMT. For details, see the help topic [Logging into Site Management Tools](#).
2. Select the Overview Mode icon  from the site management toolbar.
3. Select the **Blog** subtab.
4. Click **New Blog Post**.
5. In the **Blog Post** subtab, set the following fields:

Field	Description
Category	Determines the category of the blog post. A list of categories displays on the blog home page. You can select an existing category, add a new category, or edit an existing category by clicking Edit . You cannot delete a category that has a blog post assigned to it.
Author	Determines the author of the blog post. You can select an existing author, add a new author, or edit an existing author by clicking Edit . You cannot delete an author that has a blog post assigned to it.
Subtitle	Sets the subtitle of the blog post.
Content	Determines the content of the blog post. This field supports basic HTML format tags. You can also include SMT content in your blog post content by adding a Content Management System (CMS) area using the following key: <code>[[content:examplecontent]]</code> . The ID (examplecontent) must be unique for each piece of content you add. The ID can include letters and numbers and must not exceed 20 characters.
Header Image	Determines the header image that appears at the top of the blog post. For information about image size and format, see Image Size and Format .
Header Image Alt	Determines the description of the header image to be used to improve accessibility and SEO.
Excerpt	Determines the excerpt for the blog post preview to display in the blog post list. If left blank, the blog post preview uses the first paragraph of the post as the excerpt.
Thumbnail Image	Determines the thumbnail image that is used for the blog post preview. For more information, see Image Size and Format .
Thumbnail Image Alt	Determines the description of the thumbnail image to be used to improve accessibility and SEO.
Post Tags	Sets the tags for the blog post. Users can use tags to filter posts. You can add multiple tags in a list separated by commas.
Pin Post To	Determines the areas in which you want the blog post to be featured. Choose one of the following: ■ Featured Articles – The post is featured in the Featured Articles section. ■ Featured Articles in Category – The post is featured on the category home page. ■ No Search Results – The post appears when a search returns no results. You can edit these section titles by clicking Edit . Do not delete the Featured Articles or Featured in Category section.
Publication Date	Sets the publication date of the blog post.

The Blog Post page type also includes tabs for standard **General**, **Metadata**, **Layout**, and **Advanced** properties. For more information about these fields, see the help topic [Landing Pages](#).

6. Click **Save**.
7. Publish your changes. For details, see the help topic [Review and Publish Content in Site Management Tools](#).

Removing a Blog Post

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced | Site Management Tools

Removing a blog post makes it unavailable for visitors to your site.

To remove a blog post:

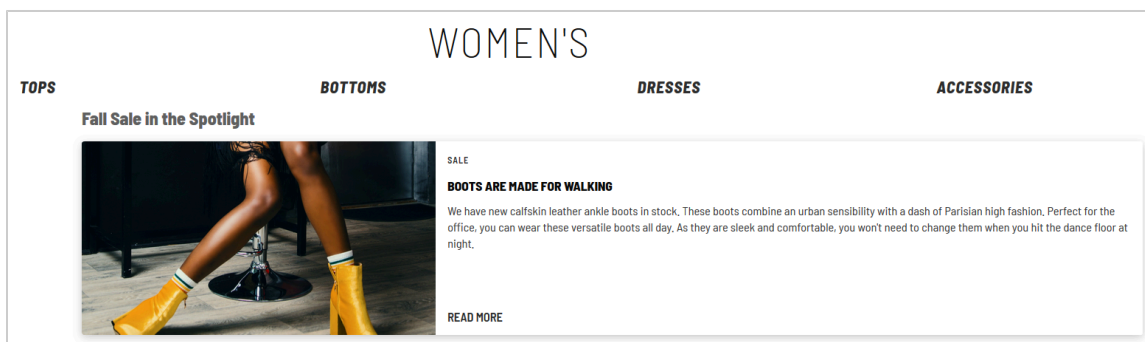

1. Log in to Site Management Tools. For details, see the help topic [Logging into Site Management Tools](#).
2. Click the Overview Mode icon  from the site management toolbar.
3. Select the **Blog** subtab.
4. Find the blog post you want to delete and click the ellipsis.
5. Click **Remove**.
6. When prompted, click **OK** to remove the blog post.
7. Publish the change. For details, see the help topic [Review and Publish Content in Site Management Tools](#).

Adding a Blog Spotlight

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced | Site Management Tools

With Site Management Tools (SMT), you can add a blog spotlight that highlights a few blog posts based on filters or keywords. You can set the spotlight title and choose how to display the article cards containing a blog post excerpt and thumbnail. For example, you might add a blog spotlight on the Woven Chair Product Detail page (PDP) and set the filters to “interior design” and “chair.” When visitors to your site go the Woven Chair PDP, they'll see a blog spotlight featuring posts about chairs and interior design.

The following image shows an example of the blog spotlight.

To add a blog spotlight:

1. Log in to SMT. For details, see the help topic [Logging into Site Management Tools](#).
2. Go to the page where you want to add a blog spotlight.
3. Select the Edit Mode icon  from the site management toolbar.
4. Click the Add icon  from the site management toolbar.
5. Drag the **Blog Spotlight** content type onto the page. You can add the content type to multiple areas of the page:
 - If you drag onto an area marked **all pages**, your content shows on any page that contains that area.
 - If you drag onto an area marked **page type**, your content shows on any page of that type.
 - If you drag onto an area marked **this page**, your content shows only on that page.

Note: If you don't see this content type, first check that the extension has been installed and is active. Then, click the gear icon on the site management toolbar and select **Custom Content Types**. Drag the content type from the Inactive Content Types list to the Active Content Type list.

6. From the Blog Spotlight Settings panel that appears, select the **General** subtab and set the following fields:

Field	Description
Name	Enter a description for the blog spotlight.
Visibility	Set when you want to display the content. For details, see the help topic View Site as of a Specific Date in Site Management Tools .
Tags	Add keywords to help filter your content. For more information, see Content Tags and Filter Tools .
Blog Spotlight Heading	Sets the title for the blog spotlight to appear above the article cards. Basic HTML formatting tags are supported.
Vertical Thumbnail-Text Alignment	If checked, displays the thumbnail above the text in the article card. If cleared, the thumbnail displays to the left of the text in the article card.
Number of Article Cards	Determines the number of blog article cards to include in the list.

7. Select the **Filters** subtab and set the following fields:

Field	Description
Category	Sets the blog post category. The posts labeled with the selected category appear in the spotlight.
Author	Sets the blog post author. The posts by the selected author appear in the spotlight.
Tags (separated by commas)	Sets one or more blog post tags, which should be listed separated by commas. The posts with the selected tags appear in the spotlight.
Additional Sections	Sets one or more additional blog sections. The posts included in the selected additional sections appear in the spotlight. The options for this field are based on the Pin to Post field options, found when editing a blog post page using Site Management Tools.
OR Search by text	Determines the keywords to search for in the blog post Heading , Excerpt , and Post Tags . The posts containing the keywords appear in the spotlight. If you use this search feature, the Categories , Authors , Tags , and Additional Sections fields are ignored.

Note: If you set more than one filter, blog posts are only included if they meet all the requirements. For example, if you set the Category to Interior Design and the Author to Bob Smith, only posts by Bob Smith in the Interior Design category will show up in the spotlight. If Bob Smith wrote a post but set it to the Architecture category, it won't be included.

8. Click **Save**.
9. Publish the change. For more information, see the help topic [Review and Publish Content in Site Management Tools](#).

Discarding or Removing a Blog Spotlight

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced | Site Management Tools

To remove a blog spotlight, choose from the following options:

- **Discard** the blog spotlight if you have not published the content.
- **Remove** the blog spotlight if you have already published the content.

To discard a blog spotlight (unpublished content):

1. Log into Site Management Tools. For details, see the help topic [Logging into Site Management Tools](#).
2. Click the Review & Publish Changes icon  from the site management toolbar.
3. Select the blog spotlight content from the Unpublished Changes list.
4. Click **Discard**.
In the pop up window that appears, click **Yes**.

To remove the blog spotlight (published content):

1. Log into Site Management Tools. For details, see the help topic [Logging into Site Management Tools](#).
2. Go to the page that contains the blog spotlight.
3. Click the Edit Mode icon  from the site management toolbar.
4. Hover over the blog spotlight content to display the content controls.
5. Click **X** to remove the blog spotlight from the page.
6. In the pop up window that appears, click **Yes**.

Setting Up a Blog RSS Feed

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced | Site Management Tools

You can set up an RSS feed so readers get updates from your blog.

To use an RSS feed with your blog, follow these steps:

1. [Schedule a Recurring Scheduled Script Submission](#)

2. Display the RSS Feed Link on your Blog

Note: If you have more than one website in your NetSuite account, the RSS feed includes posts from all your websites.

Schedule a Recurring Scheduled Script Submission

Before you use an RSS feed with your blog, you'll need to run the associated script. You can set up a recurring scheduled script submission, so that after the first run, the RSS feed updates automatically.

Schedule a recurring scheduled script submission using the following information:

- Script record: NS SC SS Blog RSS Generator
- Script Deployment record: NS SC SS Blog RSS Generator

Note: Scheduling a recurring scheduled script submission doesn't automatically run the script upon saving. To use the RSS feed with your blog quicker, you should use the **Save and Execute** command on the Script Deployment record. For more information, see the help topic [Submitting an On-Demand Scheduled Script Instance from the UI](#).

For more information, see the help topic [Scheduling a One Time or Recurring Scheduled Script Submission](#).

Display the RSS Feed Link on your Blog

You can display the RSS feed link on your blog pages, so that readers can access the RSS feed.

To display the RSS Feed link on your blog:

1. In NetSuite, go to Commerce > Websites > Configuration.
2. Select the website and domain where the Blog extension is activated and click **Configure**.
3. Go to the **Extensions** subtab.
4. In the **Blog** subtab, check the **Show RSS feed link** box.
5. Click **Save**.

Enabling JSON-LD for Your Blog

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced | Site Management Tools

You can enable JSON-LD for your blog. JSON-LD adds extra data to your blog pages to improve search engine optimization (SEO). NetSuite uses JSON-LD according to the BlogPosting schema found at [Schema.org](https://schema.org/BlogPosting).

Note: This feature requires SuiteCommerce or the 2020.1 release of SCA or later.

In addition to the Blog Post fields, JSON-LD uses the Display Name field from the Website Setup record and the Logo URL field located on the SuiteCommerce Configuration record (Layout > Header subtab). The Display Name field is required for your site. The Logo URL field determines your site's header logo and isn't required, but it's a good idea to set it to improve the information included in JSON-LD and SEO.

To enable JSON-LD:

1. In NetSuite, go to Commerce > Websites > Configuration.
2. Select the website and domain where the Blog extension is activated and click **Configure**.
3. Go to the **Shopping Catalog** subtab, then the **Structured Data Markup** subtab.
4. In the **Markup Type** field, select **JSON-LD**.
5. Click **Save**.

Image Content

📌 Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced | Site Management Tools

Images are a key part of building an engaging and effective website. Whether you want to showcase products, highlight promotions, or add visual interest to your pages, managing images efficiently helps you create a professional and dynamic web presence.

To learn more, explore the following help topics:

- [Image Manager](#) – The Image Manager is your main tool for uploading and organizing website images. With it, you can:
 - Upload multiple image files by browsing your device or by dragging and dropping files.
 - Organize images into folders and subfolders for easier management.
 - Preview images in thumbnail or list views.
- [Site Management Tools Image Content Type](#) – Single images, such as banners or featured products can be placed on your web pages using the SMT image content type. You simply drag the image onto your page and adjust basic settings.
- [Image Text Overlay](#) – Use this feature to add text, a call-to-action button, and overlays (dark or light) on top of an image. You can control text and button styles, alignment, and link settings. This feature is ideal for creating banners and promotional images with clear messages.
- [Photo Gallery](#) – The Photo Gallery extension lets you arrange up to eight images in an attractive display, either as a grid or a carousel. Each image can have its own heading, description, link, and overlay options. This is useful for showcasing product collections or event photos.
- [Slideshow](#) – With the Slideshow extension, you can add rotating images to your site. Set image order, transition timing, overlays, and include text and buttons on each slide. Each image in the slideshow can have its own link, allowing for interactive and visually appealing banners or featured sections

Image Manager

📌 Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced | Site Management Tools

Images play an important role on your website. They make your pages more interesting, grab your visitor's attention, and break up long blocks of text. Plus, images can instantly share a message or feeling that might take a lot of words to explain. For example, you might add a banner image at the top of every page to promote a sale or showcase summer clearance items.

The Image Manager is a Site Management Tools (SMT) feature that helps you add images to your site. You can upload new images or choose images you've already saved in the file cabinet. For more information about SMT, see the help topic [Site Management Tools Overview](#).

With the Image Manager, you can:

- Drag and drop one or more image files.
- Select and upload multiple files by browsing to the file location.
- Create subfolders within the site's file folder.
- Switch between multiple views, including thumbnail view and list view.

Note: All images are stored in the SMT site image folder, located at Web Site Hosting Files > Live Hosting Files > SSP Applications > NetSuite Inc. – CMS > CMS > [Site Number] > files. You can upload images directly to this folder in NetSuite, and they'll be ready to use with the Image Manager. The Image Manager only works with images in this folder. You won't be able to select images stored anywhere else in the File Cabinet.

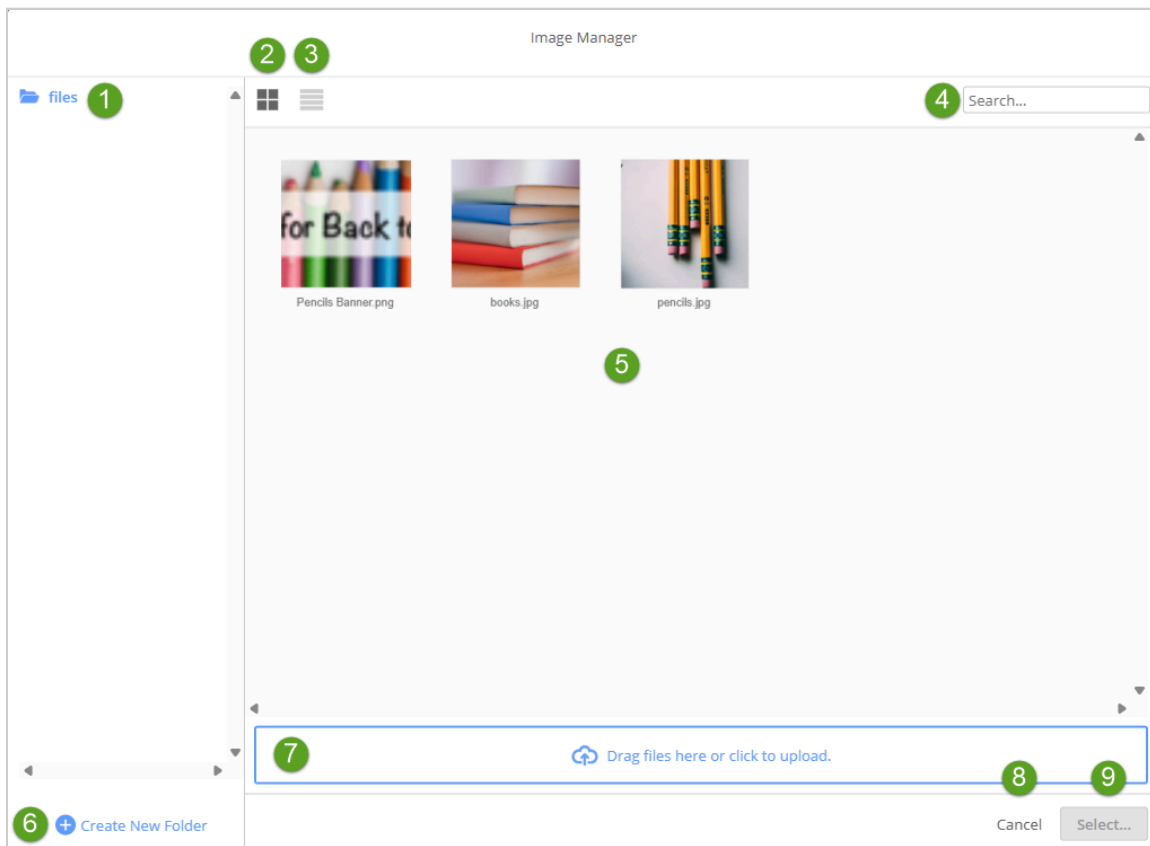

Watch the following video to learn about the Image Manager:

 [SMT Image Manager](#)

There are two ways you can access the Image Manager:

- **Image Content Type** – The Image Content Type utilizes the image manager when the selecting images for the content. For details, see [Site Management Tools Image Content Type](#).
- **Text Content Type** – The text editor tool bar includes a Image Manager button. For details, see [Site Management Tools Text Content](#).

