This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish, or display any part, in any form, or by any means. Reverse engineering, disassembly, or decompilation of this software, unless required by law for interoperability, is prohibited.

The information contained herein is subject to change without notice and is not warranted to be error-free. If you find any errors, please report them to us in writing.

If this is software, software documentation, data (as defined in the Federal Acquisition Regulation), or related documentation that is delivered to the U.S. Government or anyone licensing it on behalf of the U.S. Government, then the following notice is applicable:

U.S. GOVERNMENT END USERS: Oracle programs (including any operating system, integrated software, any programs embedded, installed, or activated on delivered hardware, and modifications of such programs) and Oracle computer documentation or other Oracle data delivered to or accessed by U.S. Government end users are "commercial computer software," "commercial computer software documentation," or "limited rights data" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, the use, reproduction, duplication, release, display, disclosure, modification, preparation of derivative works, and/or adaptation of i) Oracle programs (including any operating system, integrated software, any programs embedded, installed, or activated on delivered hardware, and modifications of such programs), ii) Oracle computer documentation and/or iii) other Oracle data, is subject to the rights and limitations specified in the license contained in the applicable contract. The terms governing the U.S. Government's use of Oracle cloud services are defined by the applicable contract for such services. No other rights are granted to the U.S. Government.

This software or hardware is developed for general use in a variety of information management applications. It is not developed or intended for use in any inherently dangerous applications, including applications that may create a risk of personal injury. If you use this software or hardware in dangerous applications, then you shall be responsible to take all appropriate fail-safe, backup, redundancy, and other measures to ensure its safe use. Oracle Corporation and its affiliates disclaim any liability for any damages caused by use of this software or hardware in dangerous applications.

Oracle®, Java, and MySQL are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Intel and Intel Inside are trademarks or registered trademarks of Intel Corporation. All SPARC trademarks are used under license and are trademarks or registered trademarks of SPARC International, Inc. AMD, Epyc, and the AMD logo are trademarks or registered trademarks of Advanced Micro Devices. UNIX is a registered trademark of The Open Group.

This software or hardware and documentation may provide access to or information about content, products, and services from third parties. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to third-party content, products, and services unless otherwise set forth in an applicable agreement between you and Oracle. Oracle Corporation and its affiliates will not be responsible for any loss, costs, or damages incurred due to your access to or use of third-party content, products, or services, except as set forth in an applicable agreement between you and Oracle.

If this document is in public or private pre-General Availability status:

This documentation is in pre-General Availability status and is intended for demonstration and preliminary use only. It may not be specific to the hardware on which you are using the software. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to this documentation and will not be responsible for any loss, costs, or damages incurred due to the use of this documentation.

If this document is in private pre-General Availability status:

The information contained in this document is for informational sharing purposes only and should be considered in your capacity as a customer advisory board member or pursuant to your pre-General Availability trial agreement only. It is not a commitment to deliver any material, code, or functionality, and should not be relied upon in making purchasing decisions. The development, release, timing, and pricing of any features or functionality described in this document may change and remains at the sole discretion of Oracle.

This document in any form, software or printed matter, contains proprietary information that is the exclusive property of Oracle. Your access to and use of this confidential material is subject to the terms and conditions of your Oracle Master Agreement, Oracle License and Services Agreement, Oracle PartnerNetwork Agreement, Oracle distribution agreement, or other license agreement which has been executed by you and Oracle and with which you agree to comply. This document and information contained herein may not be disclosed, copied, reproduced, or distributed to anyone outside Oracle without prior written consent of Oracle. This document is not part of your license agreement nor can it be incorporated into any contractual agreement with Oracle or its subsidiaries or affiliates.

Documentation Accessibility

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at <https://www.oracle.com/corporate/accessibility>.

Access to Oracle Support

Oracle customers that have purchased support have access to electronic support through My Oracle Support. For information, visit <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info> or visit <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs> if you are hearing impaired.

Sample Code

Oracle may provide sample code in SuiteAnswers, the Help Center, User Guides, or elsewhere through help links. All such sample code is provided "as is" and "as available", for use only with an authorized NetSuite Service account, and is made available as a SuiteCloud Technology subject to the SuiteCloud Terms of Service at www.netsuite.com/tos.

Oracle may modify or remove sample code at any time without notice.

No Excessive Use of the Service

As the Service is a multi-tenant service offering on shared databases, Customer may not use the Service in excess of limits or thresholds that Oracle considers commercially reasonable for the Service. If Oracle reasonably concludes that a Customer's use is excessive and/or will cause immediate or ongoing performance issues for one or more of Oracle's other customers, Oracle may slow down or throttle Customer's excess use until such time that Customer's use stays within reasonable limits. If Customer's particular usage pattern requires a higher limit or threshold, then the Customer should procure a subscription to the Service that accommodates a higher limit and/or threshold that more effectively aligns with the Customer's actual usage pattern.

Beta Features

This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish, or display any part, in any form, or by any means. Note: The following link provides access to a Microsoft Excel worksheet listing the usage of most NetSuite permissions: [NetSuitePermissionsUsage.xls](#). You can use this list to see what happens when you assign a specific permission, or to find the permission required to provide access to a specific task or page. For more information, see [Permissions Documentation](#).

NetSuite Access Overview

Access to NetSuite data and to the NetSuite user interface is based on users, roles, and permissions:

- [Users](#)
- [Roles](#)
- [NetSuite Account Access](#)
- [Internal Controls for NetSuite Access](#)

Users

A user is an individual who has access to a NetSuite account.

- Generally, most users are employees, but vendors, partners, and customers also can be users.
- Users need to be set up in NetSuite by creating employee, vendor, partner, or customer records. To access NetSuite, users' records must include an email address, which acts as their user ID. Users also need a password to access NetSuite. Users with the Administrator role can send an access notification email with a link so users can create their own passwords.

For information about creating and setting up different user types, see [Manage Different Types of Users](#).

Roles

A role is a defined access configuration that can be assigned to users.

- Each role comes with permissions that decide what data users can see and what tasks they can do. For example, the A/P Clerk role lets users enter bills and vendor credits, pay bills and sales tax, and view A/P and inventory reports.
- Each role is linked to a center, which is a set of tabbed pages in the NetSuite interface. Each center is set up to the business needs of users in a specific area, such as accounting or sales. A role's center decides which pages users see when they log into NetSuite.
- One user can have multiple roles. The user can select a default role for logging in. Users can switch between roles and accounts using the Change Roles list in NetSuite. For more information, see the help topic [Roles and Accounts](#).

NetSuite Account Access

Whoever signs up for a NetSuite account is automatically assigned the Administrator role. The user with the Administrator role has full privileges to all aspects of the system and usually sets up account access by assigning roles to users.

- The first step for setting up account access is to create roles. See [NetSuite Roles Overview](#) to understand the different types of roles, as well as how to create and manage them.
- After you set up roles, you can give users access and assign roles. See [NetSuite Users Overview](#) for information about how to manage different types of users and monitor users' login activity using the Login Audit Trail.
- NetSuite has a complex permission structure with permissions divided into different types and different access levels. See [NetSuite Permissions Overview](#) to understand the different types of permissions and how to enable the Global Permissions feature. Please note that you should avoid using the Global Permissions feature. For more information, see [Using the Global Permissions Feature](#).
- You can enable the NetSuite's Advanced Employee Permissions feature which will give you more flexibility and control over the employee information that users with certain roles can access in NetSuite. When this feature is enabled, users with the Administrator role can customize or create roles to use the Employee Self, Employee Public, Employee Confidential, Employee Compensation, Employee System Access, Employee Record Full, and Employee Administration permissions. For more information, see the help topic [Advanced Employee Permissions Overview](#). Users with the Administrator role can also create custom employee permissions and custom restrictions when this feature is enabled. For more information, see the help topics [Custom Advanced Employee Permissions](#) and [Custom Restrictions for Advanced Employee Permissions](#).
- In addition to permissions, NetSuite has role restrictions that control which record instances of a record type can a role access. See [Permissions and Restrictions](#).

Note: Users need the SuiteAnalytics Connect permission to access the NetSuite SuiteAnalytics Connect schema. See the help topic [Connect Permissions](#).

Internal Controls for NetSuite Access

To have effective internal controls, you'll need a combination of both automated and manual controls that both prevent and detect misstatements or misappropriation of assets. Companies have several responsibilities for setting up good general controls for NetSuite.

- Make sure logical access and application security are in place. Users should have only the information that they need to do their jobs.
- Segregate duties and transaction processing.
- Make sure your organization has user administration controls in place, including:
 - The process for requesting and approving access. If possible, different people should handle the request, approval, and granting of access to make sure the process is followed correctly.
 - Review access regularly to check for changes in responsibilities, make sure former employees' access is revoked, and confirm that only the right people have sensitive or critical permissions.
 - Make sure you end access quickly when needed.
- Keep a record of which roles go with each job function and job title.
- Audit the permissions in each role regularly to make sure they're still appropriate.
- The Administrator role is powerful, so access to this role should be extremely limited. Ideally, your organization should have one administrator and one back-up administrator.

Standard Roles Permissions Table

The following table lists the permissions and permission levels for each standard role.

It's best to start with a copy of the standard roles built into NetSuite before you customize them. Giving users only the access they need helps avoid showing restricted pages, records, and data. You can then add or remove permissions from the roles as needed. See [Permissions Documentation](#) for an updated list of permissions and their corresponding usage.

The standard roles available in your account may differ, depending on the modules you've purchased, and the features you've enabled. You can see the roles available in your account at Setup > Users/Roles > Manage Roles, and you can review a role's details by clicking its link on the Manage Roles page.

You can't modify standard roles. You should create a custom version of any standard role before assigning it, so you can change it later if needed, even after it has been assigned.

The Administrator role has **all** permissions available in your NetSuite account at **all** levels. To see the full list of permissions assigned to the Administrator role, go to Setup > Users/Roles > Manage Roles, click **Administrator** and see the list of permissions on the Permissions subtab. For more information about the Administrator role, see [NetSuite Account Administration](#).

The Data Warehouse Integrator role allows Connect users to have access to all NetSuite data through the NetSuite2.com data source, except for sensitive data. For more information, see the help topic [Role and Permission Considerations for NetSuite2.com](#).

Important: If you have the Advanced Employee Permissions feature enabled, see the help topic [Advanced Employee Permissions and Standard NetSuite Roles](#) for a list of the employee permissions that are assigned to standard NetSuite roles when this feature is enabled.

There are three main groups of standard roles in NetSuite: executive, managerial, and operational.

- Executive roles include top-level and senior roles that let them see everything happening in their areas.
- Managerial roles, in general, have fewer permissions than executive and operational roles, but they include the key permissions needed to manage their areas.

- Operational roles let users support their customers or colleagues.

Executive	Managerial	Operational

Roles and Permission Considerations for APIs

When you work with the following NetSuite APIs, you must consider which permissions you need. In addition to main permissions, REST and SOAP Web Services, SuiteAnalytics Connect, and SuiteScript need other permissions to access forms, sublists, fields, and other components.

- [REST Web Services](#)
- [SuiteAnalytics Connect](#)
- [SuiteScript](#)
- [SOAP Web Services](#)

REST Web Services

The following permissions must be assigned to roles, or people, who work with REST Web Services:

- REST Web Services
- Log in using Access Tokens
- SuiteAnalytics Workbook

To learn about standard roles that have these permissions enabled by default, see the help topic [Prerequisites and Setup for REST Web Services](#).

SuiteAnalytics Connect

To use SuiteAnalytics Connect, you can either have the Full level of the **SuiteAnalytics Connect** permission, or the **SuiteAnalytics Connect – Read All** permission, which gives you read-only access to all NetSuite data through the Connect Service.

 **Warning:** Note that the SuiteAnalytics Connect – Read All permission improves performance when running queries, but exposes sensitive data such as employee and customer records to the user. For more information, see the help topic [Connect Permissions](#).

Depending on which data source you use to access the Connect Service, consider the following:

- [Role and Permission Considerations for NetSuite.com](#)
- [Role and Permission Considerations for NetSuite2.com](#)

SuiteScript

To use SuiteScript, you must have the SuiteScript permission assigned to your role. You'll also need to consider what other permissions you may need. For example, if you work with records, you may need the **Find Transaction** permission to retrieve a record using the GET operation. Or if you work with employees, you'll need to check the subsidiary restrictions.

For more information, see [Feature Permissions Documentation](#).

SOAP Web Services

To log in to **SOAP Web Services**, you need the Full level of the **SOAP Web Services** permission. You should also have the correct access and operations permissions that the SOAP Web Services application

needs. Another role-related consideration is the preferred custom forms of some roles may not have access to certain fields or sublists that a SOAP application requires. When you use SOAP to set fields that you cannot access, you receive permission errors.

For example, when you work with records, you may need the **Find Transaction** permission to retrieve a record using the GET operation. Or when you work with employees, you'll need to check the subsidiary restrictions. For more information, see the help topics [Roles and Permissions in SOAP Web Services](#) and [Permissions and Restrictions](#).

Permissions Documentation

The following link provides access to a Microsoft Excel worksheet that lists how most NetSuite permissions are used. You can use this list to see what happens when you assign a specific permission, or to find the permission required to provide access to a specific task or page. The spreadsheet format lets you search and sort fields however works best for you. Each column has autofilters you can use.

To access the worksheet, click this link: [NetSuitePermissionsUsage.xls](#).

For information about standard roles and their associated permission levels, see [Standard Roles Permissions Table](#). For information about permissions required to access specific NetSuite features, see [Feature Permissions Documentation](#).

 **Note:** Most browsers will download this file in "Protected View" mode to your Downloads folder. If the Autofilters aren't working, click the **Enable Editing** button on the yellow bar in the worksheet header.

The NetSuitePermissionsUsage.xls file includes the following columns:

- **SUBTAB** – Subtab of the Roles page Permissions subtab where each permission is listed: Lists, Reports, Setup, and Transactions (sorted alphabetically)
- **PERMISSION NAME** – Name of each permission (sorted alphabetically)
- **USAGE DESCRIPTION** – Description of how each permission is used, meaning the record types, tasks, and pages that each permission makes accessible (sorted alphabetically)
- **MINIMUM SELECTABLE LEVEL** – The minimum selectable level (view, create, edit, or full) for each permission.
- **MINIMUM SYSTEM LEVEL** – Contains the minimum valid level of permissions in the system. This level takes precedence in case it differs from the level in the Minimum Selectable Level column. This column is blank from most rows.

 **Note:** This worksheet doesn't show how different access levels affect each permission usage; it simply lists the minimum level required. Some permissions follow an access model where each level (view, create, edit, full) gives you more access to the related record type, task, or page, as described in [Access Levels for Permissions](#). But some permissions don't fit exactly into this model. For some permissions, you only need the minimum view level, and other levels don't give you any additional capabilities. In general, any user with at least VIEW access to a transaction type on the Transactions subtab, or to a record type on the Lists subtab, can print records of that type.

The worksheet lists some permissions multiple times because they give access to different record types, tasks, and pages. Note that some permissions depend on other permissions, and this spreadsheet doesn't include these dependencies.

Important: The contents of NetSuitePermissionsUsage.xls are subject to change. Data is current as of the date listed in the worksheet footer. This worksheet shows how each permission works on its own. But since most roles include many different permissions, it's important to review permission changes in the context of each role and to test them before deploying them to users in your account.

For a list of permission IDs to use with SuiteScript, see the help topic [Permission Names and IDs](#).

Two-Factor Authentication (2FA) is Required for Specific Permissions

Standard and custom roles with certain permissions need 2FA. For more information, see [Permissions Requiring Two-Factor Authentication \(2FA\)](#).

Feature Permissions Documentation

The following link provides you with Microsoft Excel worksheet listing the permissions associated with NetSuite features. You can use this list to see which roles have the permissions needed to access specific features. The spreadsheet format lets you search and sort fields however works best for you.

To access the worksheet, click this link: [FeaturesStandardRoles.xlsx](#).

The following topics contain information about permissions you need to access specific NetSuite features. The listings isn't a complete set of permissions help topics. You can find more permissions documentation in the Help Center, including details about the permissions needed to access different records or features. For general permissions documentation, see [NetSuite Permissions Overview](#).

NetSuite Roles Overview

A role is a defined access configuration. To set up and manage user access in NetSuite, you need the Administrator role so you can create roles to assign to users. Roles include sets of permissions for viewing and editing data. Roles and their permissions determine the pages users can see in NetSuite and the tasks that they can complete. Each role is linked to a center, a user interface designed for a specific business area.

See the following articles about roles:

- [Standard Roles](#)
- [Custom Roles](#)
- [Manage Roles Page](#)
- [Show Permission Differences Between Roles Page](#)
- [Role Search](#)

Note: You can set a user's role as Web Services Only. When a user logs in with a Web Services Only role, validation is performed to ensure that the user is logging in through web services and not through the user interface. For details, see the help topic [Setting a Web Services Only Role for a User](#).

Standard Roles

NetSuite offers many standard roles with predefined permissions. Most of these roles match common employee positions, such as Accountant and Sales Rep. There are also standard roles for vendors, partners, and customers who have account access. For more information, see [Standard Roles Permissions Table](#).

Custom Roles

You can't modify standard roles, so it's a good idea to use these roles as templates to create your own customized roles you assign to users in your account. Customizing a standard role is easier than creating a new role. If you assign custom roles instead of standard roles to users, you can update permissions to users' roles as needed. Being able to modify a role without updating each users' role assignments makes maintenance easier.

- For instructions for customizing roles, see [Customizing or Creating NetSuite Roles](#).

Note: Because they're intended as limited access roles, Retail Clerk roles, unlike other standard NetSuite roles, can't be customized. For details, see [Retail Clerk Roles](#).

- For information about changes you can make to roles, see the following:
 - [Changing Custom Roles](#)
 - [Inactivating Roles](#)
 - [Setting Default Forms for Roles](#)
 - [Restricting Accounts for Roles](#)
 - [Customizing the Customer Center Role](#)
 - [Setting Role-Based Preferences](#)
 - [Translating Custom Role Names](#)

Manage Roles Page

To see a list of roles available in your account, go to Setup > Users/Roles > Manage Roles to open the Manage Roles page. This page shows the center associated with each role and whether the role is standard or custom. For information about center types, see the help topic [Centers Overview](#).

Click **Customize** to create a custom version of a standard role. Click **Edit** to make changes to a custom role.

Role Search

You can use the role search to find a particular role or set of roles, or to get a list of roles and their details. To use this search, go to Setup > Users/Roles > Manage Roles > Search. You can also use role fields as criteria filters and results for Employee searches. For more information, see [Use Searches to Audit Roles](#).

Note: To see a list of all users assigned a particular role, go to Setup > Users/Roles > Manage Users, and select the role from the Role dropdown list at the bottom of the Manage Users page.

NetSuite Account Administration

The person who manages NetSuite for your organization is the main contact for NetSuite and your users. This person:

- Oversees the initial setup of NetSuite
- Manages the on-going administration of NetSuite

Key administrator tasks may include:

- Handles daily account maintenance and management

- Takes care of technical and system administration, including configuration and integration
- Acts as the point of contact for end users and NetSuite Support
- Helps users adopt the system and stay satisfied through training, support, and meeting their needs
- Plans, reviews, and customizes NetSuite to meet user needs
- Helps with data extraction through reporting and searches
- Monitors usage and system performance
- Makes sure account data is high quality, runs regular data audits, and fixes data integrity issues
- Develops tests, does functional testing, and rolls out customizations, custom objects, new enhancements, application releases, and system integration based on user or business needs

The person who administers NetSuite uses [The Administrator Role](#).

The Administrator Role

The person that signs up for a NetSuite account automatically gets the Administrator role. It's a powerful role and should only go to people who require full NetSuite functionality for their job. Usually, this is a small number of people. The Administrator role should be given to at least two people on an account. With at least two Administrator roles on an account, you can handle NetSuite tasks if someone's out of office or leaves the company. Even though you should have more than one administrator for an account, you should also choose your administrators wisely. Users with the Administrator role should have their transactions checked through audit trails in system notes.

As with other standard roles, you can't customize the standard Administrator role. You should create and use a custom administrator role instead of using the standard role.

The Administrator role gives you access to all tasks and pages in NetSuite, including:

- Full visibility into all areas of the NetSuite account
- Complete access to the Setup Manager, where you can handle common administrator tasks

Users with the Administrator role have to use two-factor authentication in new accounts. For information, see the help topic [2FA in the NetSuite Application](#).

You can find the standard Administrator role in the list of roles on the Manage Roles page. But since you can't customize the standard Administrator role, the **Customize** and **Edit** buttons are not available. The Administrator role page shows all system permissions with access level set to Full, or the highest access level available for the given permission. This provides a quick way to see everyone who has the Administrator role.

The Administrator role is a global role that applies to your entire NetSuite account. Other localized administrator roles, such as the Issues Administrator, Marketing Administrator, and Sales Administrator, only apply to certain areas of NetSuite.

 **Note:** Several administration permissions are separate from the Administrator role so that you can assign them to non-administrator roles. For more information, see [Separate Administration Permissions](#).

If you need a role that behaves like the standard Administrator role but limits access to sensitive information, consider using Core Administration Permissions. Core Administration Permissions is a set of permissions that mimics what the Administrator role can do. You can assign Core Administration Permissions to any role and restrict them as needed. For more information, see [Core Administration Permissions](#).

Separate Administration Permissions

You can assign several setup-type administration permissions to users who don't have the Administrator role. With these permissions, you can limit the number of Administrator roles by assigning these administrative tasks to other users. The available Setup permissions are:

- Enable Features
- Set Up Company
- View Billing
- View SOAP Web Services Logs
- Integration Application
- SuiteScript Scheduling

You can find these permissions on the role record's Permissions Setup tab.

 **Note:** If you need a role that behaves like the standard Administrator role but limits access to sensitive information, consider using Core Administration Permissions. Core Administration Permissions is a set of permissions that mimics what the Administrator role can do. You can assign Core Administration Permissions to any role and restrict them as needed. For more information, see [Core Administration Permissions](#).

Full Access Role (Deprecated)

 **Important:** The Full Access role was deprecated in the 2021.1 release as a security enhancement. You cannot assign the Full Access role to new users.

The Full Access role was deprecated because it became a redundant role as the roles and permissions options have greatly expanded. Here are a few tips for how to replace the Full Access role:

- If any users have another existing role in your account, which they can use instead of the Full Access role, assign this other role to them. For more information, see the help topic [Assigning Roles to an Employee](#).
- Analyze the needs of other users to determine the access granted by the Full Access role that is not available through existing roles or global permission assignments.
 - You can customize standard roles or create new custom roles as needed to provide users with the specific access they require. For more information, see [Customizing or Creating NetSuite Roles](#).
 - If you need a high-access role that you can assign to users, you can use the Administrator role. For more information, see [NetSuite Account Administration](#)
 - A new permission called Core Administration Permissions is available. This permission provides access to some of the same functions that were available to users with the Full Access role. You may be able to use Core Administration Permissions as an alternative to the Full Access role. For more information, see [Core Administration Permissions](#).
 - If the Global Permissions feature is enabled in your account, you can also assign additional global permissions to users as needed. Please note that usage of the Global Permissions feature is not preferred. For more information, see [Using the Global Permissions Feature](#).

The Full Access role is now inactive for users who had this role assigned before it was deprecated. The Full Access role no longer appears in the list of roles available for users who had this role assigned. A user with the Administrator role can make this role active again for a user, but the use of this role is not preferred.

Permissions Requiring Two-Factor Authentication (2FA)

Important: As of 2018.2, the requirement for 2FA for these administrative permissions is enforced in all NetSuite accounts. See the help topic [Mandatory Two-Factor Authentication \(2FA\) for NetSuite Access](#).

Administrative permissions that require 2FA include:

- Access Token Management (for Token-based Authentication)
- OAuth 2.0 Authorized Applications Management
- Core Administration Permissions (for more information, see [Core Administration Permissions](#))
- Two-Factor Authentication base (permission to designate roles as 2FA authentication required and specify the duration of trusted devices for those roles)

Note: Standard roles with the Two-Factor Authentication base permission include Marketing Administrator, Sales Administrator, Support Administrator, and System Administrator.

- Set Up OpenID Connect (OIDC) Single Sign-on
- Set Up OpenID Single Sign-on
- Set Up SAML Single Sign-on
- OIDC Provider Setup
- Integration Application
- Device ID Management
- View Unencrypted Credit Cards
- View Unencrypted ACH Account Numbers

For more information about required 2FA and Two-Factor Authentication, see the following:

- [Two-Factor Authentication \(2FA\)](#).
- [2FA in the NetSuite Application](#)

Note: If a role is already designated as a SAML Single Sign-on (SSO) role, the 2FA requirement is ignored. The requirement for SAML SSO authentication takes precedence.

Customizing or Creating NetSuite Roles

To create a custom role with the access you want users to have, you can either customize a standard role or make a new one. Complete the following tasks:

- [Customizing and Creating Roles](#)
- [Entering Basic Role Information](#)
- [Assigning Core Administration Permissions](#)
- [Restricting Role Access to Accounting Books](#)
- [Restricting Role Access to Subsidiaries \(OneWorld Only\)](#)
- [Setting Employee Restrictions](#)
- [Setting Department, Class, and Location Restrictions](#)
- [Setting a Role as Issue Role for Issue Management](#)
- [Setting a Role as Web Services Only Role](#)

- [Setting a Role as Single Sign-On Only Role](#)
- [Restricting a Role by Device ID](#)
- [Restricting a Role by IP Address](#)
- [Setting Two-Factor Authentication Requirements](#)
- [Setting Permissions](#)
- [Setting Default and Restricted Forms](#)
- [Setting Search Defaults for a Role](#)
- [Setting Role-Based Preferences](#)
- [Translating Custom Role Names](#)
- [Selecting a Dashboard for a Role](#)

After you create a custom role, you can assign it to users. A role's assigned users are listed on the Users subtab of the role record. See [NetSuite Users Overview](#).

Role customization options depend on which NetSuite product you've purchased and what features you've enabled. Some of the fields described in the steps below may not be available to you. For example, location restrictions aren't available for NetSuite Small Business users. Also, because they're limited access roles, Retail Clerk roles, unlike other standard NetSuite roles, can't be customized. For details, see [Retail Clerk Roles](#).

You can apply the class, department, location, and subsidiary restrictions that you set here to custom records. See the help topic [Applying Role-Based Restrictions to Custom Records](#).

Be aware that updates to the default role aren't pushed to custom instances of that role. You must manually update custom roles to include any new default role features. Additionally, when you enable a new feature for an account, permissions associated with that feature aren't automatically added to custom roles that existed prior to enabling the feature. You'll need to manually assign these permissions to any custom roles that existed before you enabled the feature.

Important: When the Advanced Employee Permissions feature is enabled, restrictions set on the Role page are only applicable to the Employee Record Full, Employee System Access, and Employee Administration permissions. The Employee Self, Employee Public, Employee Confidential, and Employee Compensation permissions ignore the restrictions set on this page. For more information, see the help topic [Advanced Employee Permissions Overview](#).

Customizing and Creating Roles

The following procedure describes how to customize or create a role.

To begin customizing or creating a role:

1. To customize a standard role, go to Setup > Users/Roles > Manage Roles, and on the Manage Roles page, click **Customize** next to a standard role. This type of custom role inherits all of the standard role's permissions to start; you can make changes as necessary.
2. To create a new role that does not start with a list of associated permissions, go to Setup > Users/Roles > Manage Roles > New.

Entering Basic Role Information

1. In the **Name** field, enter a name for this custom role.
This name should be something you recognize when assigning it to users.
2. If you use scripting, you can optionally enter an ID used for this role in scripts.

3. If you are creating a new role, select the center type to base the role on. The center type sets default permissions and access levels that you can customize below. (If you are customizing a standard role, the center type is predefined.)

The **Parent Role** field allows you to see from which standard role was your custom role created. When you click the parent role name, it opens in a new tab. You may not see the **Parent Role** field on older role records.

After you enter basic information for the role, set optional restrictions for the role.

To make a copy of an existing standard or a custom role:

1. As **Administrator**, go to Setup > Users/Roles > Manage Roles.
2. Click on **Customize** or **Edit** next to the role you want to copy.
3. Enter a different name in the **Name** field.
4. Click the drop down arrow for **Save** and click **Save As**.

Assigning Core Administration Permissions

You can use the Core Administration Permissions to customize a role so that it behaves almost like the Administrator role, while also restricting access to other areas of NetSuite with role permissions and restrictions. For example, with Core Administration Permissions you can create a role specifically for an IT administrator who's responsible for the general administration of the system, but who shouldn't have access to sensitive employee information.

The Core Administration Permissions feature is enabled on your account by default. For more information, see [Core Administration Permissions](#).

- To assign Core Administration Permissions to a role, check the **Core Administration Permissions** box.

Warning: Use caution when assigning Core Administration Permissions to a role, because the role will become similar to the standard Administrator role in terms of exclusive administrator privileges.

Administrator – No HR/Employee Access SuiteApp

The Administrator – No HR/Employee Access SuiteApp gives you access to the Administrator – No HR/Employee Access role. This role has all of the permissions included with the standard Administrator role, except for any permissions associated with employee information. For example, the Administrator – No HR/Employee Access role doesn't include the Time-Off Administration, Payroll Items, and Employee Record permissions. You can use the Administrator – No HR/Employee Access SuiteApp as an alternative to customizing a standard role and as the starting point for creating a Core Administration Permissions administrator role.

Note: You don't need to install the Administrator – No HR/Employee Access SuiteApp to assign the Core Administration Permissions to a role.

Note: From June 2019, SuitePeople HR and U.S. Payroll include an Administrator – No HR/Employee Access role that allows administrative functionality while controlling access to sensitive employee data. Please see your SuiteSuccess SuitePeople Leading Practices for more information, and review the role in your environment.

You can search for the Administrator – No HR/Employee Access SuiteApp using the following information:

- Bundle name: Administrator – No HR/Employee Access
- Bundle ID: 387772

For more information about installing SuiteApps, see the help topic [Installing a Bundle](#).

After you install the Administrator – No HR/Employee Access SuiteApp, you can customize the role on the Manage Roles page. You can assign the role to employees on the Employees page.

Restricting Role Access to Accounting Books

You can choose which accounting books users can access based on their role. Users with a role that has access to an accounting book can post transactions to that book or see its reports. You can use this feature to give a role access to all accounting books, and users with this role will automatically have access to new accounting books as they're created.

To set accounting book access by role:

1. Go to Setup > Users/Roles > User Management > Manage Roles and select or create a role.
2. In the role record, go to the Accounting Books section and select one of the following in the Selected Accounting Books field:
 - **All** - This role can see all accounting books
 - **Primary** - This role can see only the primary accounting book
 - **Primary and Selected** - This role can see the primary accounting book and any secondary books you select. When you select this option, an **Accounting Book** field appears where you can select which secondary books the role has access to.
3. Click **Save**.

Restricting Role Access to Subsidiaries (OneWorld Only)

If you have NetSuite OneWorld, you can use subsidiary restrictions to restrict what users with this role can access.

When you restrict role access to subsidiaries, consider the following:

- By default, the subsidiary restrictions is set to **User Subsidiary**.
- Only a role with access to all subsidiaries assigned for a department can edit that department.

To restrict role access to specific subsidiaries:

1. Go to Setup > Users/Roles > User Management > Manage Roles
2. Click **Edit** next to the role whose access you want to restrict.
3. Go to Subsidiary Restrictions, and choose one of the following options:
 - **All** – Grants the role access to all subsidiaries, including inactive subsidiaries.
 - **Active** – Grants the role access to the active subsidiaries only.
 - **User Subsidiary** – Restricts the role's access to the user's subsidiary only. When users log in with this role, they can only access their own subsidiary. A user's subsidiary is set on the employee record. For more information, see the help topic [Assigning a Subsidiary to an Employee](#).