The following screenshot shows the options available from the Image Manager:

Item	Description
1	This panel displays the SMT files folder and any subfolders. This folder is located in the file cabinet at Web Site Hosting Files > Live Hosting Files > SSP Applications > NetSuite Inc. – CMS > CMS > [Site Number] > files.
2	Click this icon to display thumbnails of the images in the selected folder.
3	Click this icon to display a list of images in the selected folder.
4	Enter text to limit the listed images to only those files that match your search term.

Item	Description
5	Lists all images in the currently selected folder. Click an image to select it.
6	Click Create New Folder to add a new subfolder.
7	Click this area to browse to in image file on your computer and upload it to the selected folder. You can also drag one or more files to this area to upload them to the selected folder. Supported file types include, JPG, GIF, PNG, PJPG, SVG, and TIFF.
8	Click Cancel to close the Image Manager without selecting a file.
9	Select is enabled only after you click an image to select it. Click Select to choose the image and insert it into your image content type or into the text editor.

Site Management Tools Image Content Type

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced | Site Management Tools

The SMT (Site Management Tools) Image Content Type lets you add engaging visual elements to your site. These images might include:

- Banners to advertise current and upcoming sales or events
- Images that link to groups of items or categories
- Free shipping or other eye-catching notifications

Typically, a graphics designer creates these images with their intended placement in mind, so each fits perfectly in the layout area where it will appear.

Note: You cannot select images from the File Cabinet. If you have an image in the File Cabinet that you want to use, download it to your computer first, then add it to you site with SMT.

Image Size and Format

SMT doesn't let you set the image's dimensions, so it's best to size your image to fit (or slightly larger than) the area where you'll place it. If your image is larger than the area where it's placed, it'll get scaled down to fit the area. If it's smaller than the area, it's displayed at its size and won't be stretched to fit. Supported file types include: JPG, GIF, PNG, PJGP, SVG, and TIFF.

Note: Large image files can impact page load times. You should use the smallest image possible without losing quality.

Image Template File

The image template file determines how an image you add to an area is displayed. This includes image alternate text and hyperlinks. For more information, see [Image Template](#).

Note: Any changes to images, including addition, edits, or deletions must be published before the changes are available on the site.

To learn more, explore these help topics:

- [Adding the Site Management Tools Image Content Type](#)
- [Discarding or Removing the Site Management Tools Image Content Type](#)

■ Image Template

Adding the Site Management Tools Image Content Type

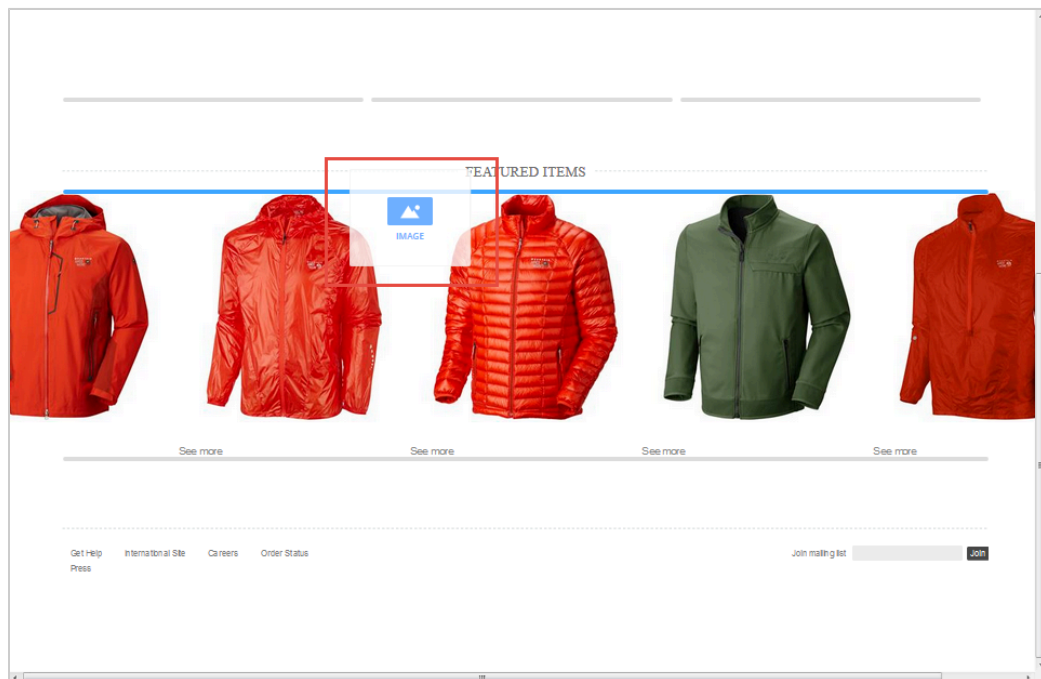

① Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced | Site Management Tools

When you use Site Management Tools (SMT) to add an image to your site, the image file is uploaded to the file cabinet: Web Site Hosting Files > Live Hosting Files > SSP Applications > NetSuite Inc. – CMS > CMS > [site-number] > files.

To add the SMT image content type:

1. Log into Site Management Tools. For details, see the help topic [Logging into Site Management Tools](#).
2. Go to the page where you want to add your image content.
3. Click the Edit Mode icon  from the site management toolbar.
4. Click the Add icon  from the site management toolbar.
5. Drag the image content from the side panel to the area where you want to place it. You can drag the image content to multiple areas of the page:
 - If you drag onto an area marked **all pages**, your content shows on any page that contains that area.
 - If you drag onto an area marked **page type**, your content shows on any page of that type.
 - If you drag onto an area marked **this page**, your content shows only on that page.
6. When you drop the content, the system automatically displays an Open File pop up and lets you browse your computer for the image file. Select the file and click **Open**. This places your image on the page.

In the following screenshot, content is placed in the first position of an area that already includes text content and merchandising zone content.

7. In the **Settings** side panel, use the **Name** field to enter a description of your new content.
8. Set the content visibility options. Choose from **Always Visible** or **Visible on Specific Dates**. For details, see the help topic [View Site as of a Specific Date in Site Management Tools](#).
9. If you want to link the image to another page on your site or to an external site, enter the URL for the page in the **Link** field.
10. In the **Alternate Text** field, enter the alternate text to display when the image doesn't load. Alternate text is also used by screen readers and helps to promote Search Process Optimization (SEO).
11. In the **Tags** field, enter one or more descriptive tags to help organize and categorize your content. For details, see [Content Tags and Filter Tools](#).
12. Click **Save**.

Discarding or Removing the Site Management Tools Image Content Type

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced | Site Management Tools

Use Site Management Tools (SMT) to remove images from your site. Follow the steps below to locate and remove specific image content as needed. For more information about SMT, see the help topic [Site Management Tools Overview](#).

To discard image content (unpublished content):

1. Log into Site Management Tools. For details, see the help topic [Logging into Site Management Tools](#).
2. Click the Review & Publish Changes icon  from the site management toolbar.
3. Select the image from the Unpublished Changes list.
4. Click **Discard**.
5. In the pop up window that appears, click **Yes**.

To remove image content (published content):

1. Log into Site Management Tools. For details, see the help topic [Logging into Site Management Tools](#).
2. Go to the page that contains the image content you want to remove.
3. Click the Edit Mode icon  from the site management toolbar.
4. Hover over the image content to display the content controls.
5. Click **X** to remove the image from the page.
6. In the pop up window that appears, click **Yes**.

Image Template

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced | Site Management Tools

When you add an image to an area, it uses the standard Site Management Tools (SMT) image template, which determines how the HTML for the image gets written. When you add an image to a page using Site

Management Tools (SMT), you can set a link (the URL the image should go to) and alternate text. Both settings are optional.

If you add a URL, the default image template makes the image a clickable link. When someone clicks it, they'll go to the page the image is linked to. The resulting link for the image might appear similar to this:

```
1 | <a href="/shoppingcart"></a>
```

If you don't set a link, the template adds a standard image , similar to this:

```
1 | 
```

You can use the default image template as-is or customize it to fit your needs.

The default image template is located in the file cabinet at:

Web Site Hosting Files > Live Hosting Files > SSP Applications > NetSuite Inc. — CMS > CMS > [application name] > Published > Templates > image_default.txt

image_default.txt

Use this default template as a starting point for creating your own custom image templates.

```
1 | <% if (data.fields.string_link) { %>
2 |   <a href="<%- data.fields.string_link %>">
3 |   <% } %>
4 |   <% if (data.fields.string_alt) { %> alt="<%- data.fields.string_alt %>"<% } %> data-
   loader="false" />
5 |   <% if (data.fields.string_link) { %>
6 |     </a>
7 |   <% } %>
8 |   <% }); %>
```

The data-loader attribute in the template lets you control **lazy loading**. Meaning the image loads only when it's needed. For example, if the image starts out off screen, it won't load until someone scrolls down to it. Lazy loading helps long pages load faster. Setting the data-loader attribute to false turns lazy loading off, so all your images load as soon as the page loads. Setting it to true turns on lazy loading, so images are only loaded when they're needed.

Note: You should set the data-loader attribute to false to disable lazy loading so images always load when the page loads.

You'll see some inline code blocks in the template that uses "<%- ... %>". This is for security and helps prevent cross-site scripting. The hyphen following the opening <% escapes certain characters, converting them to HTML character entities. These characters include: & < > " ' /.

Site Management Tools Image Compression

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced | Site Management Tools

Compressing images speeds up page load times and uses less bandwidth. There are four levels of image quality with increasing levels of compression. Typically, the decrease in quality is unnoticeable to viewers.

The quality levels are:

- High (minimal compression)
- Optimum (ed)
- Standard
- Low (maximal compression)

For website images, such as banners, logos, and promotional images, compression is managed at the website level or folder level.

The benefit of applying compression to a folder instead of the website is that you can use different compression settings for different images. Subfolders inherit the compression settings of parents, and parent settings supersede those of subfolders.

If you set compression at the website level, the settings only apply when images are accessed from the website. If you set it at the folder level, compression settings apply regardless of where the image was accessed. For example, website-level compression settings don't apply when images are accessed from SuiteCommerce InStore (SCIS), but folder-level settings do apply.

Image compression creates a compressed copy of the image the first time it is accessed and does not change the original image. The compressed image is cached internally or stored on the CDN if you're using one. For more information, see the help topic [CDN Caching](#).

Which Images Get Compressed?

When you define compression settings on a folder or website, images must meet certain criteria to be compressed. Image compression works for JPGs only. Files need to be between 500 kb and 5 MB and stored in the File Cabinet. Images stored outside NetSuite and linked to on your website can't be compressed. Item images get compressed automatically when resized, regardless of other compression settings applied to the website or folder. For more information, see [Image Resizing and Compression](#).

You can shrink file sizes even more by stripping out metadata (such as camera details or the date and time a photo was taken) and using chroma subsampling, which reduces color information in favor of luminance data.

Setting Up Website Image Compression

📘 Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced | Site Management Tools

This article explains how to manage image compression at the website level. These settings only apply to images loaded from your website. You can also set up compression at the folder level. For details, see [Setting Up Folder Image Compression](#).

To set up website image compression:

1. From NetSuite, go to Commerce > Websites > Website List.
2. Click **Edit** next to the website you want to modify.
3. Select the **Images** subtab.

4. Check the **Compress All Website Images** box to turn on compression for all images on the website that meet the compression criteria.
5. Select the compression level from the **Compressed Image Quality** field.
6. (Optional) Check the **Strip Metadata** box to remove metadata, such as camera details or the date and time a photo was taken.
7. (Optional) Check the **Chroma Subsampling** box to reduce color information in favor of luminance data, which is easier for the human eye to detect. This yields a smaller file size, but a similar visual appearance.
8. Click **Save**.

Setting Up Folder Image Compression

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced | Site Management Tools

This article explains how to manage image compression at the folder level. Applying compression at the folder level allows you to use different compression settings for different images. Subfolders inherit the compression settings of parents, and parent settings supersede those of subfolders. You can also set up compression at the website level. For details, see [Setting Up Website Image Compression](#).

To set up image compression for a folder:

1. From NetSuite, go to Documents > Files > File Cabinet.
2. Go to the folder you want to modify and click **Edit**.
3. Go to the **Hosted Images Compression** subtab.
4. Check the **Compress Website Images** box to turn on compression for all images in the folder that meet the compression criteria.
5. Select the compression level from the **Compressed Image Quality** field.
6. (Optional) Check the **Strip Metadata** box to remove metadata, such as camera details or the date and time a photo was taken.
7. (Optional) Check the **Chroma Subsampling** box to reduce color information in favor of luminance data, which is easier for the human eye to detect. This yields a smaller file size, but a similar visual appearance.
8. Click **Save**.

Image Text Overlay

Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount

With the Image Text Overlay extension, you can create eye-catching images for your home and landing pages to showcase your brands. Enhance images with light or dark overlays, choose your text color, and choose where your content goes. You can also add a call-to-action button and select a specific button style.

Important: Commerce extensions are only available if provisioned, installed, and activated for a selected domain in your account. For more information, see [Commerce Extensions](#).

Note: Extensions require SuiteCommerce or the Aconcagua release of SCA or later.

The following image shows an example of an image text overlay.

To learn more, explore these help topics:

- [Adding an Image with Text Overlay](#)
- [Discarding or Removing an Image with Text Overlay](#)
- [Changing the Image Text Overlay Button](#)

Adding an Image with Text Overlay

Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount

You can use Site Management Tools (SMT) to add images with text overlays to different areas of your website. For more information about SMT, see the help topic [Site Management Tools Overview](#).

To add an image with text overlay:

1. Log into Site Management Tools. For details, see the help topic [Logging into Site Management Tools](#).
2. Go to the page where you want to add an image with text overlay.
3. Click the Add icon  from the site management toolbar.
4. Drag the **Image Text Overlay** content type onto the page. You can add the content type to multiple areas of the page:
 - If you drag onto an area marked **all pages**, your content shows on any page that contains that area.
 - If you drag onto an area marked **page type**, your content shows on any page of that type.
 - If you drag onto an area marked **this page**, your content shows only on that page.

Note: If you don't see this content type, first check that the extension has been installed and is active. Then, click the gear icon on the site management toolbar and select **Custom Content Types**. Drag the content type from the Inactive Content Types list to the Active Content Type list.

5. In the **Settings** side panel, enter a description for your new content in the **Name** field.
6. Set when you want to display the content. Choose from **Always Visible** or **Visible on Specific Dates**. For details, see the help topic [View Site as of a Specific Date in Site Management Tools](#).
7. Use the Image Manager to select the image you want to display. For details, see [Image Manager](#).

Note: The maximum image height for Image Text Overlay is 750 px. If your image is taller, it will be resized to fit.

8. In the **Image Alignment** field, select the position of the image in the content box. Choose from top, center, or bottom.
9. In the **Image Overlay** field, select the image opacity. Choose from dark, light, or no overlay.
10. In the **Alt Text** field, enter an image description. This text helps with accessibility and Search Process Optimization (SEO).
11. In the **Text** field, enter the message you want to display over the image. You can use simple HTML tags such as `<strong>` for bold text, `<em>` for italic, and `<li>` for bulleted lists. When entering your message, enclose any body text with `<p>` tags and use `<h>` tags to create headers.
12. From the **Text Alignment** field, select the position of the text and button overlay. Choose from left, right, or center aligned.
13. In the **Text Color** field, choose your text color. By default, this field uses the color scheme of your theme.
14. In the **Button Text** field, enter the text you want to display on the button. Leave this field blank if you don't want to display a button.
15. In the **Button Style** field, choose your button style.
16. In the **Button Link** field, enter the URL you want the button to open.
17. Select **Open in New Window** if you want the button's link to open in a new tab or window.
18. Add keywords in the **Tags** field to help filter your content. For more information, see [Content Tags and Filter Tools](#).
19. Click **Save**.