- **Selected** – Grants the role access to one or more subsidiaries.
- 4. If you choose **Selected**, in the auto-generated list of active and inactive subsidiaries, select the subsidiaries that you want the role to have access to. To select multiple subsidiaries, hold down the **Ctrl** key while selecting subsidiaries.
- 5. To allow users logged in with this role to see, but not edit, records for subsidiaries to which the role does not have access, check the **Allow Cross-Subsidiary Record Viewing** box. You cannot use this setting to view employee payroll or commissions data.

 **Note:** If the Book Record Restriction option is enabled for a user, this restriction overrides permissions granted by the Allow Cross-Subsidiary Record Viewing option.

The user with this edited role must log out of NetSuite and log in again to see the changes in the restrictions.

Setting Employee Restrictions

In the **Employee Restrictions** field, you can restrict this role's access to transaction, customer, and employee records, based on values in the employee, sales rep, and supervisor fields on these records. The restrictions you set here might also limit the values that users with this role can assign to these fields on records. These restrictions don't affect access to contact records.

- **none - no default** – There is no restriction on what can be selected. Record access is not determined by this field. A default selection does not appear.
- **none - default to own** – There is no restriction on what can be selected. Record access is not determined by this field. Fields of this type will select the user by default.
- **own, subordinate, and unassigned** – Users are restricted when selecting any of the employee, sales rep, or supervisor fields. Users are granted access to records belonging to their supervisor hierarchy. Users may only select themselves or their subordinates. If the select field is optional, then the user may leave the value unassigned. Note that unassigned is technically a null value when used for filtering.
- **own and subordinates only** – Users are restricted when selecting any of the employee, sales rep, or supervisor fields. Users are granted access to records belonging to their supervisor hierarchy with the exception of unassigned records. Consequently, unassigned records are filtered and denied access. Users may only select themselves or their subordinates.

 **Note:** In some cases, a role might include both the own and subordinates only restriction and the process payroll and commit payroll permissions. In this case, to ensure that the user can create a payroll batch and view all the employees who are included in the payroll batch, the process payroll and commit payroll permissions override the own and subordinates only restriction.

 **Important:** These restrictions can also be used to restrict access to custom records, based on values in an Employee list/record custom field, if the **Apply Role Restrictions** box is checked for the field. See the help topic [Applying Role-Based Restrictions to Custom Records](#).

Check the **Allow Viewing** box to allow users logged in with this role to see, but not edit, data for employees to which the role does not have access.

- Note that this setting does not allow viewing of employee payroll or commissions data. Also, users cannot view non-subordinate employee records other than their own record when the **Employee Restrictions** field is set to **own and subordinates only**.

Check the **Do Not Restrict Employee Fields** box to allow users with this role to select any employee in employee fields.

- For example, a sales manager could select any sales rep in the **Sales Rep** field on a customer record even if that sales rep is part of another team.

Check the **Restrict Time and Expenses** box to restrict the time and expenses employees with this role can enter, edit, and view when you add the Track Time and Expense Report permissions.

- Employees with this role will not be able to enter or edit expense reports or time transactions on behalf of other employees.
- Employees with this role will be able to view expense reports and time transactions for their subordinates.
- Reports and searches will only return time or expense transactions entered by the employee or their subordinates. Class, department, location, and subsidiary restrictions will not be applied for expense and time transactions.

 **Note:** Clearing the **Restrict Time and Expenses** box enables this role to enter, edit, and approve time transactions and expense reports for all other employees when you add the Track Time and Expense Report permissions.

If you have set restrictions in the **Employee Restrictions** field, check the **Sales Role** box if employees using this role should be restricted based on the **Sales Rep** field on records and transactions.

If you use the Customer Service and Support feature and have set restrictions in the **Employee Restrictions** field, check the **Support Role** box if employees using this role should be restricted based on the **Assigned To** field on cases.

If you use the Partner Relationship Management feature and have set restrictions in the **Employee Restrictions** field, check the **Partner Role** box to restrict partners to records and transactions based on the **Partner** field.

Setting Department, Class, and Location Restrictions

If your account has the respective feature enabled, you can restrict this role's access to transaction, employee, partner, and optionally item records, based on the values in the Department, Class, and Location fields on these records. Limit the set of available values of Department, Class, and Locations that users can assign to these records using restrictions. Department, Class, and Location restrictions can be defined per role and then applied to all users logged in with that role.

To set Department, Class, and Location restrictions, click the **Restrictions** subtab. On the Restrictions subtab, set the following fields:

- **Segment** – Select the Segment by which to restrict the role. Select either Class, Department, or Location.
- **Restrictions** – Select the appropriate restriction level for the role:
 - **none - default to own** – There is no restriction on what can be selected. Record access is not determined by this field. Fields of this type will select the user by default.
 - **own, subordinate, and unassigned** – Users are restricted to records with their own location/department/class, children records of their location/department/class, and records with unassigned location/department/class field. For example, if your role has access to department A, you can only see accounts in department A, as well as its children or unassigned accounts.
 - **own and subordinates only** – Users are restricted to records with their own location/department/class and children records of their location/department/class. For example, if your role has access to location B, you can only see records with location B, as well as its children.

- **Allow Viewing** – Check this box to allow users logged in with this role to see, but not edit, data for departments, classes and locations to which the role does not have access. Note that this setting does not allow viewing of employee payroll or commissions data. Also, users cannot view non-subordinate records other than their own department, class or locations records when the **Restrictions** field is set to **own and subordinates only**.
- **Apply To Items** – Check this box to apply the department, class and locations restrictions defined here to item records, in addition to transaction, employee, and partner records.

 **Important:** Any account in the Chart of Accounts list that does not have an assigned department is not subject to the **own, subordinate, and unassigned** or **own and subordinates only** restrictions.

 **Important:** In NetSuite OneWorld, subsidiary restrictions automatically apply to departments. For example, if Department A is assigned to only Subsidiary X and a role is restricted to Subsidiary X, users with that role have access to only Department A, even if that role does not have any department restrictions.

You can also apply role-based, class restrictions to custom records. For more information, see the help topic [Applying Role-Based Restrictions to Custom Records](#).

Setting a Role as Issue Role for Issue Management

If you use the Issue Management feature and want employees with this role to work with issues, select the issue role in the **Issue Role** field.

Setting a Role as Web Services Only Role

If a role is designed to be used by programs that integrate with NetSuite through web services, check the **Web Services Only Role** box to allow NetSuite account access but disallow UI access and privileges.

This setting prohibits a user from accessing the user interface with permissions and privileges that are created specifically for web services development, adding to the security of your integration. For more details, see the help topic [Setting a Web Services Only Role for a User](#).

Setting a Role as Single Sign-On Only Role

If the role is designed to be used by users accessing NetSuite through inbound single sign-on from an external user-authenticating application, check the **Single Sign-On Only** box to allow NetSuite account access only through an inbound single sign-on mechanism (either certificate-based or OpenID).

This setting prohibits a user from accessing NetSuite through web services or the user interface without going through inbound single sign-on. This type of role supports strict control of credentials from the external application.

 **Important:** You cannot use NetSuite for Outlook with a Single Sign-on Only role.

Restricting a Role by Device ID

If you use the Restrict by Device ID feature, check the **Restrict by Device ID** box at Setup > Users/Roles > Manage Roles to allow access to this role only from the listed devices.

For more information, see the help topic [Device ID Authentication](#).

Restricting a Role by IP Address

If you use the IP Address Rules feature, check the **Restrict this role by IP Address** box at Setup > Users/Roles > Manage Roles to allow access to this role only from the IP addresses listed at .

For more information, see the help topic [Enabling and Creating IP Address Rules](#).

 **Note:** Oracle NetSuite does not support traffic that is routed through a split-tunnel Virtual Private Network (VPN) to control user access to NetSuite. For more information, see the help topic [VPN Configuration for User Access to NetSuite](#).

Setting Two-Factor Authentication Requirements

If the role requires two-factor authentication, enter the following settings:

- Select the type of authentication required in the **Two-Factor Authentication Required** field.
- In the **Duration of Trusted Device** field, select the length of time before a device a user has marked as trusted will be subject to a two-factor authentication request.

For more information about two-factor authentication, see the help topic [Two-Factor Authentication \(2FA\)](#).

Setting Permissions

 **Important:** If you have enabled the Advanced Employee Permissions feature in your NetSuite account, see the help topic [Advanced Employee Permissions](#) for more information.

- From the Role page, you can set permissions on the **Permissions** subtab. Permissions are divided into four different types on the **Transactions**, **Reports**, **Lists**, **Setup**, and **Custom Record** subtabs.
 - To view the permissions for a role, log in as an Administrator and go to Setup > Users/Roles > User Management > Manage Roles. On the Manage Roles page, choose a role. Click **Edit** to add permissions to a custom role or click **Customize** to create a custom role from a standard role. On the Role page, the Permissions subtab displays the role's permissions.
 - To add a permission, click a line in a list, click **Insert**, and select a permission. Or you can click the blank line at the bottom of a list, select a permission, and click **Add**.
 - To remove a permission, click it in a list, and click **Remove**.
 - To set the level of access for a permission, click a line in a list and select from the **Level** column. For information about these levels, see [Access Levels for Permissions](#).
 - For Custom Record permissions only, you can select a value in the **Restrict** column to limit this role's access to custom records. (Each custom record permission provides access to a custom record type.)
 - Select **Viewing and Editing** to restrict users with this role to viewing or editing only the records of this type that they or their subordinates created.
 - Select **Editing Only** to restrict users with this role to editing only the records of this type that they or their subordinates created. They can view all records of this type.
 - Leave this column blank to allow users with this role to view and edit all records of this type.

The custom record restrictions you set on this subtab are also available on the record for each custom record type. Changes made on custom record type records related to this role's permissions are reflected here. See the help topic [Setting Permissions for a Custom Record Type](#).

Important: When you newly enable a feature in your account, you must consider permissions associated with the added feature. Customized roles that you have already assigned to users may need to be updated to reflect the proper permissions associated with the added feature. See the help topic [Enabling Features](#).

For general information about permissions, see [NetSuite Permissions Overview](#). For access to a list of NetSuite permissions and their related tasks and records, see [Permissions Documentation](#).

A mass update is available to add, remove, or change the level of a permission for multiple custom roles simultaneously. See [Mass Updating a Permission on Custom Roles](#).

Important: If you have enabled the Advanced Employee Permissions feature in your NetSuite account, see the help topic [Advanced Employee Permissions](#) for more information.

Setting Default and Restricted Forms

- Click the **Forms** subtab to set default forms for a role, or to restrict a role to only using certain forms. On each of the following subtabs, **Transaction**, **Entity**, **CRM**, **Item**, **Other Record**, **Custom Record**, **Time**, **Bill of Materials**, and **Inventory Detail**, you can do the following:

- Check the box in the **Enabled** column next to the forms you want to make available to users with this role. (Not available for Customer Center roles.)

If you disable all forms for a record or transaction type, users with this role will use the standard form.

- Check the box in the **Preferred** column next to the forms you want the role to use by default.
- If you want to restrict the role to only the forms you mark as preferred, check the box in the **Restricted** column. (Not available for Customer Center roles.)

Note the following about marking a transaction or CRM form Preferred for the Customer Center role:

- External forms, meaning forms with names appended with (External), can be marked Preferred for the Customer Center roles, but not for other roles.
- Forms that are not external cannot be marked as Preferred for Customer Center roles, so they are not listed on the Forms tab of Customer Center role records.

Setting Search Defaults for a Role

Click the **Searches** subtab to set saved search definitions to be used as defaults for the search forms, search results, list views, sublist views, and dashboard views available to a role. For each kind of view, you also can make the selected saved search the only one available for a record type.

You make these selections by record type. When you select a record type on the Standard or Custom Record subtab, you can do the following:

- In the **Search Form** column, select a saved search to simplify the default search form for the selected record type.

By default, the simple search form for each record type displays a system-defined set of fields that can be used as filters. Selecting a saved search here applies the saved search's available filters to be the only fields on this form for this role.

A preferred search form also can be defined on a saved search record. See the help topic [Defining a Saved Search as a Preferred Search Form](#).

- In the **Search Results** column, select a saved search to be applied to the default global and quick search results for the selected record type.

This option applies all saved search settings, including criteria, results, and available filters, to the global and quick search results for the selected record type, for this role.

Preferred search results also can be defined on a saved search record. See the help topic [Defining a Saved Search as Preferred Results](#).

3. In the **List View** column, you can select a saved search to be the default list view for the selected record type. To make that saved search the only list view available, check the **Restricted** box.

For each record type that is available in a list, a system-defined set of columns displays by default. The displayed set of records and fields is called a list view. The selection of a saved search here overrides the system default definitions.

4. In the **Sublist View** column, you can select a saved search to be the default sublist view for the selected record type. To make that saved search the only sublist view available, check the **Restricted** box.

Some record lists may be displayed on a subtab of another record. For example, a list of transactions may display on the **History** subtab of an item record. This type of list is called a sublist. The selection of a saved search here overrides the system default definitions.

5. In the **Dashboard View** column, you can select a saved search to be the default view in a dashboard List portlet for the selected record type. To make that saved search the only dashboard view available, check the **Restricted** box.

A record list displayed in a List portlet on the dashboard is called a dashboard view. The selection of a saved search here overrides the system default definitions.

For general information about views, see the help topic [Working with List Views, Sublist Views, and Dashboard Views](#). For information about saved searches as views, see the help topic [Using a Saved Search as a View](#).

Setting Role-Based Preferences

Users with the Administrator role can set preferences that tailor NetSuite accounts to the needs of a particular role. The preferences set for a role serve as the defaults for any account users who log in with that role. Role-based preferences are defined on the Preferences subtab of a custom role record.

To set role-based preferences:

1. Click **Edit** next to a custom role or Customize next to a standard role.
2. On the **Preferences** subtab, select a preference, choose the desired value in the popup, and click Add.

 **Note:** If a customer who has only the Customer Center role assigned to them specifies a color theme, this color scheme is not used and the theme set up as the default is used instead.

3. Repeat step 3 to set additional preferences as desired.
4. Click **Save**.

Role-Based Preferences vs. Other Preference Levels

The same preferences that can be set for roles also can be set by individual users for themselves only at Home > Set Preferences. Role-based preferences are not intended to override any preferences explicitly set by an individual user. If a user has set a preference to a value other than the system default, company

default, or subsidiary default, the corresponding role-based preference is not applied when that user logs in with that role.

Some role-based preferences are also available at the company level, and in NetSuite OneWorld accounts, at the subsidiary level. A role-based preference overrides the system default setting, the corresponding company-level preference, if any, and the corresponding subsidiary-level preference, if any. Note that if a company preference has been set not to allow override, it is not available to be set as a preference on role records.

For more information, see the help topic [NetSuite Preference Levels Overview](#).

Translating Custom Role Names

If the Multi-Language feature is enabled in an account, users with the Administrator role can define translations for custom role names so they match the language of the NetSuite user interface. Note that NetSuite provides translations for standard role names.

When the NetSuite user interface is set to a different language, translated role names display in roles lists, including the popup that displays when a user clicks the icon next to the current role in the upper right corner.

Before you can translate roles names, you need to select translation languages at Setup > Company > General Preferences, on the Languages subtab. For details, see the help topic [Configuring Multiple Languages](#).

Note: The Languages subtab at Setup > Company > General Preferences lists both system-supported languages that can be used for the NetSuite user interface (and are available at Home > Set Preferences), and additional languages that can be used for website translations only (and are not available at Home > Set Preferences). You should only enter translations for role names in system-supported languages, because these are the only languages that can be displayed in the user interface.

After you have selected languages, you can enter translations on custom role pages, either when you first create a role, or when you later edit it.

To define translations for an existing custom role name:

1. Go to Setup > Users/Roles > Manage Roles.
2. Click **Edit** next to the role name that needs translations.
3. On the role page, enter translated role names on the **Translation** subtab.

Note: The name of a custom role in the Name field is always displayed in the default language of your company.

Selecting a Dashboard for a Role

Consider the following information when you select a dashboard for a role.

- For a standard role, click the **Dashboard** subtab to select a published dashboard to be used by the role.
Only dashboards that have been published to the role's assigned center are available. See the help topic [Publishing Dashboards](#).
- For a custom role, click the **Dashboard** subtab to view the dashboard currently published to the role. Dashboards cannot be published from the Dashboard tab of a custom role. Publishing a dashboard to a custom role can only be done from the Publish Dashboard link in the Home Settings portlet.

Changing Custom Roles

After you customize a role, you may later decide that you want to edit or inactivate it.

Note: If you assign an additional role to a user who is currently logged in to NetSuite, that user will need to log out and log back in to NetSuite to see the newly assigned role. The same is true if you add permissions to an existing role while a user is currently logged in to NetSuite. The user needs to log out and log back in to exercise the new permissions.

To edit a custom role:

1. Go to Setup > Users/Roles > Manage Roles.
2. Click **Edit** next to the role you want to change.
3. On the **Role** page, make desired changes, including:
 - [Restricting Role Access to Accounting Books](#)
 - [Restricting Role Access to Subsidiaries \(OneWorld Only\)](#)
 - [Setting Employee Restrictions](#)
 - [Setting Department, Class, and Location Restrictions](#)
 - [Setting a Role as Issue Role for Issue Management](#)
 - [Setting a Role as Web Services Only Role](#)
 - [Restricting a Role by IP Address](#)
 - [Setting Permissions](#)
 - [Setting Default and Restricted Forms](#)
 - [Setting Search Defaults for a Role](#)
 - [Setting Role-Based Preferences](#)
 - [Translating Custom Role Names](#)
 - [Selecting a Dashboard for a Role](#)
4. Click **Save**.

If you edit a custom role after you've assigned it to employees or vendors, the changes are automatically updated.

Note: A mass update is available to add, remove, or change the level of a permission for multiple custom roles simultaneously. See [Mass Updating a Permission on Custom Roles](#).

Using SDF and Copy to Account to Copy Customized Roles

You can use SuiteCloud Development Framework (SDF) to manage custom objects as part of file-based customization projects. For information about SDF, see .

You can use the Copy to Account feature to copy a customized role to another of your accounts. To copy a customized role, follow the instructions to edit a custom role, and click **Copy to Account** on the **Role** page.

Inactivating Roles

You can inactivate custom or standard roles that you do not want to use in your account.

When you inactivate a role, you can no longer select it in the Role field on records, and those assigned to the role can no longer access your account with that role.

 **Warning:** If you inactivate the only role an employee is assigned, you can lock that person out of your account. Before inactivating a role, go to Setup > Users/Roles > Manage Users to view who may be assigned to that role.

To inactivate a custom or standard role:

1. Go to Setup > Users/Roles > Manage Roles.
2. Check the **Show Inactives** box at the top of the list.
3. In the **Inactive** column, check the box next to any role you want to inactivate.
 To prevent errors in the website, you cannot inactivate the standard Customer Center role after you enable the Web Site feature.
 If this role was inactivated before the Web Site feature was enabled, you must temporarily disable the Web Site feature, activate the standard Customer Center role again, and enable the Web Site feature again.
 You will not lose website data in this process.
4. Click **Submit**.

You can delete a custom role if it is not currently assigned to any users AND if has never been used to log in to NetSuite. If a role has previously been used to log in, or is currently assigned to any users, you need to inactivate the role rather than delete it.

Setting Default Forms for Roles

You can set default forms for your users by customizing roles and assigning them to your users. This lets you tailor the level of access you want to give to users.

A role is a set of permissions that lets customers, vendors, and employees access specific areas of your data. You assign roles on customer, vendor, and employee records.

By setting a default form for your users you can control the entry and transaction forms they use to enter data. Note that Employee Center roles are given limited access to forms such that only one form is ever made available to this type of role. For other types of roles, in addition to setting a default, you can also restrict access to particular forms.

For example, you can set a custom case entry form as the only form your support reps can use. This maintains consistency in your company and lets you capture the information that is most important for your business.

 **Note:** To make a custom transaction or entry form a default form, you must first customize and save your forms.

See [To Set a Default Form for Roles](#) for the procedure.

To Set a Default Form for Roles

1. Go to Setup > Users/Roles > Manage Roles.

2. Click **Customize** next to the role you want to set a form for.
3. Enter a name for your custom role.
4. Click the **Forms** subtab.
5. Click the section you want to set default forms for.
 - **Transaction** – Set default forms for transactions such as cash refunds, cash sales, invoices, and sales orders.
 - **Entity** – Set default forms for the records you keep for people and companies in NetSuite, such as employees and customers.
 - **CRM** – Set default forms for CRM-related activities and records such as campaigns, cases, events, and tasks
 - **Time** – Set default forms for time entries.
 - **Item** – Set default forms for item records.
 - **Other Record** – Set default forms for other types of records, such as competitor records.
6. In the **Enabled** column, clear any boxes for forms this role should not have access to. (not available for Customer Center roles)
 If you disable all forms for a record or transaction type, users with this role will use the standard form.
7. Check the box in the **Preferred** column next to any form that should be the default for this role.

 **Note:** Be aware of the following about marking a transaction or CRM form Preferred for Customer Center roles: External forms, meaning forms with names appended with (External), can be marked Preferred for Customer Center roles, but not for other roles. Forms that are not external cannot be marked as Preferred for Customer Center roles, so they are not listed on the Forms tab of Customer Center role records.

8. To have this form to be the only form available to this role, check the box in the **Restricted** column.
9. Click **Save**.

If you set default forms and do not make the defaults restricted, your users can still change the form they use when they are entering transactions or records.

After you have set default forms, you need to assign your customized roles to your employees. You can assign roles on the Access subtab of employee records.

Restricting Accounts for Roles

You can restrict your accounts by classes, departments, or locations, to control the accounts with which employees work. If you use NetSuite OneWorld, you also can restrict roles by subsidiary. For more information, see [Customizing or Creating NetSuite Roles](#).

For example, Jennifer Sawyer, A/R manager for Wolfe Electronics' Japan location, has her accounts restricted to include only her local bank account. This account appears by default when she accepts customer payments. This increases Sawyer's efficiency and reduces her chances of making data-entry errors.

To restrict access to accounts, you first set restrictions on account records. By default, NetSuite roles do not restrict users by class, department, or location. To restrict accounts, you must set up both account restrictions and role restrictions.

See the following procedures:

- [To Set Account Restrictions](#)

■ To Set Role Restrictions

To Set Account Restrictions

1. Go to Lists > Accounting > Accounts.
2. Click **Edit** next to the account you want to restrict.
3. To restrict the account by department, select a department in the **Restrict to Department** dropdown list.
4. To restrict the account by class, select a class in the **Restrict to Class** dropdown list.
5. To restrict the account by location, select a location in the **Restrict to Location** dropdown list.
6. If you use NetSuite OneWorld, to restrict the account by subsidiary, select a subsidiary in the **Subsidiaries** dropdown list.
7. Click **Save**.

To Set Role Restrictions

1. Go to Setup > Users/Roles > Manage Roles.
2. Do one of the following:
 - To customize a standard role, click **Customize** next to the role you want to change.
 - To edit a customized role, click **Edit** next to the role you want to change.
3. Click the **Restrictions** subtab.
4. In the **Segment** dropdown list, select **Class**, **Department**, or **Location**.
5. In the **Restrictions** dropdown list, select one of the following restrictions:
 - **none - default to own** – There is no restriction on what can be selected. Record access is not determined by this field. Fields of this type will select the user by default.
 - **own, subordinate, and unassigned** – Users are restricted to records with their own location/department/class, children records of their location/department/class, and records with unassigned location/department/class field. For example, if your role has access to department A, you can only see accounts in department A, as well as its children or unassigned accounts.
 - **own and subordinates only** – Users are restricted to records with their own location/department/class and children records of their location/department/class. For example, if your role has access to location B, you can only see records with location B, as well as its children.

Important: Any account in the Chart of Accounts list that does not have an assigned department is not subject to the **own, subordinate, and unassigned** or **own and subordinates only** restrictions.

6. To allow users logged in with this role to see, but not edit, data for departments to which the role does not have access, check the **Allow Viewing** box. You cannot use this setting to view employee payroll or commissions data. Also, users cannot view non-subordinate department records other than their own department records when the **Department Restrictions** field is set to **own and subordinates only**.
7. To apply the department restrictions defined here to item records (in addition to transaction, employee, and partner records), check the **Apply to Items** box.
8. If you have NetSuite OneWorld, you can use subsidiary restrictions to restrict what users with this role can access. Under **Subsidiary Restrictions**, select one of the following options:
 - **All** – Grants the role access to all subsidiaries, including inactive subsidiaries.
 - **Active** – Grants the role access to the active subsidiaries only.

- **User Subsidiary** – Restricts the role's access to the user's subsidiary only. When users log in with this role, they can only access their own subsidiary. A user's subsidiary is set on the employee record. For more information, see the help topic [Assigning a Subsidiary to an Employee](#).
 - **Selected** – You select the subsidiaries to which you want to restrict the role's access. When you choose Selected, you need to select the subsidiaries from an autogenerated list of all of the active and inactive subsidiaries. You must select at least one subsidiary. To select multiple subsidiaries, hold down the **Ctrl** key while selecting subsidiaries.
9. To allow users logged in with this role to see, but not edit, records for subsidiaries to which the role does not have access, check the **Allow Cross-Subsidiary Record Viewing** box. You cannot use this setting to view employee payroll or commissions data.

 **Note:** If the Book Record Restriction option is enabled for a user, this restriction overrides permissions granted by the Allow Cross-Subsidiary Viewing option.

10. Click **Save**.

Customizing the Customer Center Role

Customize the Customer Center role to adjust the level of access customers have in the center. You can remove links to transactions or records or limit access to only viewing instead of editing or creating.

The Customer Center role is also applied to the My Accounts section of your website. For information about setting forms to use in your website, see the help topic [Shopping Preferences](#).

Customizing this role also enables you to ensure a customer uses a custom form when entering sales orders or making payments in the center.

 **Note:** After you create a custom Customer Center role, you will need to manually assign this role to each customer that you want to use it, on the Access subtab of each customer record.

 **Note:** Users with NetSuite specialized center roles can see only files on records they have access to, and files with the Company-Wide Usage, or the Available Without Login preferences enabled. For more information, see the help topics [NetSuite Specialized Centers](#) and [Permissions and File Cabinet Files](#).

See [To Customize the Customer Center Role](#) for the procedure.

To Customize the Customer Center Role

1. Go to Setup > Users/Roles > Manage Roles.
2. Click **Customize** next to Customer Center.
3. In the **Name** field, enter a name for this new custom role.
You select this name when you assign the role on customer records.
4. Click the **Permissions** subtab.
 - a. On the **Transactions**, **Lists**, and **Setup** subtabs, click the name of the task to which you want to change access.
 - b. In the **Level** column, adjust the permission level for the task.
 - c. Click **Edit**.
 - d. Repeat these steps for each task you want to edit the access level for.

5. Click the **Forms** subtab, and on the **Transaction** and **CRM** subtabs, check the box in the **Preferred** column next to the form you want customers to use in the Customer Center. This overrides the preferred form selected on the Transaction Forms page.
 - The Customer Center and My Account section of your website use the transaction and entry forms marked as (External) in the Custom Forms list. Note the following:
 - External forms, meaning forms with names appended with (External), can be marked Preferred for Customer Center roles, but not for other roles.
 - Forms that are not external cannot be marked as Preferred for Customer Center roles, so they are not listed on the Forms tab of Customer Center role records.
 - When a non-online order form is marked Preferred for Customer Center, it is saved as the form for the order. However, an online form is not saved as the form for an order, even if it is preferred; instead the preferred non-online order form is used.

Note: To create custom forms for transactions, go to Customization > Forms > Transaction Forms. Custom transaction forms must use Basic printing for Customer Center roles. To create custom forms for records, go to Customization > Forms > Entry Forms.

6. Click the **Searches** subtab.
 - a. To publish a custom search form or custom search results in the Customer Center, select the type of record or transaction to search.
You must already have a public saved search to publish a search form or results in the Customer Center. The fields you select on the **Filters** subtab of the saved search record are used by the customer to set criteria on search forms.
 - b. To publish a search form, select the name of the saved search in the **Search Form** column.
 - c. To allow customers to view search results as a list, select the name of the saved search in the **List View** column. Searches must be marked both Public and Available as List View to be selected here.
For example, a public transaction saved search marked Available as List View allows customers to view transactions matching the criteria of the search in their transaction lists.
 - d. To allow customers to view search results in a list on the Customer Center dashboard, select the name of the saved search in the **Dashboard View** column. Searches must be marked both Public and Available as Dashboard View to be selected here.
 - e. To allow customers to view search results in subtab lists, select the name of the saved search in the **Sublist View** column. Search must be marked both Public and Available as Sublist View to be selected here.
 - f. Check the box in the **Restricted** column to only allow customers to view the results of this search in the list view, dashboard view or sublist view, respectively.
If you clear this box, customers can select this view in a View filter at the bottom of the list, and the list of all the customer's transactions or records for that page is shown by default.
7. Click the **Preferences** tab to set preferences for the custom center role. The preferences set here are applied to new users assigned to a role and to existing users in a role who have not previously set that preference. See the help topic [Setting Personal Preferences](#).

Retail Clerk Roles

The Retail Clerk and Retail Clerk (Web Services Only) roles are specialized roles intended to provide limited access for users to implement point-of-sale workflows.

Users can be assigned the Retail Clerk role to complete point-of-sale tasks in the NetSuite user interface. The Retail Clerk (Web Services Only) is intended for use in web services transactions and is marked as a Web Services Only role. For details about Web services roles, see the help topic [Setting a Web Services Only Role for a User](#).

Because they are intended for limited access, these roles differ from other NetSuite standard roles in the following respects:

- The permissions for these roles cannot be customized. To review the permissions assigned to these roles, see the following roles in [Standard Roles Permissions Table](#):
 - Retail Clerk
 - Retail Clerk (Web Services Only)
- These roles are provisioned differently than other standard roles. Users assigned these roles may be counted differently than users assigned other roles, as described below:
 - If a user is assigned the Retail Clerk role or Retail Clerk (Web Services Only) role and any other full access role, the user counts as one Retail Clerk.
 - If a user is assigned the Retail Clerk role or Retail Clerk (Web Services Only) role and any other non-Employee Center role, the user counts only as a full access user, but not as a Retail Clerk.
 - If a user is assigned the Retail Clerk role or Retail Clerk (Web Services Only) role and an employee center role, the user counts as both a Retail Clerk and Employee Center.

Specialized User: View and Approve Role

The Specialized User: View and Approve standard role gives users limited access to NetSuite. Users with this role can do basic tasks, such as viewing or approving of reports, but cannot view payroll or employees' records. Users with this role also cannot transact within NetSuite but can approve the following transactions:

- Invoice Approval
- Journal Approval
- Return Authorization Approval
- Sales Order Approval
- Transfer Order Approval
- Vendor Bill Approval
- Vendor Payment Approval
- Vendor In-Transit Payment Approval
- Vendor Return Authorization Approval
- Blanket Purchase Order Approval (Procurement Management Cloud Service license required)
- Purchase Contract Approval (Procurement Management Cloud Service license required)
- Requisition Approval (Procurement Management Cloud Service license required)

For example, this role could be granted to a manager who needs to view the team's performance and approve requisitions but doesn't need to do any other task within NetSuite.

For information about how to assign this role to an employee, see the help topic [Assigning Roles to an Employee](#)

Customizing the Specialized User: View and Approve Role

You can customize this role by creating a custom role based on the Specialized User: View and Approve role. For more information, see [Customizing and Creating Roles](#)

You can remove permissions but cannot add any permissions outside the standard role. Additionally, you cannot grant greater access than the standard permissions allow. However, you can reduce access levels as needed. If users need to access permissions that are not available in this user type, please contact your NetSuite account manager to purchase a general access license. To see which permissions are included in the Specialized User: View and Approve role, see [Specialized User: View and Approve](#).

Specialized User: CRM Role

The Specialized User: CRM role is a standard role with predefined permissions which enables you to manage sales, CPQ, marketing, support, and other CRM activities.

CRM users, such as marketing employees, sales reps, and support reps, who only need to access the functionalities relevant to their roles can benefit from using this role.

For a detailed list of the default permissions and their access levels, see [Specialized User: CRM](#).

To assign this role to an employee, see the help topic [Assigning Roles to an Employee](#).