Discarding or Removing an Image with Text Overlay

Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount

If you haven't published your image with text overlay yet and want to get rid of it, you can discard it. If it's already published, you can remove it directly from the page. To learn the difference between discarding and removing content, see the help topic [Discard or Expire Content in Site Management Tools](#).

To discard an image with text overlay (unpublished content):

1. Log into Site Management Tools. For details, see the help topic [Logging into Site Management Tools](#).
2. Click the Review & Publish Changes icon  from the site management toolbar.

3. Select the image with text overlay from the Unpublished Changes list.
4. Click **Discard**.
5. In the pop up window that appears, click **Yes**.

To remove an image with text overlay (published content):

1. Log into Site Management Tools. For details, see the help topic [Logging into Site Management Tools](#).
2. Go to the page that contains the image with text overlay.
3. Click the Edit Mode icon  from the site management toolbar.
4. Hover over the image text overlay content to display the content controls.
5. Click **X** to remove the text overlay from the page.
6. In the pop up window that appears, click **Yes**.

Changing the Image Text Overlay Button

Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount

Follow these steps if you need to change the button link or text after the image text overlay is configured.

To change the image text overlay button:

1. Log into Site Management Tools. For details, see the help topic [Logging into Site Management Tools](#).
2. Go to the page that contains the image with text overlay.
3. Click the Edit Mode icon  from the site management toolbar.
4. Hover over the image text overlay content to display the content controls.
5. Click the **Settings** button.
6. Enter the URL for the link in the **Button Link** field or enter the alternative text in the **Alt Text** field.
7. Click **Save**.

Photo Gallery

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced | Site Management Tools

The Photo Gallery extension lets you add an image gallery to your web page using Site Management Tools (SMT).

Important: Commerce extensions are only available if provisioned, installed, and activated for a selected domain in your account. For more information, see [Commerce Extensions](#).

With the Photo Gallery extension, you can:

- Select the size and style of the gallery.
- Customize the display with animation effects.
- Add a heading and description to each image.
- Choose text colors to match your look.
- Add light or dark photo overlays.

You can link any image to a page inside your site or to an external site. For example, feature new arrivals and link to the Product Details pages. Use SMT to add, configure, or delete a photo gallery in multiple areas of your website.

 **Note:** Extensions require SuiteCommerce or the Aconcagua release of SCA or later.

To learn more, explore these topics:

- [Adding a Photo Gallery](#)
- [Configuring a Photo Gallery](#)
- [Discarding or Removing a Photo Gallery](#)

Adding a Photo Gallery

 **Applies to:** SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced | Site Management Tools

To add a photo gallery to your web store, add the Photo Galley content type to a page of your site using Site Management Tools (SMT). You can add up to eight images.

To add a photo gallery:

1. Log into Site Management Tools. For details, see the help topic [Logging into Site Management Tools](#).
2. Go to the page where you want to add a photo gallery.
3. Click the Edit Mode icon  from the site management toolbar.
4. Click the Add icon  from the site management toolbar.
5. Drag the **Photo Gallery** content type onto the page. You can add the content type to multiple areas of the page:
 - If you drag onto an area marked **all pages**, your content shows on any page that contains that area.
 - If you drag onto an area marked **page type**, your content shows on any page of that type.
 - If you drag onto an area marked **this page**, your content shows only on that page.

 **Note:** If you don't see this content type, first check that the extension has been installed and is active. Then, click the gear icon on the site management toolbar and select **Custom Content Types**. Drag the content type from the Inactive Content Types list to the Active Content Type list.

6. Configure the settings to best fit your needs. For details, see [Configuring a Photo Gallery](#).

Configuring a Photo Gallery

① Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced | Site Management Tools

When you set up a photo gallery, you can adjust things like its height, style, animation effects, and choose when it should be visible. You can also customize each featured image with its own heading, description, and display options.

You can fine-tune how your photo gallery looks by using the elements of the theme applied to your site. Pick fonts, text colors, gallery sizes, overlay colors, and more. For more information, see the help topic [Theme Skin Manager](#).

To configure a photo gallery:

1. Log into Site Management Tools. For details, see the help topic [Logging into Site Management Tools](#).
2. Go to the page that contains the photo gallery.
3. Click the Edit Mode icon  from the site management toolbar.
4. Hover over the **Photo Gallery** box to display the content controls.
5. Click **Edit** to open the Photo Gallery Settings in the side panel.
6. In the **General** subtab, set the following fields:

Field	Description
Name	
Visibility	Controls when the photo gallery appears on your site. For more information, see the help topic View Site as of a Specific Date in Site Management Tools .
Gallery Height	Determines the size of the photo gallery. You can customize these size options using the Theme Skin Manager. For more information, see the help topic Theme Skin Manager .
Style	Choose how your photo gallery looks: ■ Carousel shows images in a carousel on desktop and one at a time on mobile. ■ Grid shows images in a grid on desktop and stacked on mobile.
Hover Animation	Pick what happens when someone hovers on an image. Hover animations only work if the Style field is set to Grid . Image scale options zoom in or out of the image, without affecting the container. Container drop shadow options display a shadow around the image container.
Carousel Animation	Choose how the carousel animation works if you've picked Carousel style.
Open links in a new window	Open gallery links in a new tab or window if you check this option
Image Size ID	Link the image to the resizing option you want. To use this option, enter a Image Size ID found under the Images tab in the Image Resizing section of the Web Site Setup record (Commerce > Websites > Web Site List). For more information, see Image Resizing and Compression .
Tags	Add keywords to help filter your content in the Review Changes list. For more information, see Content Tags and Filter Tools .

7. In the **Image** subtab, set the following fields:

Field	Description
Image	Pick the image to display using the Image Manager. For best results, optimize your images before uploading. For more information, see Image Manager .
Alt Text	Add a description for the image to boost accessibility and SEO.
Image Alignment	Choose where the image appears inside the content box.
Image Overlay	Pick how transparent the image overlay should be.
Heading	Enter the main heading text you want on the image.
Description	Add a description or subheading to appear on the image.
Text Alignment	Choose where the heading and description appear on your image.
Text Color	Pick colors for the heading and description text. You can customize these color options using the Theme Skin Manager. For more information, see the help topic Theme Skin Manager .
Link	Enter the URL you want your image to link to.

 **Note:** Each image in your gallery has its own **Image** tab, so you can adjust settings for each image however you want.

8. Repeat Step 7 for every image you want to add. You can add up to eight images in single gallery.
9. Click **Save**.

Discarding or Removing a Photo Gallery

 **Applies to:** SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced | Site Management Tools

You can delete a photo gallery from your site in Site Management Tools (SMT) using one of two methods, depending on whether you've published the content:

- Discard the photo gallery if it hasn't been published yet.
- Remove the photo gallery if it's already published and live on your site.

To discard a photo gallery (unpublished content):

1. Log into Site Management Tools. For details, see the help topic [Logging into Site Management Tools](#).
2. Select the Review & Publish Changes icon  from the site management toolbar.
3. Select the photo gallery from the Unpublished Changes list.
4. Click **Discard**.
5. In the pop up window that appears, click **Yes**.

To remove a photo gallery (published content):

1. Log into Site Management Tools. For details, see the help topic [Logging into Site Management Tools](#).
2. Go to the page that contains the photo gallery content you want to remove.

3. Select the Edit Mode icon  from the site management toolbar.
4. Hover over the photo gallery content box to display the content controls.
5. Click **X** to remove the photo gallery from the page.
6. In the pop up that appears, click **Yes**.

Slideshow

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced | Site Management Tools

The Slideshow extension lets you add a carousel of images to your website using Site Management Tools (SMT). You can upload multiple images, set the image focus, and pick a dark or light overlay. Images slide automatically, and you control how long each slide appears. Add links or call-to-action buttons to each image, set the text color to match your theme, and choose where the content goes. For example, use Slideshow to showcase featured products or highlight new collections.

Important: Commerce extensions are only available if provisioned, installed, and activated for a selected domain in your account. For more information, see [Commerce Extensions](#).

Note: Extensions require SuiteCommerce or the Aconcagua release of SCA or later.

You can add a slideshow to multiple areas on your website using SMT. For more information about Site Management Tools, see the help topic [Site Management Tools Overview](#).

To learn more, explore these help topics:

- [Adding a Slideshow](#)
- [Discarding or Removing a Slideshow](#)
- [Changing the Slideshow Button](#)

Adding a Slideshow

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced | Site Management Tools

You can add a slideshow to your web store by dragging the Slideshow content type onto a page in Site Management Tools (SMT). You can add up to eight images.

To add a slideshow:

1. Log into Site Management Tools. For details, see the help topic [Logging into Site Management Tools](#).
2. Go to the page where you want to add a slideshow.
3. Click the Edit mode icon  from the site management toolbar.
4. Click the Add icon  from the site management toolbar.
5. Drag the **Slideshow** content type onto the page. You can add the content type to multiple areas of the page:

- If you drag onto an area marked **all pages**, your content shows on any page that contains that area.
- If you drag onto an area marked **page type**, your content shows on any page of that type.
- If you drag onto an area marked **this page**, your content shows only on that page.

Note: If you don't see this content type, first check that the extension has been installed and is active. Then click the gear icon on the site management toolbar, select **Custom Content Types**, and drag the content type to the Active Content Type list.

6. In the **General** tab, set the following fields:
 - a. In the **Name** field, enter a description of your new content.
 - b. Set when you want to display the content. Choose from **Always Visible** or **Visible on Specific Dates**. For details, see the help topic [View Site as of a Specific Date in Site Management Tools](#).
 - c. If you don't want images to change automatically, clear the **Automatic Slideshow** box.
 - d. In **Transition Duration**, select how long each image displays before changing (in seconds).
 - e. In **Section Height**, determine the size of your slideshow.

Note: On desktops, images resize to fit. On mobile, images are cropped to fit a small section height.

- f. Add keywords in the **Tags** field to help filter your content. For more information, see [Content Tags and Filter Tools](#).

7. In the **Image** tab:

- a. Select the image you want to display using the Image Manager. A preview displays on the page. For details, see [Image Manager](#).

Note: If you upload several images, use images with the same resolution for the best-looking slideshow.

- b. In the **Image Alignment** field, select the position of the image in the content box. Choose from top, center, or bottom.
 - c. In the **Image Overlay** field, select the image opacity. Choose from dark, light, or no overlay.
 - d. In the **Alt Text** field, enter a description for accessibility and SEO.
 - e. In the **Text** field, enter the text you want to display in the slideshow. You can use simple HTML tags such as `<strong>` for bold text, `<em>` for italic, and `<li>` for bulleted lists. When entering your message, enclose any body text with `<p>` tags and use `<h>` tags to create headers.
 - f. In **Text Alignment**, select the position of the text and the button. Choose from left, right, or center aligned.
 - g. In the **Text Color** field, choose your text color. By default, this field uses the color scheme of your theme.
 - h. In the **Button Text** field, enter the text you want to display on the button. Leave this field blank if you don't want to display a button.
 - i. In the **Button Style** field, choose your button style. Button styles are taken from the theme.
 - j. In the **Button Link** field, enter the URL you want the button to open.
 - k. Select **Open in New Window** if you want the button's link to open in a new tab or window.
8. Repeat Step 7 to include additional images. You can add up to eight images.

9. Click **Save**.

Discarding or Removing a Slideshow

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced | Site Management Tools

If you haven't published your slideshow and you decide to remove it, you can discard it. If it's already published, you can remove it right from the page. For more information, see the help topic [Discard or Expire Content in Site Management Tools](#).

To discard a slideshow (unpublished content):

1. Log into Site Management Tools. For details, see the help topic [Logging into Site Management Tools](#).
2. Select the Review & Publish Changes icon  from the site management toolbar.
3. Select the slideshow from the Unpublished Changes list.
4. Click **Discard**.
5. In the pop up window that appears, click **Yes**.

To remove a slideshow (published content):

1. Log into Site Management Tools. For details, see the help topic [Logging into Site Management Tools](#).
2. Go to the page that contains the slideshow you want to remove.
3. Select the Edit Mode icon  from the site management toolbar.
4. Hover over the slideshow content box to display the content controls.
5. Click **X** to remove the slideshow from the page.
6. In the pop up that appears, click **Yes**.

Changing the Slideshow Button

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced | Site Management Tools

Follow these steps if you need to change the button link or text after the slideshow is configured.

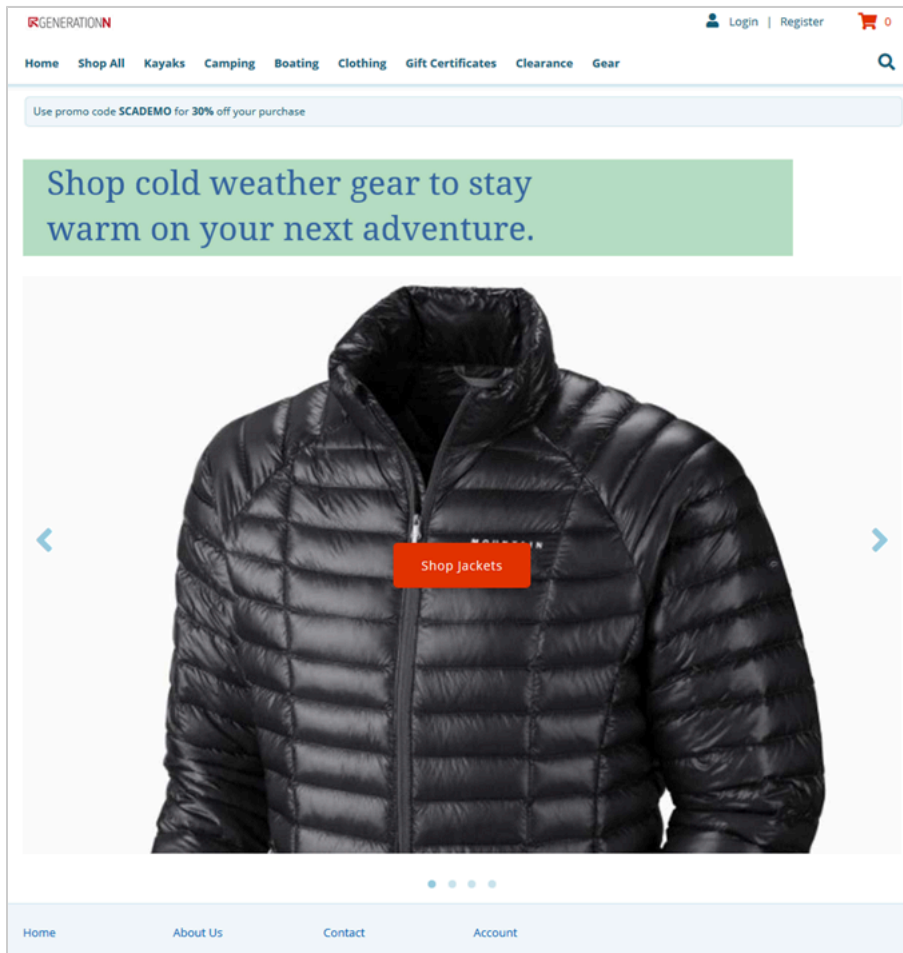

To change the button link or alternative text:

1. Log into Site Management Tools. For details, see the help topic [Logging into Site Management Tools](#).
2. Go to the page that contains the slideshow.
3. Click the Edit mode icon  from the site management toolbar.
4. Hover over the **Slideshow** box to display the content controls.
5. Click the **Settings** button. This displays the Slideshow Settings in the side panel.
6. Enter the URL for the link in the **Button Link** field or enter the alternative text in the **Alt Text** field.

- Click **Save**.

Slideshow with Button Example

The following image shows a slideshow with a button applied.

HTML Content

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced | Site Management Tools

HTML content type lets you place HTML, JavaScript, or other code on the pages of your site. See the following help topics for information about using the HTML content type and HTML related content types.

- [Site Management Tools HTML Content Type](#)
- [Map & Contact](#)

Site Management Tools HTML Content Type

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced | Site Management Tools

The HTML content type lets you place HTML, JavaScript, or other code on the pages of your site. You can use this feature for any code that can reside between the <body></body> tags on the page. You can't use the HTML content type for any code that must go in the <head></head> tags of the page.

Warning: Don't use document.write() when creating scripts for your site. It causes problems with the page's life cycle and can break your site

Note: If you use CSS from an external site in your HTML, you might see a quick page flicker while the site loads.

Examples of HTML content type include:

- Custom HTML
- Forms
- Social media widgets

Note: Any changes including additions, edits, or deletions, must be published before they are available on the site.

Using the Hyperlink Tag in HTML Code

A hyperlink lets you link to another file or document by clicking a highlighted word or image on the screen. This could include a link to a Word document, PDF, or image. When you use the hyperlink tag in the HTML Content area in Site Management Tools (SMT), you need to add an extra attribute to the CCT code. You need to add target="_blank" inside the <a> tag.

Here is example:

```
<a href="/site/images/Test.pdf" download="TEST PDF"></a>
```

For the link to work correctly, add target="_blank":

```
<a href="/site/images/Test.pdf" download="TEST PDF" target="_blank"></a>
```

Whether the link downloads automatically or opens in a new tab depends on the user's browser settings.

Alternative to document.write()

Don't use `document.write()` when creating scripts for your site, because it can interfere with the page life cycle and break your site. Instead, create an element and set its `innerHTML`.

The following depicts an example script:

```
1 <span id='suiteElement'></span>
2 <script>
3   var suiteElement = document.getElementById('suiteElement');
4   if (suiteElement) {
5       suiteElement.innerHTML = 'I Love HTML Content!';
6   }
7 </script>
```

Adding HTML Content

i Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced | Site Management Tools

When you add HTML content to an area, the HTML settings are displayed in the side panel. The HTML settings give you two different views for adding and editing your HTML content. These are the basic view and the editor view. You can toggle between the two views by clicking the expand/collapse icon, denoted by two opposing arrows, in the upper right corner of the editor. The basic view gives you a simple text area for entering your HTML code. The editor view gives you an expanded side panel and an HTML editor with syntax highlighting.

To add HTML content:

1. Log in to Site Management Tools. For details, see the help topic [Logging into Site Management Tools](#).
2. Go to the page where you want to add HTML content.
3. Click the Edit Mode icon  from the site management toolbar.
4. Click the Add icon  on the site management toolbar.
5. Drag the HTML content from the side panel to the area where you want to place it. You can drag the content to multiple areas of the page:
 - If you drag onto an area marked **all pages**, your content shows on any page that contains that area.
 - If you drag onto an area marked **page type**, your content shows on any page of that type.
 - If you drag onto an area marked **this page**, your content shows only on that page.
6. Position the content over the area and drop it. The HTML Settings open in the side panel.
7. In the **Name** field, enter a name for the HTML content.
8. Set the content visibility options. See the help topic [View Site as of a Specific Date in Site Management Tools](#).
9. Enter your HTML code or JavaScript in the HTML code field in the side panel or click the expand icon to expand the editor and enter your code. The HTML content on the page updates in real time as you enter code.
10. In the **Tags** field, enter one or more descriptive tags. For details, see [Content Tags and Filter Tools](#).

11. Click **Save**.
12. Publish your changes. For details, see the help topic [Review and Publish Content in Site Management Tools](#).

Editing HMTL Content

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced | Site Management Tools

You can edit HTML content when you need to make changes.

To edit HTML content:

1. Log in to Site Management Tools. For details, see the help topic [Logging into Site Management Tools](#).
2. Go to the page that contains the HTML content you want to edit.
3. Click the Edit Mode icon  from the site management toolbar.
4. Hover over the HTML content to display the content controls.
5. Click **Edit** to open the HTML Settings in the side panel.
6. Make any required changes and click **Save**.
7. Publish your changes. For details, see the help topic [Review and Publish Content in Site Management Tools](#).

Discarding or Removing HTML Content

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced | Site Management Tools

If you haven't published your HTML content yet and want to get rid of it, you can discard it. If it's already published, you can remove it directly from the page. To learn the difference between discarding and removing content, see the help topic [Discard or Expire Content in Site Management Tools](#).

To discard HMTL content (unpublished content):

1. Log into Site Management Tools. For details, see the help topic [Logging into Site Management Tools](#).
2. Click the Review & Publish Changes icon  from the site management toolbar.
3. Select the HTML content from the Unpublished Changes list.
4. Click **Discard**.
5. In the pop up window that appears, click **Yes**.

To remove HTML content (published content):

1. Log into Site Management Tools. For details, see the help topic [Logging into Site Management Tools](#).
2. Go to the page where the HTML content is located.
3. Click the Edit Mode icon  from the site management toolbar.

4. Hover over the HTML content to display the content controls.
5. Click **X** to remove the HTML content from the page.
6. In the pop up window that appears, click **Yes**.

Map & Contact

i Applies to: SuiteCommerce | SuiteCommerce Advanced | Site Management Tools

The SuiteCommerce Map & Contact extension lets you:

- Embed a third-party map
- Display contact details and store information, such as a phone number and operating hours
- Create a contact form for customers to get in touch
- Configure various Layout Settings, such as map position and section height
- Add a CAPTCHA challenge to the contact form for extra security

⚠ Important: Commerce extensions are only available if provisioned, installed, and activated for a selected domain in your account. For more information, see [Commerce Extensions](#).

i Note: Extensions require SuiteCommerce or the Aconcagua release of SCA or later.

Use Site Management Tools (SMT) to add these content types to your website:

- [Map & Contact Content Type](#)
- [Contact Form Content Type](#)

Adding these content types to enhanced or custom landing pages allows you to include a map, contact information, and a contact form to your web store. For more information about SMT, see the help topic [Site Management Tools Overview](#).

Map & Contact Content Type

i Applies to: SuiteCommerce | SuiteCommerce Advanced | Site Management Tools

The Map & Contact content can be added to your web store to include a map with your store's location, in addition to store hours and contact information. To learn more, explore these help topics:

- [Adding Map and Contact Information](#)
- [Configuring Map and Contact Information](#)
- [Changing Map Store Location](#)
- [Deleting Map and Contact Information](#)

Adding Map and Contact Information

i Applies to: SuiteCommerce | SuiteCommerce Advanced | Site Management Tools

To include a map with your store's location, operating hours, and contact information about your website, add the Map & Contact content type to a page of your site using Site Management Tools (SMT).

To add a map and contact information:

1. Log into SMT. For details, see the help topic [Logging into Site Management Tools](#).
2. Go to the page where you want to add a map and contact information.
3. Click the Edit Mode icon  from the site management toolbar.
4. Click the Add icon  from the site management toolbar.
5. Drag the Map & Contact content from the side panel to the area where you want to place it. You can drag the content to multiple areas of the page:
 - If you drag onto an area marked **all pages**, your content shows on any page that contains that area.
 - If you drag onto an area marked **page type**, your content shows on any page of that type.
 - If you drag onto an area marked **this page**, your content shows only on that page.

 **Note:** If you don't see this content type, first check that the extension has been installed and is active. Then, click the gear icon on the site management toolbar and select **Custom Content Types**. Drag the content type from the Inactive Content Types list to the Active Content Type list.

6. Click **Save**.

To customize your map and contact information, see [Configuring Map and Contact Information](#).

Configuring Map and Contact Information

 **Applies to:** SuiteCommerce | SuiteCommerce Advanced | Site Management Tools

Configure properties to customize your map and contact information. You can adjust the layout, add email and call buttons, and include store information.

To configure map and contact information:

1. Log into Site Management Tools. For details, see the help topic [Logging into Site Management Tools](#).
2. Go to the page that contains the Map & Contact content.
3. Click the Edit Mode icon  from the site management toolbar.
4. Hover over the Map & Contact content to display the content controls.
5. Click **Edit** to open the Map & Contact Settings in the side panel.
6. Select the **General** subtab and set the following fields:

Field	Description
Name	This sets a description of your new content.
Visibility	This sets the visibility option that determines when you would like to make the form visible. For more information, see the help topic View Site as of a Specific Date in Site Management Tools .
Map Position	This sets the layout of the map and the contact information. In mobile screens, the Map & Contact information sections stack in order depending on whether you choose the left or right position.

Field	Description
Tags	This sets keywords to help filter your content in the Review Changes list. For more information about content tags, see the help topic Content Tags and Filter Tools .

7. Select the **Map & Contact** subtab and set the following fields:

Field	Description
Header	This sets the title to display at the top of the Map & Contact box.
Map HTML Snippet	This is where you paste the HTML code of your map location. To use third-party map services, such as Google or OpenStreetMap, paste the HTML code obtained by the map provider here. To optimize display size, nest the embedded map HTML code within an iframe element.
Business Address & Information	This specifies information about your business, such as your postal address, opening hours, or special instructions. This field supports basic HTML formatting tags.
Primary Phone Number	This sets the phone number to display for your business. Mobile users can tap a Call us button to call the primary phone number automatically.
Primary Email Address	This sets the email address to display for your business. Mobile users can tap a Contact us button to send an email to the primary email address automatically.
Hide Background Color	This determines if the background color is hidden.
Hide Icons	This determines if the Call us and Contact us icons are hidden.

8. Click **Save**.
9. Publish your changes. For details, see the help topic [Review and Publish Content in Site Management Tools](#).

Changing Map Store Location

Applies to: SuiteCommerce | SuiteCommerce Advanced | Site Management Tools

You can change your store location on a preexisting map by gaining a new HTML code from a third-party provider and updating Map & Contact content on your website.

To change your store location on the map:

1. Log into Site Management Tools. For details, see the help topic [Logging into Site Management Tools](#).
2. Go to the page that contains the Map & Contact content.
3. Click the Edit Mode icon  from the site management toolbar.
4. Hover over the Map & Contact content to display the content controls.
5. Click **Edit** to open the Map & Contact Settings in the side panel.
6. Select the **Map & Contact Info** subtab.
7. In the **Map HTML Snippet** field, enter the new HTML code for the new map location.

8. Click **Save**.
9. Publish your changes. For details, see the help topic [Review and Publish Content in Site Management Tools](#).

Deleting Map and Contact Information

Applies to: SuiteCommerce | SuiteCommerce Advanced | Site Management Tools

You delete the map and contact information using Site Management Tools (SMT) in one of two ways, depending on whether you have published the content to your website:

- **Discard** the map and contact information if you have not published the content.
- **Remove** the map and contact information if you have already published the content.

To discard the map and contact (unpublished content):

1. Log into Site Management Tools. For details, see the help topic [Logging into Site Management Tools](#).
2. Select the Review & Publish Changes icon  from the site management toolbar.
3. Select the Map & Contact content from the Unpublished Changes list.
4. Click **Discard**.
5. In the pop up window that appears, click **Yes**.

To remove the map and contact (published content):

1. Log into Site Management Tools. For details, see the help topic [Logging into Site Management Tools](#).
2. Go to the page that contains the map and contact content you want to remove.
3. Select the Edit Mode icon  from the site management toolbar.
4. Hover over the map and contact content box to display the content controls.
5. Click **X** to remove the map and contact content from the page.
6. In the pop up that appears, click **Yes**.

Contact Form Content Type

Applies to: SuiteCommerce | SuiteCommerce Advanced | Site Management Tools

The **Contact Form** can be added to your web store to include a form allowing users to reach out with questions or comments. The contact form creates Lead and Case records in NetSuite to document users' names and email addresses. To learn more, explore these help topics:

- [Adding a Contact Form](#)
- [Configuring a Contact Form](#)
- [Discarding or Removing a Contact Form](#)
- [Add CAPTCHA to a Contact Form](#)

Note: If a user submits a contact form using an email address that has already been used, new Lead and Case records are created in NetSuite. The request is not added to the existing Lead and Case records.

Adding a Contact Form

Applies to: SuiteCommerce | SuiteCommerce Advanced | Site Management Tools

To include a contact form with fields that you can customize on your website, add the Contact Form content type to a page of your site using Site Management Tools (SMT).

To add a contact form:

1. Log into SMT. For details, see the help topic [Logging into Site Management Tools](#).
2. Go to the page where you want to add a contact form.
3. Click the Edit Mode icon  from the site management toolbar.
4. Click the Add icon  on the site management toolbar.
5. Drag the content form content type from the side panel to the area where you want to place it. You can drag the content to multiple areas of the page:
 - If you drag onto an area marked **all pages**, your content shows on any page that contains that area.
 - If you drag onto an area marked **page type**, your content shows on any page of that type.
 - If you drag onto an area marked **this page**, your content shows only on that page.

Note: If you don't see this content type, first check that the extension has been installed and is active. Then, click the gear icon on the site management toolbar and select **Custom Content Types**. Drag the content type from the Inactive Content Types list to the Active Content Type list.

6. Click **Save**.

Configuring a Contact Form

Applies to: SuiteCommerce | SuiteCommerce Advanced | Site Management Tools

Configure properties to customize your contact form and make it ready for use. You can set the form fields and determine aspects such as field positioning, feedback messages, and additional fields. To learn more, explore these help topics:

- [Configuring Contact Form Properties in NetSuite](#)
- [Configuring Contact Form General Settings](#)
- [Configuring Contact Form Contact Fields](#)
- [Configuring Contact Form Messaging Fields](#)
- [Configuring Contact Form Additional Fields](#)
- [Configuring Contact Form Feedback Messages](#)
- [Configuring Contact Form Layout and Style](#)

Configuring Contact Form Properties in NetSuite

Applies to: SuiteCommerce | SuiteCommerce Advanced | Site Management Tools

To set up the Map & Contact extension, you must select your preferences in NetSuite.

To configure properties in NetSuite :

1. After activating the Map & Contact extension for a domain, go to Commerce > Websites > Configuration.
For more information about activating an extension, see [Manage Themes and Extensions](#).
2. Select the website and domain where you want to set up the extension and click **Configure**.
3. Go to the **Extensions** tab.
4. In the **Map & Contact** subtab, set the following fields:

Field	Description
Associate Leads To	This determines the subsidiary with which you want the lead to be associated. This field automatically populates with the default subsidiary for your site, as set in the website record. Change this property to associate the contact form leads with a different or additional subsidiaries. If you are using SC Map & Contact version 1.1.1 or earlier and change this field from the default setting, you must edit the deployment record in NetSuite. For more information, see Link Contact Form Leads to a Subsidiary .
Default First Name	This sets the default text to display in the First Name field of the Lead record if a first name is not supplied by the user.
Default Last Name	This sets the default text to display in the Last Name field of the Lead record if a last name is not supplied by the user.
Default Company	This sets the default text to display in the Company field of the Lead record if a company is not supplied by the user.
Default Subject	This sets the default text to display in the Subject field of the Lead record if a subject is not supplied by the user.

5. Click **Save**.

Link Contact Form Leads to a Subsidiary

This section only applies if you are using SC Map & Contact version 1.1.1 or earlier and changing the **Associate Leads To** field from the default company. If you are using SC Map & Contact version 1.1.2 or later, or if you are using SC Map & Contact version 1.1.1 or earlier and want to associate the leads to the default company, no further action is necessary.

If you are using SC Map & Contact version 1.1.1 or earlier and set the **Associate Leads To** field to a subsidiary that is not the default company, you must edit the deployment record to change the associated role.

To edit the deployment record:

1. In NetSuite, go to Customization > Scripting > Scripts.
2. Click **View** next to the **NS SC SL Contact Us Form** script.
3. In the **Deployments** subtab, click the **NS SC SL Contact Us Form** deployment record.
4. Click **Edit**.
5. In the **Execute As Role** field, select the **Administrator** role.

6. Click **Save**.

Configuring Contact Form General Settings

Applies to: SuiteCommerce | SuiteCommerce Advanced | Site Management Tools

Set the general fields in Site Management Tools (SMT) to set up your contact form.

To configure contact form general settings:

1. Log into Site Management Tools. For details, see the help topic [Logging into Site Management Tools](#).
2. Go to the page that has the contact form you want to configure.
3. Click the Edit Mode icon  from the site management toolbar.
4. Hover over the contact form content to display the content controls.
5. Click **Edit** to display the Contact Form Settings in the side panel.
6. Select the **General** subtab and set the following fields:

Field	Description
Name	This sets a description of your new content.
Visibility	This sets the visibility option that determines when you would like to make the form visible. For more information about visibility options, see the help topic View Site as of a Specific Date in Site Management Tools .
Form Header	This specifies the information or instructions for the Contact Form.
Create Lead As	This determines how the contact information is stored in NetSuite. When the lead is created as an Individual , personal information, not company information, is stored in the individual's lead record. When the lead is created as a Company , company information, not personal information, is stored in the company's lead record.
Create Support Case	This determines if you want to create a Support Case record along with a lead. If you do not check the box, all fields that apply to support cases are ignored, even if visible and complete.
Mandatory Field Reference	This sets the text that displays to indicate form fields that are required.
Tags	This sets keywords to help filter your content in the Review Changes list. For more information, see the help topic Content Tags and Filter Tools .