Customizing the Specialized User: CRM Role

You will need to customize this role by creating a custom role based on the Specialized User: CRM role. This allows you to limit or modify the standard permissions to fit user needs. For more information, see [Customizing and Creating Roles](#) and [Setting Permissions](#).

You can remove permissions but cannot add any permissions outside the standard role. Additionally, you cannot grant greater access than the standard permissions allow. However, you can reduce access levels as needed. If users need to access permissions that are not available in this user type, please contact your NetSuite account manager to purchase a general access license.

It is best practice to distinguish custom roles by including "Specialized User: CRM" in the name.

Important: If you do not use SAML SSO to access NetSuite, you must customize the role to remove the **SAML Single Sign-on** permission. Otherwise, you may encounter an error since the role has full access to **SAML Single Sign-on**.

Managing the Specialized User: CRM Role

Assigning only the standard or a custom Specialized User: CRM role to an employee counts toward Specialized User: CRM usage. Assigning it along with other general access roles counts toward general access usage instead.

You can assign multiple Specialized User: CRM roles based on your company's purchased licenses. Check the number of assignable users on the Billing Information page.

Access this page by going to Setup > Company > NetSuite Account Information > View Billing Information. Click the **Billable Components** subtab and look for **Specialized User: CRM** in the **Component** column. The **Current Provisioned Qty** column shows the number of users to whom you can assign this role.

This user-friendly role setup ensures that your team has the necessary access to manage CRM activities efficiently while allowing customization to meet specific needs.

Specialized User: Site Operator

The Specialized User: Site Operator role is a standard role with predefined permissions which grants users access to features within NetSuite necessary to perform operational functions. You can assign

this role to managers who oversee specific physical locations within a larger business network, such as franchises or hospitality groups, including restaurants, retail stores, or clinics.

A user with the Specialized User: Site Operator role has the ability to:

- Enter or scan bills and credits for processing and approve bills.
- Review store sales data from Point of Sale (POS) systems.
- View selected financial reports, such as store-level profit and loss statements, and enter budgets specific to each location.
- View items and pricing and record physical inventory counts.

For a detailed list of the default permissions and their access levels, see [Specialized User: Site Operator](#).

To assign this role to an employee, see the help topic [Assigning Roles to an Employee](#).

Customizing the Specialized User: Site Operator Role

You can customize this role by creating a custom role based on the Specialized User: Site Operator role. This allows you to limit or modify the standard permissions to fit user needs. For more information, see [Customizing and Creating Roles](#) and [Setting Permissions](#).

You can remove permissions but cannot add any permissions outside the standard role. Additionally, you cannot grant greater access than the standard permissions allow. However, you can reduce access levels as needed. If users need to access permissions that are not available in this user type, please contact your NetSuite account manager to purchase a general access license.

Managing the Specialized User: Site Operator Role

Assigning only the standard or a custom Specialized User: Site Operator role to an employee counts toward the Specialized User: Site Operator license. Assigning it along with other general access roles counts toward the general access license instead.

You can assign multiple Specialized User: Site Operator roles based on your company's purchased licenses. See the number of purchased and used licenses on the Billing Information page.

Access this page by going to Setup > Company > View Billing Information. Click the **Billable Components** subtab and look for **Specialized User: Site Operator** in the **Component** column. The **Current Provisioned Qty** column shows the number of purchased licenses. The **Current Used Qty** column shows how many licenses are currently in use.

Showing Role Permission Differences

Use the Show Role Differences feature to quickly review the differences in permissions between roles. You can view all of the roles' permissions or only the permissions that are different. You can also export the list of role permission differences as a .CSV or .XLS file. You should select less than 100 roles for comparison to avoid issues with processing your request.

 **Note:** You need the Bulk Manage Roles permission assigned to use the Show Role Differences feature. For more information, see [Permissions Documentation](#).

To compare permissions for two or more roles:

1. Go to Setup > Users/Roles > Show Role Differences.
2. In the **Base Role** dropdown list, select the role that will be the basis for comparison to other roles.

3. In the **Compare To** dropdown list, select one or more roles to compare to the base role.
4. Do one of the following:
 - To view all of the permissions associated with the selected roles, clear the **Only Show Differences** box.
 - To view only the permissions that are different between the roles, select the **Only Show Differences** box.
5. Click **Show**.
On the **Role Permission Differences** page, the permissions are arranged alphabetically and by category.
6. To export the list as a .CSV or .XLS file, click one of the export options at the top of the list.
7. To compare permissions for another set of roles, click **New**.

Use Searches to Audit Roles and Permissions

You can use searches to audit your NetSuite role permissions. NetSuite provides a simple role search you can use to find a particular role or set of roles, or to return a list of roles and their characteristics. For information about running simple searches, see the help topic [Defining a Simple Search](#). You can also create advanced employee and role record saved searches to find information about role permissions. For example, you can verify permissions assigned to a role, or verify permissions assigned to an employee or an employee's role. For information about auditing permissions, see [Use Searches to Audit Roles](#) and [Use Searches to Audit Permissions By Employee](#). In addition to user interface searches, you can use the SuiteScript Search APIs to create and automate searches. For more information see the help topic [N/ search Module](#).

Use Searches to Audit Roles

You can run role and employee record saved searches to gather information about the roles in your NetSuite account.

You can do role record searches for general information about roles in your account, such as permissions assigned to a custom role. Role record body fields are available for role record searches.

Figure 3. Role Record Search Fields

The screenshot shows a web interface with two tabs: 'Standard' and 'Summary'. The 'Standard' tab is selected. Below the tabs is a 'Filter *' section. A dropdown menu is open, displaying a list of search fields. The fields listed are: Center Type, Class Allow Viewing, Class Restrictions, Custom, and Department Allow Viewing. The 'Class Restrictions' field is highlighted with a blue bar on the left. The dropdown menu has a scroll bar on the right and a downward arrow at the bottom.

Figure 5. Employee Record Filter Fields

Related record fields are also available, see the help topic [Related Records Fields Available for Advanced Searches](#). Additionally, the following role fields are available:

- Role: Provides a role's name.
- Role Change: Provides the name of a role to which a change was made.
- Role Change Action: Provides the action taken on a role.
- Role Change Date: Provides the date an action took place.

Employee Search Example

You need to see changes made to roles of employees at a specific location.

To gather this information, you would create an Employee record saved search. For the search criteria, you would add a **Location** filter equaling the office location. For the search results, you would select the **Name**, **Permission Change**, **Permission Change Date**, and **Permission Change Level** fields.

Employee Search: Results

Mass Updating a Permission on Custom Roles

You can use a specialized mass update to add, remove, or change the level of a permission for multiple roles at the same time, instead of editing each role individually. This mass update is available to users with the Manage Roles permission.

Users cannot modify permissions for standard roles, so this mass update can only be applied to custom roles. Also, this mass update is not available to customized Customer Center, Employee Center, Partner Center, or Vendor Center roles.

For general information about mass updates, see the help topic [Mass Updates](#).

See the following articles for more information:

- [To Mass Update a Permission for Multiple Roles](#)
- [Adding Custom Role Fields to be Mass Update Filter Criteria](#)

To Mass Update a Permission for Multiple Roles

1. Go to List > Mass Update > Mass Updates, expand Roles & Permissions, and select Add/Edit Permission on Roles.
2. In the **Title of Action** field, enter a name for this update.
3. In the **Permission** field, select the permission that you want to change for selected roles.
 - Click the icon at the right of this field to see a list.
 - Note that all permissions are listed in alphabetical order; they are not divided into Transactions, Reports, Lists, Setup, and Custom Records, as they are on role records.
4. In the **Level** field, choose the permission access level to be applied to selected roles.
 - Choose **None** to remove the permission from selected roles.
 - Note that the available access levels vary according to the permission selected. See [Access Levels for Permissions](#).
5. For custom record permissions only, you can select a value in the **Restrict** field, to limit the selected roles' access to custom records of the type indicated by the permission.
 - Select **Viewing and Editing** to restrict users with selected roles to viewing or editing only the records of this type that they or their subordinates created.
 - Select **Editing Only** to restrict users with selected roles to editing only the records of this type that they or their subordinates created but allow them to view all records of this type.
 - Leave this column blank to allow users with selected roles to view and edit all records of this type.

For information about custom record type permissions, see the help topic [Setting Permissions for a Custom Record Type](#).

6. To limit the roles where the selected permission should be modified, define a filter or filters on the **Criteria** subtab.
 - If existing role fields do not provide needed filtering, you can create one or more custom field(s) of the Other Custom Field type, and add them to role records, to be used as filter criteria for this mass update. See [Adding Custom Role Fields to be Mass Update Filter Criteria](#).
 - If you do not define any filter criteria, the permission change is applied to all custom roles in the account, other than customized Customer Center, Employee Center, Partner Center, and Vendor Center roles.
7. Define display options for mass update results on the **Results** subtab.
8. Define the users who can run the update on the **Audience** subtab, if available.
9. If you have the Administrator role and you want to run the mass update on a recurring basis, set up this recurrence on the **Schedule** subtab. See the help topic [Scheduling a Mass Update](#).
10. View audited changes and actions respective to the update on the **Audit Trail** subtab.

11. Click **Preview** to see which records the mass update will change, and review the Mass Update Preview page.
 - To modify the mass update, click **Return to Criteria**, and repeat the previous steps as necessary.
 - If your list has less than 1000 entries, an **Apply** column is shown. If any record listed should not be updated, clear the box in the **Apply** column.
12. Choose one of the following options: **Perform Update**, or **Save**.
 you click **Perform Update**, you cannot stop or cancel the mass update, so proceed with caution!

Adding Custom Role Fields to be Mass Update Filter Criteria

To increase the effectiveness of the Add/Edit Permission on Roles mass update, you can add one or more custom fields to the role record. This kind of field can be used to categorize roles and provide filter criteria for the mass update. The type of custom field that can be added to role records is the Other Custom Field type.

The steps below provide steps for creating this type of field. For further details, see the help topics [Creating a Custom Field](#) and [Creating Other Record Fields](#).

To create a custom field to be added to the role record:

1. Go to Customization > Lists, Records, & Fields > Other Custom Fields > New.
2. From the **Record Type** dropdown list, select **Role**.
3. In the **Label** field, enter a name for the field.
4. From the **Type** dropdown list, select the type of field.
 For example, you can choose **List/Record** if you want the field to be a dropdown list with multiple options. For this choice, you need to select the list or record that supplies dropdown list options. You may need to first create a custom list of these options, then return to creating this custom field. See the help topic [Custom Lists](#).
5. To add the field to the role page, select a value in the **Insert Before** field.
6. Complete other fields as necessary.
7. Click **Save**.

After you have created this custom field, you can set its values on role records as desired, then use it as a filter criteria for the Add/Edit Permission on Roles mass update.

The following screenshots show the record for a sample custom field, its associated custom list, and the field on the role record:

The screenshot displays the 'Other Record Field' configuration interface. Key elements include:

- Record Type:** Set to 'Role'.
- Label:** 'Role Type'.
- ID:** 'custrecord461'.
- Owner:** 'Wolfe, A'.
- Description:** (Empty text field).
- Type:** 'List/Record'.
- List/Record:** 'Role Type'.

Mass Updating the Role Assigned to Customers

You can update the role assigned to your customers using a mass update. When you mass update customer roles, a change you indicate is made for many customer records at the same time, instead of changing the records one at a time.

For example, if you customize your Customer Center role and want to assign the new custom role to all of your customers, you can use the mass update to do so.

To mass update the customer role:

1. Go to List > Mass Update > Mass Updates, expand Customer Support and Service and select Change Customer Role.
2. In the **Title of Action** field, enter a name for this update.
3. In the **Change Role** field, select the role you previously assigned that you now want to change.
4. In the **to** field, select the role you want the update to assign in place of the role selected in the **Change Role** field.

For example, in the **Change Role** field, you select Customer Center. In the **to** field, you select Customer Role Alpha, a custom role you created. When you run the mass update, selected customers are assigned the Customer Role Alpha role instead of the Customer Center role. These customers no longer have access to the Customer Center role.
5. Define a filter or filters on the **Criteria** subtab to limit the customers whose role should be modified.
6. Define display options for mass update results on the **Results** subtab.
7. Define the users who can run the update on the **Audience** subtab, if available.
8. If you have the Administrator role and you want to run the mass update on a recurring basis, set up this recurrence on the **Schedule** subtab. See the help topic [Scheduling a Mass Update](#).
9. View audited changes and actions respective to the update on the **Audit Trail** subtab.
10. Click **Preview** to see which records the mass update will change, and review the Mass Update Preview page.
 - To modify the mass update, click **Return to Criteria**, and repeat the previous steps as necessary.
 - If your list has less than 1000 entries, an **Apply** column is shown. (If you want to show the **Apply** column, select search criteria that return results with less than 1000 entries.) If any record listed should not be updated, clear the box in the **Apply** column.
11. Choose one of the following options: **Return to Criteria**, **Perform Update**, or **Save**.
you click **Perform Update**, you cannot stop or cancel the mass update, so proceed with caution!

For general information about mass updates, see the help topic [Mass Updates](#).

NetSuite Users Overview

To set up users with access to your NetSuite account, you must have the Administrator role to set up records for them, either employee, vendor, partner, or customer records, depending on the type of users. To add a user, you need to set up a record for that user and on that record, explicitly indicate that access to NetSuite should be provided

On each record, you need to provide an email address, which serves as the user ID. Each record has an Access subtab, where you can enable the Give Access option and assign roles. For users to have access to NetSuite, they must also have a password. Users with the Administrator role can send an access notification email that includes a link that lets users create their own passwords.

For links to instructions for adding NetSuite users, see the topics in [Manage Different Types of Users](#).

If you assign an additional role to a user who is currently logged in to NetSuite, that user will need to log out and log back in to NetSuite to see the newly assigned role. The same is true if you add permissions to an existing role while a user is currently logged in to NetSuite. The user needs to log out and log back in to exercise the new permissions.

Note: When the Advanced Employee Permissions feature is enabled, the Employee System Access permission must be assigned to a role to give access and assign roles to employees. For more information, see the help topic [Employee Access Tab Permission Overview](#).

To review users' roles, go to Setup > Users/Roles > Manage Users. The Manage Users page lists all users by name, with their email addresses and roles.

The Manage Users Page

1. Click a user name to open his or her record. You can then click the **Edit** button in the record to make changes.
2. Click an email address to send mail to the user.

For more information, see [Viewing Your NetSuite Users List](#).

The Login Audit Trail

The Login Audit Trail is a specialized search that returns a list of account login and logout activity, that can be filtered by date, user, role, or IP address. This search helps keep track of account users, when they have logged in or logged out, and from where. Search results indicate whether each login or logout attempt was successful. This search is available at Setup > Users/Roles > View Login Audit Trail.

Note: In some cases, users' login to NetSuite is ended when they have not explicitly logged out of NetSuite. For example, this situation occurs when a user's NetSuite session times out. If the logout is not explicit, the system does not create a logout entry in the Login Audit Trail.

For more information, see [Login Audit Trail Overview](#).

Manage Different Types of Users

See the following topics for information about setting up and maintaining access for different types of NetSuite users.

- [Employee Users](#)
- [Vendor Users](#)
- [Partner Users](#)
- [Customer Users](#)

Note: Only active users with access count against the Full User Count purchased for your account. Inactive users that have access do not count. For details about making users inactive, see the help topic [Employee Termination](#).

Employee Users

You can give NetSuite access to employees by checking the Give Access box on the Access subtab of the Employee record. You assign roles to an employee on the Roles subtab of the Access subtab. Most roles in the system are available to employees, and you can assign multiple roles to each employee.

- For instructions for setting up NetSuite access for employees, see the help topic [Giving an Employee Access to NetSuite](#).
- For instructions for assigning roles, see the help topic [Assigning Roles to an Employee](#).

- For instructions for limiting employees' ability to enter time records, see the help topic [Restricting Employee Time Tracking Entries](#).
- For instructions for adding employees, see the help topic [Adding an Employee](#).

After you have set up employees with access and one or more roles each, you can return to their records and make changes to their assigned roles as necessary. The Access subtab includes a History subtab that lists changes made to role assignments.

If the Global Permissions feature is enabled, you also can assign permissions directly to employees, on a Global Permissions subtab of the Access subtab. These permissions supersede permissions for the employee's assigned role, in the event of a conflict. Please note that usage of the Global Permissions feature is not preferred. For more information, see [Using the Global Permissions Feature](#).

You can use employee searches to track employees' roles and changes to them. The following role fields are available to be used as filters for employee searches:

- Center Type
- Custom
- Inactive
- Internal ID
- Level
- Name
- Permission
- Permission Change
- Permission Change Date

The following role fields are available to be displayed as results for employee searches:

- Center Type
- Custom/Standard
- Inactive
- Internal ID
- Level
- Name
- Permission
- Permission Change
- Permission Change Date
- Permission Change Level

Important: When an employee leaves your company, you should modify the person's record to reflect the termination date and remove any previously granted user roles and access permissions. You can also inactivate the employee record if you want to prevent it from appearing in lists or as choices anywhere in your account. For more information, see the help topic [Employee Termination](#).

Vendor Users

Vendor access is supported if you have enabled the Vendor Access option on the Web Presence subtab at Setup > Company > Setup Tasks > Enable Features. If this feature is disabled, Vendor records do not include an Access subtab.

You can give vendors access by checking the Give Access box on the Access subtab of the Vendor record. You assign roles to a vendor on the Roles subtab of the Access subtab. Most roles in the system are available to vendors, and you can assign multiple roles per vendor. There may be a Vendor Center role available.

After you have set up vendors with access, you can return to their records and make changes to their assigned roles as necessary. The Access subtab includes a History subtab that lists changes made to role assignments.

For more information about setting up vendors, see the help topics [Creating a Vendor Record](#), [Assigning a Role to a Vendor](#), and [The Vendor Center Role](#).

Partner Users

Partner access to your account is supported if you have enabled the following features at Setup > Company > Setup Tasks > Enable Features:

- Partner Relationship Management on the CRM subtab
- Partner Access and/or Advanced Partner Access on the Web Presence subtab

You can give partners access by checking the Give Access box on the Access subtab on the Partner record. You can assign one role per partner. Available roles may include the Partner Center, the Advanced Partner Center, or your customized versions of these roles. You also can grant access to individual partner contacts based on their email addresses.

Customer Users

Customer access to your account is supported if you have enabled the Customer Access option on the Web Presence subtab at Setup > Company > Setup Tasks > Enable Features. If this feature is disabled, Customer records do not include an Access subtab. For more information, see [Giving Customers Access](#).

You can give customers access by checking the Give Access box on the Access subtab of the Customer record. You can assign one role per customer, usually the Customer Center role, or your customized version of it. You also can grant access to individual customer contacts based on their email addresses.

Giving Customers Access

NetSuite provides a standard role for customers. The Customer Center role lets customers view their estimates, orders, invoices, and payments. You can customize this role to adjust the level of permission for certain tasks in the center. For example, if you do not want customers to make payments from the Customer Center, you can set the level for Customer Payments to None instead of Edit.

For more information about giving access to customers, see the following:

- [Enable the Customer Access Feature](#)
- [Provide Access to Individual Customers](#)
- [Use CSV Import to Provide Access to Multiple Customers](#)
- [Set the Customer Center Sales Order Form](#)

Enable the Customer Access Feature

To allow customer access to NetSuite, a user with the Administrator role must first enable the Customer Access feature.

To enable the Customer Center:

1. Go to Setup > Company > Setup Tasks > Enable Features.
2. On the Enable Features page, click the **Web Presence** subtab.
3. Check the **Customer Access** box.
4. Click **Save**.

When customer access has been enabled, roles can be assigned to customer users individually or by CVS import to give access to multiple customers.

Provide Access to Individual Customers

You can use customer records in NetSuite to give access to customers and assign roles.

Important: Do not give access to unknown email addresses, or unknown customers. It is also unsafe to use generic email addresses like test@test.com.

You should use the **Send New Access Notification Email** feature that lets customers set up a NetSuite password for themselves. However, if you prefer to set their passwords yourself, use the procedure in Set a Customer's Password Manually instead.

See the following topics and procedures:

- [To assign a customer a role and provide access to NetSuite](#)
- [Set a Customer's Password Manually](#)

To assign a customer a role and provide access to NetSuite

1. Go to Lists > Relationships > Customers.
2. Click **Edit** next to the customer that you want to assign a role to.
3. In the **Email** field, enter the customer's email address.
The customer uses this email address to log in to NetSuite.
4. Click the **Access** subtab.
5. Click the **Give Access** box.
6. If you run multiple websites, you can restrict a customer's login access to a specific website (for example, the website that the customer registered on). To assign a customer to a website, in the **Assigned Web Site** field, select a website. For more information, see the help topic [Assign Customers to Websites](#).
7. To assign the standard Customer Center role, in the **Role** field, select **Customer Center**. If you customized the Customer Center role, select the name of the custom role. For more on customizing this role, see [Customizing or Creating NetSuite Roles](#).
8. Check the **Send New Access Notification Email** box to notify your customer of this new access. As of 2018.2, the new access notification email includes the user's email address (used for logging in to NetSuite), the administrator's email address, and explains login procedures. It also contains a URL so that the customer can set up a NetSuite password. The email containing the link is sent as secure email, and comes from NetSuite <n1mailer@netsuite.com>.

Note: The URL sent in the notification email expires, by default, in 24 hours after sending. A user with the Administrator role can change the number of hours of expiration. For more information, see the Help for the **User Registration Link Expiration In Hours** field at [Setting General Display Preferences](#).

To customize the email message, go to Setup > Company > System Email Templates. Next to **Standard Customer Center Access Email**, click **Edit**.

9. To assign individual logins to the customer's contacts, on the **Access** subtab, check the **Access** box next to the contacts you want to grant access to.

 **Note:** If this is a new customer, you might need to save the record before you can view contacts on the **Access** subtab.

- a. Make sure that an email address is listed for each of the contacts that you want to assign login access to.
- b. Check the Manually Assign Password box and enter a password for each of the contacts.
- c. Check the Notify box for the contacts that you want to notify by email.

For security reasons, the contact's password is not included in the email message.

10. Click **Save**.

 **Important:** To revoke access, you should clear the **Give Access** box. If you want to inactivate all roles of the customer, and the customer is also a vendor, partner, or employee, you must revoke access and inactivate those records, too.

Set a Customer's Password Manually

You should use the **Send New Access Notification Email** feature that lets customers set up a NetSuite password for themselves. However, if you prefer to set their passwords yourself, use the following procedure instead.

To set a customer's password manually:

1. Go to Lists > Relationships > Customers.
2. Click **Edit** next to the customer that you want to assign a role to.
3. In the **Email** field, enter the customer's email address.
The customer uses this email address to log in to NetSuite.
4. Click the **Access** subtab.
5. Check the **Give Access** box.
6. If you run multiple websites, you can restrict a customer's login access to a specific website (for example, the website that the customer registered on). To assign a customer to a website, in the **Assigned Website** field, select a website. For more information, see the help topic [Assign Customers to Websites](#).
7. To assign the standard Customer Center role, in the **Role** field, select **Customer Center**. If you customized the Customer Center role, select the name of the custom role. For more on customizing this role, see [Customizing or Creating NetSuite Roles](#).
8. Do not check the **Send New Access Notification Email**
9. Check the **Manually Assign or Change Password** box.
10. Enter and confirm the customer's password.

 **Note:** When customers register on your website, the passwords they enter are saved here.

For details about password requirements, see the help topic [NetSuite Password Requirements](#).

11. Click **Save**.

12. Next, tell your customer to go to your customer center login page. To find the URL, go to Setup > Company > Company Information in the Customer Center Login field. Your customer can log in with the email address and the password you entered on the customer's record. Do not send the customer the password by email.

The customer can now use the email address and password to log in to your NetSuite account with the Customer Center role. Customers can log in to see their own sales orders, invoices, estimates, and payments.

Note: After you save the record, you can preview the account. To preview the account, go to the **Access** subtab, and click the **Log in as customer** link.

You can use the preview to ensure the role given to the customer is set up correctly.

Use CSV Import to Provide Access to Multiple Customers

You can use the Import Assistant to provide access to your NetSuite account to a large set of customers at Setup > Import/Export > Import Tasks > Import CSV Records, without needing to individually update each customer record.

You must have the Import CSV File permission to complete this task. For general instructions for using the Import Assistant, see the help topic [Importing CSV Files with the Import Assistant](#). For general information about setting up CSV files for import, see the help topic [Guidelines for CSV Import Files](#). See also [Boolean Values in CSV Files](#).

Important: There are two procedures in this section. The preferred procedure uses CSV import to provide access to your NetSuite account to multiple customers without assigning passwords. The other procedure also uses CSV import to provide access to your NetSuite account, but requires that you assign a password for each customer.

Users with the Administrator role no longer need to create the initial passwords when giving access to users. You should use the following procedure to provide access, setting the value for the Send New Access Notification Email field to Yes. The standard access notification email includes a link that lets users create their own passwords for accessing NetSuite.

You should follow this procedure to provide access to your NetSuite account for multiple customers.

See the following procedures:

- [To provide access for existing customers](#)
- [To provide access and assign passwords for existing customers](#)

To provide access for existing customers

1. Create a CSV file of customer data, with (at minimum) the following fields. You can include other fields in the CSV file, if necessary.
 - **Unique ID** – You should use the Internal ID for the customer record. For information about obtaining internal ID values, see the help topic [Displaying Internal IDs](#). However, using the Customer ID is supported.
 - **Email address** – Required for NetSuite access. You can omit the value for customers whose email address is already populated in their NetSuite records.
 - **Give Access** – Set the value of this field to Yes for all customers included in your CSV file to which you want to provide access.

- **Send New Access Notification Email** – Set this value to Yes. The notification email includes a link that lets customers create their own passwords for accessing NetSuite.
 - **Role** – For most customers, this value should be Customer Center.
- 2. Go to Setup > Import/Export > Import CSV Records.
- 3. In the Import Assistant, do the following:
 - a. Select an **Import Type** of **Relationships**.
 - b. Select a **Record Type** of **Customers Only**.
 - c. Click the **Select** button and browse to the CSV file you created.
 - d. Click **Next**.
- 4. Choose a **Data Handling** value of **Update** and click Next.
- 5. Map all of the fields listed in step 1 and any other required fields. Click **Next**.
 - For information about importing customer records, see the help topic [Customers Only Import](#).
 - For information about mapping import fields, see the help topic [CSV Field Mapping Tasks](#).
- 6. Give the import map a name and click **Save & Run**.

If you prefer to assign passwords to customers, as well as give them access to your NetSuite account, follow this procedure.

To provide access and assign passwords for existing customers

1. Create a CSV file of customer data, with (at minimum) the following fields. You can include other fields in the CSV file, if necessary.
 - **Unique ID** – You should use the Internal ID for the customer record. For information about obtaining internal ID values, see the help topic [Displaying Internal IDs](#). However, using the Customer ID is supported.
 - **Email address** – Required for NetSuite access. You can omit the value for customers whose email address is already populated in their NetSuite records.
 - **Give Access** – Set the value of this field to Yes for all customers included in your CSV file to which you want to provide access.
 - **Manually Assign or Change Password** – Set the value of this field to Yes.
 - **Password** – The minimum password length for customers is eight characters.
 - **Confirm Password** – The value must match the value set for **Password**.
 - **Role** – For most customers, this value should be Customer Center.
2. Go to Setup > Import/Export > Import CSV Records.
3. In the Import Assistant, do the following:
 - a. Select an **Import Type** of **Relationships**.
 - b. Select a **Record Type** of **Customers Only**.
 - c. Click the **Select** button and browse to the CSV file you created.
 - d. Click **Next**.
4. Choose a **Data Handling** value of **Update** and click Next.
5. Map all of the fields listed in step 1 and any other required fields. Click **Next**.
 - For information about importing customer records, see the help topic [Customers Only Import](#).
 - For information about mapping import fields, see the help topic [CSV Field Mapping Tasks](#).
6. Give the import map a name and click **Save & Run**.

 **Note:** After the CSV import completes successfully, you must tell each customer the password you assigned. Do not send passwords by email.

Set the Customer Center Sales Order Form

When a customer views a sales order in the Customer Center, the form used to display the order depends on how the order was originally entered in NetSuite. You can determine the sales order form that is shown to Customer Center users.

- For a sales order created in the Customer Center or entered directly into NetSuite, the order is displayed using the preferred sales order form defined at Customization > Forms > Transaction Forms at the time the order was saved.
- For a sales order created through the Web Store, the order is displayed using the form that was defined at the time the order was saved in the Sales Order Type field on the Website record at Commerce > Websites > Website List on the Shopping subtab, Checkout Preferences.

 **Important:** If this form preference is changed, sales orders saved prior to the change are displayed using the originally saved form.

If your default external form is an invoice form instead of a cash sale, perform the following procedure to determine which fields show on the form.

To determine which fields show on the form:

1. Go to Customization > Forms > Transaction Forms.
2. Click **Customize** next to Standard Sales Order — Invoice.
3. Go to the **Printing Fields** subtab and check (or clear) the **Print/Email** box for fields you want to show (or not show.) The Printing Field subtab is displayed if you have the Basic printing type selected. For information about printing types, see the help topic [Creating Custom Entry and Transaction Forms](#).

The **Screen Fields** subtab controls the appearance of the form when it is viewed from an internal role, such as Administrator.

4. Click **Save**.

 **Note:** Be aware of the following about marking a transaction or CRM form Preferred for Customer Center roles: External forms, meaning forms with names appended with (External), can be marked Preferred for Customer Center roles, but not for other roles. Forms that are not external cannot be marked as Preferred for Customer Center roles.

Changing a User's NetSuite Password

Users can change their own NetSuite passwords, but there are occasions when an administrator must reset a user's password. For example, when users forget the answers to their security questions.

The procedures in this section are for users with the Administrator role.

- For instructions written for users to change their own passwords, see the help topic [Change Password Link](#).

- For more information written for Administrators about passwords, see the help topic [Password Reset Tips for Administrators](#). See also [Password Requirements and Policies in NetSuite](#).

As of 2019.2, the User Access Reset Tool is the preferred method for changing a user's NetSuite password. You can also perform other actions to assist users: clear security questions, unlock NetSuite access, and reset (clear) the user's two-factor authentication (2FA) settings.

Important: To initiate a password reset for a user who has access to multiple NetSuite accounts, you must be an Administrator in all of those accounts.

See the following procedures:

- [To change a user's NetSuite password with the User Access Reset Tool](#)
- [To manually change a user's NetSuite password on the entity record](#)

To change a user's NetSuite password with the User Access Reset Tool

1. In your Administrator role, go to Setup > Users/Roles > User Management > User Access Reset Tool.
2. On the User Access Reset page, enter the email address of the user who requires your help.
3. Check the appropriate box or boxes. You can check multiple boxes if the user needs help with more than one thing.
 - a. **Initiate Password Reset** - check this box to send an email to the user containing a link so that the user can reset the NetSuite password.
 - b. **Clear User's Security Questions** - check this box to clear the user's security questions. The user will be prompted to set up new security questions and answers after the next login to NetSuite.
 - c. **Unlock The User's Access** - check this box to unlock NetSuite access for a user who is locked out of NetSuite after submitting five consecutive incorrect passwords.
 - d. **Reset 2FA Settings** - check this box to reset (or clear) the user's settings for 2FA. The user will be prompted to enter new 2FA settings after the next login to NetSuite with a 2FA required role.
4. Click **Save**.

To manually change a user's NetSuite password on the entity record

1. Do one of the following:
 - If the user is an employee, go to Lists > Employees > Employees.
 - If the user is not an employee, go to List > Relationships, and then click **Customers**, **Partners**, or **Vendors**.
2. Next to the user's name, click **Edit**.
3. Click the **Access** subtab.
4. Verify that the **Give Access** box is checked.
5. Check the **Manually Assign or Change Password** box.

6. Enter a password in the **Password** field. As you type, the characters are validated against password policy criteria and the results are displayed.
7. Enter the password in the **Confirm Password** field.
8. Do not check the **Send New Access Notification Email** box.
9. To require the user to create and save a new password, check the **Require Password Change on Next Login** box. For security reasons, you should select this option.