7. Click **Save**.

Configuring Contact Form Contact Fields

Applies to: SuiteCommerce | SuiteCommerce Advanced | Site Management Tools

Site Management Tools (SMT) lets you configure multiple properties for each Contact Form field to determine how the form looks to users on your site. For each contact field appearing on your Contact Form, you choose the label, placeholder, help text, whether the field is required, and whether the field is visible.

To configure contact form contact fields:

1. Log into Site Management Tools. For details, see the help topic [Logging into Site Management Tools](#).
2. Go to the page that contains the contact form.
3. Click the Edit Mode icon  from the site management toolbar.
4. Hover over the content form box to display the content controls and click Edit.
This displays the Contact Form Settings in the side panel.
5. In the **Contact Fields** subtab, set your preferences for each of the following **Contact Form** fields, using the table below as a reference:
 - First Name
 - Last Name
 - Email
 - Phone
 - Company

Field Type	Description
Label	This sets the label for the Contact Form field.
Placeholder	This sets the placeholder text to display in the Contact Form field.
Help Text	This sets the help text for the Contact Form field.
Mandatory	This determines if the Contact Form field is required.
Hide	This determines if the Contact Form field is hidden.

6. Click **Save**.

Configuring Contact Form Messaging Fields

 **Applies to:** SuiteCommerce | SuiteCommerce Advanced | Site Management Tools

SMT lets you configure multiple properties for each Contact Form field to determine how the form looks to users on your site. For each messaging field appearing on the Contact Form of your site, you choose the label, placeholder, help text, whether the field is required, and whether the field is visible.

To configure contact form messaging fields:

1. Log into Site Management Tools. For details, see the help topic [Logging into Site Management Tools](#).
2. Go to the page that contains the contact form.
3. Click the Edit Mode icon  from the site management toolbar.
4. Hover over the content form box to display the content controls and click Edit.
This displays the Contact Form Settings in the side panel.
5. In the **Messaging Fields** subtab, set your preferences for each of the following **Contact Form** fields, using the table below as a reference:
 - Subject
 - Message

Field Type	Description
Label	This sets the label for the Contact Form field.
Placeholder	This sets the placeholder text to display in the Contact Form field.
Help Text	This sets the help text for the Contact Form field.
Mandatory	This determines if the Contact Form field is required.
Hide	This determines if the Contact Form field is hidden.

6. Click **Save**.

Configuring Contact Form Additional Fields

Applies to: SuiteCommerce | SuiteCommerce Advanced | Site Management Tools

Site Management Tools (SMT) lets you configure multiple properties for each Contact Form field to determine how the form looks to users on your site. In addition to the established Contact Form fields, you can add an additional field to better fit your needs. You customize this field by choosing the field type, label, placeholder, help text, whether the field is required, and whether the field is visible.

You first create the custom field in NetSuite, then use the Internal ID to connect the additional form field in SMT to the custom field record in NetSuite. For more information about creating a custom field in NetSuite, see the help topic [Creating a Custom Field](#).

To configure contact form additional fields:

1. Log into Site Management Tools. For details, see the help topic [Logging into Site Management Tools](#).
2. Go to the page that contains the contact form.
3. Click the Edit Mode icon  from the site management toolbar.
4. Hover over the content form box to display the content controls and click Edit.
This displays the Contact Form Settings in the side panel.
5. In the **Additional Field** subtab, set your preferences for the additional form field, using the table below as a reference:

Field	Description
Field Type — Additional Field	This determines the field type for a customized additional field. The field type correlates to the custom field type in NetSuite. Supported custom field types in NetSuite include Free-Form Text, Date, Checkbox, and Text Area. The Free-Form Text field type in NetSuite is equivalent to the Text Input field type in SMT.
Link to — Additional Field	This determines if the additional field is linked to the lead or case. If you select Lead, the additional field is linked to the Lead record created with form submission. If you select Support Case, the additional field is linked to the Support Case record. For Lead records, an additional field is an Entity field type that applies to a Customer. For Support Case records, an additional field is a CRM field type that applies to a Case.
Internal ID — Additional Field	This requires the Internal ID from the custom field record in NetSuite. This field is required for the following field types: Text Input, Text Area, Date, and Checkbox.

Field	Description
	The Text field type is only for display and does not require an Internal ID.
Label — Additional Field	This sets the label for the additional field.
Placeholder — Additional Field	This sets the placeholder text to display in the additional field.
Help Text — Additional Field	This sets the help text for the additional field.
Mandatory Additional Field	This determines if the additional field is required.
Hide Additional Field	This determines if the additional field is hidden.

There is a different **Additional Field** subtab in SMT for each customized field you add.

- Click **Save**.

Configuring Contact Form Feedback Messages

Applies to: SuiteCommerce | SuiteCommerce Advanced | Site Management Tools

You can determine the feedback messages shown to users by editing the feedback message fields in Site Management Tools (SMT).

To configure contact form feedback messages:

- Log into Site Management Tools. For details, see the help topic [Logging into Site Management Tools](#).
- Go to the page that contains the contact form.
- Click the Edit Mode icon  from the site management toolbar.
- Hover over the content form box to display the content controls and click Edit.
This displays the Contact Form Settings in the side panel.
- In the **Feedback Messages** subtab, set the following fields:

Field	Description
Success Message	This sets the message to display upon successful form submission.
Required Field Message	This sets the message to display when a required field has been left blank. The required field's label replaces the placeholder <code>[[field]]</code> automatically.
Invalid Email Field Message	This sets the message to display when an invalid email address has been entered.
Submit Error Message	This sets the message to display when there is an error during form submission.

- Click **Save**.

Configuring Contact Form Layout and Style

Applies to: SuiteCommerce | SuiteCommerce Advanced | Site Management Tools

You can customize the look of the contact form by setting the layout and style fields in Site Management Tools (SMT).

To configure contact form layout and style:

1. Log into Site Management Tools. For details, see the help topic [Logging into Site Management Tools](#).
2. Go to the page that contains the contact form.
3. Click the Edit Mode icon  from the site management toolbar.
4. Hover over the content form box to display the content controls and click Edit.
This displays the Contact Form Settings in the side panel.
5. In the **Layout & Style** subtab, set the following fields:

Field	Description
Button Text	This sets the text to display on the submit button. If you leave this field blank, the button will not appear.
Button Help Text	This sets the help text for the submit button.
Button Style	This sets the button style.
Hide Background Color	This determines if the background color is hidden. Background color and padding can be customized using the Theme Customizer in SMT.
Position	This determines the field for this position. If the same field is selected for multiple positions, the ranking is ignored and default settings are applied.

6. Click **Save**.

Discarding or Removing a Contact Form

 **Applies to:** SuiteCommerce | SuiteCommerce Advanced | Site Management Tools

You delete a contact form using Site Management Tools (SMT) in one of two ways, depending on whether you have published the content to your website:

- **Discard** the contact form if you have not published the content.
- **Remove** the contact form if you have already published the content.

To discard a contact form (unpublished content):

1. Log into Site Management Tools. For details, see the help topic [Logging into Site Management Tools](#).
2. Select the Review & Publish Changes icon  from the site management toolbar.
3. Select the Content Form content from the Unpublished Changes list.
4. Click **Discard**.
5. In the pop up window that appears, click **Yes**.

To remove the contact form (published content):

1. Log into Site Management Tools. For details, see the help topic [Logging into Site Management Tools](#).

2. Go to the page that contains the contact form you want to remove.
3. Select the Edit Mode icon  from the site management toolbar.
4. Hover over the column content box to display the content controls.
5. Click **X** to remove the column from the page.
6. In the pop up that appears, click **Yes**.

Add CAPTCHA to a Contact Form

 **Applies to:** SuiteCommerce | SuiteCommerce Advanced | Site Management Tools

To enhance the security of your contact form, you can add a CAPTCHA challenge using a third-party CAPTCHA provider, either hCaptcha or Google reCAPTCHA v2.

CAPTCHA challenges prompt customers to complete simple tasks to verify they are human before submitting the contact form. This adds an extra layer of protection against automated abuse and fraudulent activity and helps prevent bot attacks from creating spam submissions.

 **Note:** CAPTCHA for a contact form is different than SuiteCommerce CAPTCHA. For more information about setting up CAPTCHA for your SuiteCommerce web store, see the help topic [SuiteCommerce CAPTCHA](#).

To set up CAPTCHA for a contact form:

1. Sign up with the provider of your choice and get a Site Key
 Provider choices:
 - [Google reCAPTCHA v2](#)
 - [hCaptcha](#)
2. Create a secret key in NetSuite using API secrets
 For more information, see the help topic [Creating Secrets](#).
 In the Restrictions tab:
 - Check the box for **Allow for All Scripts**
 - For **Restrict to Domains**, add the corresponding CAPTCHA validation domain:
 - For hCaptcha: [api.hcaptcha.com](#)
 - For Google reCaptcha v2: [www.google.com](#)

Note that with this domain restriction, the secret key is only exposed when communicating with the designated CAPTCHA validation service.
3. [Configure CAPTCHA in NetSuite](#)

Configure CAPTCHA in NetSuite

To set up CAPTCHA for the contact form, configure the fields on the SuiteCommerce Configuration record.

CAPTCHA configuration is domain-specific. You can disable CAPTCHAs that are no longer needed.

To configure CAPTCHA

1. Go to Commerce > Websites > Configuration.

2. Select the website and domain where the Map&Contact extension is activated and click **Configure**.
3. Go to the **Extensions** tab and the **Contact Us Form** subtab.
4. Set the following fields:

Field	Description
CAPTCHA Type Option	Choose your CAPTCHA provider. You can choose between Google reCAPTCHA v2 and hCaptcha. To disable this CAPTCHA challenge, select Disabled .
CAPTCHA Site Key	Enter the public key provided by your CAPTCHA provider (reCAPTCHA or hCaptcha).
CAPTCHA Secret Key ID	Enter the private key's ID. For more information about how to create a secret key using API secrets, see the help topic Creating Secrets .

5. Click **Save**.

Note: It may take a little time for the changes to take effect. To see the changes sooner, trigger a [Cache Invalidation Request](#).

Multi-Language Sites

i Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced | Site Management Tools

i Note: The information for Multi-Language Support for Commerce Categories refers to SuiteCommerce and the 2020.1 release of SuiteCommerce Advanced or later.

The information for Multi-Language Support for Pages and Website Content refers to SuiteCommerce and the 2020.2 release of SuiteCommerce Advanced or later.

The information for Exporting and Importing Bulk Translation Content in Site Management Tools refers to SuiteCommerce and the 2021.1 release of SuiteCommerce Advanced or later.

With Multi-Language websites, you can add your own foreign language translations to your commerce web store. Each website linked to your account can have multiple, language-specific domains. You can add translations for commerce categories, pages, and content.

After you've enabled and set up the feature, you can add, edit, hide, or delete translations for any language supported by NetSuite. With this feature, you can also use Site Management Tools to export and import bulk translations. For details, see [Multi-Language Sites](#).

i Note: To update the My Account area of your Commerce website using Site Management Tools, a single secure domain is required. For details, see the help topic [Set Up Domains for Web Stores](#).

i Note: Translation for the following fields is not supported when web pages are run through the SEO page generator:

- Meta Title
- Meta Tag HTML
- Schema Markup
- Open Graph Tags and all other social media meta tags

Your website's default language and currency are displayed instead of any other languages and locales you've configured.

i Note: You can register new domains through an internet domain registration service.

See the following help topics for information about using Multi-Language Sites:

- [Multi-Language Setup](#)
- [Managing Your Translation Content](#)

Multi-Language Setup

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced | Site Management Tools

To use the Multi-Language feature, you'll need to set a few preferences and enable the feature in NetSuite. After it's set up, you can manage translations in Site Management Tools for your commerce categories, pages, and content. To learn more about enabling and setting up the Multi-Language feature, check out these topics:

- [Multi-Language Preferences](#)
- [Prerequisites for Using Multi-Language](#)

Multi-Language Preferences

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced | Site Management Tools

It's important to set up language preferences correctly for your website and NetSuite account. There are four language preference settings:

- **Company default language** – Also called the base language. It's set when you create your account, and all your system record information and data are stored in this language.

Note: You can't change this setting after your account is created.

- **Website languages** – These are the different languages users can use to view your website.
- **Website default language** – This is the language your website uses unless you set up a different one.
- **User Preference language** – This is the language your employees see in the NetSuite interface.

Translation Responsibilities

It's also important to know which translation areas NetSuite manages and which ones you provide.

NetSuite manages these translation areas:

- NetSuite Administration Interfaces
- Commerce Transactional Application
- Extensions

You are responsible for:

- Items
- Commerce Categories
- Landing Pages
- Website Content
- SEO Metadata

How to Edit Your Translations

Here's how you can add, edit, hide, or delete your translations:

- **CSV Import** – Use CSV import to add, edit, or delete translations. You can only use CSV import for items, commerce categories, and landing pages. For more information, see the help topic [Importing CSV Files with the Import Assistant](#).
- **CMS Records** – You can edit each commerce category, item, and page record directly, but this isn't available for custom page types like blogs.
- **Site Management Tools** – Manage translations for commerce categories, pages, and content, and export or import bulk translations from the **Translations** tab in **Overview Mode**. For more information, see [Exporting and Importing Bulk Translation Content in Site Management Tools](#).

Prerequisites for Using Multi-Language

i Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced | Site Management Tools

Complete the following tasks to set up a multi-language site. If you skip a step or do them out of order, you might run into setup issues.

1. [Enabling Multiple Languages](#)
2. [Configuring Multiple Languages](#)
3. [Updating Your Item and Commerce Category Translations](#)
4. [Updating Your Website Settings](#)
5. [Creating the Language Specific Domain](#)
6. [Setting Up the Locale for the New Domain](#)
7. [Updating Your Translations for Landing Pages](#)
8. [Updating Your Translations for Website Content](#)
9. [Configuring the Foreign Language Domains](#)

Enabling Multiple Languages

First, you'll need to enable foreign languages in your account. This setting applies across all NetSuite solutions, including sales orders and email. If it's not enabled, you can't complete the multi-language setup.

To enable multiple languages for your company:

1. Go to Setup > Company > Enable Features.
2. Under the **International** subtab, check the **Multi-Language** box.
3. Click **Save**.

Configuring Multiple Languages

This task lets you pick any available languages in NetSuite for translations. The link in Step 3 shows all language options for the NetSuite user interface and for your site visitors.

To configure the languages for your website:

1. Go to Setup > Company > General Preferences.

2. On the **Languages** subtab, choose all the languages you want for your NetSuite account and website from the dropdown list.
3. Click **Save**.

For more information, see the help topic [Configuring Multiple Languages](#).

Updating Your Item and Commerce Category Translations

After you finish the first two tasks, you'll need to update your items and commerce categories for the new languages. Update your existing CSV import files to include the new languages, then upload them using the CSV Import tool in NetSuite.

For item imports, see the help topic [Item Sublists Available for Import](#).

For commerce category imports, see the help topic [Commerce Category Import](#).

Updating Your Website Settings

This task lets you choose which configured languages your customers can use.

To update your website settings:

1. Go to Commerce > Websites > Web Site List.
2. Click **Edit** next to the website you want to update.
3. Click the **Shopping** subtab.
4. Click the **Languages** subtab.
5. Check the **Online** box next to each language you want to show on your site. This automatically starts a reindex of your site.
6. Click **Save**.

Creating the Language Specific Domain

Now you'll create a language-specific domain for the languages you picked in the previous task.

To create your new language specific domain:

1. Go to Commerce > Hosting > Domains > New.
2. Enter a name in **Domain Name**. Ensure the new domain name indicates the specific language.
3. Make sure the information and settings match your website. For more information, see the help topic [Domains](#).
4. Click **Save**.