 **Note:** The **Require Password Change on Next Login** box is not available on Customer records.

10. Click **Save**.

 **Important:** If a message appears saying that only the user can change this password, click **OK** to close the message. Some users access multiple NetSuite accounts with the same email address and you might not have management over all of the accounts.

11. You must tell the user the password you created. For security reasons, do not send the password by email or in a chat application.

NetSuite permits each user a maximum of five failed login attempts. When a user exceeds this maximum (usually because of an incorrect password), an email message is sent to notify users with the Administrator role, and the user is locked out of NetSuite for 30 minutes.

Viewing Your NetSuite Users List

Your Users list gives you quick access to records for the customers, vendors, partners or employees who have access to your NetSuite account.

To view your Users list:

1. Go to Setup > Users/Roles > Manage Users.
2. Here are some procedures you can use with the Users list:
 - Click a column heading to sort the list by that column.
For example, if you click **Name**, the page will show the alphabetical list of users. If you click **Role**, it will show the alphabetical list of roles.
 - Click a user's name to go to that person's record.
 - Click a user's email address to send email to that user.
 - Select a role from the **Role** dropdown list in the page filter at the top left to list only users for the selected role.
 - Click **Print** to print your list.

- Click **Export** to export this list as a CSV file or Microsoft Excel file.

Note: If your page does not include the Export button, your account administrator may not have assigned you the Export Lists and Perform Search permissions. Contact the person in your company who manages NetSuite.

- The **Total:** at the top of the list on the right indicates the total number of records.

Note: Inactive users do not appear in the Users list, but they can appear in the different Entity Lists if the Show Inactives box is checked. For example, you can get a list of all Employee records at Lists > Employees > Employees and if you check the Show Inactives box, you can see the inactive Employee records too.

Login Audit Trail Overview

The Login Audit Trail is a specialized search that helps keep track of account users, when they have logged in, and from where. It is available at Setup > Users/Roles > View Login Audit Trail.

The Login Audit Trail captures and records the IP address at the beginning of the user's session. It does not capture changes in IP addresses that might occur during a session, such as when a user connects to a Virtual Private Network (VPN) while the session is active. If the user logs out of NetSuite, then logs back in while the VPN is still open, the IP address of the VPN will be captured for that session.

Note: Oracle NetSuite does not support traffic that is routed through a split-tunnel Virtual Private Network (VPN) to control user access to NetSuite. For more information, see the help topic [VPN Configuration for User Access to NetSuite](#).

This search returns a list of login activity, that can include each session listed by date and time of initial login, the user's name, and the IP address from which the user logged in. When you drill down on individual login entries, you view a list of the transactions completed during the user's session. If no data appears, then the user did not complete any transactions during the period you are viewing.

Note: The Login Audit Trail search also is available from general search task links, like Reports > New Search, and Reports > Saved Searches > All Saved Searches > New.

Login Audit Trail Search Capabilities

The Login Audit Trail offers the same capabilities as other NetSuite searches, including:

- Simple search mode, where you can select from a limited set of filters, including IP address, user name, date range, and role.
- Advanced search mode, with more options, including filtering by formulas and join fields, display of formula and join fields as results, and sorting and grouping of results. Available join fields include Role, Employee, and in some cases, Customer, Partner, and Vendor fields.
- Saved searches that you can define and run repeatedly. Saved searches offer all advanced search options, and more, including defining audiences and sending emails of search results.

When you open the Login Audit Trail Search page it displays in the mode last used, initially simple search.

For instructions for using the Login Audit Trail, see the following:

- Defining a Simple Login Audit Trail Search
- Defining an Advanced Login Audit Trail Search

Defining a Simple Login Audit Trail Search

Important: By default, the Administrator role has the View Login Audit Trail permission that allows managing the Login Audit Trail. You can add this permission to any role that can make changes on the Manage Roles page.

To define a simple Login Audit Trail search:

1. Go to Setup > Users/Roles > View Login Audit Trail.

2. Define filters for searching login activity:
 - **User** – Select one or more users, holding down the **CTRL** key to select more than one. To search by exclusion, change the dropdown list to **none of**.
 - **Role** – Select one or more roles.
 - **Date Range** – Select a named time period (such as last fiscal year), or enter a start date and end date to define a custom date range.
 - **Email Address** – Enter an email address in the field.
 - **IP Address** – Select search logic in the dropdown list, and enter an IP address or part of an IP address.
 - **User Agent** – Select search logic, and enter a value like “Mozilla” to find the client browser used to access your account.
 - **Request URI** – Select search logic, and then enter a URI (or any part of a URI) for a NetSuite page used for login.

The list below includes examples you might use to find the services used to access your account:

- /app/center/mobile/iphone.nl
- /app/reporting/webquery.nl
- /app/site/hosting/restlet.nl

- /app/webservices/wslogin.nl
- /internal/admin/acctrepl.nl
- **Status** – Select an option: Success, Failure, or Either.

Note: If a user enters an incorrect 2FA verification code, it is counted as a login Failure.

- **Security Challenge** – Select an option: Success, Failure, or Either.
- **Token-based Application Name** – Select a parameter to use, and then type the name.
- **Token-based Access Token Name** – Select a parameter to use, and then type the name.

NOTES ABOUT USER AND EMAIL ADDRESS FILTERS FOR CUSTOMER CENTER ROLES:

- Generally, a user is determined by a combination of email address and password. There is not necessarily a one-to-one mapping between email addresses and users, because two users might share the same email address but use different passwords.
- If an email address is used by only one user, then a login audit trail search filtered by that email address and a search filtered by the matching user produce the same results.
- If an email address can be matched to more than one user, then a login audit trail search filtered by that email address and a search filtered by one of the matching users would produce different results sets.

3. Choose one of the following actions:

- Click **Submit** to run the search and open a NetSuite page with a list of results.
- Click **Export** button to run the search and save results to a .csv file that you can save to disk or open on your desktop. For more information about exporting search results, see the help topic [Exporting Search Results](#).
- Click **Personalize Search** to open a saved search page with no filters defined, where you can define a personalized search form to be your default search form for audit trail.
- Click **Create Saved Search** to open a saved search page that includes the filters you defined. For more information, see the help topic [Saved Searches](#).

Defining an Advanced Login Audit Trail Search

To define an advanced Login Audit Trail search:

1. Go to Setup > Users/Roles > View Login Audit Trail.
2. Check the **Use Advanced Search** box.
3. Click the **Criteria** subtab to define filters.
 - Select a field from the **Filter** dropdown list, select a value in the field popup, and click **Add**, repeating to define additional filter fields.
 - Available filter fields include: Date, formulas, IP Address, Role, User, Employee fields, Role fields, and in some cases Customer, Partner, or Vendor fields.
 - For more information, see the help topic [Advanced Search Criteria Filters](#).
4. Click the **Results** subtab to define columns to appear in search results.
 - Select a field from the **Field** dropdown list and click **Add**, repeating to define additional results fields.
 - Available results fields include: Date, Email Address, formulas, IP Address, Request URI, Role, Security Challenge, Status, User, User Agent, Employee fields, Role fields, token-based

Authentication fields (Detail, Token-based Access Token Name, Token-based Application Name) and in some cases Customer, Partner, or Vendor fields.

- You also can set up sorting and summarizing options for results. For more information, see the help topic [Search Results Display Options](#).

5. After you have defined criteria and results display options for an advanced search, you can:

- Click **Submit** to run the search and open a NetSuite page with a list of results.
- Click **Export** to run the search and save results to a .csv file that you can save to disk or open on your desktop. For more information about exporting search results, see the help topic [Exporting Search Results](#).
- Click **Personalize Search** to open a saved search page with no criteria or results options defined, where you can define a personalized search form to be your default search form for the record type.
- Click **Create Saved Search** to open a saved search page that includes the criteria and results options you defined. For more information, see the help topic [Saved Searches](#).

Logout Entries in the Login Audit Trail

The Logout Entries for the Login Audit Trail feature tracks successful logouts of your users. Every time the users explicitly log out of NetSuite, the Login Audit Trail creates a new entry with one of the following values in the Detail column:

- **ExplicitLogout** - A value in the Detail column that indicates the user clicked the Log Out link in the NetSuite UI and the active session was terminated.
- **RoleSwitchLogout** - A value in the Detail column that indicates the user switched to a different role in the account, or to a role in a different account. Switching roles terminates the session and is considered a logout.
- **SAMLIdPInitiatedLogout** - A value in the Detail column that indicates the SAML Identity Provider initiated a logout and the NetSuite UI active session was terminated.

In some cases, a user's NetSuite session is ended even when the user has not explicitly logged out of NetSuite. For example, this situation occurs when a user's NetSuite session times out. If the logout is not explicit, the system does not create a logout entry in the Login Audit Trail.

Important: If you use the data from the Login Audit Trail to count the number of successful logins, you should not include the successful logout entries. You can do this by filtering out the new values for successful logout occurrences.

For more information about the Login Audit Trail, see [Login Audit Trail Overview](#).

Inactivating Users

If an employee is terminated, or you revoke a customer's access, you might also want to inactivate the record. Inactive users do not appear in record lists.

Here are some cases in which you would want to inactivate a user record:

- You do not want to delete the record because it contains information that you might need in the future for record-keeping or auditing purposes. Also, the user could return (employee might be rehired or a vendor might sign a new contract) and you could make the record active again.
- You want to temporarily remove the user's access to NetSuite and restore it later.

When you inactivate a user:

- The user's login credentials and role assignments are saved. If the record is later made active again, the user can access NetSuite as they did before being inactivated.
- If the user set up schedules to run reports, the reports are not run. The schedule definition is still available, but the task stops running because one part of the schedule was deleted.
- If the user owns calendar events, those events remain in the calendar.
- If the user owns saved searches, they remain in the list of saved searches.

Inactive users do not appear in entity lists unless the Show Inactives box is checked.

Any jobs, for example, reports or scripts, that were scheduled by a user who is now inactive are not run. The jobs are still available, but the schedule is deleted.

Mass Updates process inactive records unless criteria is added to the update to exclude inactive records.

See the following procedures:

- [To inactivate a user](#)
- [To activate an inactivated user](#)

To inactivate a user

1. Open the record list page.
 - Lists > Employees > Employees
 - Lists > Relationships > Vendors
 - Lists > Relationships > Partners
 - Lists > Relationships > Customers
2. Click **Edit** beside the user record you want to inactivate.
3. Click the **System Information** subtab.
4. Check the **Inactive** box.

The screenshot shows the 'System Information' subtab of a user record. At the top, there's a navigation bar with tabs like Communication, Address, Human Resources, etc. The 'Inactive' checkbox is checked and highlighted with a red box. Below this, there's a section for 'System Notes' with tabs for System Notes, Active Workflows, and Workflow History. Under 'System Notes', there's a 'View' dropdown set to 'Default' and a 'Field' dropdown set to '<Type then tab>'. A 'Customize View' button is also present. Below these, a table shows a log of changes:

Date	Set by	Context	Type	Field	Old Value	New Value
9/26/2024 9:41 am	Wolfe, A	UI	Change	Password	PASSWORD_CHANGE_USER_RESET	*****

5. Click **Save**.

To see inactivated users, go to the appropriate list of records and check the **Show Inactives** box at the top of the list.

To activate an inactivated user

1. Open the record list page.
 - Lists > Employees > Employees
 - Lists > Relationships > Vendors

- Lists > Relationships > Partners
 - Lists > Relationships > Customers
2. Check the **Show Inactives** box at the top of the list.
 3. Click **Edit** beside the user record you want to activate.
 4. Click the **System Information** subtab.
 5. Clear the **Inactivate** box.
 6. Click **Save**.

Restricting an Individual User View

Although users with the Administrator role can restrict a users' access to data by department, class, location or for NetSuite OneWorld, subsidiary, by customizing the roles they use to log in, there are situations when a user might want to artificially restrict the information seen for a particular login session.

For example, a bookkeeper might want to approve purchase orders for a single location. Restricting her view allows her to view only the purchase orders for that location. Additionally, reports and search results only show records and transactions associated with that location.

You can restrict your view for the current login session at Home > Set Preferences. The next time you log in, the normal restrictions set for your role are restored.

To restrict your view:

1. Go to Home > Set Preferences.
2. Click the **Restrict View** subtab.
3. In the **Subsidiary**, **Department**, **Location**, or **Class** fields, select the classification for which you want to restrict your view in this login session.

Important: If you restrict your subsidiary view, the departments, locations, and classes available to you are limited to those associated with the selected subsidiary.

4. Check the **Include Sub** box if you want to also see records and transactions associated with child subsidiaries, departments, locations, or classes of the selections.
5. Check the **Include Unassigned** box if you want to see those records and transactions that have not been associated with a department, location, or class.
6. Click **Save**.

NetSuite Permissions Overview

NetSuite provides a large number of permissions that govern the data and interface that users can access. Role permissions are used to define usage of record types, tasks, and pages. Permissions are associated with roles, and roles are assigned to users, who can be employees, vendors, partners, or customers.

Standard roles for specific business functions include predefined sets of permissions. Users with the Administrator role can create custom roles to vary from these standard sets. For information about setting up roles, see [NetSuite Roles Overview](#). For information about assigning roles to users, see [NetSuite Users Overview](#).

You can use the following sources to understand permissions:

- Each role definition page lists permissions already assigned to that role, and other permissions that can be assigned. Permissions are divided into different types: Transactions, Reports, Lists, Setup, and Custom Records. To see this page, go to Setup > Users/Roles > Manage Roles, and click **Customize** for a role. For more information, see [Reviewing Permissions Assigned to Roles](#). For many permissions, different access levels are available. For information, see [Access Levels for Permissions](#).
- NetSuite provides a page where you can compare the permissions assigned to two or more roles and identify differences. To access this page, go to Setup > Users/Roles > Show Role Differences.
- The Help Center provides a link to a spreadsheet listing how permissions are used, meaning the record types, pages, and/or tasks to which permissions provide access. To access this spreadsheet, click here: [NetSuitePermissionsUsage.xls](#) For more information, see [Permissions Documentation](#).

Be aware of the following:

- If the Advanced Employee Permissions feature is enabled in your account, you can customize or create roles to use the Employee Self, Employee Public, Employee Confidential, Employee Compensation, Employee System Access, Employee Record Full, and Employee Administration permissions. For more information, see the help topic [Advanced Employee Permissions Overview](#).
- If the Global Permissions feature is enabled in your account, you can assign permissions directly to employees. Employees retain these global permissions with all of their roles. If there is a conflict between role-based permissions and global permissions, global permissions take precedence. Please note that usage of the Global Permissions feature is not preferred. For more information, see [Using the Global Permissions Feature](#).
- A special permission is required to see unmasked credit card numbers, the View Unencrypted Credit Card Numbers permission. To make this permission available to be assigned to roles in your account, you need to complete a signed agreement.
- A special permission is available that masks employee information about financial reports. For more information, see [Hiding Employee Information on Financial Reports](#).
- When you newly enable a feature in your account, you must consider permissions associated with the added feature. Customized roles that you have already assigned to users may need to be updated to reflect the proper permissions associated with the added feature. See [Customizing or Creating NetSuite Roles](#).

Permissions and Restrictions

- A permission grants access to a specific record type. Some permissions grant access to tasks rather than record types, but for the purposes of understanding the difference between permissions and restrictions, only record type access is relevant.
- A restriction defines, after you have the necessary permissions, which instances of that record type can be accessed.

Note that users with create or full permissions to a restricted record type are able to create and submit new instances of that record type. However, these users are not able to view these newly created restricted records. In other words, users cannot view records to which they are restricted, regardless of their permissions and levels.

Permissions and Restrictions Example

As the manager of a team of employees your role might be granted the View access level for the Employees permission. This level would enable you to view, but not edit, all employee records.

In addition, a restriction might be applied to your role so you can only access employee records of members of your team.

Permissions are generally assigned to roles, and apply to users to which roles are assigned. If the global permissions feature is enabled, permissions can also be assigned to employees, independently of roles. For details about NetSuite permissions, see [NetSuite Permissions Overview](#).

For instructions for setting restrictions on a role, see [Customizing or Creating NetSuite Roles](#).

For available types of restrictions, see [Types of Restrictions](#).

You can audit assigned permissions through searches of role and employee records. You can audit assigned restrictions through searches of role records.

Types of Restrictions

Restrictions are defined on roles, and apply to users to which roles are assigned. The following types of restrictions are available:

- **Employee Restrictions:** You can restrict a role's access to transaction, customer, and employee records, based on values in the employee, sales rep, and supervisor fields on these records. These restrictions may also limit the values that users logged in with this role can assign to these fields on records. These restrictions do not affect access to contact records. You can choose an option to allow viewing of records that are not available for editing due to these restrictions.
- **Department Restrictions:** You can restrict this role's access to transaction, employee, partner, and optionally item records, based on values in the department field on these records. These restrictions may also limit the values that users logged in with this role can assign to the department field on records. You can choose an option to allow viewing of records that are not available for editing due to these restrictions.
- **Class Restrictions:** You can restrict this role's access to transaction, employee, partner, and optionally item records, based on values in the class field on these records. These restrictions may also limit the values that users logged in with this role can assign to the class field on records. You can choose an option to allow viewing of records that are not available for editing due to these restrictions.
- **Location Restrictions:** You can restrict this role's access to transaction, employee, partner, and optionally item records, based on values in the location field on these records. These restrictions may also limit the values that users logged in with this role can assign to the location field on records. You can choose an option to allow viewing of records that are not available for editing due to these restrictions.
- **(OneWorld only) Subsidiary Restrictions:** You can limit the subsidiary values that users with this role can select for customer and vendor records, and to limit the transaction, customer, and vendor records that users with this role can edit, based on these records' selected subsidiaries. You can choose an option to allow viewing of records that are not available for editing due to these restrictions.

Reviewing Permissions Assigned to Roles

You can review lists of permissions on any role definition page, including the permissions assigned to each role, and other available permissions. To review these lists:

1. Go to Setup > Users/Roles > Manage Roles.
2. On the Manage Roles page, click **Customize** for a role.

The **Permissions** subtab on each role definition page has four subtabs that list different types of permissions already assigned to the role: **Transactions**, **Reports**, **Lists**, and **Setup**.

3. Scroll through the **Permissions** dropdown list on each of these subtabs to see other available permissions. Notice that each permission has a level of access selected.

For information about assigning permissions to roles, see [Customizing or Creating NetSuite Roles](#).

Important: When you newly enable a feature in your account, you must consider permissions associated with the added feature. Customized roles that you have already assigned to users may need to be updated to reflect the proper permissions associated with the added feature. See the help topic [Enabling Features](#).

Unsupported Permissions

Since the 2025.1 release, permissions for certain standard roles were updated, therefore some of the permissions assigned to your customized roles are no longer supported. You can see the unsupported permissions in the Unsupported column at the Permissions subtab of the custom roles. These unsupported permissions are still assigned to the roles, but you should consider updating permission assignment for this role.

Standard roles with updated permissions:

- Advanced Partner Center
- Employee Center
- Partner Center
- Vendor Center
- Customer Center
- Specialized User: CRM
- Specialized User: View and Approve
- Specialized User: WMS

Access Levels for Permissions

The following are general definitions of possible access levels for permissions.

- **NONE** - User doesn't have access to existing files. The user cannot create new, view existing, edit existing, or delete existing files. This access level makes the Restrict column in the Custom Record subtab invalid. For more information, see [Setting Permissions](#).
- **VIEW** - User has access to view existing files only. The user cannot create new, edit existing, or delete existing files.
- **CREATE** - User can create new and view existing files. The user cannot edit or delete existing files.
- **EDIT** - User has access to create new, view existing, and edit existing files. The user cannot delete existing files.
- **FULL** - User has access to create new files and view, edit, and delete existing files.

Note that for some permissions, only the minimum view level is required for usage, and other levels do not provide any additional capabilities. In the model defined by the above access level definitions, each successive level (view, create, edit, full) of a permission provides increased usage of the related record

type, task, or page, but the usage of some permissions does not fit exactly into this model. Generally, any user with at least VIEW access to a record type has the ability to print records of that type.

Core Administration Permissions

SuiteCloud: Core Administration Permissions

Access to various features, records, transactions, or reports in NetSuite is primarily controlled by permissions associated with roles that are assigned to end users. This way the user logged in under a given role can be granted full permissions to one record, while having read-only access to another record, and no access to a third record. Unfortunately, not every kind of access in NetSuite can be granted to the user by giving the right permission. Most likely this is because such a permission is missing in the system, and access to this functionality is only available for a user with the Administrator role.

Core Administration Permissions is a feature that can be enabled for a role and gives the role access to a functionality that is currently only accessible to the standard Administrator role. You can use Core Administration Permissions to customize a role so that it behaves almost like the Administrator role, while also restricting access to other areas of NetSuite using role permissions and restrictions. For example, with Core Administration Permissions you can create a role specifically for an IT administrator who is responsible for the general administration of the system, but who should not have access to sensitive employee information.

See [Differences Between Core Administration Permissions and Administrator Role](#) for more information.

By default, Core Administration Permissions is not assigned to any roles. The Core Administration Permissions feature is enabled by default. For more information, see [Customizing or Creating a Role with Core Administration Permissions](#).

Important: Use caution when assigning a role with Core Administration Permissions to a user, because the role will become similar to the standard Administrator role in terms of exclusive administrator privileges.

Differences Between Core Administration Permissions and Administrator Role

Although Core Administration Permissions is designed to behave like the standard Administrator role, the following table outlines some of the differences between these two roles.

Functionality	Core Administration Permissions	Administrator Role
Searches	- Can only view saved searches through the user interface - Can only view private and saved searches by entering an URL	- Can view, edit, make inactive, and delete ALL saved searches, including: - Shared searches, with or without the Allow Audience to Edit option enabled, whether they include the administrator as the audience - Public searches, with or without the Allow Audience to Edit option enabled - Private searches owned by users other than the administrator
Account administration	Cannot edit employees that are assigned the Administrator role	Can edit employees that are assigned the Administrator role

Functionality	Core Administration Permissions	Administrator Role
	- Cannot approve Employee change request - Cannot assign the Administrator role - Cannot close a NetSuite account - Cannot provide access to a demo account - Cannot create payment instruments - Role with Core Administration Permissions assigned can be edited by users with non-administrator roles	- Can approve Employee change request - Can assign the Administrator role - Can close a NetSuite account - Can provide access to a demo account - Can create payment instruments - Administrator role can only be edited by a user with an Administrator role
Contact Records	- When the Advanced Employee Permissions feature is not enabled, any role using Core Administration Permissions must include the Lists > Employees permission when the Show Employees as Contacts box on the General Preferences page is checked - When the Advanced Employee Permissions feature is enabled, Show Employees as Contacts is not supported - For details, see the help topic Advanced Employee Permissions and Contact Records.	—

Customizing or Creating a Role with Core Administration Permissions

Consider the following when you are customizing or creating a role with Core Administration permissions:

- Use caution when assigning Core Administration Permissions to a role, because the role will become similar to the standard Administrator role in terms of exclusive administrative privileges.
- When you assign Core Administration Permissions to a role, you should consider making two-factor authentication required for the role. For more information, see the help topic [Two-Factor Authentication \(2FA\)](#).

The Core Administration Permissions feature is enabled on all accounts by default.

You can assign Core Administration Permissions to any role, and then configure the role to restrict access to areas of NetSuite.

Note: To assign Core Administration Permissions to a role, you must be logged in using the Administrator role or a role with Core Administration Permissions and Manage Roles permissions assigned.

To assign Core Administration Permissions to a role:

- Go to Setup > Users/Roles > Manage Roles.
- On the **Manage Roles** list page, next to the role that you want to add Core Administration Permissions to, click **Customize**.
- On the Role record, check the **Core Administration Permissions** box.
- To make two-factor authentication required for the role, in the **Two-Factor Authentication Required** dropdown list, select **2FA authentication required**.
- Click **Save**.

Important: If you are logged in with a role where two-factor authentication (2FA) is required and you select **Not required** in the **Two-Factor Authentication Required** dropdown list, the required 2FA policy supersedes the role setting. This means that two-factor authentication is required for the role even though it says two-factor authentication is not required on the Role record. For more information, see the help topics [Mandatory Two-Factor Authentication \(2FA\) for NetSuite Access](#) and [Two-Factor Authentication \(2FA\)](#).

Using the Global Permissions Feature

The Global Permissions feature allows users with the Administrator role to assign permissions that apply across all of assigned roles of employees. With global permissions, users with the Administrator role can make changes to each employee's permissions directly on the employee record. Please note that usage of the Global Permissions feature is not preferred.

Note: Not all permissions that are supported for assignment to roles are available for assignment as global permissions.

To enable the Global Permissions feature:

1. Go to Setup > Company > Setup Tasks > Enable Features, and on the Employees tab, check the Global Permissions box.

When this feature is enabled, each employee record includes the Global Permissions subtab on the Access subtab.

To assign global permissions to an employee:

1. After the Global Permissions feature has been enabled, open an employee record.
2. Click the **Access** subtab, and the **Global Permissions** subtab.
3. Select a permission from the **Permission** dropdown list, select an access level for that permission (**View**, **Create**, **Edit**, **Full**, **None**) from the **Level** dropdown list, and click **Add**.

Note: For more information about the permission access levels, see [Access Levels for Permissions](#).

4. Repeat step 3 until you have added all desired permissions.
5. Click **Save**.

You still need to assign one or more role to each employee on the Access subtab's Roles subtab. When an employee logs in, the applicable permission set is a combination of the employee's global permissions and the currently used role's permissions. Where conflicts between an employee's role-based permissions and global permissions occur, global permissions take precedence, even if global permissions are at a lower level.

The global permissions are not taken into account for the Administrator role. It is not possible to downgrade access for the Administrator role by using the global permissions.

Giving Access to the Transactions Subtab on Entity Records

If a user cannot see the Transactions subtab on customer or vendor records, an administrator can make this subtab visible by adding the Financial History permission to a role assigned to the user.

The Financial History permission gives a role access to the Transactions subtab. Additionally, the role must be given access to the specific types of transactions shown on the Transactions subtab.

For examples of where to find the Transactions subtab, see [Transactions Subtab on Entity Records](#).

See the following procedures and topics:

- [To create a custom role with access to the Transactions subtab](#)
- [To assign employees this custom role](#)
- [Transactions Subtab on Entity Records](#)

To create a custom role with access to the Transactions subtab

1. Go to Setup > Users/Roles > Manage Roles.
2. Click **Customize** next to the name of the role you want to customize.
3. In the **Name** field, enter the name for this new role.
This name is selected in employee records on the **Access** subtab.
4. On the **Permissions** tab, click the **Lists** subtab.
5. In the **Role** column, select **Financial History**.
6. In the **Level** column, select **View** (or higher).
7. Click **Add**.
8. Click the **Transactions** subtab.
9. Select the name of the type of transaction you would like this role to view.
10. In the **Level** field, select **View**.
This level of access allows employees to view the transaction but not edit it.
11. Click **Add**.
12. Repeat these steps for each type of transaction you want this role to view.
13. Click **Save**.

Now, users assigned this customized role can view the **Transactions** subtab on entity records and click the links to view those transactions.

To assign employees this custom role

1. Go to Lists > Employees > Employees.
2. Click **Edit** beside the employee you want to assign the role.
3. Click the **Access** subtab.
4. Select the new role in the **Role** field, and click **Add/Edit**.
5. Click **Save**.

When the employee logs in again, they will see the **Transactions** subtab on entity records.

Transactions Subtab on Entity Records

On Customer records, the Transactions subtab is located on the Sales subtab.

On Vendor records, the Transactions subtab is located on the Financial subtab.

Giving Access to Financial Statements

You can assign one permission, Financial Statements, to grant the ability to run all financial statement reports. The Financial Statements permission is a Reports type permission with only a View level possible.

Users also must have the Report Customization permission to be able to customize financial statements in the Financial Report Builder and to rename, delete, or reassign financial statement layouts. The View level of this permission is sufficient.

For information about assigning permissions, see [NetSuite Permissions Overview](#).

For information about financial statement reports, see the help topic [Financial Statements Overview](#).

Hiding Employee Information on Financial Reports

If a user requires access to financial reports, but should not be able to view personal employee information on these reports, an administrator can mask this information by adding the Hide Employee Information on Financial Reports permission to a role assigned to the user. This permission prevents a role from seeing employee information, such as the employee name on the following financial reports:

- [Financial Statements Overview](#)
- [Expense Account Register](#)
- [Other Current Liability Account Register](#)
- [Income Statement Detail Report](#)
- [Balance Sheet Report](#)
- [General Ledger Report](#)
- [Trial Balance Report](#)
- [Viewing the Chart of Accounts](#)
- [Transaction Detail Report](#)
- [Account Detail Report](#)

Important: The Payroll feature must be enabled on your account to use the Hide Employee Information on Financial Reports permission.

To hide employee information on financial reports:

1. Go to Setup > Users/Roles > Manage Roles and select a role from the list.
2. On the **Permissions** tab, click the **Reports** subtab.
3. In the **Permission** column, select **Hide Employee Information on Financial Reports**, and click **Add**.
4. Click **Save**.

Now users with roles that have this permission will not be able to see personal employee information on financial reports.

Setting Permissions for Custom Records

Each custom record includes a Permissions subtab where you can restrict access by role to your custom records and the forms used to enter the records. Setting permissions within custom records themselves is the most flexible way to provide access to custom records.

1. Go to Customization > Lists, Records, & Fields > Record Types, and select a record type from the list.
2. On the **Permissions** subtab, choose a role and set the access level.
3. Repeat to provide access to additional roles, then **Save**.

You also can add the Custom Record Entries permission to a role, to provide users with that role access to all custom records.

1. Go to Setup > Users/Roles > Manage Roles, and select a role from the list.
2. Click the **Lists** subtab, select **Custom Record Entries** from the dropdown list, set the access level, and click **Save**.

If you make either of these changes, users may need to log out and log back in for the changes to take effect.

For more information about custom record permissions, see the help topic [Setting Permissions for a Custom Record Type](#).

Permissions for Inbound Single Sign-on Methods

The correct permission to assign to a role for single sign-on (SSO) inbound access to NetSuite depends on the SSO feature enabled in your account.

OpenID Connect (OIDC) Single Sign-on Permission

OpenID Connect (OIDC) Single Sign-on is an inbound single sign-on (SSO) method to access NetSuite. OIDC is an identity layer on top of the OAuth 2.0 protocol. OIDC uses JavaScript Object Notation (JSON) as the data format, and uses JSON Web Tokens (JWT) to transfer claims between parties.

If the OIDC configuration is shared between different NetSuite accounts, users can switch between OpenID Connect (OIDC) Single Sign-on roles without requiring a separate login. User credentials and policies are managed by the OIDC provider (OP). NetSuite is the client, or relying party (RP).

When this feature is enabled, you can provide OIDC SSO access to your account users by assigning the OIDC Single Sign-on permission to their roles.

See the help topics [Customize Roles for OpenID Connect](#) and [OpenID Connect Permissions](#) for more information about the OpenID Connect (OIDC) Single Sign-on permission and granting OIDC access to center roles.

For more information about the OIDC feature in NetSuite, see the help topic [OpenID Connect \(OIDC\) Single Sign-on](#).

SAML Single Sign-on Permission

The SAML Single Sign-on feature supports inbound single sign-on access to NetSuite using authentication from a third-party identity provider. This feature allows users who have logged in to an external application to go directly to NetSuite. Users do not need to log in separately to NetSuite, because authentication from the same identity provider is used for login to both the external application and NetSuite.

When this feature is enabled, you can provide SAML Single Sign-on access to your account users by assigning the SAML Single Sign-on permission to their roles.

See the help topic [Add SAML Single Sign-on Permissions to Roles](#) for more information about the SAML Single Sign-on permission, granting SAML access to center roles, and limitations and restrictions that apply to SAML permissions.

For more information about the SAML feature in NetSuite, see the help topic [SAML Single Sign-on](#).