Note: You'll need to redeploy all extensions, themes, and custom content types for the new domain.

Setting Up the Locale for the New Domain

Next, you'll need to set the locale for each language-specific domain. The locale uses a four-character code that shows both the language and the country or region. For example, Spanish in Spain uses the locale code es_ES. For a list of locale codes, see the help topic [translation.Locale](#).

To setup the locale for the new domain:

1. Go to Commerce > Web Sites > Configuration.
2. Select the website and domain, and click **Configure**.
3. Click **Multi-Domain**.
4. Click **Hosts**.
5. Complete the empty fields and click **Add**.
6. Click **Save**.

Updating Your Translations for Landing Pages

You've got two options for updating translations for your landing pages.

- You can use your existing CSV import files and update them to include the new languages. Use the CSV Import tool in the NetSuite administration to upload the new translations. See the help topic [CMS Page Import](#).
- Or
- You can use Site Management Tools to update the translations for your landing pages. For details, see [Multi-Language Support for Landing Pages](#).

Updating Your Translations for Website Content

To update website content, you'll need to use Site Management tools. For more information, see [Multi-Language Support for Website Content](#).

Configuring the Foreign Language Domains

Perform the following task to complete the configuration for each of your selected languages. Visitors won't see your translations for any categories, content, or pages until you finish this task. This also lets you access new language domains in the website's language selector.

To configure the foreign language domains for your website:

1. Go to Commerce > Web Sites > Configuration.
2. Select the website from the **Select Website** list.
3. Select the domain from the **Select Domain** list.
4. Click **Save**.

Managing Your Translation Content

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced | Site Management Tools

To learn more about the different ways you can manage your translation content, check out these topics:

- [Translations Tab User Interface](#)

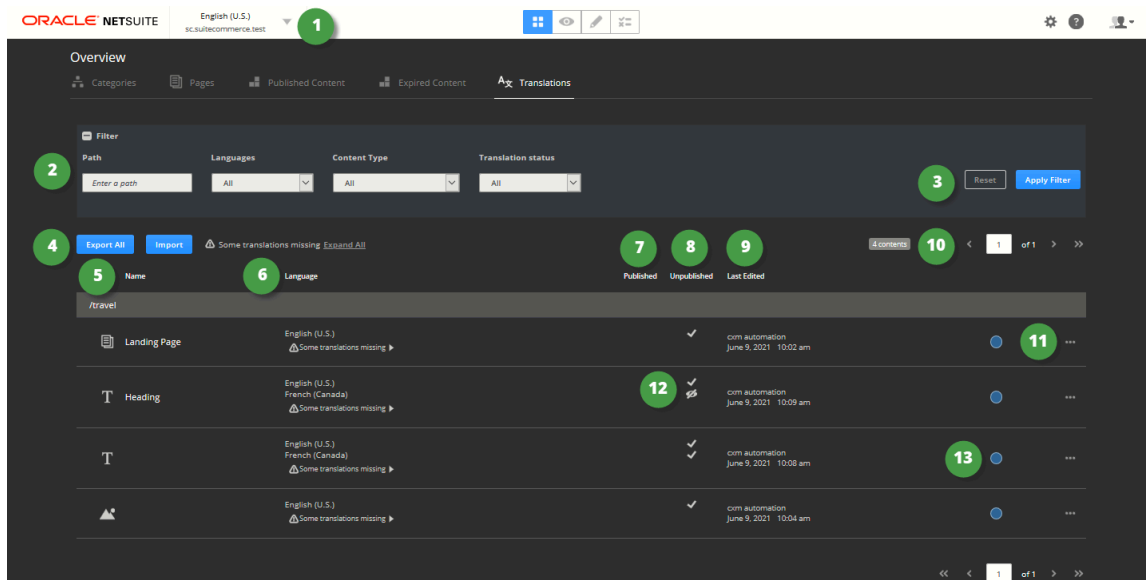

- Multi-Language Support for Commerce Categories
- Multi-Language Support for Landing Pages
- Multi-Language Support for Website Content
- Exporting and Importing Bulk Translation Content in Site Management Tools

Translations Tab User Interface

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced | Site Management Tools

Using Site Management Tools (SMT), when working in Overview Mode, you'll see the Translations tab. On this tab, you can view all your translation content. This includes hidden content, published content, and unpublished content. Content is grouped together by the URL. Under the Language column, you'll see an alert if you've got missing translations for any configured languages.

Note: If there aren't any translations for content in the current domain, you can't view that content in the default language in **Preview Mode**. The content only shows up in **Edit Mode**. Edit the content in **Edit Mode** and enable the translation for that domain so you can view it in **Preview Mode**.

Item	Description
1	Domain Switcher – Lets you switch between all configured domains in your account without logging out of Site Management Tools (SMT). The domain switcher only shows domains set up to use SMT v3.
2	Filter – You can use filters to review translated content. This menu gives you four ways to filter content: ■ Path – Filter by location or URL. ■ Languages – Filter by language. ■ Content Type – Filter by type to look at HTML, image, text, page, or other content. ■ Translation Status – Filter by translation status to see displayed, hidden, or missing content.

Item	Description
3	Apply Filter – Applies the filters you’ve chosen and only shows those items. Reset – Click to reset the filters and go back to the main display.
4	Export All – Click to export all content supported by SMT for translation. Import – Click to import translated content back into SMT.
5	Name – The name of the content.
6	Languages – Displays all configured languages and missing translations.
7	Published – A check mark indicates which translations for this content are published.
8	Unpublished – A check mark indicates which translations for this content are unpublished.
9	Last Edited – Lets you know the last time this content was edited.
10	Page Selector – Lets you go to the next page to keep viewing your content.
11	Ellipsis – Click to preview or edit the content.
12	Hidden Translations – Lets you know when translations are hidden on your site.
13	Unpublished Content – The blue dot indicates that some or all of the content is unpublished.

Multi-Language Support for Commerce Categories

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced | Site Management Tools

After you’ve enabled the Multi-Language feature and picked your preferred languages, you can start adding new translations and editing existing translations.

Multi-Language support for your domains lets you add your own translations for several languages. You can do this by adding the translation directly to the commerce category record in NetSuite or by creating a category in Site Management Tools. Each website supports multiple domains. This lets you create language-specific domains and host multiple languages on one site. After you enable and set up the feature, you can add, edit, or delete custom translations on the category record for any language NetSuite supports.

If a category doesn’t have any translations, the base language shows by default. For SEO metadata, this behavior isn’t applied so there’s no negative impact on SEO. You’ll need to provide any SEO translation data for the commerce category.

For commerce categories, you can add translations for the following fields:

- **Name**
- **Heading**
- **Title**
- **Meta Description**
- **Meta Keywords**
- **Add to <head>**

To learn more, explore these topics:

- [Category Translations Using NetSuite](#)
- [Category Translations Using Site Management Tools](#)

Category Translations Using NetSuite

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced | Site Management Tools

You can add translations directly to the commerce category record in NetSuite.

To learn more, explore the following help topics:

- [Creating Category Translations Using NetSuite](#)
- [Editing Category Translations Using NetSuite](#)
- [Deleting Category Translations Using NetSuite](#)

Creating Category Translations Using NetSuite

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced | Site Management Tools

You can create a new commerce category and enter a new translation using the NetSuite Administrator role. Any category and translation you create will be available to manage in Site Management Tools (SMT). Any changes you make to the commerce category and translations in SMT show up in the category record.

To create category translations using NetSuite:

1. Go to Commerce > Content Management > Commerce Categories > New.
2. Select the **System Information** subtab.
3. Click the **Locale** list and select your preferred language. Only languages that have been previously set up are listed.
4. Enter your translations in the fields on the line of the selected language.
5. Click **Add** for each translation you add to the commerce category record.
6. Click **Save**.

Editing Category Translations Using NetSuite

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced | Site Management Tools

This procedure lets you update your commerce category translations without using the CSV Import function. Use your NetSuite account if you only need to make a few changes.

To edit category translations using NetSuite:

1. Go to Commerce > Content Management > Commerce Categories.
2. Click **Edit** on the category record you want to update.
3. Select the **System Information** subtab.

4. Click the **Locale** list and select the preferred language.
5. Make any required changes.
6. Click **Save**.

Deleting Category Translations Using NetSuite

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced | Site Management Tools

You can delete translations directly from the commerce category record.

 **Important:** You can't recover deleted translations.

To delete category translations using NetSuite:

1. Go to Commerce > Content Management > Commerce Categories.
2. Click **Edit** on the category record you want to delete.
3. Select the **System Information** subtab.
4. Select the **Translations** subtab.
5. Click **Remove**.
6. Click **Save**.

Category Translations Using Site Management Tools

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced | Site Management Tools

You can add translations in Site Management Tools (SMT), by creating a category.

To learn more, explore the following help topics:

- [Creating Category Translations Using Site Management Tools](#)
- [Editing Category Translations Using Site Management Tools](#)
- [Deleting Category Translations Using Site Management Tools](#)

Creating Category Translations Using Site Management Tools

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced | Site Management Tools

Before you can create a new translation using Site Management Tools (SMT), you'll need to create a new commerce category. For details, see [Set Up Commerce Categories](#).

To create category translations using SMT:

1. Log in to SMT. For details, see the help topic [Logging into Site Management Tools](#).
2. Select the Overview Mode icon  from the site management toolbar.

3. Select the **Categories** subtab.
4. Click **New Category**.
5. From the Category Settings panel, enter the category name in the **Name** field.

Note: You won't be able to enter translations until you've entered a name for the content in your default language.

6. Select the language you want to create a translation for from the language dropdown list.
7. Enter your translations.
8. Click **Save**.

Editing Category Translations Using Site Management Tools

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced | Site Management Tools

Use SMT to edit an existing translation if you need to make quick changes or fix a single translation. For bigger updates, you'll usually need to use CSV or bulk imports.

To edit category translations using SMT:

1. Log in to SMT. For details, see the help topic [Logging into Site Management Tools](#).
2. Select the Overview Mode icon  from the site management toolbar.
3. Select the **Categories** subtab.
4. Click the ellipsis beside the category for which you want to edit a translation.
5. Click **Edit Settings**.
6. From the Category Settings panel, select the language you want to update from the language dropdown list.
7. Make any required changes.
8. Click **Save**.

Deleting Category Translations Using Site Management Tools

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced | Site Management Tools

Use SMT to delete a translation when you no longer need it.

Important: You can't recover deleted translations.

To delete category translations using SMT:

1. Log in to SMT. For details, see the help topic [Logging into Site Management Tools](#).
2. Select the Overview Mode icon  from the site management toolbar.
3. Select the **Categories** subtab.
4. Click the ellipsis beside the category you want to delete a translation from.
5. Click **Edit Settings**.

6. From the **Category Settings** panel, select the language from the language dropdown list.
7. Clear the **Enable this Translation instead of values in English (U.S.)** box.
8. Click **Save**.

Multi-Language Support for Landing Pages

i Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced | Site Management Tools

Multi-Language pages let you create landing pages and add your own translations in any language you've set up. The page name and all other attributes are stored in your company's default language. For landing pages, you can add translations for the following fields:

- **Heading**
- **Title**
- **Meta Description**
- **Meta Keywords**
- **Add to <head>**

If a landing page doesn't have translations, the base language shows by default. For SEO metadata, this behavior isn't applied so there's no negative impact on SEO. You'll need to provide any SEO translation data for the landing page.

i Note: The visibility dates you select apply to the default language and any translations. There is no option to select individual visibility dates for a specific translation.

To learn more, explore these topics:

- [Creating Landing Page Translations](#)
- [Editing Landing Page Translations](#)
- [Hiding Landing Page Translations](#)
- [Deleting Landing Page Translations](#)

Creating Landing Page Translations

i Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced | Site Management Tools

In Site Management Tools (SMT), you can enter translations for the preferred language when you create a new landing page. You can also add translations to existing landing pages.

To create landing page translations:

1. Log in to SMT. For details, see the help topic [Logging into Site Management Tools](#).
2. Select the Overview Mode icon  from the site management toolbar.
3. Select the **Pages** subtab.
4. Click **New Page**.

- From the Landing Page Settings panel, enter a name in the **Name** field.

Note: You won't be able to enter translations until you've entered a name for the content in your default language.

- Select the language from the language dropdown list.
- Check the **Enable this Translation** box.
- Enter your translations.
- Click **Save**.

Editing Landing Page Translations

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced | Site Management Tools

In Site Management Tools (SMT), you can edit a translation when you need to update a landing page.

To edit landing page translations:

- Log in to SMT. For details, see the help topic [Logging into Site Management Tools](#).
- Select the Overview Mode icon  from the site management toolbar.
- Select the **Pages** subtab.
- Click the ellipsis next to the landing page you want to edit.
- Click **Edit**.
- From the Landing Page Settings panel, select the language from the language dropdown list.
- Make any required changes.
- Click **Save**.

Hiding Landing Page Translations

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced | Site Management Tools

In Site Management Tools (SMT), you can hide translated content you're not ready to show on your website.

To hide landing page translations:

- Log in to SMT. For details, see the help topic [Logging into Site Management Tools](#).
- Select the Overview Mode icon  from the site management toolbar.
- Select the **Pages** subtab.
- Click the ellipsis next to the page you want to hide translations for.
- Click **Preview**.
- Select **Edit Mode**.
- Hover over the content you want to hide translations for and click the Edit icon .
- From the Landing Page Settings panel, select the language from the language dropdown list.

9. Clear the **Enable this Translation** box.
10. Click **Save**.

You can view hidden translations in **Overview Mode** from the **Translations** tab. Use the **Translation Status** filter and select **Hidden** to display all hidden content.

Deleting Landing Page Translations

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced | Site Management Tools

In Site Management Tools (SMT), you can delete a translation when you don't need it anymore for your landing page.

 **Important:** You can't recover deleted translations.

To delete landing page translations:

1. Log in to SMT. For details, see the help topic [Logging into Site Management Tools](#).
2. Select the Overview Mode icon  from the site management toolbar.
3. Select the **Pages** subtab.
4. Click the ellipsis next to the page you want to delete a translation from.
5. Click **Edit**.
6. From the Landing Page Settings panel, select the language from the language dropdown list.
7. Click the ellipsis and select **Delete this Translation**.
8. Click **Save**.

Multi-Language Support for Website Content

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced | Site Management Tools

In Site Management Tools (SMT), Multi-Language pages let you create website content and add your own translations in any of your configured languages. The type of content you add determines what translation options are available. If website content doesn't have translations, the base language shows by default. For SEO metadata, this behavior isn't applied so there's no negative impact on SEO. You'll need to provide any SEO translation data for the commerce category.

 **Note:** The visibility dates you select apply to both the default language and all translations. You can't pick visibility dates for individual translations.

To learn more, explore these topics:

- [Creating Website Content Translations](#)
- [Editing Website Content Translations](#)
- [Hiding Website Content Translations](#)
- [Deleting Website Content Translations](#)

Creating Website Content Translations

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced | Site Management Tools

In Site Management Tools (SMT), you can create a translation when you add content to a new or existing landing page.

To create website content translations:

1. Log in to SMT. For details, see the help topic [Logging into Site Management Tools](#).
2. Select the Overview Mode icon  from the site management toolbar.
3. Click the ellipsis beside the page you want to add a translation to.
4. Click **Preview**.
5. Click **Edit Mode**.
6. Click **Add**.
7. Select the content type you want to add and drag it to the preferred location on the page.
8. From the settings panel, enter a name in the **Name** field.

 **Note:** You won't be able to enter translations until you've entered a name for the content in your default language.

9. From the language dropdown list, select the language you want to create a translation for.
10. Check the **Enable this Translation** box.
11. Where you enter your translation will depend on the content type you've chosen:
 - a. If you added the CMS HTML content type, enter the translation in the **HTML Code** field.
 - b. If you added the CMS Image content type, enter the translation in the **Image Upload, Link**, and **Alternate Text** fields.
 - c. If you added the CMS MerchZone content type, enter the translation in the **Merchandising Rule** field.
 - d. If you added the CMS MerchZone2 content type, enter the translation in the **Section Heading** and **Merchandising Rule** fields.
 - e. If you added the CMS Text content type, enter the translation in the **Text** field.
12. Click **Save**.

Editing Website Content Translations

Applies to: SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced | Site Management Tools

In Site Management Tools (SMT), you can edit a translation when you need to update website content.

To edit website content translations:

1. Log in to SMT. For details, see the help topic [Logging into Site Management Tools](#).
2. Select the Overview Mode icon  from the site management toolbar.
3. Select the **Pages** subtab.

4. Click the ellipsis next to the page you want to edit.
5. Click **Preview**.
6. Click **Edit Mode**.
7. Hover over the content you want to edit and click the Edit icon .
8. From the settings panel, select the language from the language dropdown list.
9. Make any required changes.
10. Click **Save**.

Hiding Website Content Translations

 **Applies to:** SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced | Site Management Tools

In Site Management Tools (SMT), you can hide translated content you're not ready to show on your website.

To hide website content translations:

1. Log in to SMT. For details, see the help topic [Logging into Site Management Tools](#).
2. Select the Overview Mode icon  from the site management toolbar.
3. Select the **Pages** subtab.
4. Click the ellipsis next to the page you want to hide translations for.
5. Click **Preview**.
6. Select **Edit Mode**.
7. Hover over the content you want to hide translations from and click the Edit icon .
8. From the settings panel, select the language from the language dropdown list.
9. Clear the **Enable this Translation** box.
10. Click **Save**.

You can view hidden translations in **Overview Mode** from the **Translations** tab. Use the **Translation Status** filter and select **Hidden** to display all hidden content.

Deleting Website Content Translations

 **Applies to:** SuiteCommerce | SuiteCommerce MyAccount | SuiteCommerce Advanced | Site Management Tools

In Site Management Tools (SMT), you can delete a translation when you don't need it anymore.

Important: You can't recover deleted translations.

To delete website content translations:

1. Log in to SMT. For details, see the help topic [Logging into Site Management Tools](#).
2. Select the Overview Mode icon  from the site management toolbar.
3. Click the ellipsis next to the page you want to delete a translation from.

4. Click **Preview**.
5. Select **Edit Mode**.
6. Hover over the content that you want to delete translations from and click the Edit icon .
7. From the settings panel, select the language from the language dropdown list.
8. Click the ellipsis and select **Delete this Translation**.
9. Click **Save**.

Exporting and Importing Bulk Translation Content in Site Management Tools

Applies to: SuiteCommerce | SuiteCommerce Advanced | Site Management Tools

This information refers to SuiteCommerce and the 2021.1 release of SuiteCommerce Advanced or later.

With Site Management Tools (SMT), you can export bulk content that needs translation from your web store and import the translated content back into SMT from the Translations tab in Overview Mode. Content includes CMS Pages and CMS Content Types. All formatting, like HTML content and special characters, is preserved. Content is exported as individual XLIFF 1.2 files, compressed into a ZIP, and then sent to a third-party translator. After you get the translated content, you can import it back into SMT, review it, and publish it to the language-specific domain.

Prerequisites for Exporting and Importing Bulk Translation Content in SMT

To export and import bulk translation content, your account must meet the following conditions:

- Your account must be using SMT version 3. To check your version of SMT, see the help topic [Site Management Tools Versions](#).
- Your account must be using SuiteCommerce and SuiteCommerce Advanced 20.2 or later.
- Multi-Languages must be set up for your site. For details, see [Prerequisites for Using Multi-Language](#).
- You need to configure multiple languages on the website record. For details, see the help topic [Web Site Language Preferences](#).
- All content for your site must be added to the CMS records of the default language. For more information, see the help topic [CMS Records for Site Management Tools](#).

To learn more about bulk translation content in SMT, explore these topics:

- [Exporting Bulk Content for Translation from Site Management Tools](#)
- [Importing Bulk Translation Content into Site Management Tools](#)
- [Editing and Reviewing Bulk Translations in Site Management Tools](#)

Exporting Bulk Content for Translation from Site Management Tools

Applies to: SuiteCommerce | SuiteCommerce Advanced | Site Management Tools

In Site Management Tools (SMT), you can find and export content that needs translating from the Translations tab in Overview Mode. For details, see [Translations Tab User Interface](#). You can export all

CMS Pages and CMS Content Types supported by SMT. The Translations tab lets you manage original translations, content updates, and see any content with pending translations. Each file is saved as an individual XLIFF file, compressed into a ZIP, and saved to the File Cabinet. For details, see the help topic [File Cabinet Overview](#). You can also choose to save the file locally.

Watch the following video for information about how to export translation content in bulk using SMT.

 [Exporting Bulk Content for Translation](#)

To export bulk content for translation from SMT:

1. Log in to SMT. For details, see the help topic [Logging into Site Management Tools](#).
2. Select the Overview Mode icon  from the site management toolbar.
3. Select the **Translations** subtab.
4. After you've reviewed the content, click **Export All**.
5. When prompted, select the language you want to translate the default language into.

 **Note:** If there's a translation for any content, it's included in the export.

6. If needed, check the **Include Unpublished** box to include unpublished content in the export.
7. Click **Next** to export the content.
8. Click **Close**.
9. After the export finishes, a banner appears at the top of the page. From the banner you can:
 - a. Download the ZIP file from the File Cabinet (**Documents > Files > File Cabinet**), under **SuiteBundle > Bundle ID > ExportforTranslation**.
 - Or
 - b. Save a local file by clicking the **Click here to save a local file** link.

 **Note:** The content in the Export for Translation folder is automatically replaced when you start a new export.

10. After the ZIP file is downloaded, you can send it to a third party translator. When you've received the translated content, you can import it back into SMT. For details, see [Importing Bulk Translation Content into Site Management Tools](#).

Importing Bulk Translation Content into Site Management Tools

 **Applies to:** SuiteCommerce | SuiteCommerce Advanced | Site Management Tools

In Site Management Tools (SMT), you can import new translations, update existing ones, or do both from the Translations tab in Overview Mode. For details, see [Translations Tab User Interface](#). Content is imported as a draft to the correct language-specific domain so you can review it before publishing to your website.

Watch the following video for information about how to import translation content in bulk using SMT.

 [Importing Bulk Translation Content](#)

To import bulk translation content into SMT:

1. Log in to SMT. For details, see the help topic [Logging into Site Management Tools](#).
2. Select the Overview Mode icon  from the site management toolbar.
3. Select the **Translations** subtab.
4. Click **Import**.
5. When prompted, select the ZIP file you want to import.

Note: To import content successfully, make sure the ZIP file contains the XLIFF files directly (not in a subfolder).

6. Click **Next**.
7. When prompted, review the content on the Import Mapping Review window.

Important: If a file's path or language isn't found (based on the filename), the Import Mapping Review window will tell you. Click Next to continue. SMT will ignore the file name and get the import path and locale straight from the XLIFF file

8. Click **Next**.
9. Select from the following options to import translations:
 - **Add New** – Add any new translations only. This includes translation entries with no translations and existing translation entries with empty fields.
 - **Update** – Replace only existing translations.
 - **Add or Update** – Add new translations and replace existing translations.
10. Click **Next**.
11. When prompted, review the changes listed in the Import Confirmation window. This window displays the number of content blocks and pages that were updated and, if applicable, the number of stale translations. Stale translations indicate when content has changed since it was exported and that it may not match the translated text that was imported.
12. If required, click **See report for details** for more information about the imported content. This report identifies any stale content, displays errors for content that wasn't updated, and provides reference to the content in the default language for identification.
13. Click **Done**.

Now that you've imported the translations, review the content before publishing it to your site. If needed, you can manually update anything before publishing the content. For details, see [Editing and Reviewing Bulk Translations in Site Management Tools](#).

Troubleshooting Tips for Importing Bulk Translation Content

This section gives you some helpful tips for solving issues when importing bulk translation content into SMT.

- When you start an import, you need to select a ZIP file that has only the XLIFF files in the main directory. If you pick a ZIP file that includes a folder, the Import Mapping Review window will show an error.
- Some computer-aided translation (CAT) systems might replace the XLIFF file header or change the locale. If these don't match, the target language may not be recognized. Make sure the header hasn't been replaced and the locale isn't set to a language-only identifier. For example, the locale for a file containing French Canadian translations should be `language=fr_CA`.
- Check the XLIFF file to make sure any target tag (`<target>`) with an empty source tag is closed (`</target>`). If it's not closed, the translation might not be recognized.

Editing and Reviewing Bulk Translations in Site Management Tools

i Applies to: SuiteCommerce | SuiteCommerce Advanced | Site Management Tools

You can review translated content on your website before you publish it. You should review translations to make sure nothing's missing and special characters are displayed properly. This is also a good time to upload any language-specific images you want to appear on your site.

To edit and review translations:

1. Log in to Site Management Tools (SMT). For details, see the help topic [Logging into Site Management Tools](#).
2. Select the Overview Mode icon  from the site management toolbar.
3. Select the **Translations** subtab.
4. Select the ellipsis next to the content you want to check translations for and select **Preview**.
5. Select **Edit Mode**.
6. To check the translation status, hover over the Translation Status icon .
7. To edit content, click the Edit icon .
8. From the settings panel, select the language you want to review.
9. Make any changes you need and click **Save**.

i Note: If you clear the **Enable this Translation** box, it hides the translated content. For more information, see [Hiding Landing Page Translations](#) and [Hiding Website Content Translations](#).

10. To review your changes, select the language specific domain from the domain switcher.
11. Click **Overview Mode**.
12. Select the **Translations** tab.
13. Select the ellipsis next to the content you want to review and click **Preview**.
14. When you're ready, publish the changes. For details, see the help topic [Review and Publish Content in Site Management Tools](#).

You can also edit translations from the Translations tab by clicking the ellipsis next to the content you want to edit, and then selecting Edit. From the settings panel, select the preferred language and make any required changes.

Commerce Custom Fields

i Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount | Site Management Tools

SuiteCommerce and SuiteCommerce Advanced sites let you access core and custom field values through the Commerce API, Items API, and SuiteScript. You can add custom fields to your site in two ways:

- [Create Custom Fields Using an Extension](#) – When you install and activate the SuiteCommerce Custom Fields extension, you add a subtab to your SuiteCommerce Configuration record where you specify the custom fields you want to add, the location, and the order in which the fields appear.

The SuiteCommerce Custom Fields extension lets you add fields to Checkout and Product Detail Pages of your website. Custom Checkout fields only support the custom transaction body field type.

- [Create Custom Fields by Customizing Templates](#) – Alternatively you can configure your site and customize template files as part of a theme to render information or ask for information stored in these fields on your web store's Shopping, Checkout, and My Account pages.

i Note: If you are using SuiteCommerce Advanced Aconcagua or later, you implement custom fields as part of a theme or using an extension. If you are using SuiteCommerce Advanced Kilimanjaro or earlier, you implement custom fields by customizing the core SCA source code.

Commerce websites support the following kinds of custom field records:

- **Custom Item Fields** – Add custom item field data associated with an item. These fields apply to the Product Details Page (PDP), Checkout, and My Account.
- **Custom Transaction Body Fields** – Add custom transaction fields to the body of a web store transaction (order as a whole). You can also include some field metadata (such as the field label or item options). These fields apply to Checkout and My Account.
- **Custom Transaction Line Fields** – Add a custom transaction field to the column of a transaction record (across multiple transaction lines in an order). These fields apply to the PDP, Cart, Checkout, and My Account.
- **Custom Transaction Item Options** – Add a custom transaction field that applies to a transaction line (one line item within an order). These fields apply to the PDP, Cart, Checkout, and My Account.

i Note: Site Builder Reference implementations support custom fields appearing in Checkout and My Account only.

Create Custom Fields Using an Extension

i Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount | Site Management Tools

The SuiteCommerce Custom Fields extension lets you add custom fields to the Checkout application and Product Detail Pages (PDP) of your website without customizing any source code or themes.

Important: Commerce extensions are only available if provisioned, installed, and activated for a selected domain in your account. For more information, see [Commerce Extensions](#).

Note: If you are a SuiteCommerce Advanced customer, you must be implementing the Aconcagua release or later to take advantage of extensions.

You can use custom fields to add more information about items in your web store or add and request additional information about the checkout process. Custom fields are grouped together in a separate block, which you can set off by adding a header.

This topic includes information about the following custom field types:

- [Custom Fields for Checkout](#)
- [Custom Fields for the Product Details Page](#)

Custom Fields for Checkout

Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount | Site Management Tools

The SC Custom Fields extension lets you add custom transaction body fields to the checkout application in Commerce websites. You can use these fields to request or provide additional information, such as shipping instructions, special order requests, and delivery time slots.

SC Custom Fields lets you add text, checkbox, and date-type transaction body fields to Commerce websites. You can add custom fields before or after existing checkout modules. For example, you can include fields before shipping method, billing address, or payment method blocks in the standard checkout flow.

To display custom transaction body fields in the Checkout application of your site, perform the following steps:

1. [Creating Custom Fields for Checkout](#)
2. [Configuring Custom Fields for Checkout](#)

Creating Custom Fields for Checkout

Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount | Site Management Tools

To add new fields to Checkout, you must create custom transaction body fields in your NetSuite account. For more information about how to create custom fields in NetSuite, see the help topic [Creating Custom Transaction Body Fields](#).

Note: The SC Custom Fields extension only supports transaction body fields. To implement custom item, custom transaction line, and custom transaction item option fields, see [Create Custom Fields by Customizing Templates](#).

The SC Custom Fields extension allows the following transaction body field types:

- Checkbox
- Date
- Text Area
- Long Text
- Free-Form Text

When you create a transaction body field for the SC Custom Fields extension, be aware of the following:

- The **Field Type** must match the field type you want to include in the checkout application.
- The **Web Store** and **Sale** fields must be checked in the **Applies To** subtab.
- If you select the **Mandatory** box in the **Validation & Defaulting** subtab, the field is required for all domains and you must mark it as required in the SuiteCommerce Configuration record for all the domains of your website.
If you want the new transaction body field to be required in only one domain, you should mark the field as required in the configuration of that domain only. You do not need to mark it as mandatory during creation.
- The subtab where you want to display the custom field on the Sales Order record should be selected in the **Display** subtab. Otherwise, the field is shown in the **Custom** subtab of the Sales Order record.

 **Note:** The character limitation for the custom fields in Commerce websites is set by the field type in NetSuite. For more information about the limits, see the help topic [Field Type Descriptions for Custom Fields](#).

When you have created your custom transaction body fields, you are ready to [Configuring Custom Fields for Checkout](#).

Configuring Custom Fields for Checkout

 **Applies to:** SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount | Site Management Tools

Use the SC Configuration record to choose which fields to add to Checkout and how they display. You can also set feedback messages that display to users on your site.

Consider the following points when determining the order and positioning of your custom fields:

- You can add a custom field before or after a standard checkout module. For example, if your SC site uses the standard checkout flow, you can add custom fields before or after the shipping method block in the Shipping Address page.
- If you want to change the order of existing modules in the checkout application, you should do this before adding new custom fields. For more information, see the help topic [Reorder Checkout Modules](#).
- The order in which you list custom checkout fields in the **Custom Fields** subtab of the SC Configuration record determines the order of the custom fields in Checkout.

 **Important:** Only custom transaction body fields are supported by the SC Custom Fields extension for the Checkout Application. Standard NetSuite transaction body fields cannot be used.

To configure custom fields for checkout:

1. In NetSuite, go to Commerce > Websites > Configuration.
2. Select the website and domain where the Custom Fields extension is activated and click **Configure**.
3. Go to the **Extensions** tab.
4. In the **Custom Fields** subtab, set the following fields:

Messaging Fields:

Field	Description
Required Field Warning Message	Sets the message to display when the user leaves a required field blank. The placeholder <code>[[field]]</code> is replaced by the field name automatically.

Field	Description
Required Fields General Warning	Sets the message to display at the top of the page when the user leaves a required field blank.
Loading Message	Sets the message to display when the custom fields are loading.
Loading Error Message	Sets the message to display when an error occurs while loading.
Saving Error Message	Sets the message to display when an error occurs while saving.

Checkout Custom Fields:

For each custom field you want to include in Checkout, insert a row in the Checkout Custom Fields table, and complete the following fields as needed.

Field	Description
Field ID	Links the field ID of the custom field you want to employ with a Checkout field. To find the field ID, go to Customization > Lists, Records & Fields > Transaction Body Fields and open the Transaction Body Field record.
Position	Determines the position in Checkout where the custom field appears.
Module	Determines the module in Checkout on which the custom field's position is based. You can choose from the following Checkout modules: - Shipping Address - Shipping Method - Gift Certificate - Payment Method - Review Shipping - Review Payment - Terms and Conditions
Field Type	Determines the type of the custom field. The Field Type must be identical to the Field Type selected in the Transaction Body Field record.
Label	Sets the label for the custom field to display to users.
Placeholder	Sets the placeholder text to display in the custom field.
Required	If checked, makes the custom field required for a user in Checkout. You must check this box if the Mandatory field is checked on the Transaction Body Field record.

5. Click **Save**.

Custom Fields for the Product Details Page

Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount | Site Management Tools

Using the SC Custom Fields extension, you can choose to display any standard or custom item field on the Product Details Page (PDP) and Quick View window. Additionally, experienced customers can add Schema.org item properties to the fields to improve search engine optimization.

Activating the Custom Fields extension adds several native NetSuite fields to the Custom Fields section of the SC Configuration record, which you can use to display additional item details.

You can also create your own custom fields to include on the PDP. Standard or custom item fields display on the PDP in the SKU label format.

To make native NS or custom fields available for use on the PDP, you must:

1. [Update Field Sets](#)
2. [Configure Custom Fields for the PDP](#)

Update Field Sets

The field sets for a website determine the data that is exposed to site templates. To employ custom fields on the PDP, you must add several fields to the **details** field set for the site. In addition, to display the custom fields on the PDP of a matrix subitem, you must also add the fields to the **matrixchilditems** field set. For more information about field sets, see [Define Field Sets](#).

These instructions include the fields added automatically with the extension, but you must also add any additional fields you want to display on the PDP.

To add custom fields to the web site setup record:

1. In NetSuite, go to Commerce > Websites> Configuration.
2. Click **Edit** next to the website to which you are adding custom fields.
3. Go to the **Field Sets** subtab.
4. Add the following fields to the **details** and **matrixchilditems** field sets:
 - **UPC Code**
 - **Manufacturer**
 - **MPN**
 - **Manufacturer Country**
 - **Item Weight**

To add each field to each field set, perform the following steps:

- a. Locate the **Fields Included in Field Set** column and click the **Set** button.
 - b. Select the fields from the **Field Name** list and click **Add**.
 - c. In the Field Set window, click **Submit**.
 - d. In the Field Set row, click **OK**.
5. After adding all of the fields to both field sets, click **Save**.

Configure Custom Fields for the PDP

Use the SC Configuration record to choose which fields to add to the PDP and Quick View window. You can also associate each field with a schema property to improve search engine optimization.

To configure custom fields for the PDP:

1. In NetSuite, go to Commerce > Websites> Configuration.
2. Select the website and domain where the Custom Fields extension is activated and click **Configure**.
3. Go to the **Extensions** tab.
4. In the **Custom Fields** subtab, PDP Fields section, set the following fields for each custom field you want to include on the PDP:

Field	Description
Label and Field ID	Links to the label and field ID of the field to include on the PDP. The item field ID is listed as <code>[[fieldid]]</code> to automatically display the value. If an item does not have a value for a field, the field does not display for that item. You can use more than one field within the same line to display the fields in conjunction. For example, if the Label and Field ID field is set to Item Weight: <code>[[weight]]</code> <code>[[weightunit]]</code>, the line displays as Item Weight: 7 lb. Basic HTML formatting tags are supported.
Enable	If checked, displays this field on the PDP and Quick View window.
Hide from Quick View	If checked, hides this field from the Quick View window. If unchecked, this field still appears on the PDP if the Enable field is checked.
Schema.org Property	Links to a schema property tag to improve search engine optimization. You can find a list of suggested schema properties and more information at Schema.org. This feature is for experienced users; NetSuite does not verify if the schema property is correct.

5. Click **Save**.

Create Custom Fields by Customizing Templates

Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount | Site Management Tools

You can configure your site and customize template files as part of a theme to render information or ask for information stored in these fields on your web store's Shopping, Checkout, and My Account pages.

Important: If you are using SuiteCommerce or the Aconcagua release of SCA or later, you implement custom fields as part of a theme. See the help topic [Overview](#) for details on creating themes.

If you are implementing the Kilimanjaro release of SCA and earlier, you implement custom fields by customizing the core SCA source code. See the help topic [Develop Your SCA Customization](#) for details.

You can set up custom item, custom transaction body, and custom transaction column and transaction item option fields in SuiteCommerce and SCA by customizing the template files:

- [Setting Up Custom Item Fields](#)
- [Setting Up Custom Transaction Body Fields](#)
- [Setting Up Custom Transaction Line and Transaction Item Option Fields](#)

Setting Up Custom Item Fields

Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount | Site Management Tools

Set up custom item fields to appear in the PDP, Checkout, and My Account. This requires setting up the custom item field in NetSuite and overriding the correct template to render the information in your web store.

To set up a custom item field in NetSuite:

1. In NetSuite, create the custom item field. See the help topic [Creating Custom Item Fields](#) for details.

Note: The custom item field information rendered to your web store is read-only.

For a custom item field to render in your Commerce website, note the following:

- Enter a Label and ID for your custom item. If you do not specify an ID, NetSuite will create one for you. Use these when adding field sets and customizing templates.
 - Set the Subtype (**Applies To** subtab) to either **Both** or **Sale**.
2. In NetSuite, go to Commerce > Websites > Website List and click **edit** next to your site.
 3. In the Web Site record, click **Actions** > **Rebuild Search Index** and wait for the index to build.
 4. On the **Field Sets** tab, perform the following as applicable:
 - If adding the field to the PDP, locate the **Details** field set name and add the custom field ID to the **Fields Included in Field Set** column.
 - If adding the field to Checkout or the Purchase History page of My Account, add the field ID to the **Order** field set name and add the custom field ID to the **Fields Included in Field Set** column.

Note: The **order** field set is the default for the Review Order page, but you can change this by editing the `fieldKeys.itemsFieldsAdvancedName` property in the SuiteCommerce Configuration Record. See the help topic [Backend Subtab](#) for details.

To display the custom item field in the PDP or in Checkout:

1. As part of your theme, update the appropriate template:
 - `product_details_full.tpl` – exposes the field as read-only information to the PDP.
 - `transaction_line_views_cell_navigable.tpl` – exposes the field as read-only information to the Review Your Order page and in the Order Summary information displayed throughout Checkout.

See the help topic [Overview](#) for details on creating themes.

Note: If you implementing a SuiteCommerce Advanced site using the Kilimanjaro release or earlier, you must override the appropriate template. See the help topic [Develop Your SCA Customization](#) for details.

2. Add the following code to any HTML tag within the template that does not have the data-view attribute:

```
1 | {{model.item.custitem_my_custom_field_id}}
```

In this example, `custitem_my_custom_field_id` is the ID of your custom item field

Note: If the custom field record's **Type** is set to **Multiple Select**, the values render on your site separated by commas.

3. Save your code and test on a local server or deploy to NetSuite and activate as required.

To display the custom item field in My Account:

1. As part of your theme, update the `transaction_line_views_cell_actionable.tpl` template.

See the help topic [Overview](#) for details on creating themes.

Note: If you implementing a SuiteCommerce Advanced site using the Kilimanjaro release or earlier, you must override the appropriate template. See the help topic [Develop Your SCA Customization](#) for details.

2. Add the following code to the template wherever you want the field to appear:

```
1 | {{model.item.custitem_my_custom_field_id}}
```

In this example, custitem_my_custom_field_id is the ID of your custom item field

3. Save your code and test on a local server or deploy to NetSuite and activate as required.

Setting Up Custom Transaction Body Fields

Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount | Site Management Tools

Set up custom transaction body fields to appear in Checkout and My Account. This requires setting up the custom transaction body field in NetSuite and overriding the correct template to render the information in your web store.

To set up a custom transaction body field:

1. In NetSuite, set up the custom transaction body field. See the help topic [Creating Custom Transaction Body Fields](#) for details.
For a custom transaction body field to render in your Commerce website, note the following:
 - Create a Label and ID for your custom item. If you do not specify an ID, NetSuite will create one for you. Use these when configuring your site and customizing templates.
 - Check **Sale** and **Web Store (Applies To)** subtab).
 - SCA supports the **Mandatory** option in the **Validation & Defaulting** subtab, but as information only. Transaction body fields are not validated in the frontend (client side). If a custom transaction body field is setup as **mandatory**, the field will be required for Quotes as well.
2. In NetSuite, go to Commerce > Websites> Configuration.
3. In the **Advanced** tab and **Custom Fields** subtab, add your transaction body field ID to the **Sales Order** property. See the help topic [Custom Fields Subtab](#) for more information about this configuration property.

Note: If any transaction body fields were available in the Vinson release of SCA or earlier, you must expose them in the configuration as well.

To display the custom transaction body field:

1. You can add a custom transaction body field to any module template linked to a checkout wizard step or in the Purchase History pages of My Account. See [Supported Field Types](#) for a list of supported field types.
As part of your theme, update the appropriate template:
 - To render information in Checkout, override any applicable checkout wizard template.
 - To render the information in My Account, override the order_history_details.tpl or the order_history_summary.tpl, as required.

See the help topic [Overview](#) for details on creating themes.

Note: If you implementing a SuiteCommerce Advanced site using the Kilimanjaro release or earlier, you must override the appropriate template. See the help topic [Develop Your SCA Customization](#) for details.

2. In your template, you can include the custom field's metadata as an option. This is important for rendering the label of a field, for example. The label, type, and mandatory metadata components apply to all supported transaction body field types. The options metadata component applies to **List/Record** types only.

Note: After changing the type, label, or mandatory attributes of a transaction body field, your site uses the metadata values for up to two hours. If you configure a new transaction body field, and that field's attribute is not in the cache, the cache reloads, attempting to get the requested metadata. If the Sales Order Field ID property does not belong to any transaction body field, the application does not render that field.

To display metadata for the custom field, include the following helpers (where `custbody_my_transaction_body_field` is the ID of your custom transaction body field):

Note: The metadata is available in the Sales Order object as part of the `__customFieldsMetadata` attribute. In your template override, access custom field metadata by introducing the following script (where `custbody_my_transaction_body_field` is the ID of your custom transaction body field).

Metadata Fields	Information	Script
Label	Display the label of the field	<code>model.__customFieldsMetadata.custbody_my_transaction_body_field.label</code>
Type	Display the type of the field	<code>model.__customFieldsMetadata.custbody_my_transaction_body_field.type</code>
Mandatory	Display the Mandatory field. This is information only and is not validated in the frontend (client side).	<code>model.__customFieldsMetadata.custbody_my_transaction_body_field.mandatory</code>
Options	Display the options for a List/Record field.	<code>model.__customFieldsMetadata.custbody_my_transaction_body_field.options</code>

3. To display the value of a transaction body field, include the following helper (where `custbody_my_transaction_body_field` is the ID of your custom transaction body field):

```
1 | {{model.options.custbody_my_transaction_body_field}}
```

4. To request information from a user, include an input, textarea, or select component (where the name property is the custom field ID). Whenever the Change event is triggered on the field, the value of the HTML component is set in the model associated with the template.

The following examples use the **Label** metadata to display the label of the custom TBF:

```
1 | <div>
2 |     {{model.__customFieldsMetadata.custbody_my_transaction_body_field.label}}:
3 |     <input type="text" name="custbody_my_transaction_body_field" value="{{model.options.custbody_my_transaction_body_field.value}}"/>
4 | </div>
```

```
1 | <div>
2 |     {{model.__customFieldsMetadata.custbody_my_transaction_body_field_sel.label}}
```

```

3      <select name="custbody_my_transaction_body_field_sel">
4          {{#each model.__customFieldsMetadata.custbody_my_transaction_body_field_sel.options}}
5              <option value="{{id}}" {{#ifEquals id ../model.options.custbody_my_transaction_body_field_sel}}selected="true"{{/ifEquals}}>
6                  {{text}}
7              </option>
8          {{/each}}
9      </select>
10 </div>

```

```

1 <div>
2     {{model.__customFieldsMetadata.custbody_my_transaction_body_field_2.label}}
3     <textarea name="custbody_my_transaction_body_field_2">
4         {{model.options.custbody_my_transaction_body_field_2}}
5     </textarea>
6 </div>

```

Supported Field Types

Commerce websites support custom transaction body fields of the following **Type**:

Type	Example HTML5 Elements Used to Render the Field
Check Box	text, checkbox
Currency	text
Date	text, date
Date/Time	text, datetime
Decimal Number	text, number
Document	select
Email Address	text, email
Free Form Text	text
Hyperlink	url
Inline HTML	text
Integer Number	text, number
List/Record	input, select
Long Text	text
Multiple Select	select
Password	text, password
Percent	text
Phone Number	text, tel
Rich Text	text
Text Area	text, textarea
Time of Day	text, time

Setting Up Custom Transaction Line and Transaction Item Option Fields

i Applies to: SuiteCommerce | SuiteCommerce Advanced | SuiteCommerce MyAccount | Site Management Tools

Set up custom transaction line fields to appear in your PDP, Cart, Checkout, and My Account. This requires setting up the custom fields in NetSuite. Commerce websites include a set of default templates (listed below) to render these fields, but you can override these as required.

- product_views_option_color.tpl
- product_views_option_dropdown.tpl
- product_views_option_radio.tpl
- product_views_option_text.tpl
- product_views_option_textarea.tpl
- product_views_option_email.tpl
- product_views_option_phone.tpl
- product_views_option_currency.tpl
- product_views_option_float.tpl
- product_views_option_integer.tpl
- product_views_option_percent.tpl
- product_views_option_password.tpl
- product_views_option_url.tpl
- product_views_option_timeofday.tpl
- product_views_option_datetimetz.tpl
- product_views_option_tile.tpl
- product_views_option_checkbox.tpl
- product_views_option_date.tpl

i Note: Transaction line fields and transaction item options render in the same locations on your site. To set up these fields, follow the same set up and configuration procedures and customize the same template file.

To set up a Custom Transaction Line and Transaction Item Option:

1. In NetSuite, set up the transaction line field or transaction item option. See the help topics [Creating Custom Transaction Line Fields](#) and [Creating Custom Transaction Item Options](#) for details.

For a custom transaction line or transaction item option to render in your Commerce website, note the following:

- Enter a label and ID for your custom item. If you do not specify an ID, NetSuite will create one for you. Use these when customizing templates to render the field.
- To enable a custom transaction line field to render in the PDP, check **Sale Item** and **Store Item** (**Applies To** subtab).
- To enable a custom transaction item option to render in the PDP, check **Sale** and **Web Store** (**Applies To** subtab).

- SCA supports the **Mandatory** option in the **Validation & Defaulting** subtab. Some of these fields are validated in the frontend (client side). Others are validated in the backend.
 - SCA does not support all transaction item option types.
 - All the transaction line fields and item options are displayed automatically if the **Show Only Items Listed in: ItemOptions and Custom Transaction Line fields** property is unchecked. Enabling this property only displays fields with the ID specified in the item options and custom transaction line field's Item options and custom transaction line fields property.
2. In NetSuite, go to Commerce > Websites > Configuration.
 3. In the **Shopping Catalog** tab and **Item Options** subtab, check the **Show Only Items Listed in: Item Options and Custom Transaction Line Fields** property and set up your item options fields to display. See the help topic [Item Options Templates Subtab](#) for more information.

Supported Field Types

Commerce websites support transaction line fields and transaction item options of the following **Type**:

 **Note:** Some of these fields are validated on the frontend (client side). Others are validated on the backend (NetSuite). Invalid fields in the frontend result in error messages displayed at the field where the error occurred. Invalid fields in the backend result in error messages at the top of the page.

Type	Validation	Example HTML5 Elements Used to Render the Field
Check Box	Backend	checkbox
Currency	Frontend	text
Date	Backend	date, datepicker (Bootstrap)
Date/Time	Backend	text
Decimal Number	Frontend	number
Email Address	Frontend	email
Free Form Text	Frontend	text
Hyperlink	Frontend	url
Integer Number	Frontend	number
List/Record	Frontend	input, select
Password	Backend	password
Percent	Frontend	text
Phone Number	Frontend	tel
Text Area	Frontend	textarea
Time of Day	Backend	text
